

# Keyfactor Web APIs 10.1

## Reference Guide

# Table of Contents

1.0 Introduction .....	1
2.0 Web APIs Reference .....	2
2.1 Overview .....	2
2.1.1 Transaction Security .....	2
2.1.2 Architecture .....	3
2.1.3 Web API Common Features .....	3
2.1.4 Versioning .....	6
2.2 Keyfactor API .....	7
2.2.1 Agents .....	8
2.2.1.1 GET Agents ID .....	9
2.2.1.2 GET Agents .....	12
2.2.1.3 POST Agents Reset .....	16
2.2.1.4 POST Agents Approve .....	17
2.2.1.5 POST Agents Disapprove .....	17
2.2.1.6 POST Agents ID Reset .....	18
2.2.1.7 POST Agents ID FetchLogs .....	18
2.2.1.8 POST Agents Set Auth Certificate Reenrollment .....	19
2.2.2 Agent Blueprint .....	20
2.2.2.1 DELETE Agent Blueprint ID .....	21
2.2.2.2 GET Agent Blueprint ID .....	21
2.2.2.3 GET Agent Blueprint .....	22
2.2.2.4 GET Agent Blueprint ID Jobs .....	23
2.2.2.5 GET Agent Blueprint ID Stores .....	26
2.2.2.6 POST AgentBlueprint ApplyBlueprint .....	28
2.2.2.7 POST AgentBlueprint GenerateBlueprint .....	29
2.2.3 Agent Pools .....	30
2.2.3.1 DELETE Agent Pools ID .....	30
2.2.3.2 GET Agent Pools ID .....	31
2.2.3.3 GET Agent Pools .....	32
2.2.3.4 POST Agent Pools .....	34
2.2.3.5 PUT Agent Pools .....	36
2.2.3.6 GET Agent Pools Agents .....	38
2.2.4 Alerts .....	40
2.2.4.1 Alerts Denied .....	40
2.2.4.2 Alerts Expiration .....	64
2.2.4.3 Alerts Issued .....	94
2.2.4.4 Alerts Key Rotation .....	124
2.2.4.5 Alerts Pending .....	153
2.2.5 Audit .....	189
2.2.5.1 GET Audit ID .....	189
2.2.5.2 GET Audit ID Validate .....	194
2.2.5.3 GET Audit .....	194
2.2.5.4 GET Audit Download .....	200
2.2.5.5 GET Audit Related Entities .....	202
2.2.6 Certificates .....	208
2.2.6.1 GET Certificates ID Security .....	209
2.2.6.2 GET Certificates ID Validate .....	210
2.2.6.3 GET Certificates Locations ID .....	216
2.2.6.4 GET Certificates Identity Audit ID .....	219
2.2.6.5 DELETE Certificates ID .....	220
2.2.6.6 GET Certificates ID .....	221
2.2.6.7 GET Certificates Metadata Compare .....	233
2.2.6.8 GET Certificates ID History .....	234
2.2.6.9 DELETE Certificates .....	236
2.2.6.10 GET Certificates .....	237
2.2.6.11 PUT Certificates Metadata .....	251

2.2.6.12	PUT Certificates Metadata All	252
2.2.6.13	POST Certificates Import	255
2.2.6.14	POST Certificates Revoke	258
2.2.6.15	POST Certificates Analyze	260
2.2.6.16	POST Certificates Recover	261
2.2.6.17	POST Certificates Download	263
2.2.6.18	POST Certificates Revoke All	265
2.2.6.19	DELETE Certificates Query	266
2.2.6.20	DELETE Certificates Private Key	267
2.2.6.21	DELETE Certificates Private Key ID	268
2.2.7	Certificate Authority	269
2.2.7.1	DELETE Certificate Authority ID	269
2.2.7.2	GET Certificate Authority ID	270
2.2.7.3	GET Certificate Authority	283
2.2.7.4	POST Certificate Authority	296
2.2.7.5	PUT Certificate Authority	322
2.2.7.6	POST Certificate Authority Test	349
2.2.7.7	POST Certificate Authority PublishCRL	351
2.2.8	Certificate Collections	351
2.2.8.1	GET Certificate Collections ID	352
2.2.8.2	GET Certificate Collections Name	353
2.2.8.3	GET Certificate Collections	355
2.2.8.4	POST Certificate Collections	357
2.2.8.5	PUT Certificate Collections	363
2.2.8.6	POST Certificate Collections Copy	367
2.2.8.7	POST Certificate Collections ID Permissions	373
2.2.9	Certificate Stores	375
2.2.9.1	DELETE Certificate Stores	376
2.2.9.2	GET Certificate Stores	377
2.2.9.3	POST Certificate Stores	384
2.2.9.4	PUT Certificate Stores	404
2.2.9.5	DELETE Certificate Stores ID	424
2.2.9.6	GET Certificate Stores ID	425
2.2.9.7	GET Certificate Stores ID Inventory	438
2.2.9.8	GET Certificate Stores Server	440
2.2.9.9	POST Certificate Stores Server	441
2.2.9.10	PUT Certificate Stores Server	446
2.2.9.11	PUT Certificate Stores Password	450
2.2.9.12	PUT Certificate Stores Discovery Job	453
2.2.9.13	PUT Certificate Stores Assign Container	459
2.2.9.14	POST Certificate Stores Approve	466
2.2.9.15	POST Certificate Stores Schedule	475
2.2.9.16	POST Certificate Stores Reenrollment	477
2.2.9.17	POST Certificate Stores Certificates Add	480
2.2.9.18	POST Certificate Stores Certificates Remove	485
2.2.10	Certificate Store Containers	488
2.2.10.1	GET Certificate Store Containers	488
2.2.10.2	POST Certificate Store Containers	491
2.2.10.3	PUT Certificate Store Containers	495
2.2.10.4	DELETE Certificate Store Containers ID	499
2.2.10.5	GET Certificate Store Containers ID	499
2.2.11	Certificate Store Types	505
2.2.11.1	DELETE Certificate Store Types ID	505
2.2.11.2	GET Certificate Store Types ID	506
2.2.11.3	GET CertificateStoreTypes Name Name	511
2.2.11.4	DELETE Certificate Store Types	517
2.2.11.5	GET Certificate Store Types	518
2.2.11.6	POST Certificate Store Types	523
2.2.11.7	PUT Certificate Store Types	535
2.2.12	CSR Generation	548
2.2.12.1	DELETE CSR Generation Pending ID	549
2.2.12.2	GET CSR Generation Pending ID	549

2.2.12.3	DELETE CSR Generation Pending	550
2.2.12.4	GET CSR Generation Pending	550
2.2.12.5	POST CSR Generation Generate	551
2.2.13	Custom Job Types	554
2.2.13.1	DELETE Custom Job Types ID	555
2.2.13.2	GET Custom Job Types ID	555
2.2.13.3	GET Custom Job Types	556
2.2.13.4	POST Custom Job Types	558
2.2.13.5	PUT Custom Job Types	561
2.2.14	Enrollment	565
2.2.14.1	GET Enrollment Settings ID	566
2.2.14.2	GET Enrollment CSR Content My	573
2.2.14.3	GET Enrollment PFX Content My	585
2.2.14.4	GET Enrollment Available Renewal ID	597
2.2.14.5	GET Enrollment Available Renewal Thumbprint	598
2.2.14.6	POST Enrollment CSR	600
2.2.14.7	POST Enrollment PFX	605
2.2.14.8	POST Enrollment CSR Parse	618
2.2.14.9	POST Enrollment PFX Deploy	619
2.2.14.10	POST Enrollment PFX Replace	625
2.2.14.11	POST Enrollment Renew	627
2.2.15	License	629
2.2.15.1	GET License	629
2.2.16	MacEnrollment	631
2.2.16.1	GET MacEnrollment	632
2.2.16.2	PUT MacEnrollment	633
2.2.17	MetadataFields	634
2.2.17.1	DELETE MetadataFields ID	635
2.2.17.2	GET MetadataFields ID	635
2.2.17.3	GET MetadataFields Name	639
2.2.17.4	GET MetadataFields ID InUse	642
2.2.17.5	DELETE MetadataFields	643
2.2.17.6	GET MetadataFields	643
2.2.17.7	POST MetadataFields	647
2.2.17.8	PUT MetadataFields	653
2.2.18	Monitoring Revocation	659
2.2.18.1	DELETE Monitoring Revocation ID	660
2.2.18.2	GET Monitoring Revocation ID	660
2.2.18.3	GET Monitoring Revocation	664
2.2.18.4	POST Monitoring Revocation	668
2.2.18.5	PUT Monitoring Revocation	674
2.2.18.6	POST Monitoring Resolve OSCP	680
2.2.18.7	POST Monitoring Revocation Test	681
2.2.18.8	POST Monitoring Revocation Test All	683
2.2.19	Orchestrator Jobs	685
2.2.19.1	GET Orchestrator Jobs Job Status Data	686
2.2.19.2	GET Orchestrator Jobs Job History	687
2.2.19.3	GET Orchestrator Jobs Scheduled Jobs	692
2.2.19.4	POST Orchestrator Jobs Custom	696
2.2.19.5	POST Orchestrator Jobs Reschedule	700
2.2.19.6	POST Orchestrator Jobs Unschedule	702
2.2.19.7	POST Orchestrator Jobs Acknowledge	703
2.2.19.8	POST Orchestrator Jobs Custom Bulk	704
2.2.20	PAM Providers	709
2.2.20.1	DELETE PAM Providers ID	710
2.2.20.2	GET PAM Providers ID	710
2.2.20.3	GET PAM Providers Types	718
2.2.20.4	POST PAM Providers Types	721
2.2.20.5	GET PAM Providers	724
2.2.20.6	POST PAM Providers	733
2.2.20.7	PUT PAM Providers	749
2.2.21	Reports	765

2.2.21.1	GET Reports ID	766
2.2.21.2	DELETE Reports Custom ID	773
2.2.21.3	GET Reports Custom ID	773
2.2.21.4	DELETE Reports Schedules ID	774
2.2.21.5	GET Reports Schedules ID	775
2.2.21.6	GET Reports ID Parameters	779
2.2.21.7	PUT Reports ID Parameters	780
2.2.21.8	GET Reports	782
2.2.21.9	PUT Reports	785
2.2.21.10	GET Reports Custom	788
2.2.21.11	POST Reports Custom	790
2.2.21.12	PUT Reports Custom	792
2.2.21.13	GET Reports ID Schedules	793
2.2.21.14	POST Reports ID Schedules	797
2.2.21.15	PUT Reports ID Schedules	806
2.2.22	Security Identities	815
2.2.22.1	DELETE Security Identities ID	815
2.2.22.2	GET Security Identities ID	816
2.2.22.3	GET Security Identities Lookup	819
2.2.22.4	GET Security Identities	820
2.2.22.5	POST Security Identities	839
2.2.23	Security Roles Permissions	840
2.2.23.1	GET Security Roles ID Permissions	842
2.2.23.2	GET Security Roles ID Permissions Global	843
2.2.23.3	POST Security Roles ID Permissions Global	844
2.2.23.4	PUT Security Roles ID Permissions Global	864
2.2.23.5	GET Security Roles ID Permissions Containers	885
2.2.23.6	POST Security Roles ID Permissions Containers	886
2.2.23.7	PUT Security Roles ID Permissions Containers	887
2.2.23.8	GET Security Roles ID Permissions Collections	889
2.2.23.9	POST Security Roles ID Permissions Collections	890
2.2.23.10	PUT Security Roles ID Permissions Collections	891
2.2.24	Security Roles	893
2.2.24.1	DELETE Security Roles ID	894
2.2.24.2	GET Security Roles ID	895
2.2.24.3	GET Security Roles ID Identities	897
2.2.24.4	PUT Security Roles ID Identities	898
2.2.24.5	GET Security Roles	898
2.2.24.6	POST Security Roles	901
2.2.24.7	PUT Security Roles	918
2.2.24.8	POST Security Roles ID Copy	935

# 1.0 Introduction

The *Keyfactor Command Documentation Suite* includes:

- *Keyfactor Command Reference Guide*
- *Keyfactor Web APIs Reference Guide*
- *Keyfactor Command Server Installation Guide*
- *Keyfactor Orchestrators Installation and Configuration Guide*
- *Keyfactor Command Release Notes*

In addition, Keyfactor offers documentation for products that are not part of the *Keyfactor Command Documentation Suite*, including the *Keyfactor Command Upgrade Overview* and installation guides for third-party CA gateways that interface with Keyfactor, which are available upon request.

## 2.0 Web APIs Reference

The Keyfactor Command solution by Keyfactor exposes Web APIs to allow third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command in a secure manner and to provide a mechanism for automating routine or bulk tasks that would be cumbersome to perform through the browser-based user interface. The APIs complement the web components of Keyfactor Command and offer a number of HTTP method calls that provide similar functionality to that available within the portal's user interface, but which can be accessed programmatically by any system capable of making web requests. These APIs have the following goals and constraints:

- Provide a simple interface to make integration easy for third parties.
- Develop interoperability between different technology frameworks and operating systems.
- Support common certificate enrollment and management tasks.
- Deliver a securable interface.
- Preserve backward-compatibility so that existing clients continue to work, where possible.

## 2.1 Overview

Keyfactor exposes two APIs for external use:

- The Keyfactor API was introduced in Keyfactor Command version 6.1 and is the newer API. Customers should be using this API going forward.
- The Classic API has been provided in the product for several product generations and is continuing to be supported for legacy implementations but should not be used for new implementations.

### 2.1.1 Transaction Security

The Keyfactor Web APIs rely on SSL/TLS to protect the HTTP communications between the client and Keyfactor Command server. In a typical deployment, the APIs will be configured for Basic authentication, where client credentials are provided in an HTTP header, formatted as "DOMAIN\user:Password" and base-64-encoded. Basic Authentication itself is not a secure way to pass a set of user credentials. However, it is very interoperable and works well across all of the various technologies that use these APIs. SSL is used to protect the confidentiality of user credentials; therefore, SSL should be used with the Keyfactor Web APIs.

Keyfactor recommends that any device using these APIs already be configured to trust the SSL certificate presented by Keyfactor Command, allowing the SSL connection to be established without error. The process for this will depend on the platform and operating environment of the connecting client, but the appropriate documentation or support for your platform should outline the necessary steps for this.

There is no longer the need to configure an API application with a key and secret and a particular template in the portal to allow for enrollment for a certificate with the API. Certificate enrollment no longer requires a key and secret and enrollment permissions are now controlled on the template level.

Finally, access to the API methods can be limited per client to a maximum request frequency. The amount of time required between calls can also be configured in the Keyfactor Command Management Portal Application Settings for the APIs. Increasing this interval can mitigate certain threats such as denial of service or dictionary attacks against passwords and other sensitive data. However, setting this too high can negatively impact performance of client applications that need to make a large number of requests.

## 2.1.2 Architecture

By default, all Web API methods start with a base path, which varies depending on the API and corresponds to an application under IIS; this path is configurable at install time. For the Keyfactor API, the default base path is *KeyfactorApi*. The API component name, version number (only applicable to the Classic API), and method name then comprise the second through fourth parts of the URL, each separated by a forward slash. For example, `"/KeyfactorApi/Certificates/Import"` would be the URL format for the Import method of the Certificates component in the Keyfactor API and `"/CMSApi/CertEnroll/1/Token"` would be the URL format for the Token method of version 1 of the CertEnroll API component in the Classic API. Version numbers are only used in the URL for the Classic API.

## 2.1.3 Web API Common Features

Some aspects of the Web API request and response formats are consistent across all endpoints. This includes a small set of HTTP headers, HTTP statuses returned by the server for successful requests, and various error conditions. Common request headers are given in [Table 1: Common Request Headers](#), common response headers (for successful requests and certain unsuccessful requests) are given in [Table 2: Common Response Headers](#), and HTTP statuses are given in [Table 3: HTTP Statuses](#).

Additionally, many Classic API methods operate on a certificate resource stored in Keyfactor Command, and a standardized way to identify the certificate for the operation is used in the request structure across several Classic API components; this is described in [Table 4: Classic API Certificate Lookup Structure](#). This table does not apply to the Keyfactor API.

Table 1: Common Request Headers

Header Name	API Version	Header Value	Description
Content-Type	Both	application/json OR application/xml	POST methods use application/json. When application/xml is needed, it is specifically indicated on the endpoint page.
Accept	Both	application/json; charset=utf-8	Most methods returning complex values will use this content type.
Authorization	Both	Basic <base-64 DOMAIN\user:pass>	In most cases, Web API clients will use Basic authentication over SSL/TLS.
Host	Both	<Keyfactor Command server hostname>	Address of Keyfactor Command server. Automatically generated in most clients.
Content-Length	Both	Request length in bytes	Optional, but automatically generated by most

Header Name	API Version	Header Value	Description
			clients.
X-Keyfactor-Requested-With	Both	XMLHttpRequest	This is mandatory to send in a request to the Keyfactor API on POSTs, PUTs, and DELETes, and the value is case sensitive. This is for security.
X-Keyfactor-API-Version	Keyfactor API	1 or 2	Desired version of the endpoint. If not provided, this defaults to version 1.

Table 2: Common Response Headers

Header Name	API Version	Header Value	Description
Cache-Control	Both	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Pragma	Both	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Content-Length	Both	<varies>	Length of the HTTP response.
Content-Type	Both	application/json	Most calls return application/json, but occasionally text/plain or text/xml.
Expires	Both	-1	Usually ignored.
Server	Both	<varies>	Software version reported by IIS platform hosting Keyfactor Command.
X-CSS-CMS-APIVersion	Classic API	2.0	Classic API version accessed (see usage in <a href="#">Versioning on page 6</a> ).
X-CSS-CMS-CMSVersion	Classic API	10.1	Keyfactor Command platform version.
X-Keyfactor-Product-Version	Keyfactor API	<varies>	Keyfactor Command platform version.
X-Total-Count	Keyfactor API	<varies>	Total number of elements returned.
X-AspNet-Version	Both	<varies>	Version of ASP.NET supporting Keyfactor Command installation.
X-Powered-By	Both	ASP.NET	Header added by underlying ASP.NET implementation.

Header Name	API Version	Header Value	Description
Date	Both	<varies>	Timestamp of the HTTP response.

Table 3: HTTP Statuses

Number/Name	Description
200 OK	Request successful; results in response body
204 No Content	Request successful; no content in response body
400 Bad Request	Malformed or invalid data; additional information may be available in the response body and/or Keyfactor Command server logs
401 Unauthorized	Invalid credentials (user unauthenticated)
403 Forbidden	Can often indicate that the credentials map to a user without permissions for this action in Keyfactor Command (user unauthorized)
404 Page not Found	Invalid request path
500 Internal Server Error	Keyfactor Command encountered an unexpected error attempting to handle the request. See response body and Keyfactor Command server logs for details.
502 Bad Gateway	Keyfactor Command attempted to contact a CA or other upstream server to process the request, but was unable to. See Keyfactor Command server logs for details.

Table 4: Classic API Certificate Lookup Structure

Parameter Name	Parameter Value
Type	One of "Serial", "Thumbprint", and "CMSID".
SerialNumber	Hexadecimal serial number of referenced certificate. Required only if Type is "Serial".
IssuerDN	Distinguished Name of the issuer of the referenced certificate. Required only if Type is "Serial".
Thumbprint	SHA-1 thumbprint of the referenced certificate. Required only if Type is "Thumbprint".
CMSID	Identifier assigned by Keyfactor Command to the referenced certificate. Required only if Type is "CMSID".

## 2.1.4 Versioning

The Keyfactor Web APIs are versioned as a set and released in conjunction with Keyfactor Command at the same version level (e.g. version 10.1). In addition, both the Keyfactor API and the Classic API<sup>1</sup> have multiple versions of select endpoints.

The current strategy is to increment the version of an API when changes are made that might break backwards compatibility for existing clients. New endpoints are generally implemented in the most recent version of their API.

Generally, updates to an existing version of an endpoint are restricted to updates that should not break existing clients. Updates may be made that add HTTP response headers or response body parameters, or that correct existing bugs, or must be made to conform to newer or more granular security constraints. When an update cannot be made without breaking existing clients, a new endpoint is added in a later API version.

The Classic API provides various methods to retrieve the version of Keyfactor Command. For example, values for both the Classic API version and the Keyfactor Command version are returned in HTTP headers with each response to an API call. Additionally, the *Status* endpoint (see [Status on page 1450](#)) provides additional information about the capabilities of the Classic API in its installed version. The Keyfactor API does not presently have an equivalent functionality.

Most Keyfactor API endpoints have only one version, though a second version has been released for a select few endpoints. The Keyfactor API uses the *x-keyfactor-api-version* request header to differentiate between versions 1 and 2 of a given endpoint. If a version isn't specified, version 1 is assumed.

Several endpoints of the Classic API have their own incremental versioning. For example, the CertEnroll endpoint has three versions, the most recent of which is three:

- CertEnroll/1
- CertEnroll/2
- CertEnroll/3

As the Keyfactor Web APIs have evolved and continue to evolve, an additional security constraint is available to limit access to deprecated legacy versions of API endpoints. In many cases, newer versions of an endpoint are more secure and robust, easier to use, and offer more functionality. Keyfactor highly recommends use of the newest endpoints wherever possible. To this end, it is possible to disable deprecated API endpoints in the Classic API from the API Application Settings within the Keyfactor Command Management Portal. In Keyfactor Command 10.1, this setting will disable the following endpoints:

- CertEnroll/1/Token<sup>2</sup>
- CertEnroll/1/Status<sup>1</sup>
- CertEnroll/1/Certificates/Pkcs10<sup>1</sup>
- CertEnroll/1/Certificates/Pkcs12<sup>1</sup>

---

<sup>1</sup>The Classic API was historically versioned on a different release schedule to Keyfactor Command and so has separate reporting of versions for itself and Keyfactor Command.

<sup>2</sup>The CertEnroll v1 endpoints are deprecated.

- Metadata/2/Set
- Metadata/2/Get
- Metadata/2/Compare
- Certificates/1/Metafield
- Certificates/1/Import<sup>1</sup>

If the *Allow Deprecated API Calls* setting is disabled, any client attempting to access one of these endpoints will receive an error message instead of the expected results. This will, of course, prevent client applications that rely on these endpoints from functioning, and if these applications cannot be updated to the newer endpoints then the *Allow Deprecate API Calls* setting must be enabled. Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.

The following endpoints have been removed from the Classic API and are no longer supported:

- CertEnroll/1/Templates

**Note:** API versioning strategy in Keyfactor Command shifted somewhat between versions 4.0 and 5.0 (when the product was known as Certificate Management System or CMS). As such, the API versioning mechanisms described in CMS 4.0-4.5 documentation, while still generally correct, are no longer our primary recommendation.

## 2.2 Keyfactor API

The Keyfactor API is the Web API introduced in Keyfactor Command version 6.1. It is designed to support the updated platform architecture in the new version of the main Keyfactor Command solution and to, in time, replace the Classic API. The Keyfactor API allows for integration with other systems to automate certificate lifecycle management tasks. It will continue to be developed going forward to expose more core functionality that is built into the main product to allow for more in-depth integrations.

Documentation for the Keyfactor API is available as two companion pieces—this document (the *Keyfactor Web APIs Reference Guide*), which provides an overview of the API's endpoints, parameters to be provided in them, and data expected back from them, and the interactive code examples installed with your Keyfactor Command instance in the *Keyfactor API Endpoint Utility*.

**Tip:** Click the help icon (💡) at the top of the Keyfactor Command Management Portal page next to the **Logout** button to find the embedded web copies of the *Keyfactor Command Documentation Suite* and the *Keyfactor API Endpoint Utility*.

<sup>1</sup>The Certificates/1/Import endpoint, using a multipart/form-data request, is no longer supported by Keyfactor for customers that are not currently using it.

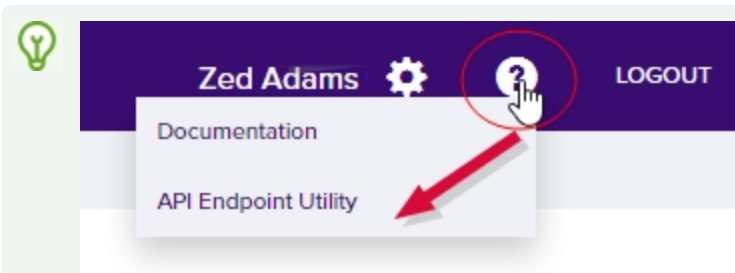

Figure 1: Documentation in the Help Dropdown

You can also browse to the *Keyfactor API Endpoint Utility* directly using the following link (where *keyfactor.keyexample.com* is the fully qualified domain name of your Keyfactor Command server or the DNS alias you are using to reference your Keyfactor Command server, if applicable):

<https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#>

This link assumes that the Keyfactor API has been installed in the default IIS virtual directory (KeyfactorAPI). If you have installed in an alternate virtual directory, your path will be different.

A static reference (without the interactive utility you can find in the Keyfactor Command Management Portal) is available as a zip file in the [Keyfactor Client Portal](#)<sup>1</sup>.

## 2.2.1 Agents

The Agents component of the Keyfactor API includes methods necessary to list orchestrators and agents and schedule jobs to retrieve log files for orchestrators and agents that support that functionality.

Table 5: Agents Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns details for a single orchestrator or agent.	<a href="#">GET Agents ID on the next page</a>
/	GET	Returns a list of all orchestrators and agents according to the provided filters and input parameters.	<a href="#">GET Agents on page 12</a>
/Reset	POST	Resets one or more orchestrators or agents to a new state and clears jobs.	<a href="#">POST Agents Reset on page 16</a>
/Approve	POST	Approves an orchestrator.	<a href="#">POST Agents Approve on</a>

<sup>1</sup>Embedded links to external documents point to the document on the Keyfactor Client Portal. Access to the portal requires a login. See your administrator or your Keyfactor Client Success representative to obtain a login to the portal.

Endpoint	Method	Description	Link
			<a href="#">page 17</a>
/Disapprove	POST	Disapproves an orchestrator.	<a href="#">POST Agents Disapprove on page 17</a>
/ {id} /Reset	POST	Resets a single orchestrator or agent to a new state and clears jobs.	<a href="#">POST Agents ID Reset on page 18</a>
/ {id} /FetchLogs	POST	Schedules a job on the orchestrator or agent to retrieve log files.	<a href="#">POST Agents ID FetchLogs on page 18</a>
/SetAuthCertificateReenrollment	POST	Configures an orchestrator or agent to either request or require a new client authentication certificate on its next session registration.	<a href="#">POST Agents Set Auth Certificate Reenrollment on page 19</a>

### 2.2.1.1 GET Agents ID

The GET /Agents/{id} method is used to retrieve a single orchestrator or agent registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: Read

Table 6: GET Agents{id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to retrieve. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

Table 7: GET Agent {id} Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.																		
AgentPlatform	<p>An integer indicating the platform for the orchestrator.</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Keyfactor Windows Orchestrator</td></tr> <tr> <td>2</td><td>Keyfactor Java Agent</td></tr> <tr> <td>3</td><td>Keyfactor Mac Auto-Enrollment Agent</td></tr> <tr> <td>4</td><td>Keyfactor Android Agent</td></tr> <tr> <td>5</td><td>Keyfactor Native Agent</td></tr> <tr> <td>6</td><td>Keyfactor Bash Orchestrator</td></tr> <tr> <td>7</td><td>Keyfactor Universal Orchestrator</td></tr> </table>	Value	Parameter Value	0	Unknown	1	Keyfactor Windows Orchestrator	2	Keyfactor Java Agent	3	Keyfactor Mac Auto-Enrollment Agent	4	Keyfactor Android Agent	5	Keyfactor Native Agent	6	Keyfactor Bash Orchestrator	7	Keyfactor Universal Orchestrator
Value	Parameter Value

JKS	Java Keystore																																
PEM	PEM Store																																
LOGS	Fetch Logs																																
TemplateSync	Template Synchronization																																
Blueprint	A string indicating the name of the blueprint associated with the orchestrator.																																
Thumbprint	A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.																																
LegacyThumbprint	A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the orchestrator successfully registers with the new thumbprint.																																
AuthCertificateReenrollment	An integer indicating the value of the orchestrator certificate reenrollment request or require status.																																

Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .								
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.								
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.								

### 2.2.1.2 GET Agents

The GET /Agents method is used to retrieve a list of orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 8: GET Agents Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Orchestrator Management Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i></li> <li>• <i>Blueprint</i></li> <li>• <i>Capabilities</i> (See <a href="#">Table 9: GET Agent Response Data Capabilities</a>)</li> <li>• <i>ClientMachine</i></li> <li>• <i>ErrorCode</i></li> <li>• <i>ErrorMessage</i> (last error message)</li> <li>• <i>Identity</i> (Username)</li> <li>• <i>LastSeen</i> (DateTime)</li> <li>• <i>Platform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• <i>Status</i> (1-New, 2-Approved, 3-Disapproved)</li> <li>• <i>Version</i></li> </ul> <div>  <p><b>Tip:</b> Use the following query to return only approved orchestrators:  Status -eq "2"  A value of 1 will return orchestrators with a status of <i>New</i> and a value of 3 will return orchestrators with a status of <i>Disapproved</i>.</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 9: GET Agent Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.																		
AgentPlatform	<p>An integer indicating the platform for the orchestrator. Possible values are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Keyfactor Windows Orchestrator</td></tr> <tr> <td>2</td><td>Keyfactor Java Agent</td></tr> <tr> <td>3</td><td>Keyfactor Mac Auto-Enrollment Agent</td></tr> <tr> <td>4</td><td>Keyfactor Android Agent</td></tr> <tr> <td>5</td><td>Keyfactor Native Agent</td></tr> <tr> <td>6</td><td>Keyfactor Bash Orchestrator</td></tr> <tr> <td>7</td><td>Keyfactor Universal Orchestrator</td></tr> </table>	Value	Parameter Value	0	Unknown	1	Keyfactor Windows Orchestrator	2	Keyfactor Java Agent	3	Keyfactor Mac Auto-Enrollment Agent	4	Keyfactor Android Agent	5	Keyfactor Native Agent	6	Keyfactor Bash Orchestrator	7	Keyfactor Universal Orchestrator

JKS	Java Keystore																																
PEM	PEM Store																																
LOGS	Fetch Logs																																
TemplateSync	Template Synchronization																																
Blueprint	A string indicating the name of the blueprint associated with the orchestrator.																																
Thumbprint	A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.																																
LegacyThumbprint	A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the orchestrator successfully registers with the new thumbprint.																																
AuthCertificateReenrollment	An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:																																

Name	Description	
	Value	Description
	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).
	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.
	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .	
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.	
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.	

### 2.2.1.3 POST Agents Reset

The POST /Agents/Reset method is used to reset one or more orchestrators, including:

- Remove all current orchestrator jobs for the selected orchestrator(s).
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator(s) to allow them to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

AgentManagement: *Read*  
AgentManagement: *Modify*

Table 10: POST Agents Reset Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of GUIDs of the orchestrators to reset. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs.

### 2.2.1.4 POST Agents Approve

The POST /Agents/Approve method is used to approve one or more orchestrators (a.k.a. agents). An orchestrator must be approved before jobs for it can be scheduled or carried out. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 11: POST Agents Approve Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to approve. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

### 2.2.1.5 POST Agents Disapprove

The POST /Agents/Disapprove method is used to disapprove one or more orchestrators (a.k.a. agents). When an orchestrator is disapproved, operations with Keyfactor Command can no longer be carried out by this orchestrator. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 12: POST Agents Disapprove Input Parameters

Name	In	Description
agentIds	Body	<b>Required.</b> An array of strings indicating the orchestrator GUIDs to disapprove. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

### 2.2.1.6 POST Agents ID Reset

The POST /Agents/{id}/Reset method is used to reset a single orchestrator, including:

- Remove all current orchestrator jobs for the selected orchestrator.
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator to allow it to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 13: POST Agents {id} Reset Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to reset. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

### 2.2.1.7 POST Agents ID FetchLogs

The POST /Agents/{id}/FetchLogs method is used to schedule a job on a Native Agent to retrieve log files. The job will be scheduled to run immediately, which means it should complete within a few minutes depending on other activity occurring at the same time. This method is currently only supported for the Native Agent. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

**Tip:** To schedule a job to retrieve logs from a Keyfactor Universal Orchestrator, use the POST /OrchestratorJobs/Custom method (see [POST Orchestrator Jobs Custom on page 696](#)).

Table 14: POST Agents {id} FetchLogs Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The GUID of the orchestrator to schedule the job for. Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

### 2.2.1.8 POST Agents Set Auth Certificate Reenrollment

The POST /Agents/SetAuthCertificateReenrollment method is used to request or require that one or more orchestrators (a.k.a. agents) enroll for a new client authentication certificate on the orchestrator's next session registration. This method returns HTTP 200 OK on a success with details

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 15: POST Agents Set Auth Certificate Reenrollment Input Parameters

Name	In	Description								
OrchestratorIds	Body	<p><b>Required.</b> An array of strings indicating the GUIDs of the orchestrators on which you want to change the AuthCertificateReenrollment value to request or require the orchestrator(s) to enroll for a new client authentication certificate on the next session registration.</p> <p>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 12</a>) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p>								
Status	Body	<p>An integer indicating the value that AuthCertificateReenrollment should be set to. Status options are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr><tr><td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr><tr><td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr></table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description									
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).									
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.									
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.									

Table 16: POST Agents Set Auth Certificate Reenrollment Response Data

Name	Description								
FailedOrchestratorIds	An array of strings indicating the GUIDs of orchestrators that failed to update.								
Status	<p>A string indicating the value for AuthCertificateReenrollment that was requested. Status options are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								

## 2.2.2 Agent Blueprint

The Agent Blueprint component of the Keyfactor API includes methods necessary to list, generate, and apply orchestrator and orchestrator blueprints for orchestrators and agents that support blueprint functionality.

Table 17: Agent Blueprint Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the orchestrator blueprint with the specified GUID.	<a href="#">DELETE Agent Blueprint ID on the next page</a>
/id}	GET	Returns details for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent Blueprint ID on the next page</a>
/	GET	Returns details for all orchestrator blueprints.	<a href="#">GET Agent Blueprint on page 22</a>
/id}/Jobs	GET	Returns details of the certificate store scheduled jobs for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent Blueprint ID Jobs on page 23</a>
/id}/Stores	GET	Returns details of the certificate stores for the orchestrator blueprint with the specified GUID.	<a href="#">GET Agent Blueprint ID Stores on page 26</a>

Endpoint	Method	Description	Link
/ApplyBlueprint	POST	Applies an orchestrator blueprint to one or more orchestrators.	<a href="#">POST AgentBlueprint ApplyBlueprint on page 28</a>
/GenerateBlueprint	POST	Creates a new orchestrator blueprint from an orchestrator.	<a href="#">POST AgentBlueprint GenerateBlueprint on page 29</a>

### 2.2.2.1 DELETE Agent Blueprint ID

The DELETE /AgentBlueprint/{id} method is used to delete an existing orchestrator blueprint with the specified blueprint GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 18: DELETE AgentBlueprint {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be deleted. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on the next page</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

### 2.2.2.2 GET Agent Blueprint ID

The GET /AgentBlueprint/{id} method is used to retrieve information about the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with information about the blueprint.

**Tip:** To see the certificate stores or scheduled jobs associated with the blueprint, use the GET /AgentBlueprint/{id}/Jobs method (see [GET Agent Blueprint ID Jobs on page 23](#)) or GET /AgentBlueprint/{id}/Stores method (see [GET Agent Blueprint ID Stores on page 26](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 19: GET AgentBlueprint {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint below</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

Table 20: GET AgentBlueprint {id} Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

### 2.2.2.3 GET Agent Blueprint

The GET /AgentBlueprint method is used to retrieve a list of blueprints defined for the orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all blueprint details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: Read

Table 21: GET AgentBlueprint Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 22: GET AgentBlueprint Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

### 2.2.2.4 GET Agent Blueprint ID Jobs

The GET /AgentBlueprint/{id}/Jobs method is used to retrieve details of the scheduled certificate store jobs for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint scheduled job details, including certificate stores.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 23: GET AgentBlueprint {id} Jobs Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on the previous page</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 24: GET AgentBlueprint {id} Jobs Response Data

Name	Description
AgentBlueprintJobId	A string indicating the GUID of the certificate store job associated with the blueprint.
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
JobType	A string indicating the GUID of the certificate store job type.
JobTypeName	A string indicating the certificate store job type (e.g. JksInventory).
OperationType	An integer indicating the type of operation (e.g. 2 = add to certificate store, 3 = remove from certificate store).
Thumbprint	A string indicating the thumbprint of the certificate to add to or remove from the certificate store. This field is populated only for management jobs.
Contents	A string containing the certificate to be added to the certificate store. This field is populated only for management add to certificate store jobs.
Alias	A string indicating the alias to be used for the certificate upon entry into or removal from the certificate store. The function of the alias varies depending on the certificate store type. For example, for a Java keystore, it is user-generated and stored in the keystore associated with the certificate while for PEM stores it is the thumbprint of the certificate. Some certificate store types don't require an alias and some do. See the <a href="#">Add Certificate</a> section of the <i>Keyfactor Command Reference Guide</i> for more information. This field is populated only for management jobs.
PrivateKeyEntry	A Boolean indicating whether the certificate store has a separate private key file. This field is populated only for management jobs.
Overwrite	A Boolean indicating whether the certificate already in the certificate store should be overwritten with the new certificate, if applicable. This field is populated only for management jobs.
HasEntryPassword	A Boolean indicating whether the certificate in the certificate store has a different password from the certificate store itself. This field is populated only for management jobs.
HasPfxPassword	A Boolean indicating whether the certificate being added to the certificate store has a private key. This field is populated only for management jobs.
RequestTimestamp	A string indicating the time at which the management job was requested. This field is populated only for management jobs.

Name	Description								
KeyfactorSchedule	The schedule for the certificate store job. This field is populated only for inventory and discovery jobs.								
Subject	A string containing the reenrollment subject name using X.500 format. This field is populated only for reenrollment jobs.								
Directories	A string containing the directory or directories to search during a discovery job. This field is populated only for discovery jobs.								
IgnoredDirectories	A string containing the directories that should not be included in the search during discovery jobs. This field is populated only for discovery jobs.								
SymLinks	A Boolean indicating whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file during discovery jobs. This option is ignored on Windows. This field is populated only for discovery jobs.								
Compatibility	A Boolean indicating whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false) during Java keystore discovery jobs. This field is populated only for discovery jobs.								
FileExtensions	A string containing the file extensions for which to search during a discovery job. For example, search for files with the extension "jks" in order to exclude files with other extensions such as "txt". This field is populated only for discovery jobs.								
FileNamePatterns	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. "myjks") during discovery jobs. This field is populated only for discovery jobs.								
AgentBlueprintStores	<p>An array that includes the certificate store information of the job. The following certificate store details are included:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentBlueprintStoreId</td><td>A string indicating the GUID of the certificate store associated with the blueprint.</td></tr> <tr> <td>AgentBlueprintId</td><td>A string indicating the GUID of the blueprint.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i></td></tr> </table>	Name	Description	AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.	AgentBlueprintId	A string indicating the GUID of the blueprint.	StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i>
Name	Description								
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.								
AgentBlueprintId	A string indicating the GUID of the blueprint.								
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i>								

Name	Description	
	Name	Description
		for more information.
	ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
	CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).
	Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
	CreatelfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
	Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).

### 2.2.2.5 GET Agent BluePrint ID Stores

The GET /AgentBlueprint/{id}/Stores method is used to retrieve details of the certificate stores for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint certificate store details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 25: GET AgentBlueprint {id} Stores Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 22</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 26: GET AgentBlueprint {id} Stores Response Data

Name	Description
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).
Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).

### 2.2.2.6 POST AgentBlueprint ApplyBlueprint

The POST /AgentBlueprint/ApplyBlueprint method is used to apply a blueprint with associated certificate stores and scheduled jobs to an orchestrator. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 AgentManagement: *Read*  
 AgentManagement: *Modify*

Table 27: POST AgentBlueprint Apply Input Parameters

Name	In	Description
agentIds	Body	<p><b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to which the blueprint should be applied.</p> <p>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 12</a>) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p> <div>  <b>Note:</b> Orchestrators must be approved before a blueprint can be applied.         </div>
templateId	Body	<p>A string indicating the GUID of the blueprint to apply to the orchestrator(s).</p> <p>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 22</a>) to retrieve a list of all the blueprints to determine the blueprint GUIDs.</p>

### 2.2.2.7 POST AgentBlueprint GenerateBlueprint

The POST /AgentBlueprint/GenerateBlueprint method is used to create a new blueprint based on the certificate stores and scheduled jobs of one orchestrator. This method returns HTTP 200 OK on a success with details of the new blueprint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 AgentManagement: *Read*  
 AgentManagement: *Modify*

Table 28: POST AgentBlueprint Generate Input Parameters

Name	In	Description
agentIds	Body	<p><b>Required.</b> A string indicating the GUID of the orchestrator that should be used to generate the blueprint.</p> <p>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 12</a>) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p>
name	Body	<p><b>Required.</b> A string indicating the name for the new blueprint.</p>

Table 29: POST AgentBlueprint Generate Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).

## 2.2.3 Agent Pools

The Agent Pools component of the Keyfactor API includes methods necessary to programmatically add, edit, get, and delete Agent Pools. An orchestrator (a.k.a. agent) pool is a group of Keyfactor Command Windows Orchestrators and/or Universal Orchestrators that have the SSL capability. Each pool is used to divide the work of scanning a network between all orchestrators that are members of it.

Table 30: Agent Pool Endpoints

Endpoint	Method	Description	Links
/id}	DELETE	Deletes the specified orchestrator pool.	<a href="#">DELETE Agent Pools ID below</a>
/id}	GET	Returns limited information about the orchestrators in the specified pool.	<a href="#">GET Agent Pools ID on the next page</a>
/	GET	Returns a list of all orchestrator pools with limited information about the orchestrators assigned to each pool.	<a href="#">GET Agent Pools on page 32</a>
/	POST	Creates an orchestrator pool based on information in the request.	<a href="#">POST Agent Pools on page 34</a>
/	PUT	Updates an orchestrator pool based on information in the request.	<a href="#">PUT Agent Pools on page 36</a>
/Agents	GET	Returns a list of orchestrators associated with the Default Agent Pool.	<a href="#">GET Agent Pools Agents on page 38</a>

### 2.2.3.1 DELETE Agent Pools ID

The DELETE /AgentPools/{id} method is used to delete an existing orchestrator (a.k.a. agent) pool. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*  
SslManagement: *Modify*

Table 31: DELETE AgentPools {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator pool to delete. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on the next page</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID. The Default Agent Pool cannot be deleted.

### 2.2.3.2 GET Agent Pools ID

The GET /AgentPools/{id} method is used to return information about a single orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with details about the requested orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 32: GET AgentPools {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the orchestrator pool to retrieve. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on the next page</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID.

Table 33: GET AgentPools {id} Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

### 2.2.3.3 GET Agent Pools

The GET /AgentPools method is used to retrieve all orchestrator (a.k.a. agent) pools. This method returns HTTP 200 OK on a success with a list of all agent pool details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: Read

Table 34: GET AgentPools Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Id</i> (AgentPoolID)</li> <li>• <i>Name</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 35: GET AgentPools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

### 2.2.3.4 POST Agent Pools

The POST /AgentPools method is used to create a new orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SslManagement: *Read*

SslManagement: *Modify*

Table 36: POST AgentPools Input Parameters

Name	In	Description								
Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool.								
Agents	Body	<p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AgentId</td><td><b>Required.</b> A string indicating the GUID of the orchestrator being assigned.</td></tr><tr><td>EnableDiscover</td><td><b>Required*</b>. A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td></tr><tr><td>EnableMonitor</td><td><b>Required*</b>. A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td></tr></table>	Name	Description	AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.	EnableDiscover	<b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .	EnableMonitor	<b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .
Name	Description									
AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.									
EnableDiscover	<b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									
EnableMonitor	<b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									

Table 37: POST AgentPools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

### 2.2.3.5 PUT Agent Pools

The PUT /AgentPools method is used to update an existing orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SslManagement: *Read*

SslManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 38: PUT AgentPools Input Parameters

Name	In	Description								
AgentPoolId	Body	<b>Required.</b> A string indicating the GUID of the orchestrator pool that is to be updated.								
Name	Body	<b>Required.</b> A string indicating the name of the orchestrator pool.								
Agents	Body	<p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AgentId</td><td><b>Required.</b> A string indicating the GUID of the orchestrator being assigned.</td></tr><tr><td>EnableDiscover</td><td><b>Required</b><sup>*</sup>. A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td></tr><tr><td>EnableMonitor</td><td><b>Required</b><sup>*</sup>. EnableMonitor	<b>Required</b> <sup>*</sup> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .
Name	Description									
AgentId	<b>Required.</b> A string indicating the GUID of the orchestrator being assigned.									
EnableDiscover	<b>Required</b> <sup>*</sup> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									
EnableMonitor	<b>Required</b> <sup>*</sup> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .									

Table 39: PUT AgentPools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

### 2.2.3.6 GET Agent Pools Agents

The GET /AgentPools/Agents method is used to retrieve the orchestrators (a.k.a. agents) associated with the Default Agent Pool. This method has no required input parameters. It returns HTTP 200 OK on a success with information about the Default Agent Pool orchestrators.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 40: GET AgentPools Default Agent Pool Agents Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Collection Manager</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Id</i> (Orchestrator ID, AgentID)</li> <li>• <i>ClientMachine</i></li> <li>• <i>EnableDiscover</i> (true or false)</li> <li>• <i>EnableMonitor</i> (true or false)</li> <li>• <i>Version</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 41: GET AgentPools Default Agent Pool Agents Response Data

Name	Description
AgentId	A string indicating the GUID of the orchestrator.
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).
Version	A string indicating the version of the orchestrator.
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).
ClientMachine	A string indicating the client machine on which the orchestrator is installed.

## 2.2.4 Alerts

The Alerts component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, test and delete alerts for denied certificate requests, expired certificates, issued certificate requests, pending certificate requests and SSH Key Rotations.

- [Alerts Denied below](#)
- [Alerts Expiration on page 64](#)
- [Alerts Issued on page 94](#)
- [Alerts Key Rotation on page 124](#)
- [Alerts Pending on page 153](#)

### 2.2.4.1 Alerts Denied

The Alerts Denied component of the Keyfactor API includes methods necessary to create, update, retrieve, and delete alerts for denied certificate requests.

Table 42: Alerts Denied

Endpoint	Method	Description	Link
/Alerts/Denied/{id}	DELETE	Deletes a denied certificate request alert for the specified ID.	<a href="#">DELETE Alerts Denied ID on the next page</a>
/Alerts/Denied/{id}	GET	Retrieves details for a denied certificate request	<a href="#">GET Alerts Denied ID on</a>

Endpoint	Method	Description	Link
		alert for the specified ID.	<a href="#">the next page</a>
/Alerts/Denied	PUT	Updates a denied certificate request alert for the specified ID.	<a href="#">PUT Alerts Denied on page 56</a>
/Alerts/Denied	GET	Retrieves details for all configured denied certificate request alerts.	<a href="#">GET Alerts Denied on page 45</a>
/Alerts/Denied	POST	Creates a new denied certificate request alert.	<a href="#">POST Alerts Denied on page 49</a>

## DELETE Alerts Denied ID

The DELETE /Alerts/Denied/{id} method is used to delete the denied certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 43: DELETE Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert to be deleted. Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 45</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

## GET Alerts Denied ID

The GET /Alerts/Denied/{id} method is used to retrieve details for the denied certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 44: GET Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert.</p> <p>Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 45</a>) to retrieve a list of all the issued request alerts to determine the alert ID.</p>

Table 45: GET Alerts Denied {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description														
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell								
ID	Event Handler Type														
6	DeniedLogger														
7	DeniedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:														

Name	Description	
	Value	Description
	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
	Key	A string indicating the reference name of the configured parameter.
	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## GET Alerts Denied

The GET /Alerts/Denied method is used to retrieve details of all denied certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 46: GET Alerts Denied Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DisplayName</i></li> <li>• <i>Message</i></li> <li>• <i>RegisteredEventHandlerId</i></li> <li>• <i>Subject</i></li> <li>• <i>Template_Id</i></li> <li>• <i>UseHandler</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 47: GET Alerts Denied Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

## POST Alerts Denied

The POST /Alerts/Denied method is used to create a new denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 48: POST Alerts Denied Input Parameters

Name	In	Description
DisplayName	Body	<b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {care-qid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>
TemplateId	Body	An integer indicating the certificate template for which the denied request alerts will be

Name	In	Description												
		<p>generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1185</a>) to retrieve a list of all the templates to determine the template ID.</p>

Supported types are:<ul style="list-style-type: none"><li>LogTarget</li></ul></td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"><li>LogTarget</li></ul>		
Value	Description													
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.													
Key	A string indicating the reference name of the configured parameter.													
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).													
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"><li>LogTarget</li></ul>													

Name	In	Description	
		Value	Description
			<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"><li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li><li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul>
For example, for a PowerShell handler:			
<pre>"EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "rcn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",     "DefaultValue": "Denied Alert: Enterprise Web Server",     "ParameterType": "Value"   } ]</pre>			

Name	In	Description
		<pre>    },     {       "Id": 31,       "Key": "DenialComment",       "DefaultValue": "cmnt",       "ParameterType": "Token"     },     {       "Id": 32,       "Key": "ScriptName",       "DefaultValue": "MyScript.ps1",       "ParameterType": "Script"     }   ]</pre>

Table 49: POST Alerts Denied Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description														
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell								
ID	Event Handler Type														
6	DeniedLogger														
7	DeniedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:														

Name	Description	
	Value	Description
	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
	Key	A string indicating the reference name of the configured parameter.
	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>• <b>LogTarget</b> This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• <b>Script</b> This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• <b>Token</b> This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• <b>Value</b> This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## PUT Alerts Denied

The PUT /Alerts/Denied method is used to update a denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 50: PUT Alerts Denied Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	Body	<b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {care-qid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	In	Description												
TemplateId	Body	<p>An integer indicating the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1185</a>) to retrieve a list of all the templates to determine the template ID.</p>												
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>6</td><td>DeniedLogger</td></tr><tr><td>7</td><td>DeniedPowershell</td></tr></tbody></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></tbody></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>6</td><td>DeniedLogger</td></tr><tr><td>7</td><td>DeniedPowershell</td></tr></tbody></table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	UseHandler	<p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>

		For example, for a PowerShell handler:	
		<pre>"EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "rcn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",</pre>	

Name	In	Description
		<pre>         "DefaultValue": "Denied Alert: Enterprise Web Server",         "ParameterType": "Value"       },       {         "Id": 31,         "Key": "DenialComment",         "DefaultValue": "cmnt",         "ParameterType": "Token"       },       {         "Id": 32,         "Key": "ScriptName",         "DefaultValue": "MyScript.ps1",         "ParameterType": "Script"       }     ] </pre>

Table 51: PUT Alerts Denied Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>

Name	Description														
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell								
ID	Event Handler Type														
6	DeniedLogger														
7	DeniedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:														

Name	Description	
	Value	Description
	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.
	Key	A string indicating the reference name of the configured parameter.
	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## 2.2.4.2 Alerts Expiration

The Alerts Expiration component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for expired certificates.

Table 52: Alerts Expiration

Endpoint	Method	Description	Link

Endpoint	Method	Description	Link
		specified ID.	<a href="#">ID on the next page</a>
/Alerts/Expiration/{id}	GET	Retrieves details for an expired certificate for the specified ID.	<a href="#">GET Alerts Expiration ID on the next page</a>
/Alerts/Expiration/Schedule	GET	Retrieves details of the schedule for delivery of expired certificate alerts.	<a href="#">GET Alerts Expiration Schedule on page 69</a>
/Alerts/Expiration/Schedule	PUT	Updates the schedule for delivery of expired certificate alerts.	<a href="#">PUT Alerts Expiration Schedule on page 70</a>
/Alerts/Expiration	GET	Retrieves details for all configured expired certificate.	<a href="#">GET Alerts Expiration on page 72</a>
/Alerts/Expiration	POST	Creates a new expired certificate alert.	<a href="#">POST Alerts Expiration on page 76</a>
/Alerts/Expiration	PUT	Updates an expired certificate for the specified ID.	<a href="#">PUT Alerts Expiration on page 83</a>
/Alerts/Expiration/Test	POST	Test an Expiration Alert	<a href="#">POST Alerts Expiration Test on page 90</a>
/Alerts/Expiration/TestAll	POST	Test All Expiration Alerts	<a href="#">POST Alerts Expiration Test All on page 92</a>

## DELETE Alerts Expiration ID

The DELETE /Alerts/Expiration/{id} method is used to delete the expiration alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 53: DELETE Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert to be deleted. Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 72</a> ) to retrieve a list of all the expiration alerts to determine the alert ID.

## GET Alerts Expiration ID

The GET /Alerts/Expiration/{id} method is used to retrieve details for the expiration alert with the specified ID. This method returns HTTP 200 OK on a success with details about the specified alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 54: GET Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert. Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 72</a> ) to retrieve a list of all the expiration alerts to determine the alert ID.

Table 55: GET Alerts Expiration {id} Response Data

Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.						
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.						
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.						
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>						
ExpirationWarningDays	An integer indicating the number of days prior to expiration to send the warning.						
Recipients	<p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>						
CertificateQuery	<p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.
Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.						
Name	A string containing the name of the certificate collection.						

Name	Description																
RegisteredEventHandler	<p>An array containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description																
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal								
ID	Event Handler Type																
1	ExpirationLogger																
2	ExpirationPowershell																
3	ExpirationRenewal																
DisplayName	A string containing the name of the event handler.																
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).																
EventHandlerParameters	<p>An object containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul>						
Value	Description																
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.																
Key	A string indicating the reference name of the configured parameter.																
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).																
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul>																

Name	Description	
	Value	Description
		<ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## GET Alerts Expiration Schedule

The GET /Alerts/Expiration/Schedule method is used to retrieve the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for expiration alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 56: GET Alerts Expiration Schedule Response Data

Name	Description								
Schedule	<p>An array indicating the schedule for delivery of the expiration alerts. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>
Name	Description								
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>				
Name	Description								
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>								

## PUT Alerts Expiration Schedule

The PUT /Alerts/Expiration/Schedule method is used to create or update the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for the alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 57: PUT Alerts Expiration Schedule Input Parameters

Name	In	Description								
Schedule	Body	An array indicating the schedule for delivery of the expiration alerts. Possible values are:								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. Name	Description								
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>								

## GET Alerts Expiration

The GET /Alerts/Expiration method is used to retrieve details of all expiration alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 59: GET Alerts Expiration Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CertificateQueryId</i></li> <li>• <i>Days</i></li> <li>• <i>DisplayName</i></li> <li>• <i>Message</i></li> <li>• <i>RegisteredEventHandlerId</i></li> <li>• <i>ScheduledTaskId</i></li> <li>• <i>Subject</i></li> <li>• <i>UseHandler</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 60: GET Alerts Expiration Response Data

Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.						
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.						
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.						
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>						
ExpirationWarningDays	An integer indicating the number of days prior to expiration to send the warning.						
Recipients	<p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>						
CertificateQuery	<p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.
Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.						
Name	A string containing the name of the certificate collection.						

Name	Description																
RegisteredEventHandler	<p>An array containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description																
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal								
ID	Event Handler Type																
1	ExpirationLogger																
2	ExpirationPowershell																
3	ExpirationRenewal																
DisplayName	A string containing the name of the event handler.																
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).																
EventHandlerParameters	<p>An object containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul>						
Value	Description																
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.																
Key	A string indicating the reference name of the configured parameter.																
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).																
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> </ul>																

Name	Description	
	Value	Description
		<ul style="list-style-type: none"> <li>• Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## POST Alerts Expiration

The POST /Alerts/Expiration method is used to create a new expiration alert. This method returns HTTP 200 OK on a success with details about the expiration alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 61: POST Alerts Expiration Input Parameters

Name	In	Description
DisplayName	Body	<b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	Body	<b>Required.</b> An integer indicating the number of days prior to expiration to send the warning.
Recipients	Body	An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses

Name	In	Description														
		<p>at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li></ul>														
CertificateQueryId	Body	<p><b>Required.</b> An integer indicating the certificate collection on which to base the alert.</p> <p>Use the <code>GET /CertificateCollections</code> method (see <a href="#">GET Certificate Collections on page 355</a>) to retrieve a list of all the certificate collections to determine the collection ID.</p>														
RegisteredEventHandler	Body	<p>An array containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>1</td><td>ExpirationLogger</td></tr><tr><td>2</td><td>ExpirationPowershell</td></tr><tr><td>3</td><td>ExpirationRenewal</td></tr></tbody></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></tbody></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>1</td><td>ExpirationLogger</td></tr><tr><td>2</td><td>ExpirationPowershell</td></tr><tr><td>3</td><td>ExpirationRenewal</td></tr></tbody></table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	UseHandler	<p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>

## PUT Alerts Expiration

The PUT /Alerts/Expiration method is used to update an expiration alert. This method returns HTTP 200 OK on a success with details about the alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 63: PUT Alerts Expiration Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	Body	<b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

## POST Alerts Expiration Test

The POST /Alerts/Expiration/Test method is used to test individual certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of "NoActionTaken" if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert.  
By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 65: POST Alerts Expiration Test Input Parameters

Name	In	Description										
expirationAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>											

Table 66: POST Alerts Expiration Test Response Data

Parameter	Description																		
ExpirationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAName</td><td>A string indicating the certificate authority that issued the certificate in hostname\logical name format.</td></tr> <tr> <td>CARow</td><td>An integer containing the CA's reference ID for certificate.</td></tr> <tr> <td>IssuedCN</td><td>A string indicating the common name of the certificate.</td></tr> <tr> <td>Expiry</td><td>A string indicating the date and time when the certificate expires.</td></tr> <tr> <td>Subject</td><td>A string indicating the subject for the email message, including any replaced substitutable special text.</td></tr> <tr> <td>Message</td><td> <p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td></tr> <tr> <td>Recipients</td><td>An object containing the recipients for the alert.</td></tr> <tr> <td>SendDate</td><td>A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).</td></tr> </table>	Name	Description	CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.	CARow	An integer containing the CA's reference ID for certificate.	IssuedCN	A string indicating the common name of the certificate.	Expiry	A string indicating the date and time when the certificate expires.	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipients	An object containing the recipients for the alert.	SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).
Name	Description																		
CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.																		
CARow	An integer containing the CA's reference ID for certificate.																		
IssuedCN	A string indicating the common name of the certificate.																		
Expiry	A string indicating the date and time when the certificate expires.																		
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.																		
Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>																		
Recipients	An object containing the recipients for the alert.																		
SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).																		
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

## POST Alerts Expiration Test All

The POST /Alerts/Expiration/TestAll method is used to test all certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of "NoActionTaken" if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 67: POST Alerts Expiration Test All Input Parameters

Name	In	Description								
expirationAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

### 2.2.4.3 Alerts Issued

The Alerts Issued component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for issued certificate requests.

Table 69: Alerts Issued

Endpoint	Method	Description	Link
/Alerts/Issued/{id}	DELETE	Deletes an issued certificate request alert for the specified ID.	<a href="#">DELETE Alerts Issued ID on the next page</a>

Endpoint	Method	Description	Link
/Alerts/Issued/{id}	GET	Retrieves details for an issued certificate request alert for the specified ID.	<a href="#">GET Alerts Issued ID below</a>
/Alerts/Issued/Schedule	GET	Retrieves details of the schedule for delivery of issued certificate request alerts.	<a href="#">GET Alerts Issued Schedule on page 100</a>
/Alerts/Issued/Schedule	PUT	Updates the schedule for delivery of issued certificate request alerts.	<a href="#">PUT Alerts Issued Schedule on page 101</a>
/Alerts/Issued	GET	Retrieves details for all configured issued certificate request alerts.	<a href="#">GET Alerts Issued on page 103</a>
/Alerts/Issued	POST	Creates a new issued certificate request alert.	<a href="#">POST Alerts Issued on page 108</a>
/Alerts/Issued	PUT	Updates an issued certificate request alert for the specified ID.	<a href="#">PUT Alerts Issued on page 116</a>

## DELETE Alerts Issued ID

The DELETE /Alerts/Issued/{id} method is used to delete the issued certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 70: DELETE Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert to be deleted. Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 103</a> ) to retrieve a list of all the issued request alerts to determine the alert ID.

## GET Alerts Issued ID

The GET /Alerts/Issued/{id} method is used to retrieve details for the issued certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 71: GET Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert.</p> <p>Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 103</a>) to retrieve a list of all the issued request alerts to determine the alert ID.</p>

Table 72: GET Alerts Issued {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnld-link}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul>

Name	Description														
	<ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>														
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell								
ID	Event Handler Type														
4	IssuedLogger														
5	IssuedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														

Name	Description										
	For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i> .										
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.										
Key	A string indicating the reference name of the configured parameter.										
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).										
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>										

## GET Alerts Issued Schedule

The GET /Alerts/Issued/Schedule method is used to retrieve the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for issued certificate request alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 73: GET Alerts Issued Schedule Response Data

Name	Description														
Schedule	<p>An array indicating the schedule for delivery of the issued request alerts. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

## PUT Alerts Issued Schedule

The PUT /Alerts/Issued/Schedule method is used to create or update the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for issued certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 74: PUT Alerts Issued Schedule Input Parameters

Name	In	Description																										
Schedule	Body	An array indicating the schedule for delivery of the issued request alerts. Possible values are:																										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td></tr><tr><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td><td></td></tr><tr><td colspan="2">For example, every hour:</td></tr><tr><td colspan="2"><pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr><tr><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table></td><td></td></tr><tr><td colspan="2">For example, daily at 11:30 pm:</td></tr><tr><td colspan="2"><pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></td></tr></table>	Name	Description	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.		For example, every hour:		<pre>"Interval": {   "Minutes": 60 }</pre>		Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	
		Name	Description																									
		Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.																									
<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.																								
Name	Description																											
Minutes	An integer indicating the number of minutes between each interval.																											
For example, every hour:																												
<pre>"Interval": {   "Minutes": 60 }</pre>																												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:																											
<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																								
Name	Description																											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																											
For example, daily at 11:30 pm:																												
<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>

Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

## GET Alerts Issued

The GET /Alerts/Issued method is used to retrieve details of all issued certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 76: GET Alerts Issued Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>Subject</i></li><li>• <i>Template_Id</i></li><li>• <i>UseHandler</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 77: GET Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnld-link}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul>

Name	Description														
	<ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>														
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell								
ID	Event Handler Type														
4	IssuedLogger														
5	IssuedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														

Name	Description										
	For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i> .										
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. For example, for a PowerShell handler:			

Name	In	Description
		<pre>"EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "cn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",     "DefaultValue": "Issued Alert: Enterprise Web Server",     "ParameterType": "Value"   },   {     "Id": 31,     "Key": "DownloadLink",     "DefaultValue": "dnldlink",     "ParameterType": "Token"   },   {     "Id": 32,     "Key": "ScriptName",     "DefaultValue": "MyScript.ps1",     "ParameterType": "Script"   } ]</pre>

Table 79: POST Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnld-link}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> </ul>

Name	Description														
	<ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>														
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>           An integer indicating the Keyfactor Command reference ID for the event handler.           <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell								
ID	Event Handler Type														
4	IssuedLogger														
5	IssuedPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														

Name	Description										
	For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i> .										
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.										
Key	A string indicating the reference name of the configured parameter.										
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).										
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>										

## PUT Alerts Issued

The PUT /Alerts/Issued method is used to update an issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 80: PUT Alerts Issued Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	Body	<b>Required.</b> A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	Body	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text

Name	In	Description												
		<p>strings include:</p> <ul style="list-style-type: none"><li><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li></ul>												
TemplateId	Body	<p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1185</a>) to retrieve a list of all the templates to determine the template ID.</p>												
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	UseHandler	<p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>
Value	Description													
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell							
ID	Event Handler Type													
4	IssuedLogger													
5	IssuedPowershell													
UseHandler	<p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>													
EventHandlerParameters	Body	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID of the configured parameter.</p></td></tr></table>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID of the configured parameter.</p>								
Value	Description													
Id	<p>An integer indicating the Keyfactor Command reference ID of the configured parameter.</p>													

Name	In	Description	
		Value	Description
		Key	A string indicating the reference name of the configured parameter.
		DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).
		ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"><li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li><li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li><li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul>
For example, for a PowerShell handler:			

Name	In	Description
		<pre>"EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "cn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",     "DefaultValue": "Issued Alert: Enterprise Web Server",     "ParameterType": "Value"   },   {     "Id": 31,     "Key": "DownloadLink",     "DefaultValue": "dnldlink",     "ParameterType": "Token"   },   {     "Id": 32,     "Key": "ScriptName",     "DefaultValue": "MyScript.ps1",     "ParameterType": "Script"   } ]</pre>

Table 81: PUT Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>										

## 2.2.4.4 Alerts Key Rotation

The Alerts Key Rotation component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for SSH keys approaching the end of the key lifetime. The default key lifetime is 365 days, but this setting is configurable (see [Application Settings: SSH Tab](#) in the *Keyfactor Command Reference Guide*). Key rotation alerts apply to both user keys (see [My SSH Key](#) in the *Keyfactor Command Reference Guide*) and service account keys (see [Service Account Keys](#) in the *Keyfactor Command Reference Guide*) generated within Keyfactor Command.

Table 82: Alerts Key Rotation

Endpoint	Method	Description	Link
/Alerts/KeyRotation/{id}	DELETE	Deletes an SSH key rotation alert for the specified ID.	<a href="#">DELETE Alerts Key Rotation ID below</a>
/Alerts/KeyRotation/{id}	GET	Retrieves details for the SSH key rotation alert for the specified ID.	<a href="#">GET Alerts Key Rotation ID on the next page</a>
/Alerts/KeyRotation/Schedule	GET	Retrieves details of the schedule for delivery of SSH key rotation alerts.	<a href="#">GET Alerts Key Rotation Schedule on page 128</a>
/Alerts/KeyRotation/Schedule	PUT	Updates the schedule for delivery of SSH key rotation alerts.	<a href="#">PUT Alerts Key Rotation Schedule on page 129</a>
/Alerts/KeyRotation	GET	Retrieves details for all configured SSH key rotation alerts.	<a href="#">GET Alerts Key Rotation on page 131</a>
/Alerts/KeyRotation	POST	Creates a new SSH key rotation alert.	<a href="#">POST Alerts Key Rotation on page 135</a>
/Alerts/KeyRotation	PUT	Updates the SSH key rotation alert for a specified ID.	<a href="#">PUT Alerts Key Rotation on page 142</a>
/Alerts/KeyRotation/Test	POST	Used to test specific SSH key rotation alerts.	<a href="#">POST Alerts Key Rotation Test on page 149</a>
/Alerts/KeyRotation/TestAll	POST	Used to test all SSH key rotation alerts.	<a href="#">POST Alerts Key Rotation Test All on page 151</a>

## DELETE Alerts Key Rotation ID

The DELETE /Alerts/KeyRotation/{id} method is used to delete the SSH key rotation alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 83: DELETE Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert to be deleted. Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 131</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

## GET Alerts Key Rotation ID

The GET /Alerts/KeyRotation/{id} method is used to retrieve details for the SSH key rotation alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 84: GET Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert. Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 131</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Table 85: GET Alerts Key Rotation {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{server-logons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!"</pre> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell								
ID	Event Handler Type														
10	SSHKeyRotationLogger														
11	SSHKeyRotationPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used</li> </ul>														

Name	Description	
	Value	Description
		<p>to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the file-name and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</p> <ul style="list-style-type: none"> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## GET Alerts Key Rotation Schedule

The GET /Alerts/KeyRotation/Schedule method is used to retrieve the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 86: GET Alerts Key Rotation Schedule Response Data

Name	Description														
Schedule	<div>An array indicating the schedule for delivery of the SSH key rotation alerts. Possible values are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><div>For example, every hour:</div><div><pre>"Interval": {   "Minutes": 60 }</pre></div></td></tr><tr><td>Daily</td><td><div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table><div>For example, daily at 11:30 pm:</div><div><pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></div></td></tr></table>	Name	Description	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	<div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <div>For example, daily at 11:30 pm:</div> <div><pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

PUT Alerts Key Rotation Schedule

The PUT /Alerts/KeyRotation/Schedule method is used to create or update the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 87: PUT Alerts Key Rotation Schedule Input Parameters

Name	In	Description				
Schedule	Body	An array indicating the schedule for delivery of the SSH key rotation alerts. Possible values are:				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td></tr></table>	Name	Description	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.
		Name	Description			
		Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.			
<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.		
Name	Description					
Minutes	An integer indicating the number of minutes between each interval.					
For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>						
Daily		A dictionary that indicates a job scheduled to run every day at the same time with the parameter:				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
		For example, daily at 11:30 pm: <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>				

Table 88: PUT Alerts Key Rotation Schedule Response Data

Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

## GET Alerts Key Rotation

The GET /Alerts/KeyRotation method is used to retrieve details of all SSH key rotation alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 89: GET Alerts Key Rotation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"><li>• <i>Days</i></li><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>ScheduledTaskId</i></li><li>• <i>Subject</i></li><li>• <i>UseHandler</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 90: GET Alerts Key Rotation Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{server-logons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!"</pre> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell								
ID	Event Handler Type														
10	SSHKeyRotationLogger														
11	SSHKeyRotationPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. ## POST Alerts Key Rotation

The POST /Alerts/KeyRotation method is used to create a new SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 91: POST Alerts Key Rotation Input Parameters

Name	In	Description
DisplayName	Body	<b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following inform- ation:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt; {username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt; {fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt; &lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt; &lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt; {serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/Key- factorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href- f=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!"</pre> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	Body	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

Name	In	Description														
RegisteredEventHandler	Body	An object containing the event handler configuration for the alert, if applicable. Possible values are:														
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the event handler.</td></tr><tr><td></td><td><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>10</td><td>SSHKeyRotationLogger</td></tr><tr><td>11</td><td>SSHKeyRotationPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler.		<table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>10</td><td>SSHKeyRotationLogger</td></tr><tr><td>11</td><td>SSHKeyRotationPowershell</td></tr></table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
		Value	Description													
		Id	An integer indicating the Keyfactor Command reference ID for the event handler.													
			<table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>10</td><td>SSHKeyRotationLogger</td></tr><tr><td>11</td><td>SSHKeyRotationPowershell</td></tr></table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell

## PUT Alerts Key Rotation

The PUT /Alerts/KeyRotation method is used to update a SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 93: PUT Alerts Key Rotation Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	Body	<b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nYou requested an SSH key pair almost a year ago with the following inform- ation:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt; {username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt; {fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt; &lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt; &lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt; {serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is used</li> </ul>														

Name	Description	
	Value	Description
		<p>to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the file-name and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</p> <ul style="list-style-type: none"> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## POST Alerts Key Rotation Test

The POST /Alerts/KeyRotation/Test method is used to test a specific SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of "NoActionTaken" if no keys match the test criteria entered.

**Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting). By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 95: POST Alerts Key Rotation Test Input Parameters

Name	In	Description										
keyRotationAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Parameter</th><th>Description</th></tr><tr><td>AlertId</td><td><p><b>Required.</b> An integer of the reference ID of the SSH key rotation alert to test.</p><p>Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 131</a>) to retrieve a list of all your key rotation alerts to determine the alert Id.</p></td></tr><tr><td>EvaluationDate</td><td><p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p><p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.</p></td></tr><tr><td>PreviousEvaluationDate</td><td><p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p></td></tr></table> <p>For example:</p> <pre>{  "EvaluationDate": "2022-08-31T20:51:33.528Z",  "PreviousEvaluationDate": "2022-08-31T20:51:33.528Z",  "SendAlerts": true}</pre>	Parameter	Description	AlertId	<p><b>Required.</b> An integer of the reference ID of the SSH key rotation alert to test.</p> <p>Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 131</a>) to retrieve a list of all your key rotation alerts to determine the alert Id.</p>	EvaluationDate	<p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p> <p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.</p>	PreviousEvaluationDate	<p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p>	SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>
Parameter	Description											
AlertId	<p><b>Required.</b> An integer of the reference ID of the SSH key rotation alert to test.</p> <p>Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 131</a>) to retrieve a list of all your key rotation alerts to determine the alert Id.</p>

Table 96: POST Alerts Key Rotation Test Response Data

Parameter	Description								
KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the subject for the email message, including any replaced substitutable special text.</td></tr> <tr> <td>Message</td><td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td></tr> <tr> <td>Recipient</td><td>A string indicating the recipient for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.								
Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>								
Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

## POST Alerts Key Rotation Test All

The POST /Alerts/KeyRotation/TestAll method is used to test all SSH key rotation alerts. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of "NoActionTaken" if no keys match the test criteria entered.

**Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting). By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 WorkflowManagement: *Read*  
 WorkflowManagement: *Test*

Table 97: POST Alerts Key Rotation Test All Input Parameters

Name	In	Description								
keyRotationAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Parameter</th><th>Description</th></tr><tr><td>EvaluationDate</td><td><p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p><p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.</p></td></tr><tr><td>PreviousEvaluationDate</td><td><p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

## 2.2.4.5 Alerts Pending

The Alerts Pending component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for certificate requests that require approval based on policy on the CA.

**Important:** Pending alerts are **not** used to provide email alerts for certificate requests that require approval based on policies configured in Keyfactor Command workflows. These alerts are configured as steps within the workflow (see [Workflow Definitions on page 1234](#)). For more information about the difference between alerting for certificate requests that require manager approval at the CA level and alerting for certificate requests that require manager approval at the Keyfactor Command workflow level, see [Pending Certificate Request Alerts](#) in the *Keyfactor Command Reference Guide*.

Table 99: Alerts Pending

Endpoint	Method	Description	Link
/Alerts/Pending/{id}	DELETE	Deletes a pending certificate request alert for the specified ID.	<a href="#">DELETE Alerts Pending ID on the next page</a>
/Alerts/Pending/{id}	GET	Retrieves details for a pending certificate request alert for the specified ID.	<a href="#">GET Alerts Pending ID on the next page</a>
/Alerts/Pending	PUT	Updates a pending certificate request alert for a specified ID.	<a href="#">PUT Alerts Pending on page 175</a>

Endpoint	Method	Description	Link
/Alerts/Pending/Schedule	GET	Retrieves details of the schedule for delivery of pending certificate request alerts.	<a href="#">GET Alerts Pending Schedule on page 159</a>
/Alerts/Pending/Schedule	PUT	Updates the schedule for delivery of pending certificate request alerts.	<a href="#">PUT Alerts Pending Schedule on page 160</a>
/Alerts/Pending	GET	Retrieves details for all configured pending certificate request alerts.	<a href="#">GET Alerts Pending on page 162</a>
/Alerts/Pending	POST	Creates a new pending certificate request alert.	<a href="#">POST Alerts Pending on page 167</a>
/Alerts/Pending/Test	POST	Tests all alerts	<a href="#">POST Alerts Pending TestAll on page 186</a>
/Alerts/Pending/Test/{id}	POST	Tests specific alerts	<a href="#">POST Alerts Pending Test on page 183</a>

## DELETE Alerts Pending ID

The DELETE /Alerts/Pending/{id} method is used to delete the pending certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 100: DELETE Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert to be deleted. Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 162</a> ) to retrieve a list of all the pending request alerts to determine the alert ID.

## GET Alerts Pending ID

The GET /Alerts/Pending/{id} method is used to retrieve details for the pending certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 101: GET Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert. Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 162</a> ) to retrieve a list of all the pending request alerts to determine the alert ID.

Table 102: GET Alerts Pending {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}</li> </ul>

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr><tr><td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr><tr><td>ForestRoot</td><td><p>A string indicating the forest root of the template.</p><div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div></td></tr><tr><td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell

	Value	Description
		<p>used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</p> <ul style="list-style-type: none"> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## GET Alerts Pending Schedule

The GET /Alerts/Pending/Schedule method is used to retrieve the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 103: GET Alerts Pending Schedule Response Data

Name	Description														
Schedule	<p>An array indicating the schedule for delivery of the pending request alerts. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description														
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.										
Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

## PUT Alerts Pending Schedule

The PUT /Alerts/Pending/Schedule method is used to create or update the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 104: PUT Alerts Pending Schedule Input Parameters

Name	In	Description																	
Schedule	Body	An array indicating the schedule for delivery of the pending request alerts. Possible values are:																	
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td></tr><tr><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td><td>For example, every hour:<div>"Interval": {   "Minutes": 60 }</div></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table></td></tr><tr><td>For example, daily at 11:30 pm:<div>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</div></td></tr></table>	Name	Description	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	For example, every hour: <div>"Interval": {   "Minutes": 60 }</div>	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm: <div>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</div>
		Name	Description																
		Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.																
<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	For example, every hour: <div>"Interval": {   "Minutes": 60 }</div>														
Name	Description																		
Minutes	An integer indicating the number of minutes between each interval.																		
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																		
For example, daily at 11:30 pm: <div>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</div>																			

Table 105: PUT Alerts Pending Schedule Response Data

Name	Description

Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).														

## GET Alerts Pending

The GET /Alerts/Pending method is used to retrieve details of all pending certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: Read

Table 106: GET Alerts Pending Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>ScheduledTaskId</i></li><li>• <i>Subject</i></li><li>• <i>Template_Id</i></li><li>• <i>UseHandler</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 107: GET Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}</li> </ul>

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr><tr><td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr><tr><td>ForestRoot</td><td><p>A string indicating the forest root of the template.</p><div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div></td></tr><tr><td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul>														

Name	Description	
	Value	Description
		<p>used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</p> <ul style="list-style-type: none"> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>

## POST Alerts Pending

The POST /Alerts/Pending method is used to create a new pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 108: POST Alerts Pending Input Parameters

Name	In	Description
DisplayName	Body	<b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}</li> </ul> <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>

Name	In	Description												
		<ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>												
TemplateId	Body	<p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1185</a>) to retrieve a list of all the templates to determine the template ID.</p>												
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Key	<p>A string indicating the reference name of the configured parameter.</p>													
DefaultValue	<p>A string indicating the value for the parameter. This</p>													

Name	In	Description	
		Value	Description
			value is related to the type of parameter (see <i>ParameterType</i> ).
		ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"><li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li><li>Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li><li>Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul>
		For example, for a PowerShell handler:	
		<pre>"EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "rcn",</pre>	

Name	In	Description
		<pre>         "ParameterType": "Token"       },       {         "Id": 29,         "Key": "AppOwnerFirstName",         "DefaultValue": "metadata:AppOwnerFirstName",         "ParameterType": "Token"       },       {         "Id": 30,         "Key": "Text",         "DefaultValue": "Pending Alert: Enterprise Web Server",         "ParameterType": "Value"       },       {         "Id": 31,         "Key": "ApprovalLink",         "DefaultValue": "apprlink",         "ParameterType": "Token"       },       {         "Id": 32,         "Key": "ScriptName",         "DefaultValue": "MyScript.ps1",         "ParameterType": "Script"       }     ] </pre>
CARquestId		A string containing the CA's reference ID for the certificate request.
CommonName		A string indicating the common name of the certificate.
LogicalName		A string indicating the logical name of the certificate authority.

Table 109: POST Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANS: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}</li> </ul>

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"><li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr><tr><td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr><tr><td>ForestRoot</td><td><p>A string indicating the forest root of the template.</p><div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div></td></tr><tr><td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.

## PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 110: PUT Alerts Pending Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run the
DisplayName	Body	<b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	<p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. For example:</p> <p>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</table></p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}</li> </ul>

Name	In	Description

Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div> <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul> </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul>				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>Script This type is used for the PowerShell handler and is</li> </ul>														

Name	Description	
	Value	Description
		<p>used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</p> <ul style="list-style-type: none"> <li>• Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul>
CARestId	A string containing the CA's reference ID for the certificate request.	
CommonName	A string indicating the common name of the certificate.	
LogicalName	A string indicating the logical name of the certificate authority.	

## POST Alerts Pending Test

The POST /Alerts/Pending/Test method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

**Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowManagement: *Read*

WorkflowManagement: *Test*

Table 112: POST Alerts Pending Test Input Parameters

Parameter	In	Description						
req	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>AlertId</td><td>An integer indicating the Keyfactor Command reference ID for the pending alert.</td></tr><tr><td>SendAlerts</td><td>A Boolean indicating whether to send alert emails with the test (true), or not (false).</td></tr></table> <p>For example:</p> <pre>{  "AlertId": 1,  "SendAlertEmails": false}</pre>	Value	Description	AlertId	An integer indicating the Keyfactor Command reference ID for the pending alert.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true), or not (false).
Value	Description							
AlertId	An integer indicating the Keyfactor Command reference ID for the pending alert.							
SendAlerts	A Boolean indicating whether to send alert emails with the test (true), or not (false).							

Table 113: POST Alerts Pending Test Response Data

Parameter	Description				
PendingAlerts	<p>An object containing alert details resulting from the test. Pending alert details are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Subject</td><td><p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p><div> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</div></td></tr></table>	Name	Description	Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</div>
Name	Description				
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</div>				

Parameter	Description	
	Name	Description
	Message	A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.
	Recipients	An object containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.
	CARquestId	An string containing the CA's reference ID for the certificate request.
	CommonName	A string indicating the common name of the certificate request.
	LogicalName	A string indicating the logical name of the certificate authority from which the certificate was requested.
AlertBuildResult	A string indicating the result of pending alerts test (e.g. Success).	

## POST Alerts Pending TestAll

The POST /Alerts/Pending/TestAll method is used to test all pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting number of alerts generated.

**Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>	Message	A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.	Recipients	An object containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.	CARequestId	An string containing the CA's reference ID for the certificate request.	CommonName	A string indicating the common name of the certificate request.	LogicalName	A string indicating the logical name of the certificate authority from which the certificate was requested.
Name	Description														
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>														
Message	A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.														
Recipients	An object containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.														
CARequestId	An string containing the CA's reference ID for the certificate request.														
CommonName	A string indicating the common name of the certificate request.														
LogicalName	A string indicating the logical name of the certificate authority from which the certificate was requested.														
AlertBuildResult	An integer indicating the number of pending alerts run by the test.														

## 2.2.5 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 116: Audit Endpoints

Endpoint	Method	Description	Links
/id	GET	Returns information about the specified audit log entry.	<a href="#">GET Audit ID below</a>
/id/Validate	GET	Validates the specified audit log entry.	<a href="#">GET Audit ID Validate on page 194</a>
/	GET	Returns a list of all audit log entries according to the provided filters and input parameters.	<a href="#">GET Audit on page 194</a>
/Download	GET	Returns a comma separated list of audit log entries according to the provided filters and input parameters.	<a href="#">GET Audit Download on page 200</a>
/RelatedEntities	GET	Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters.	<a href="#">GET Audit Related Entities on page 202</a>

### 2.2.5.1 GET Audit ID

The GET /Audit/{id} method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: Read

Table 117: GET Audit {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the audit log entry to retrieve. Use the <i>GET /Audit</i> method (see <a href="#">GET Audit on page 194</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 118: GET Audit {id} Response Data

Name	Description																																													
Id	The ID of the specified audit log entry.																																													
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																													
Message	XML data on the audit event.																																													
Signature	The signature on the audit entry.																																													
Category	An integer identifying the category of the audit entry. Possible values are:																																													
	<table><tr><th>Value</th><th>Subcategory Name</th><th>Description</th></tr><tr><td>2001</td><td>Certificate</td><td>Certificate</td></tr><tr><td>2001</td><td>AuditingCertificateScheduledReplacement</td><td>Auditing Certificate Scheduled Replacement</td></tr><tr><td>2001</td><td>AuditingCertificateRequest</td><td>Certificate Request</td></tr><tr><td>2002</td><td>ApiApplication</td><td>API Application</td></tr><tr><td>2003</td><td>Template</td><td>Template</td></tr><tr><td>2004</td><td>CertificateQuery</td><td>Certificate Collec- tion/Query</td></tr><tr><td>2005</td><td>ExpirationAlert</td><td>Expiration Alert</td></tr><tr><td>2005</td><td>ExpirationAlertDefinitionContextModel</td><td>Expiration Alert</td></tr><tr><td>2006</td><td>PendingAlert</td><td>Pending Alert</td></tr><tr><td>2006</td><td>PendingAlertDefinitionContextModel</td><td>Pending Alert</td></tr><tr><td>2007</td><td>ApplicationSetting</td><td>Application Setting</td></tr><tr><td>2008</td><td>IssuedAlert</td><td>Issued Alert</td></tr><tr><td>2008</td><td>IssuedAlertDefinitionContextModel</td><td>Issued Alert</td></tr><tr><td>2009</td><td>DeniedAlert</td><td>Denied Alert</td></tr></table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	AuditingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collec- tion/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert	2009	DeniedAlert	Denied Alert
	Value	Subcategory Name	Description																																											
	2001	Certificate	Certificate																																											
	2001	AuditingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement																																											
	2001	AuditingCertificateRequest	Certificate Request																																											
	2002	ApiApplication	API Application																																											
	2003	Template	Template																																											
	2004	CertificateQuery	Certificate Collec- tion/Query																																											
	2005	ExpirationAlert	Expiration Alert																																											
	2005	ExpirationAlertDefinitionContextModel	Expiration Alert																																											
	2006	PendingAlert	Pending Alert																																											
	2006	PendingAlertDefinitionContextModel	Pending Alert																																											
	2007	ApplicationSetting	Application Setting																																											
	2008	IssuedAlert	Issued Alert																																											
2008	IssuedAlertDefinitionContextModel	Issued Alert																																												
2009	DeniedAlert	Denied Alert																																												

Name	Description		
	Value	Subcategory Name	Description
	2009	DeniedAlertDefinitionContextModel	Denied Alert
	2010	ADIdentityModel	Security Identity
	2011	SecurityRole	Security Role
	2012	AuthorizationFailure	Authorization Failure
	2013	CertificateSigningRequest	CSR
	2014	ServerGroup	SSH Server Group
	2015	Server	SSH Server
	2016	DiscoveredKey	Rogue Key for Logon
	2016	Key	SSH Key
	2017	ServiceAccount	SSH Service Account
	2018	Logon	SSH Logon
	2019	SshUser	SSH User
	2020	KeyRotationAlertDefinitionContextModel	SSH Key Rotation Alert
	2021	CertificateStore	Certificate Store
	2022	JobType	Orchestrator Job Type
	2023	AgentSchedule	Orchestrator Job
	2024	BulkAgentSchedule	Bulk Orchestrator Job
	2025	CertificateStoreContainer	Store Container
	2026	Agent	Orchestrator
	2027	RevocationMonitoring	Monitoring
	2028	License	License
	2029	WorkflowDefinition	Workflow Definition

Name	Description		
	<b>Value</b>	<b>Subcategory Name</b>	<b>Description</b>
	2030	WorkflowInstance	Workflow Instance
	2031	WorkflowInstanceSignal	Workflow Instance Signal
	<div> <b>Tip:</b> To do a query by category, use the subcategory string. For example, the following query would return audit records for categories 2023, 2024, and 2026 since they all contain "Agent" in the subcategory: category -contains "Agent"</div>		
Operations	An integer identifying the operation of the audit entry. Possible values are:		
	<b>Value</b>	<b>Description</b>	
	1	Created	
	2	Updated	
	3	Deleted	
	4	Approved	
	5	Denied	
	6	Revoked	
	7	Downloaded	
	8	Deleted Private Key	
	9	Renewed	
	10	Encountered	
	11	Scheduled Replacement	
	12	Recovered	
	13	Imported	
	14	Removed from Hold	

Name	Description																								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>15</td><td>Scheduled Add</td></tr> <tr> <td>16</td><td>Scheduled Removal</td></tr> <tr> <td>17</td><td>Download with Private Key</td></tr> <tr> <td>18</td><td>Scheduled</td></tr> <tr> <td>19</td><td>Reset</td></tr> <tr> <td>20</td><td>Disapproved</td></tr> <tr> <td>21</td><td>Restarted</td></tr> <tr> <td>22</td><td>Sent</td></tr> <tr> <td>23</td><td>Failed</td></tr> <tr> <td>24</td><td>Completed</td></tr> <tr> <td>25</td><td>Rejected</td></tr> </table>	Value	Description	15	Scheduled Add	16	Scheduled Removal	17	Download with Private Key	18	Scheduled	19	Reset	20	Disapproved	21	Restarted	22	Sent	23	Failed	24	Completed	25	Rejected

19	Reset																								
20	Disapproved																								
21	Restarted																								
22	Sent																								
23	Failed																								
24	Completed																								
25	Rejected																								
Level	<p>The alert level of the audit log entry. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Information</td></tr> <tr> <td>1</td><td>Warning</td></tr> <tr> <td>2</td><td>Failure</td></tr> </table>	Value	Description	0	Information	1	Warning	2	Failure																
Value	Description																								
0	Information																								
1	Warning																								
2	Failure																								
User	The user who performed the audit event in DOMAIN\username format.																								
EntityType	The category of the object being audited (e.g. Template, Certificate).																								
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.																								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.																								

## 2.2.5.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a value of true or false.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: Read

Table 119: GET Audit {id} Validate Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the audit log entry to validate. Use the <i>GET /Audit</i> method (see <a href="#">GET Audit below</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 120: GET Audit {id} Validate Response Data

Name	Description
	A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name.

## 2.2.5.3 GET Audit

The GET /Audit method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: Read

Table 121: GET Audit Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i> (EntityIdentifier)</li> <li>• <i>Category</i> (EntityType) (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>ImmutableIdentifier</i></li> <li>• <i>Level</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>Operation</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>PropertyChanged</i></li> <li>• <i>Timestamp</i></li> <li>• <i>ActingUser</i></li> </ul> <p> <b>Tip:</b> To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example: category -contains "Agent"</p>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 122: GET Audit Response Data

Name	Description																																													
Id	The ID of the specified audit log entry.																																													
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																													
Message	XML data on the audit event.																																													
Signature	The signature on the audit entry.																																													
Category	An integer identifying the category of the audit entry. Possible values are:																																													
	<table><tr><th>Value</th><th>Subcategory Name</th><th>Description</th></tr><tr><td>2001</td><td>Certificate</td><td>Certificate</td></tr><tr><td>2001</td><td>AuditingCertificateScheduledReplacement</td><td>Auditing Certificate Scheduled Replacement</td></tr><tr><td>2001</td><td>AuditingCertificateRequest</td><td>Certificate Request</td></tr><tr><td>2002</td><td>ApiApplication</td><td>API Application</td></tr><tr><td>2003</td><td>Template</td><td>Template</td></tr><tr><td>2004</td><td>CertificateQuery</td><td>Certificate Collec- tion/Query</td></tr><tr><td>2005</td><td>ExpirationAlert</td><td>Expiration Alert</td></tr><tr><td>2005</td><td>ExpirationAlertDefinitionContextModel</td><td>Expiration Alert</td></tr><tr><td>2006</td><td>PendingAlert</td><td>Pending Alert</td></tr><tr><td>2006</td><td>PendingAlertDefinitionContextModel</td><td>Pending Alert</td></tr><tr><td>2007</td><td>ApplicationSetting</td><td>Application Setting</td></tr><tr><td>2008</td><td>IssuedAlert</td><td>Issued Alert</td></tr><tr><td>2008</td><td>IssuedAlertDefinitionContextModel</td><td>Issued Alert</td></tr><tr><td>2009</td><td>DeniedAlert</td><td>Denied Alert</td></tr></table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	AuditingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collec- tion/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert	2009	DeniedAlert	Denied Alert

User	The user who performed the audit event in DOMAIN\username format.																								
EntityType	The category of the object being audited (e.g. Template, Certificate).																								
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.																								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.																								

## 2.2.5.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information requested in comma-delimited form with the property names at the start of the list and then the values.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: Read

Table 123: GET Audit Download Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Name</i> (EntityIdentifier)</li><li>• <i>Category</i> (EntityType) (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li><li>• <i>ImmutableIdentifier</i></li><li>• <i>Level</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li><li>• <i>Operation</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li><li>• <i>PropertyChanged</i></li><li>• <i>Timestamp</i></li><li>• <i>ActingUser</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 124: GET Audit Download Response Data

Name	Description																																
Id	The ID of the specified audit log entry.

It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. Also known as the <i>Name</i> in some interfaces.																						

### 2.2.5.5 GET Audit Related Entities

The GET /Audit/RelatedEntities method returns a list of all audit entries and all audit entries related to those audit entries. This method returns HTTP 200 OK on a success with the information requested.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: Read

Table 125: GET Audit Related Entities Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i> (EntityIdentifier)</li> <li>• <i>Category</i> (EntityType) (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>ImmutableIdentifier</i></li> <li>• <i>Level</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>Operation</i> (see <a href="#">Table 122: GET Audit Response Data</a> for codes)</li> <li>• <i>PropertyChanged</i></li> <li>• <i>Timestamp</i></li> <li>• <i>ActingUser</i></li> </ul> <div>  <p><b>Tip:</b> In order to return related entries, your queryString needs to query for the specific immutable identifier of the audit record for which you wish to see related entries. For example: <code>ImmutableIdentifier -eq 707662</code></p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .

It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.																								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.																								

## 2.2.6 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 127: Certificates Endpoints

Endpoint	Method	Description	Link
/id/Security	GET	Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are.	<a href="#">GET Certificates ID Security on the next page</a>
/id/Validate	GET	Validates that a certificate chain can be built for the specified certificate.	<a href="#">GET Certificates ID Validate on page 210</a>
/Locations/id	GET	Returns details about the certificates stores in which the certificate is located.	<a href="#">GET Certificates Locations ID on page 216</a>
/IdentityAudit/id	GET	Returns audit identity permissions for certificate.	<a href="#">GET Certificates Identity Audit ID on page 219</a>
/id	DELETE	Deletes a certificate from the Keyfactor Command database by its ID.	<a href="#">DELETE Certificates ID on page 220</a>
/id	GET	Returns certificate details for a specified certificate.	<a href="#">GET Certificates ID on page 221</a>
/Metadata/Compare	GET	Compares the metadata value provided with the metadata value associated with the specified certificate.	<a href="#">GET Certificates Metadata Compare on page 233</a>
/id/History	GET	Returns the certificate operations history for a specified certificate.	<a href="#">GET Certificates ID History on page 234</a>
/	DELETE	Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.	<a href="#">DELETE Certificates on page 236</a>
/	GET	Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level.	<a href="#">GET Certificates on page 237</a>
/Metadata	PUT	Updates the metadata for a specified certificate.	<a href="#">PUT Certificates Metadata on page 251</a>
/Metadata/All	PUT	Updates the metadata for an array of certificate	<a href="#">PUT Certificates</a>

Endpoint	Method	Description	Link
		IDs.	<a href="#">Metadata All on page 252</a>
/Import	POST	Imports a certificate into Keyfactor Command.	<a href="#">POST Certificates Import on page 255</a>
/Revoke	POST	Revokes a certificate.	<a href="#">POST Certificates Revoke on page 258</a>
/Analyze	POST	Reads a base-64 encoded PEM certificates and returns it in human-readable form.	<a href="#">POST Certificates Analyze on page 260</a>
/Recover	POST	Returns a recovered certificate as a PFX.	<a href="#">POST Certificates Recover on page 261</a>
/Download	POST	Downloads a certificate.	<a href="#">POST Certificates Download on page 263</a>
/RevokeAll	POST	Revokes all the certificates in the provided query.	<a href="#">POST Certificates Revoke All on page 265</a>
/Query	DELETE	Deletes multiple certificates from the Keyfactor Command database based on search query.	<a href="#">DELETE Certificates Query on page 266</a>
/PrivateKey	DELETE	Deletes the stored private keys of multiple certificates within the Keyfactor Command database.	<a href="#">DELETE Certificates Private Key on page 267</a>
/PrivateKey/{id}	DELETE	Deletes the stored private key(s) of a certificate within the Keyfactor Command database.	<a href="#">DELETE Certificates Private Key ID on page 268</a>

### 2.2.6.1 GET Certificates ID Security

The GET /Certificates/{id}/Security method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

SecuritySettings: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 128: GET Certificates {id} Security Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate for which to check security permissions.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 129: GET Certificates {id} Security Response Data

Name	Description						
Roles	<p>An array containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string containing the short reference name for the security role.</td></tr><tr><td>Permissions</td><td>An array of strings containing the permissions assigned to the role.</td></tr></table> <p>For example, the following return snippet shows the response for the "Power Users" security role:</p> <pre>{   "Name": "Power Users",   "Permissions": [     "Read",     "EditMetadata",     "Recover"   ] }</pre>	Name	Description	Name	A string containing the short reference name for the security role.	Permissions	An array of strings containing the permissions assigned to the role.
Name	Description						
Name	A string containing the short reference name for the security role.						
Permissions	An array of strings containing the permissions assigned to the role.						

### 2.2.6.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 130: GET Certificates {id} Validate Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate to be validated.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 131: GET Certificates {id} Validate Response Data

Name	Description																
Valid	A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false).																
Results	An array containing the X509 certificate chain validity fields. The included validity fields are:																
	<table> <tr> <th>Name</th><th>Keyfactor Command Management Portal Equivalent</th><th>Description</th></tr> <tr> <td>NotTimeValid</td><td>Time Valid</td><td>A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.</td></tr> <tr> <td>NotTimeNested</td><td>n/a</td><td>A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.</td></tr> <tr> <td>Revoked</td><td>Active</td><td>A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.</td></tr> <tr> <td>NotSignatureValid</td><td>Signature</td><td>A value of <i>Fail</i> indicates that the X509 certi-</td></tr> </table>	Name	Keyfactor Command Management Portal Equivalent	Description	NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. 	Name	Keyfactor Command Management Portal Equivalent	Description
			that the X509 certificate chain is invalid as a result of an invalid policy constraint.
	InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.
	InvalidNameConstraints	Valid Name Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.
	HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.
	HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.
	HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.
	HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.

Name	Description		
	Name	Keyfactor Command Management Portal Equivalent	Description
	PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.
	CtlNotTimeValid	CTL Time Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired).
	CtlNotSignatureValid	CTL Signature Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) contains an invalid signature.
	CtlNotValidForUsage	CTL Usage Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.
	HasWeakSignature	Strong Signature	A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate.
	OfflineRevocation	CRL online	A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.

Name	Description		
	Name	Keyfactor Command Management Portal Equivalent	Description
	NoIssuanceChainPolicy	Chain Policy	A value of <i>Pass</i> indicates that there is either no certificate policy by design in the certificate or that if a group policy has specified that all certificates must have a certificate policy, the certificate policy exists in the certificate.
	ExplicitDistrust	No Explicit Distrust	A value of <i>Pass</i> indicates that the certificate is not explicitly distrusted.
	HasNotSupportedCriticalExtension	Critical Extensions	A value of <i>Pass</i> indicates that the certificate has a critical extension that is supported or has no critical extensions.

### 2.2.6.3 GET Certificates Locations ID

The GET /Certificates/Locations/{id} method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 132: GET Certificates Locations {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 133: GET Certificates Locations {id} Response Data

Name	Description																				
Details	<p>An array containing the certificate stores in which the certificate is found. Certificate store details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StoreType</td><td>A string indicating the type of certificate store (e.g. Java Keystore).</td></tr> <tr> <td>StoreTypeId</td><td> <p>An integer indicating the Keyfactor Command referenced ID for the type of certificate store.</p> <p>Use the <i>GET CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 518</a>) to retrieve a list of all the certificate store types to see a complete list of types.</p> </td></tr> <tr> <td>StoreCount</td><td>An integer indicating the number of stores of the type referenced by StoreType in which the certificate is found.</td></tr> <tr> <td>Locations</td><td> <p>An array containing details about the specific certificate stores in which the certificate is found. StoreTypeId	An integer indicating the Keyfactor Command reference ID for the type of certificate store.	ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.	StorePath	A string containing the path to the certificate store on
Name	Description																				
StoreType	A string indicating the type of certificate store (e.g. Java Keystore).																				
StoreTypeId	<p>An integer indicating the Keyfactor Command referenced ID for the type of certificate store.</p> <p>Use the <i>GET CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 518</a>) to retrieve a list of all the certificate store types to see a complete list of types.</p>																				
StoreCount	An integer indicating the number of stores of the type referenced by StoreType in which the certificate is found.																				
Locations	<p>An array containing details about the specific certificate stores in which the certificate is found. The following details are included about each store:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StoreId</td><td>A GUID that identifies the certificate store in which the certificate is located.</td></tr> <tr> <td>StoreTypeId</td><td>An integer indicating the Keyfactor Command reference ID for the type of certificate store.</td></tr> <tr> <td>ClientMachine</td><td>A string containing the client machine name. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>StorePath</td><td>A string containing the path to the certificate store on</td></tr> </table>	Name	Description	StoreId	A GUID that identifies the certificate store in which the certificate is located.	StoreTypeId	An integer indicating the Keyfactor Command reference ID for the type of certificate store.	ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.	StorePath	A string containing the path to the certificate store on										
Name	Description																				
StoreId	A GUID that identifies the certificate store in which the certificate is located.																				
StoreTypeId	An integer indicating the Keyfactor Command reference ID for the type of certificate store.																				
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.																				
StorePath	A string containing the path to the certificate store on																				

Name	Description		
	Name	Description	
		Name	Description
			the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.
	Alias		A string containing the alias of the certificate in the certificate store. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a user-provided string, but for an IIS Personal store, this will be the thumbprint of the certificate. See the <a href="#">PFX Enrollment</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.

#### 2.2.6.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 134: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 135: GET Certificates {id} History Response Data

Name	Description						
Id	An integer containing the Keyfactor ID of the user/group.						
AccountName	A string containing the name of the Keyfactor user/group.						
IdentityType	A string that specifies if the account is a user or a group.						
SID	A string containing the SID of the user/group						
Permissions	An array of the permissions for the certificate. <table> <tr> <th>Parameter</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td></tr> <tr> <td>GrantedBy</td><td>A string containing the list of roles or collections that grant the given permission to the user-/group.</td></tr> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)	GrantedBy	A string containing the list of roles or collections that grant the given permission to the user-/group.
Parameter	Description						
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)						
GrantedBy	A string containing the list of roles or collections that grant the given permission to the user-/group.						

### 2.2.6.5 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this

private key is also removed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 136: DELETE Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate to delete. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 237</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

### 2.2.6.6 GET Certificates ID

The GET /Certificates/{id} method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 137: GET Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the certificate. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 237</a> ) to retrieve a list of multiple certificates to determine the desired certificate's ID.
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 138: GET Certificates {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:																		

Name	Description																																	
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
	Value	Function	Description																															
	0	None	No key usage parameters.																															
	1	Encipherment Only	The key can be used for encryption only.																															
	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																															
	4	Key Certificate Signing	The key can be used to sign certificates.																															
	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																															
	16	Data Encipherment	The key can be used for data encryption.																															
	32	Key Encipherment	The key can be used for key encryption.																															
	64	Nonrepudiation	The key can be used for authentication.																															
	128	Digital Signature	The key can be used as a digital signature.																															
32768	Decipherment Only	The key can be used for decryption only.																																
	For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i> . A value of 224 would add <i>nonrepudiation</i> to those.																																	
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																																	
CertStateString	A string containing the certificate state. The possible values are: <ul style="list-style-type: none"><li>Unknown (0)</li><li>Active (1)</li><li>Revoked (2)</li><li>Denied (3)</li><li>Failed (4)</li><li>Pending (5)</li><li>Certificate Authority (6)</li><li>Parent Certificate Authority (7)</li><li>External Validation (8)</li></ul>																																	
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .																																	

Name	Description																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation Of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the name of the template that was used when issuing the certificate.																		
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).																		
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)																		
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).																		
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.																		
RequesterName	A string containing the name of the identity that requested the certificate.																		
ContentBytes	A string containing the certificate as bytes.																		
ExtendedKeyUsages	An array containing the extended key usages associated with the certificate. Extended																		

Name	Description								
	Key data includes:								
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr><tr><td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr><tr><td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr></table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the SAN Element.</td></tr> <tr> <td>Type</td><td> <p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table> </td></tr> <tr> <td>ValueHash</td><td>A string indicating a hash of the SAN value.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown

ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description										
CRLDistributionPoints	<p>An array containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td></tr> <tr> <td>URL</td><td>A string indicating the URL of the CRL distribution point.</td></tr> <tr> <td>URLHash</td><td>A string indicating a hash of the URL.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.		
Name	Description										
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.										
URL	A string indicating the URL of the CRL distribution point.										
URLHash	A string indicating a hash of the URL.										
LocationsCount	<p>An array containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre>"LocationsCount": [   {     "Type": "IIS",     "Count": 2   },   {     "Type": "F5-SL-REST",     "Count": 1   } ]</pre>										
SSLLocations	<p>An array containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StorePath</td><td>A string indicating the machine where the certificate was discovered.</td></tr> <tr> <td>AgentPool</td><td>A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td></tr> <tr> <td>IPAddress</td><td>A string indicating the IP address where the certificate was discovered.</td></tr> <tr> <td>Port</td><td>An integer indicating the port on which the certificate was discovered.</td></tr> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.	IPAddress	A string indicating the IP address where the certificate was discovered.	Port	An integer indicating the port on which the certificate was discovered.
Name	Description										
StorePath	A string indicating the machine where the certificate was discovered.										
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.										
IPAddress	A string indicating the IP address where the certificate was discovered.										
Port	An integer indicating the port on which the certificate was discovered.										

Name	Description	
	Name	Description
	NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.

Name	Description																																										
Locations	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StoreMachine</td><td>A string indicating the machine on which the certificate store is located.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td></tr> <tr> <td>StoreType</td><td> <p>An integer indicating the type of certificate store the certificate is located in. 100	Amazon Web Services																																										
101	File Transfer Protocol																																										
1xx	User-defined certificate stores will be given a type ID over 101.																																										
Alias	A string indicating the alias of the certificate in the certificate store.																																										
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																										

Name	Description																		
Metadata	An array containing the metadata fields populated for the certificate.																		
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.																		
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div>  <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARERecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARERecordId</i> value parsed to an integer. </div>																		
CARERecordId	A string containing the CA's reference ID for certificate.																		
DetailedKeyUsage	<p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CrlSign</td><td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DataEncipherment</td><td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DecipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td></tr> <tr> <td>DigitalSignature</td><td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>EncipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td></tr> <tr> <td>KeyAgreement</td><td>A Boolean that indicates whether the certificate is configured for key agreement.</td></tr> <tr> <td>KeyCertSign</td><td>A Boolean that indicates whether the certificate is configured for certificate signing.</td></tr> <tr> <td>KeyEncipherment</td><td>A Boolean that indicates whether the certificate is</td></tr> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is
Name	Description																		
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).																		
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).																		
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).																		
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).																		
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).																		
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.																		
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.																		
KeyEncipherment	A Boolean that indicates whether the certificate is																		

Name	Description	
	Name	Description
		configured for key encipherment.
	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.
	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).	
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul>	

### 2.2.6.7 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 139: GET Certificates Metadata Compare Input Parameters

Name	In	Description
certificateId	Query	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.
metadataFieldName	Query	<b>Required.</b> A string containing the name of the metadata field whose value should be compared.
value	Query	<b>Required.</b> A string containing the value for comparison.
collectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## 2.2.6.8 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see the [Certificate Details](#) section of the *Keyfactor Command Reference Guide*. This method returns HTTP 200 OK on a success with certificate history details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 140: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
query.pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
query.returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
query.sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .
query.sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 141: GET Certificates {id} History Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID of the certificate.
OperationStart	The date, in UTC, on which the operation begin.
OperationEnd	The date, in UTC, on which the operation completed.
Username	The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.
Comment	A string containing a comment that provides more information about the history record. For example (for a metadata field): AppOwnerEmailAddress has been updated from 'john.smith@keyexample.com' to 'martha.jones@keyexample.com'
Action	A string naming the action that was taken. For example: Metadata Update

### 2.2.6.9 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 142: DELETE Certificates Input Parameters

Name	In	Description
ids	Body	<b>Required.</b> Array of Keyfactor Command certificate IDs for certificates that should be deleted in the form: [123,789,567]
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## 2.2.6.10 GET Certificates

The GET /Certificates method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 143: GET Certificates Input Parameters

Name	In	Description
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
includeHasPrivateKey	Query	A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
includeRevoked	Query	A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .
includeExpired	Query	A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .

Name	In	Description
queryString	Query	<ul style="list-style-type: none"> <li>• <i>ArchivedKey</i></li> <li>• <i>CertId</i></li> <li>• <i>CA</i></li> <li>• <i>CertState</i></li> <li>• <i>CertStoreFQDN</i> (alias: <i>JavaKey-storeFQDN</i>)</li> <li>• <i>CertStorePath</i> (alias: <i>JavaKey-storePath</i>)</li> <li>• <i>CN</i> (alias: <i>IssuedCN</i>)</li> <li>• <i>DN</i> (alias: <i>IssuedDN</i>)</li> <li>• <i>ExpirationDate</i> (alias: <i>NotAfter</i>)</li> </ul> <ul style="list-style-type: none"> <li>• <i>SKU</i></li> <li>• <i>EKUName</i></li> <li>• <i>HasPrivateKey</i></li> <li>• <i>ImportDate</i></li> <li>• <i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>)</li> <li>• <i>IssuerDN</i></li> <li>• <i>KeySize</i> (alias: <i>KeySizeInBits</i>)</li> <li>• <i>KeyType</i></li> <li>• <i>KeyUsage</i></li> </ul> <ul style="list-style-type: none"> <li>• <i>OU</i></li> <li>• <i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>)</li> <li>• <i>PublicKey</i></li> <li>• <i>NetBIOSRequester</i> (alias: <i>RequesterName</i>)</li> <li>• <i>RevocationDate</i> (alias: <i>RevocationEffDate</i>)</li> <li>• <i>Revoker</i></li> <li>• <i>RFC2818Compliant</i></li> <li>• <i>SelfSigned</i></li> <li>• <i>SerialNumber</i></li> </ul> <ul style="list-style-type: none"> <li>• <i>SigningAlgorithm</i></li> <li>• <i>SSLDNSName</i></li> <li>• <i>SSLIPAddress</i> (alias: <i>SslHostName</i>)</li> <li>• <i>SSLNetworkName</i></li> <li>• <i>SSLPort</i></li> <li>• <i>SAN</i></li> <li>• <i>TemplateDisplayName</i> (alias: <i>TemplateName</i>)</li> <li>• <i>TemplateShortName</i></li> <li>• <i>Thumbprint</i></li> </ul> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <li>• <i>CARequestID</i></li> <li>• <i>CertRequestID</i></li> <li>• <i>IsPfx</i></li> </ul>

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 144: GET Certificates Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:																		

Name	Description		
	Value	Function	Description
	0	None	No key usage parameters.
	1	Encipherment Only	The key can be used for encryption only.
	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
	4	Key Certificate Signing	The key can be used to sign certificates.
	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.
	16	Data Encipherment	The key can be used for data encryption.
	32	Key Encipherment	The key can be used for key encryption.
	64	Nonrepudiation	The key can be used for authentication.
	128	Digital Signature	The key can be used as a digital signature.
	32768	Decipherment Only	The key can be used for decryption only.
	For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i> . A value of 224 would add <i>nonrepudiation</i> to those.		
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.		
CertStateString	A string containing the certificate state. The possible values are: <ul style="list-style-type: none"><li>Unknown (0)</li><li>Active (1)</li><li>Revoked (2)</li><li>Denied (3)</li><li>Failed (4)</li><li>Pending (5)</li><li>Certificate Authority (6)</li><li>Parent Certificate Authority (7)</li><li>External Validation (8)</li></ul>		
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .		

Name	Description																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation Of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the name of the template that was used when issuing the certificate.																		
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).																		
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)																		
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).																		
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.																		
RequesterName	A string containing the name of the identity that requested the certificate.																		
ContentBytes	A string containing the certificate as bytes.																		
ExtendedKeyUsages	An array containing the extended key usages associated with the certificate. Extended																		

Name	Description								
	Key data includes: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr><tr><td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr><tr><td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr></table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the SAN Element.</td></tr> <tr> <td>Type</td><td> <p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table> </td></tr> <tr> <td>ValueHash</td><td>A string indicating a hash of the SAN value.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown

101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description										
CRLDistributionPoints	<p>An array containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td></tr> <tr> <td>URL</td><td>A string indicating the URL of the CRL distribution point.</td></tr> <tr> <td>URLHash</td><td>A string indicating a hash of the URL.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.		
Name	Description										
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.										
URL	A string indicating the URL of the CRL distribution point.										
URLHash	A string indicating a hash of the URL.										
LocationsCount	<p>An array containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre>"LocationsCount": [   {     "Type": "IIS",     "Count": 2   },   {     "Type": "F5-SL-REST",     "Count": 1   } ]</pre>										
SSLLocations	<p>An array containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StorePath</td><td>A string indicating the machine where the certificate was discovered.</td></tr> <tr> <td>AgentPool</td><td>A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td></tr> <tr> <td>IPAddress</td><td>A string indicating the IP address where the certificate was discovered.</td></tr> <tr> <td>Port</td><td>An integer indicating the port on which the certificate was discovered.</td></tr> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.	IPAddress	A string indicating the IP address where the certificate was discovered.	Port	An integer indicating the port on which the certificate was discovered.
Name	Description										
StorePath	A string indicating the machine where the certificate was discovered.										
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.										
IPAddress	A string indicating the IP address where the certificate was discovered.										
Port	An integer indicating the port on which the certificate was discovered.										

Name	Description	
	Name	Description
	NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.

Name	Description																																										
Locations	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StoreMachine</td><td>A string indicating the machine on which the certificate store is located.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td></tr> <tr> <td>StoreType</td><td> <p>An integer indicating the type of certificate store the certificate is located in. 11	F5 CA Bundles REST																																										
100	Amazon Web Services																																										
101	File Transfer Protocol																																										
1xx	User-defined certificate stores will be given a type ID over 101.																																										
Alias	A string indicating the alias of the certificate in the certificate store.																																										
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																										

Name	Description																		
Metadata	An array containing the metadata fields populated for the certificate.																		
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.																		
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div>  <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>																		
CARecordId	A string containing the CA's reference ID for certificate.																		
DetailedKeyUsage	<p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CrlSign</td><td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DataEncipherment</td><td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DecipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td></tr> <tr> <td>DigitalSignature</td><td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>EncipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td></tr> <tr> <td>KeyAgreement</td><td>A Boolean that indicates whether the certificate is configured for key agreement.</td></tr> <tr> <td>KeyCertSign</td><td>A Boolean that indicates whether the certificate is configured for certificate signing.</td></tr> <tr> <td>KeyEncipherment</td><td>A Boolean that indicates whether the certificate is</td></tr> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is
Name	Description																		
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).																		
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).																		
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).																		
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).																		
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).																		
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.																		
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.																		
KeyEncipherment	A Boolean that indicates whether the certificate is																		

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>configured for key encipherment.</td></tr> <tr> <td>NonRepudiation</td><td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td></tr> <tr> <td>HexCode</td><td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td></tr> </table>	Name	Description		configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description								
	configured for key encipherment.								
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.								
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .								
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).								
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul>								

### 2.2.6.11 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the PUT /Certificates/Metadata/All method (see [PUT Certificates Metadata All on the next page](#)). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 145: PUT Certificates Metadata Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> An integer specifying the Keyfactor Command reference ID for the certificate to update.
Metadata	Body	<b>Required.</b> An array containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example:

Name	In	Description
		<pre> "Metadata": {   "AppOwnerEmailAddress":"john.smith@keyexample.com",      // This is String field.   "SiteCode":23,   // This is   "BusinessCritical":true,                                 // This is   "Notes":"Here are some notes about this certificate.",    // This is a BigText field.   "BusinessUnit":"E-Business",                             // This is a Multiple Choic with a pre-defined value.   "TicketResolutionDate":"2021-07-23"                      // This is a Date field in yyyy-mm-dd format. } </pre>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## 2.2.6.12 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of active certificates. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 146: PUT Certificates Metadata All Input Parameters

Name	In	Description
Query	Body	<p><b>Required*</b>. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Certificate Search Page</a> section. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>ArchivedKey</i></li> <li>• <i>EKU</i></li> <li>• <i>OU</i></li> <li>• <i>Sign-</i></li> </ul>

Name	In	Description
		<ul style="list-style-type: none"> <li><i>CertId</i></li> <li><i>CA</i></li> <li><i>CertState</i></li> <li><i>CertStoreFQDN</i> (alias: <i>JavaKey-storeFQDN</i>)</li> <li><i>CertStorePath</i> (alias: <i>JavaKey-storePath</i>)</li> <li><i>CN</i> (alias: <i>IssuedCN</i>)</li> <li><i>DN</i> (alias: <i>IssuedDN</i>)</li> <li><i>ExpirationDate</i> (alias: <i>NotAfter</i>)</li> </ul>
		<ul style="list-style-type: none"> <li><i>EKUName</i></li> <li><i>HasPrivateKey</i></li> <li><i>ImportDate</i></li> <li><i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>)</li> <li><i>IssuerDN</i></li> <li><i>KeySize</i> (alias: <i>KeySizeInBits</i>)</li> <li><i>KeyType</i></li> <li><i>KeyUsage</i></li> </ul>
		<ul style="list-style-type: none"> <li><i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>)</li> <li><i>PublicKey</i></li> <li><i>NetBIOSRequester</i> (alias: <i>RequesterName</i>)</li> <li><i>RevocationDate</i> (alias: <i>RevocationEffDate</i>)</li> <li><i>Revoker</i></li> <li><i>RFC2818Compliant</i></li> <li><i>SelfSigned</i></li> <li><i>SerialNumber</i></li> </ul>
		<ul style="list-style-type: none"> <li><i>SSLDNSName</i></li> <li><i>SSLIPAddress</i> (alias: <i>SslHostName</i>)</li> <li><i>SSLNetworkName</i></li> <li><i>SSLPort</i></li> <li><i>SAN</i></li> <li><i>TemplateDisplayName</i> (alias: <i>TemplateName</i>)</li> <li><i>TemplateShortName</i></li> <li><i>Thumbprint</i></li> </ul>
		<p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <li><i>CARrequestID</i></li> <li><i>CertRequestID</i></li> <li><i>IsPfx</i></li> <li><i>RequestResolutionDate</i></li> </ul>
		<p> <b>Note:</b> Queries may be done using either the primary field name or the field alias(es).</p>
		<p> <b>Tip:</b> To exclude revoked certificates from the update, include a query of:  <code>CertState -ne \"2\"</code>  To exclude expired certificates from the update, include a query of:</p>

Name	In	Description								
		<div> ExpirationDate -ge \"%TODAY%\"</div>								
Certi- ficatelds	Body	<b>Required*</b> . An array of Keyfactor Command certificate IDs to update. A value for one of <i>Certi- ficatelds</i> , <i>Query</i> , or <i>CollectionId</i> is <b>required</b> .								
Metadata	Body	<b>Required</b> . An array containing information about the metadata field(s) to update. The parameters are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><b>Required</b>. The value that should be set for the metadata field.</td></tr><tr><td>MetadataName</td><td><b>Required</b>. The name of the metadata field that should be updated for the certificates.</td></tr><tr><td>OverwriteExisting</td><td>A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>"Metadata": [   {     "MetadataName": "AppOwnerEmailAddress", // This is a String field.     "Value": "john.smith@keyexample.com",     "OverwriteExisting": true   },   {     "MetadataName": "SiteCode", // This is an Integer field.     "Value": 5,     "OverwriteExisting": true   },   {     "MetadataName": "BusinessCritical", // This is a Boolean field.     "Value": true,     "OverwriteExisting": true   },   {     "MetadataName": "Notes", // This is a BigText field.     "Value": "Here are some notes about this certificate.",     "OverwriteExisting": true   }, ]</pre>	Name	Description	Value	<b>Required</b> . The value that should be set for the metadata field.	MetadataName	<b>Required</b> . The name of the metadata field that should be updated for the certificates.	OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .
Name	Description									
Value	<b>Required</b> . The value that should be set for the metadata field.									
MetadataName	<b>Required</b> . The name of the metadata field that should be updated for the certificates.									
OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .									

Name	In	Description
		<pre> {   "MetadataName": "BusinessUnit", // This is a Multiple Choice field.   "Value": "E-Business", // This is a value pre-defined for the field.   "OverwriteExisting": true }, {   "MetadataName": "TicketResolutionDate", // This is a Date field in   yyyy-mm-dd format.   "Value": "2021-07-23",   "OverwriteExisting": true } ] </pre>
CollectionId	Query	<p><b>Required</b>*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p>

### 2.2.6.13 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Import*

Table 147: POST Certificates Import Input Parameters

Name	In	Description
Certificate	Body	<b>Required.</b> The base-64 encoded contents of the certificate that is to be imported into Keyfactor Command.
Password	Body	<b>Required*.</b> The password used to decrypt the imported PFX. This field is <b>required</b> if a PFX certificate is provided in the <i>Certificate</i> field.
Metadata	Body	<p>A list of certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example:</p> <pre>"Metadata": {   "AppOwnerFirstName": "John",   "AppOwnerLastName": "Smith" }</pre>
StoreIds	Body	A list of the certificate store GUIDs that the imported certificate will be installed into.

Name	In	Description																																						
StoreTypes	Body																																							
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeid</td><td><p>The ID of the store type being used. There must be one for each type of store ID used. 1xx	User-defined certificate stores will be given a type ID over 101.																																							
Alias	<p><b>Required</b>*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See the <a href="#">Add Certificate</a> section of the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</p>																																							
Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i>																																							

Use the *GET Certificates/Locations/{id}* method (see [GET Certificates Locations ID on page 216](#)) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.

Name	In	Description
Schedule	Body	The time the imported certificate should be scheduled to be installed into the certificate store. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).

Table 148: POST Certificates Import Response Data

Name	Description														
ImportStatus	The status of the import job indicating, for example, whether the certificate was newly created in Keyfactor Command or already existed in Keyfactor Command and was just updated based on provided private key, metadata, or location information.														
InvalidKeyStores	Which key store items failed with some information. Included parameters are: <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>KeystoreId</td><td>The ID of the store that failed.</td></tr> <tr> <td>ClientMachine</td><td>The client machine of the store that failed.</td></tr> <tr> <td>StorePath</td><td>The path to the location of the certificate store that failed.</td></tr> <tr> <td>Alias</td><td>The alias for the certificate in the store that failed.</td></tr> <tr> <td>Reason</td><td>The simple reason why it failed.</td></tr> <tr> <td>Explanation</td><td>A more specific reason for the failure.</td></tr> </table>	Name	Description	KeystoreId	The ID of the store that failed.	ClientMachine	The client machine of the store that failed.	StorePath	The path to the location of the certificate store that failed.	Alias	The alias for the certificate in the store that failed.	Reason	The simple reason why it failed.	Explanation	A more specific reason for the failure.
Name	Description														
KeystoreId	The ID of the store that failed.														
ClientMachine	The client machine of the store that failed.														
StorePath	The path to the location of the certificate store that failed.														
Alias	The alias for the certificate in the store that failed.														
Reason	The simple reason why it failed.														
Explanation	A more specific reason for the failure.														
JobStatus	The state of all certificate store jobs.														

## 2.2.6.14 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 149: POST Certificates Revoke Input Parameters

Name	In	Description																				
CertificateIds	Body	<b>Required.</b> An array containing the list of Keyfactor Command reference IDs for certificates that should be revoked.																				
Reason	Body	<div><div>An integer containing the specific reason that the certificate is being revoked. Available values are:</div><table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>-1</td><td>Remove from Hold</td></tr><tr><td>0</td><td>Unspecified</td></tr><tr><td>1</td><td>Key Compromised</td></tr><tr><td>2</td><td>CA Compromised</td></tr><tr><td>3</td><td>Affiliation Changed</td></tr><tr><td>4</td><td>Superseded</td></tr><tr><td>5</td><td>Cessation of Operation</td></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td></tr></tbody></table><div>The default is <i>Unspecified</i>.</div></div>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																					
Comment	Body	<b>Required.</b> A string containing a freeform reason or comment on why the certificate is being revoked.																				
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.																				
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a																				

Name	In	Description
		certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## 2.2.6.15 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. This method returns HTTP 200 OK on a success with a list of the contents of the certificate.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: Read

Table 150: POST Certificates Analyze Input Parameters

Name	In	Description
Certificate	Body	<b>Required.</b> The base-64 encoded PEM string of the certificate, <b>not</b> including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----).
Password	Body	The password used to encrypt the private key of the certificate for a base-64 encoded PEM containing the certificate's private key (-----BEGIN ENCRYPTED PRIVATE KEY-----).

Table 151: POST Certificates Analyze Response Data

Name	Description
IssuedDN	A string containing the distinguished name of the certificate.
IssuerDN	A string containing the distinguished name of the issuer.
Thumbprint	A string containing the thumbprint of the certificate.
NotAfter	The date/time, in UTC, on which the certificate expires.
NotBefore	The date/time, in UTC, on which the certificate was issued by the certificate authority.
Metadata	An array containing the metadata fields populated for the certificate.
IsEndEntity	A boolean flag is marked true if the certificate is the end entity of the chain.

## 2.2.6.16 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 263](#)).

**Tip:** CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see [Details Tab](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Recover*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 152: POST Certificates Recover Input Parameters

Name	In	Description
Password	Body	<b>Required</b> . The password to set on the certificate.
CertID	Body	<b>Required</b> *. The Keyfactor Command reference ID of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li><i>CertID</i></li> <li><i>Thumbprint</i></li> <li><i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
SerialNumber	Body	<b>Required</b> *. The serial number of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li><i>CertID</i></li> <li><i>Thumbprint</i></li> <li><i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IssuerDN	Body	<b>Required</b> *. The distinguished name of the issuer of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li><i>CertID</i></li> <li><i>Thumbprint</i></li> <li><i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
Thumbprint	Body	<b>Required</b> *. The thumbprint of the certificate to retrieve. One of the following is <b>required</b> : <ul style="list-style-type: none"> <li><i>CertID</i></li> <li><i>Thumbprint</i></li> <li><i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	The desired output format for the certificate. Supported options are: <ul style="list-style-type: none"> <li>PEM</li> <li>PFX</li> </ul>

Table 153: POST Certificates Recover Response Data

Name	Description
PFX	<p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content   ConvertFrom-Json  \$targetFile = 'C:\path_to_target_file\' + \$ResponseContent.FileName  \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p>
FileName	The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).

## 2.2.6.17 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the *POST /Certificates/Recover* method (see [POST Certificates Recover on page 261](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: Recover

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 154: POST Certificates Download Input Parameters

Name	In	Description
CertID	Body	<p><b>Required*</b>. The Keyfactor Command reference ID of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
SerialNumber	Body	<p><b>Required*</b>. The serial number of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IssuerDN	Body	<p><b>Required*</b>. The distinguished name of the issuer of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
Thumbprint	Body	<p><b>Required*</b>. The thumbprint of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	<p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> <li>• DER Not supported if IncludeChain is set to <i>true</i>.</li> <li>• PEM</li> <li>• P7B Only supported if IncludeChain is set to <i>true</i></li> </ul>

Table 155: POST Certificates Download Response Data

Name	Description
Content	The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain.

### 2.2.6.18 POST Certificates Revoke All

The POST /Certificates/RevokeAll method is used to revoke all the certificates in the specified query or collection ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 156: POST Certificates Revoke All Input Parameters

Name	In	Description								
Query	Body	<b>Required*</b> . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Certificate Search Page</a> section. A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b> . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.								
Reason	Body	<div>An integer containing the specific reason that the certificates are being revoked. Available values are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-1</td><td>Remove from Hold</td></tr><tr><td>0</td><td>Unspecified</td></tr><tr><td>1</td><td>Key Compromised</td></tr></table>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised
Value	Description									
-1	Remove from Hold									
0	Unspecified									
1	Key Compromised									

Name	In	Description																	
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>2</td><td>CA Compromised</td></tr><tr><td>3</td><td>Affiliation Changed</td></tr><tr><td>4</td><td>Superseded</td></tr><tr><td>5</td><td>Cessation of Operation</td></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL</td></tr><tr><td>999</td><td>Unknown</td></tr></table>	Value	Description	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL	999	Unknown	
		Value	Description																
		2	CA Compromised																
		3	Affiliation Changed																
		4	Superseded																
		5	Cessation of Operation																
		6	Certificate Hold																
		7	Remove from CRL																
		999	Unknown																
The default is <i>Unspecified</i> .																			
Comment	Body	<b>Required.</b> A string containing a freeform reason or comment on why the certificates are being revoked.																	
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.																	
IncludeRevoked	Body	A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																	
IncludeExpired	Body	A Boolean that indicates whether expired certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																	
CollectionId	Query	<b>Required<sup>*</sup></b> . An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b> . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.																	

## 2.2.6.19 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of active certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 157: DELETE Certificates Query Input Parameters

Name	In	Description
sq	Body	<p><b>Required.</b> Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>"CN –contains \"mycertificate.keyexample.com\""</pre> <p>See <a href="#">Certificate Search Page</a> section of the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.</p> <p> <b>Tip:</b> Revoked and expired certificates are excluded from the selection regardless of the query you enter.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

## 2.2.6.20 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 158: DELETE Certificates Private Key Input Parameters

Name	In	Description
ids	Body	<b>Required.</b> An array of Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form: [ 123, 789, 567 ]
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

### 2.2.6.21 DELETE Certificates Private Key ID

The DELETE /Certificates/PrivateKey/{id} method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 159: DELETE Certificates Private Key {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the certificate whose private key should be deleted. Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 237</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

## 2.2.7 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 160: Certificate Authority Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the certificate authority record for the specified ID.	<a href="#">DELETE Certificate Authority ID below</a>
/ {id}	GET	Returns details for the certificate authority identified by the specified ID.	<a href="#">GET Certificate Authority ID on the next page</a>
/	GET	Returns a list of all certificate authorities.	<a href="#">GET Certificate Authority on page 283</a>
/	POST	Creates a new certificate authority record.	<a href="#">POST Certificate Authority on page 296</a>
/	PUT	Updates an existing certificate authority record.	<a href="#">PUT Certificate Authority on page 322</a>
/Test	POST	Validates that the certificate authority with the provided information can be reached.	<a href="#">POST Certificate Authority Test on page 349</a>
/PublishCRL	POST	Publishes the Certificate Revocation List of the given certificate authority.	<a href="#">POST Certificate Authority PublishCRL on page 351</a>

### 2.2.7.1 DELETE Certificate Authority ID

The DELETE /CertificateAuthority/{id} endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

**Note:** You can't delete a CA from Keyfactor Command that has active records associated with it (e.g. certificates, certificate requests).

Table 161: DELETE Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete.

## 2.2.7.2 GET Certificate Authority ID

The POST /CertificateAuthority method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 162: GET Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve.

Table 163: GET Certificate Authority {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). </div>								
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> </table>	Value	Description	0	Key Retention Disabled	1	Indefinite		
Value	Description								
0	Key Retention Disabled								
1	Indefinite								

Name	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).  <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>	Value	Description	2	After Expiration	3	From Issuance
Value	Description						
2	After Expiration						
3	From Issuance						
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.						
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>						
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>						
ExplicitUser	A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set						

Name	Description
	<p>to <i>true</i>.</p> <div data-bbox="483 321 1411 737">  <p><b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="483 758 1411 919">  <p><b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="483 1104 1411 1472">  <p><b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="483 1493 1411 1728">  <p><b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>).</p> </div>

Name	Description										
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ] }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>	Name	Description		<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>						
Name	Description										
	<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>										
IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	
Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>					
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
For example, daily at 11:30 pm:													
<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>													
CAType	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> <li>0—DCOM</li> <li>1—HTTPS</li> </ul>												
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> <li>Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li> </ul> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> </table>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.						
Value	Description												
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.												
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.												

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Provider</td><td>           A string indicating the ID of the PAM provider.            Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.         </td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.						
Value	Description										
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.										
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td>           A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:            "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"         </td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.										

### 2.2.7.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 164: GET Certificate Authority Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 165: GET Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). </div>								
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> </table>	Value	Description	0	Key Retention Disabled	1	Indefinite		
Value	Description								
0	Key Retention Disabled								
1	Indefinite								

Name	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).  <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>	Value	Description	2	After Expiration	3	From Issuance
Value	Description						
2	After Expiration						
3	From Issuance						
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.						
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>						
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>						
ExplicitUser	A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set						

Name	Description
	<p>to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul>           These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.         </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.         </div> <div>  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>).         </div>

Name	Description										
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ] }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>	Name	Description		<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>						
Name	Description										
	<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>										
IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description		<p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre> "Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" } </pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre> "Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" } </pre>								
Name	Description												
	<pre> "Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" } </pre>												
ThresholdCheck	<p>The schedule for threshold monitoring checks on this certificate authority (see <i>MonitorThresholds</i>). The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre> "Interval": {   "Minutes": 60 } </pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre> "Interval": {   "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	
Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td colspan="2">For example, daily at 11:30 pm:</td></tr> <tr> <td colspan="2"> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>					
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
For example, daily at 11:30 pm:													
<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>													
CAType	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>												
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li> </ul> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> </table>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.						
Value	Description												
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.												
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.												

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Provider</td><td>           A string indicating the ID of the PAM provider.            Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.         </td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.						
Value	Description										
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.										
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td>           A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:            "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"         </td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.										

#### 2.2.7.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

Table 166: POST Certificate Authority Input Parameters

Name	In	Description
LogicalName	Body	<b>Required.</b> A string indicating the logical name of the certificate authority.
HostName	Body	<b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	Body	<p><b>Required.</b> A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div>  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>

Name	In	Description
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <p><b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	In	Description										
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</div>										
Properties	Body	<p><b>Required.</b> Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>										
AllowedEnrollmentTypes	Body	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></tbody></table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Key Retention Disabled</td></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></tbody></table>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											

Name	In	Description
		<p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft</p>

Name	In	Description
		 CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i> ) and the <i>AllowedRequesters</i> option. <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command. </div>
ExplicitPassword	Body	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	Body	A Boolean that sets whether the allowed requesters option is enabled ( <i>true</i> ) or not ( <i>false</i> ). See also <i>AllowedRequesters</i> . The default is <i>false</i> . <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div>  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>). </div>
AllowedRequesters	Body	An array of Keyfactor Command security roles that are allowed to enroll for certificates

Name	In	Description										
		<p>via Keyfactor Command for this CA. For example:</p> <div><pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre></div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	Body	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description															
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).															
Name	Description															
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).															
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").															

Name	In	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>"Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" }</pre></td></tr></table> <div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div> <p>For example:</p> <pre>"FullScan": {   "Daily": {     "Time": "2022-05-27T17:30:00Z"   } }</pre> <p>Or:</p> <pre>"FullScan": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-05-27T17:30:00Z"   } }</pre> <div> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a</div>	Name	Description		<pre>"Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" }</pre>
Name	Description					
	<pre>"Wednesday", "Friday" ], "Time": "2022-02-27T17:30:00Z" }</pre>					

Name	In	Description																
		<div> long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</div>

Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																	
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"><li>0—DCOM</li></ul>																

Name	In	Description								
		<ul style="list-style-type: none"><li>1—HTTPS</li></ul>								
AuthCertificatePassword	Body	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"><li>Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr><tr><td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.</td></tr></table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre>{  "SecretValue": "MySuperSecretPassword"}</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{  "Provider": "1",  "Parameters":{    "Folder": "MyFolderName",    "Object": "MyEJBAClientAuthPassword"  } }</pre> <p>The password stored as a Delinea PAM secret will look like (where the Provider value—1</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<p>in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre> {   "Provider": "1",   "Parameters": {     "SecretId": "MyEJBCAPasswordId"   } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 167: POST Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). </div>								
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> </table>	Value	Description	0	Key Retention Disabled	1	Indefinite		
Value	Description								
0	Key Retention Disabled								
1	Indefinite								

Name	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).  <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>	Value	Description	2	After Expiration	3	From Issuance
Value	Description						
2	After Expiration						
3	From Issuance						
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.						
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>						
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>						
ExplicitUser	A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set						

Name	Description
	<p>to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul>           These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.         </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.         </div> <div>  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>).         </div>

Name	Description										
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div><pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre></div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ] }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>	Name	Description		<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>						
Name	Description										
	<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>										
IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	For example, daily at 11:30 pm:		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>					
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
For example, daily at 11:30 pm:													
<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>													
CAType	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>												
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> <li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li> </ul> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> </table>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.						
Value	Description												
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.												
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.												

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Provider</td><td>           A string indicating the ID of the PAM provider.            Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.         </td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.						
Value	Description										
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.										
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td>           A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:            "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"         </td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.										

### 2.2.7.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 168: PUT Certificate Authority Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	Body	<b>Required.</b> A string indicating the logical name of the certificate authority.
HostName	Body	<b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	Body	<p><b>Required.</b> A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div>  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same </div>

Name	In	Description
		 <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be

Name	In	Description								
		denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div> <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</div>								
Properties	Body	<p><b>Required.</b> Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal\" :true} OR {"syncExternal\" :false}</pre>								
AllowedEnrollmentTypes	Body	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></tbody></table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description									
1	PFX Enrollment									
2	CSR Enrollment									
3	PFX and CSR Enrollment									
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Key Retention Disabled</td></tr></tbody></table>	Value	Description	0	Key Retention Disabled				
Value	Description									
0	Key Retention Disabled									

Name	In	Description								
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div>	Value	Description	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description									
1	Indefinite									
2	After Expiration									
3	From Issuance									
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.								
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority ( <i>true</i> ) or not ( <i>false</i> ). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <div> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</div>								
SubscriberTerms	Body	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> . <div> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor</i></div>								

Name	In	Description
		 <i>Command Reference Guide</i> for more information.
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div>
ExplicitPassword	Body	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.         </div>

Name	In	Description				
		<div> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>).</div>				
AllowedRequesters	Body	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div><pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre></div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	Body	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description					
Off	Turn off a previously configured schedule.

Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").											

Name	In	Description										
		<div><pre>    ],     "Time": "2022-05-27T17:30:00Z"   } }</pre></div> <div> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</div>										
IncrementalScan	Body	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"><li>• 0—DCOM</li><li>• 1—HTTPS</li></ul>								
AuthCertificatePassword	Body	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"><li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authen-</td></tr></table>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authen-		
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An array indicating the parameters to supply for PAM authen-									

Name	In	Description						
		<table><tr><th>Value</th><th>Description</th></tr><tr><td></td><td>tication. These will vary depending on the PAM provider.</td></tr><tr><td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.</td></tr></table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre>{  "SecretValue": "MySuperSecretPassword"}</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{  "Provider": "1",  "Parameters":{    "Folder": "MyFolderName",    "Object": "MyEJBAClientAuthPassword"  } }</pre> <p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre>{  "Provider": "1",  "Parameters":{    "SecretId": "MyEJBAPasswordId"  } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description		tication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.
Value	Description							
	tication. These will vary depending on the PAM provider.							
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.							
AuthCertificate	Body	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>						

Name	In	Description
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 169: PUT Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>). </div>								
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> </table>	Value	Description	0	Key Retention Disabled	1	Indefinite		
Value	Description								
0	Key Retention Disabled								
1	Indefinite								

Name	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).  <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>	Value	Description	2	After Expiration	3	From Issuance
Value	Description						
2	After Expiration						
3	From Issuance						
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.						
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>						
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>						
ExplicitUser	A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set						

Name	Description
	<p>to <i>true</i>.</p> <div data-bbox="483 321 1411 737">  <p><b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="483 758 1411 919">  <p><b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="483 1104 1411 1472">  <p><b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="483 1493 1411 1728">  <p><b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1195</a>).</p> </div>

Name	Description										
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div><pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre></div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1195</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description		<pre>"Interval": {   "Minutes": 60 }</pre>		
Name	Description						
	<pre>"Interval": {   "Minutes": 60 }</pre>						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ] }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>	Name	Description		<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>						
Name	Description										
	<pre>],   "Time": "2022-02-27T17:30:00Z" }</pre>										
IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.		
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Provider</td><td>           A string indicating the ID of the PAM provider.            Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of all the PAM providers to determine the ID.         </td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.						
Value	Description										
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of all the PAM providers to determine the ID.										
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td>           A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:            "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"         </td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.										

### 2.2.7.6 POST Certificate Authority Test

The POST /CertificateAuthority/Test method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 170: POST Certificate Authority Test Input Parameters

Name	In	Description
LogicalName	Body	<b>Required.</b> A string indicating the logical name of the certificate authority.
HostName	Body	<b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
ConfigurationTenant	Body	<b>Required</b> *. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com). This parameter is required for Microsoft CAs.
AuthCertificatePassword	Body	<b>Required</b> *. An array indicating the password for the PKCS#12 client certificate to use to authenticate to the EJBCA CA. The password is provided in the following format: <pre> {   "SecretValue": "MySuperSecretPassword" } </pre> This parameter is required for EJBCA CAs.
AuthCertificate	Body	<b>Required</b> *. An array containing the base-64 encoded PKCS#12 client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format: <pre> {   "SecretValue": "MIACAQMwGAY ... CAwGQAAAA" } </pre> This parameter is required for EJBCA CAs.
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> <li>0—DCOM Use this option for Microsoft CAs and CA gateways.</li> <li>1—HTTPS Use this option for EJBCA CAs.</li> </ul> The default is 0.

Table 171: POST Certificate Authority Test Response Data

Name	Description
Success	A Boolean that indicates whether the CA could successfully be reached (True) or not (False).
Message	A string indicating a message about the validation test of the certificate authority.

### 2.2.7.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Revoke*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 172: POST Certificate Authority PublishCRL Input Parameters

Name	In	Description
CertificateAuthorityHostName	Body	The host name of the machine hosting the CA. This field is optional, but is recommended.
CertificateAuthorityLogicalName	Body	<b>Required.</b> The logical name of the CA.

## 2.2.8 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, list and set permissions on certificate collections.

Table 173: Certificate Collections Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the certificate collection with the specified ID.	<a href="#">GET Certificate Collections ID on the next page</a>
/name}	GET	Returns the certificate collection with the specified name.	<a href="#">GET Certificate Collections Name on page 353</a>
/	GET	Returns all certificate collections with details about the collection configuration.	<a href="#">GET Certificate Collections on page 355</a>

Endpoint	Method	Description	Link
/	POST	Creates a new certificate collection.	<a href="#">POST Certificate Collections on page 357</a>
/	PUT	Updates an existing certificate collection.	<a href="#">PUT Certificate Collections on page 363</a>
/Copy	POST	Creates a new certificate collection based on an existing collection.	<a href="#">POST Certificate Collections Copy on page 367</a>
/ {id} /Permissions	POST	Grants the specified collection permissions for the specified role to the specified certificate collection.   <b>Note:</b> This endpoint will be removed in version 11.	<a href="#">POST Certificate Collections ID Permissions on page 373</a>

### 2.2.8.1 GET Certificate Collections ID

The GET /CertificateCollections/{id} method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 174: GET CertificateCollections {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the ID of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificates on page 237</a> ) to retrieve a list of all the certificate collections to determine the certificate collection ID.

Table 175: GET CertificateCollections {id} Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<div>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table></div>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

2.2.8.2 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 176: GET CertificateCollections Name Input Parameters

Name	In	Description
name	Path	<p><b>Required.</b> A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificates on page 237</a>) to retrieve a list of all the certificate collections to determine the certificate collection name.</p> <div> <b>Tip:</b> When using the Keyfactor API Endpoint Utility, provide this name without quotation marks.</div>

Table 177: GET CertificateCollections ID Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<div>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table></div>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

2.2.8.3 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 178: GET Certificate Collections Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Collection Manager Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Name</i></li><li>• <i>Query</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 179: GET CertificateCollections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

## 2.2.8.4 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 180: POST Certificate Collections Input Parameters

Name	In	Description										
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .										
Query	Body	<b>Required.</b> A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .										
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	In	Description
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 355</a>) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div>  <p><b>Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre> {   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> </div> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>, and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the <i>Power Users</i> role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the <i>Power Users</i> role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the <i>Power Users</i> role and is not a full administrator.</p> <p>Gina uses <i>POST /CertificateCollections/Copy</i> (or <i>POST /CertificateCollections</i>—the behavior and output would be the same) to</p>

Name	In	Description
		<p> create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{   "Id": 16,</pre>

Name	In	Description
		<div><pre>"Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre></div> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 181: POST Certificate Collections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

### 2.2.8.5 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 182: PUT CertificateCollections Input Parameters

Name	In	Description										
ID	Body	<b>Required.</b> The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 355</a> ) to locate the ID of the collection you wish to update.										
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Query	Body	<b>Required.</b> A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.										
DuplicationField	Body	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. The default is 0. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	In	Description
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .

Table 183: PUT CertificateCollections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

### 2.2.8.6 POST Certificate Collections Copy

The POST `/CertificateCollections/Copy` method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it

with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 184: POST Certificate Collections Copy Input Parameters

Name	In	Description										
Name	Body	<b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	<b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .										
Query	Body	<b>Required.</b> A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .										
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .										

Name	In	Description
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 355</a>) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div>  <p><b>Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre> {   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> </div> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>, and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses <i>POST /CertificateCollections/Copy</i> (or <i>POST /CertificateCollections</i>—the behavior and output would be the same) to</p>

Name	In	Description
		<p> create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{   "Id": 16,</pre>

Name	In	Description
		<div><pre>"Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre></div> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 185: POST Certificate Collections Copy Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).										

## 2.2.8.7 POST Certificate Collections ID Permissions

The POST `/CertificateCollections/{id}/Permissions` method is used to set permissions on a certificate collection. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Security Settings: *Modify*

**Warning:** When using this method to update an existing certificate collection, all existing RoleId and Permission information must be submitted along with any updates. Any existing permissions that are not included with their full existing data (RoleId and Permission mappings) on an update using this method will be removed from the permissions for the certificate collection. There is not presently a GET method to retrieve the current state of the permissions for certificate collections.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in release 11. It has been replaced by the endpoint: PUT /Security/Roles/{id}/Permissions/Collection.

Table 186: POST CertificateCollections {id} Permissions Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the ID of the certificate collection to update. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 355</a> ) to retrieve a list of all the certificate collections to determine the certificate collection ID.
RoleId	Body	An integer identifying the Keyfactor Command security role that you wish to grant collection security permissions to. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 898</a> ) to retrieve a list of your defined security roles to determine the security role ID to use.
Permissions	Body	<p>An array of the collection permissions that can be granted to the role. Possible values are:</p> <ul style="list-style-type: none"><li>• Read</li><li>• EditMetadata</li><li>• Recover</li><li>• Revoke</li><li>• Delete</li></ul> <p>For example:</p> <pre>"Permissions": [   "Read",   "Recover",   "Revoke" ]</pre> <p>Permissions for certificates can be set at either the global or certificate collection level. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information about global vs collection permissions.</p>

## 2.2.9 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the *Keyfactor Command Reference Guide* and *Keyfactor Command Orchestrator Installation and Configuration Guide*, or contact your Keyfactor representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 187: Certificate Stores Endpoints](#).

Table 187: Certificate Stores Endpoints

Endpoint	Method	Description	
/	DELETE	Deletes multiple certificate stores specified in the request body.	<a href="#">DELETE Certificate Stores on the next page</a>
/	GET	Returns all certificate stores with paging and option to specify detail level.	<a href="#">GET Certificate Stores on page 377</a>
/	POST	Creates a new certificate store if valid parameters are supplied.	<a href="#">POST Certificate Stores on page 384</a>
/	PUT	Updates an existing certificate store.	<a href="#">PUT Certificate Stores on page 404</a>
/ {id}	DELETE	Deletes a certificate store by its GUID.	<a href="#">DELETE Certificate Stores ID on page 424</a>
/ {id}	GET	Returns certificate store details for the specified certificate store.	<a href="#">GET Certificate Stores ID on page 425</a>
/ {id}/Inventory	GET	Returns certificate inventory for the specified certificate store.	<a href="#">GET Certificate Stores ID Inventory on page 438</a>
/Server (*deprecated)	GET	Returns a list of certificate store servers.	<a href="#">GET Certificate Stores Server on page 440</a>
/Server (*deprecated)	POST	Creates a new certificate store server.	<a href="#">POST Certificate Stores Server on page 441</a>
/Server (*deprecated)	PUT	Updates an existing certificate store server.	<a href="#">PUT Certificate Stores Server on page 446</a>
/Password	PUT	Updates the password for a certificate store.	<a href="#">PUT Certificate Stores</a>

Endpoint	Method	Description	
			<a href="#">Password on page 450</a>
/DiscoveryJob	PUT	Creates a job to find certificate stores.	<a href="#">PUT Certificate Stores Discovery Job on page 453</a>
/AssignContainer	PUT	Assigns a certificate store to a container.	<a href="#">PUT Certificate Stores Assign Container on page 459</a>
/Approve	POST	Approves an array of pending certificate stores.	<a href="#">POST Certificate Stores Approve on page 466</a>
/Schedule	POST	Creates an inventory schedule for a certificate store.	<a href="#">POST Certificate Stores Schedule on page 475</a>
/Reenrollment	POST	Schedules a reenrollment of a certificate into a certificate store.	<a href="#">POST Certificate Stores Reenrollment on page 477</a>
/Certificates/Add	POST	Configures a management job to add a certificate to one or more stores with the provided schedule.	<a href="#">POST Certificate Stores Certificates Add on page 480</a>
/Certificates/Remove	POST	Configures a management job to remove a certificate from one or more stores with the provided schedule.	<a href="#">POST Certificate Stores Certificates Remove on page 485</a>

### 2.2.9.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 188: DELETE Certificate Stores Input Parameters

Name	In	Description
IDs	Body	<p><b>Required.</b> An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <pre>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</pre> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores below</a>) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p>

## 2.2.9.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 189: GET Certificate Stores Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AddSupported</i> (True, False)</li> <li>• <i>AgentAvailable</i> (True, False)</li> <li>• <i>AgentId</i></li> <li>• <i>Approved</i> (True, False)</li> <li>• <i>Category</i> (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</li> <li>• <i>CertificateId</i></li> <li>• <i>ClientMachine</i></li> <li>• <i>Container</i> (ContainerName)</li> <li>• <i>ContainerId</i></li> <li>• <i>HasInventoryScheduled</i> (True, False)</li> <li>• <i>PrivateKeyAllowed</i> (0-Forbidden, 1-Optional, 2-Required)</li> <li>• <i>RemoveSupported</i> (True, False)</li> <li>• <i>StorePath</i></li> </ul> <div>  <b>Tip:</b> Use the following query to limit the results to only active certificate stores and not include discovery results:  approved -eq true </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 190: GET Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy</p>

Name	Description
	<p>methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="500 604 1036 709">"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="500 919 1174 1024">"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="500 1171 1271 1297">"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre data-bbox="500 1518 1295 1707">"{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description
	<div>  <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):           <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <b>Tip:</b> Built-in stores that make use of this field include:           <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	The inventory schedule for this certificate store. The following schedule types are supported:

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description						
	<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [   {"NetscalerVserver": "MyVirtualServerName"} ]</pre> <div>  <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality. </div> <p>This field is optional.</p>						
CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> <li>• 0—forbidden</li> <li>• 1—optional</li> <li>• 2—required</li> </ul>						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div>  <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>						

### 2.2.9.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 191: POST Certificate Stores Input Parameters

Name	In	Description
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	Body	<b>Required.</b> The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	<b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	<b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	<p><b>Required.</b> Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values</p>

Name	In	Description
		<p>being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre>{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the user-name and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre>{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p> <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> </ul>

Name	In	Description
		<div>  <ul style="list-style-type: none"> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <p><b>Tip:</b> Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheck-RetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	Body	The inventory schedule for this certificate store. The following schedule types are supported:

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																			
Off	Turn off a previously configured schedule.																			
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>																			
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.															
Name	Description																			
Minutes	An integer indicating the number of minutes between each interval.																			
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).															
Name	Description																			
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																			

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>ExactlyOnce</td><td><p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. Name	Description								
	<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [  { "NetscalerVserver": "MyVirtualServerName" } ]</pre> <div> <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div> <p>This field is optional.</p>								
CustomAliasAllowed		<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"><li>• 0—forbidden</li><li>• 1—optional</li><li>• 2—required</li></ul>							
SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .							
Password	Body	An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 441</a> ).							

Name	In	Description												
		<p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"><li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li><li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li></ul> <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div><pre>"Password": {   "Value": {null} }</pre><p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p><pre>"Password": {   "Value": "MyVerySecurePassword" }</pre></td></tr><tr><td>SecretType-Guid</td><td>A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.</td></tr><tr><td>InstanceId</td><td>The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.</td></tr><tr><td>InstanceGuid</td><td>The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.</td></tr><tr><td>Provider-Type-Para-</td><td>An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:</td></tr></table>	Name	Description	Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div> <pre>"Password": {   "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": {   "Value": "MyVerySecurePassword" }</pre>	SecretType-Guid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.	InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.	InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.	Provider-Type-Para-	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:
Name	Description													
Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div> <pre>"Password": {   "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": {   "Value": "MyVerySecurePassword" }</pre>													
SecretType-Guid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.													
InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.													
InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.													
Provider-Type-Para-	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:													

Name	In	Description																										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>meterValues</td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>The Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Value</td><td>The value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td></tr><tr><td>InstanceId</td><td>The Keyfactor Command reference ID for the PAM provider. If you are attaching to something with an integer Id, this will be used.</td></tr><tr><td>Instance-Guid</td><td>The Keyfactor Command reference GUID for the PAM provider. If you are attaching to something with a GUID ID, this will be used.</td></tr><tr><td>Provider</td><td>An array containing information about the provider. PAM provider details include:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider.</td></tr><tr><td>Area</td><td>An integer indicating the area of Keyfactor Command the provider is used for. 				ParamValues	the provider types specified by ProviderTypeParams. See the previous level of <i>ProviderTypeParamValues</i> for details.
			SecuredAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>

					provider type parameter.																												
Provider-TypeParams	Unused field																																
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.																																
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																																

Table 192: POST Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy</p>

Name	Description
	<p>methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre>"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre>"{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\":     {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\":     {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description
	<div>  <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):           <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <b>Tip:</b> Built-in stores that make use of this field include:           <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	The inventory schedule for this certificate store. The following schedule types are supported:

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div>  <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>						

## 2.2.9.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 193: PUT Certificate Stores Input Parameters

Name	In	Description
Id	Body	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	Body	<b>Required.</b> The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	<b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	<b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmaonWebServices, 101-FileTransferProtocol)
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	<b>Required.</b> Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).  As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but

Name	In	Description
		<p>are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre>"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the user-name and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre>"{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\":     {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\":     {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <div> <b>Note:</b> There are three standard properties that are used for any built-in certificate</div>

Name	In	Description
		<div>  <p>store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <p><b>Tip:</b> Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	Body	The inventory schedule for this certificate store. The following schedule types are supported:

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description								
	<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [  { "NetscalerVserver": "MyVirtualServerName" } ]</pre> <div> <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div> <p>This field is optional.</p>								
CustomAliasAllowed		<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"><li>• 0—forbidden</li><li>• 1—optional</li><li>• 2—required</li></ul>							
SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .							
Password	Body	An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 441</a> ).							

Name	In	Description												
		<p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"><li>• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li><li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 709</a> for more information.</li></ul> <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div><pre>"Password": {   "Value": {null} }</pre><p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p><pre>"Password": {   "Value": "MyVerySecurePassword" }</pre></td></tr><tr><td>SecretType-Guid</td><td>A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.</td></tr><tr><td>InstanceId</td><td>The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.</td></tr><tr><td>InstanceGuid</td><td>The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.</td></tr><tr><td>Provider-Type-Para-</td><td>An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:</td></tr></table>	Name	Description	Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div> <pre>"Password": {   "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": {   "Value": "MyVerySecurePassword" }</pre>	SecretType-Guid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.	InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.	InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.	Provider-Type-Para-	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:
Name	Description													
Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div> <pre>"Password": {   "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": {   "Value": "MyVerySecurePassword" }</pre>													
SecretType-Guid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.													
InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.													
InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.													
Provider-Type-Para-	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:

				ParamValues	the provider types specified by ProviderTypeParams. See the previous level of <i>ProviderTypeParamValues</i> for details.
			SecuredAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>

Table 194: PUT Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy</p>

Name	Description
	<p>methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="475 573 1409 735"> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="475 888 1409 1050"> {   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="475 1140 1409 1323"> {   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre data-bbox="475 1482 1409 1726"> {   "ServerUsername": {"value": {"Provider": "1", "Parameters": {"SecretId": "User_Name"}}},   "ServerPassword": {"value": {"Provider": "1", "Parameters": {"SecretId": "Password"}}},   "ServerUseSsl": {"value": "true"} }</pre>

Name	Description
	<div>  <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):           <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <b>Tip:</b> Built-in stores that make use of this field include:           <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	The inventory schedule for this certificate store. The following schedule types are supported:

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description						
	<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [   {"NetscalerVserver": "MyVirtualServerName"} ]</pre> <div>  <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality. </div> <p>This field is optional.</p>						
CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> <li>• 0—forbidden</li> <li>• 1—optional</li> <li>• 2—required</li> </ul>						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div>  <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>						

### 2.2.9.5 DELETE Certificate Stores ID

The DELETE /CertificateStores/{id} method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 195: DELETE Certificate Stores Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store to delete. Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a> ) to retrieve a list of all the certificate stores to determine the certificate store GUID.

## 2.2.9.6 GET Certificate Stores ID

The *GET /CertificateStores/{id}* method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 196: GET Certificate Stores {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command.

Table 197: GET Certificate Stores {id} Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p>

Name	Description
	<p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="461 493 997 600">"{   \"privateKeyPath\": \"opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="461 810 1136 917">"{   \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="461 1058 1230 1192">"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre data-bbox="461 1402 1255 1591">"{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <div data-bbox="444 1661 1373 1755">  <p><b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> </ul> </div>

This value is automatically set by Keyfactor Command.	ProviderTypeParameterValues	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:
Name	Description												
Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div>  <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:  <pre>"Password": {   "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": {   "Value": "MyVerySecurePassword" }</pre> </div>												
SecretTypeGuid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.												
InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.												
InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.												
ProviderTypeParameterValues	An array containing the values for the PAM provider types specified by ProviderTypeParams. The provider type parameter values include:												

Name	Description		
	Name		Description
	Name		Description
	Id	The Keyfactor Command reference ID for the PAM provider type parameter.	
	Value	The value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	
	InstanceId	The Keyfactor Command reference ID for the PAM provider. If you are attaching to something with an integer Id, this will be used.	
	InstanceGuid	The Keyfactor Command reference GUID for the PAM provider. If you are attaching to something with a GUID ID, this will be used.	
	Provider	An array containing information about the provider. PAM provider details include:	
	Name		Description
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider.	
	Name	A string indicating the internal name for the PAM provider.	
	Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.	
	ProviderType	An array containing details about the provider type for the provider, including:	

Name	Description				
	Name	Description			
		Name	Description		
			Name	Description	
				Name	Description
				Id	A string indicating the Keyfactor Command reference GUID for the provider type.
				Name	A string that indicates the name of the provider type.
			Provider Type Params	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.  See below instance of <i>Provider-TypeParam</i> for details.	
				ProviderType ParamValues	An array containing the values for the provider types specified by ProviderTypeParams. See the previous level of <i>Provider-TypeParamValues</i> for details.

Name	Description		
	Name	Description	
		Name	Description
		Name	Description
		SecuredAreaId	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>
	Provider-Type Param	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. PAM provider type parameters include:	

Name	Description		
	Name	Description	
		Name	Description
		Name	Description
		Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		DisplayNa-me	A string indicating the display name for the PAM provider type parameter. For parameters with an InstanceLevel of <i>false</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an InstanceLevel of <i>true</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
		DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul>
		InstanceLe-vel	A Boolean that sets whether the parameter is used to define the underlying PAM provider ( <i>false</i> ) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider ( <i>true</i> ). For an example, see <a href="#">GET PAM Providers on page 724</a> .
		Provider-	An array containing details for the

				provider type.							
			<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>Provider-TypeParams</td><td>Unused field</td></tr></table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	Provider-TypeParams	Unused field
			Name	Description							
	Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.									
	Name	A string indicating the internal name for the PAM provider type parameter.									
	Provider-TypeParams	Unused field									
	ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.									
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.										

Name	Description
	 <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.

### 2.2.9.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 198: GET Certificate Stores {id} Inventory Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 199: GET Certificate Stores {id} Inventory Response Data

Name	Description																				
Name	A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See the <a href="#">PFX Enrollment</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.																				
Certificates	<p>An array of certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>The date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>The date, in UTC, on which the certificate expires.</td></tr> <tr> <td>SigningAlgorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the issuer.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>CertStoreInventoryItemId</td><td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	The date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	Thumbprint	A string indicating the thumbprint of the certificate.	CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																				
IssuedDN	A string indicating the distinguished name of the certificate.																				
SerialNumber	A string indicating the serial number of the certificate.																				
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																				
NotAfter	The date, in UTC, on which the certificate expires.																				
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																				
IssuerDN	A string indicating the distinguished name of the issuer.																				
Thumbprint	A string indicating the thumbprint of the certificate.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.																				
Parameters	An array of entry parameters associated with the certificate in the certificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See <a href="#">POST Certificate Store Types on page 523</a> for more information about entry parameters.																				

## 2.2.9.8 GET Certificate Stores Server

The GET /CertificateStores/Server method is used to retrieve all servers for certificate stores. Only select types of certificate stores have an associated server. These include F5, FTP, NetScaler, and any custom method you've defined to support this. This method returns HTTP 200 OK on a success with details for each server.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in release 12. Certificate store server information is now found in the certificate store (see [GET Certificate Stores on page 377](#)).

Table 200: GET Certificate Stores Server Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature</i> section. The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Id</i></li><li>• <i>Name</i></li><li>• <i>ServerType</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 201: GET Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
Username	The username used to connect to the certificate store.   <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.														
Password	The password used to connect to the certificate store.   <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	An integer indicating the type of server. Possible values include (plus any custom values): <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>F5 Web Server &amp; F5 SSL Profiles</td></tr> <tr> <td>1</td><td>NetScaler</td></tr> <tr> <td>2</td><td>FTP</td></tr> <tr> <td>3</td><td>F5 Web Server REST</td></tr> <tr> <td>4</td><td>F5 SSL Profiles REST</td></tr> <tr> <td>5</td><td>F5 CA Bundles REST</td></tr> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles	1	NetScaler	2	FTP	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles														
1	NetScaler														
2	FTP														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

### 2.2.9.9 POST Certificate Stores Server

The POST /CertificateStores/Server method is used to create a new server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the newly created server record.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Creating new certificate store server records requires permissions at the global level. See [Container Permissions](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. Certificate store server information is now found in the certificate store (see [POST Certificate Stores on page 384](#)). The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new API endpoint.

**Tip:** If a certificate store that requires a server is missing a server definition within the store record, the certificate store server created with this method will be used. If no credentials are supplied in the request and no certificate store server exists, an error is returned and the request fails.

Table 202: POST Certificate Stores Server Input Parameters

Name	In	Description								
Username	Body	<p><b>Required.</b> The username used to connect to the certificate store. Username parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your user-name in the Keyfactor Command database.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the user-name. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p><p>This value only needs to be supplied if you're storing your user-name using a PAM provider.</p></td></tr><tr><td>Parameters</td><td><p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p><p>For example, for Delinea (formerly Thycotic), this might be:</p><pre>"Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } },</pre><p>For CyberArk, this might be:</p><pre>"Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } },</pre></td></tr></table>	Name	Description	SecretValue	<p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your user-name in the Keyfactor Command database.</p>	Provider	<p>An integer that identifies the PAM provider used to store the user-name. 3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

## 2.2.9.10 PUT Certificate Stores Server

The PUT /CertificateStores/Server method is used to update the server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the server record.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Updating certificate store server records requires permissions at the global level. See [Container Permissions](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new [PUT Certificate Stores on page 404](#) API endpoint. Using this deprecated API endpoint could potentially, for instance, overwrite all cert stores on the server.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 204: PUT Certificate Stores Server Input Parameters

Name	In	Description								
Id	Body	The ID of the server.								
Username	Body	<p><b>Required.</b> The username used to connect to the certificate store. Username parameters</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your user-name in the Keyfactor Command database.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the user-name. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. 3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

### 2.2.9.11 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 206: PUT Certificate Stores Password Input Parameters

Name	Type	Description								
CertStoreID	Body	<b>Required.</b> A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a> ) to retrieve a list of all your certificate stores to determine the GUID of the store.								
NewPassword	Body	<b>Required.</b> A array that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command's definition of it. Password settings include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.</td></tr><tr><td>Provider</td><td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you're storing your password using a PAM provider.</td></tr><tr><td>Parameters</td><td>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be:<pre>"NewPassword": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre>For CyberArk, this might be:<pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"</pre></td></tr></table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you're storing your password using a PAM provider.	Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre> For CyberArk, this might be: <pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.  This value only needs to be supplied if you're storing your password using a PAM provider.									
Parameters	The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.  For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre> For CyberArk, this might be: <pre>"NewPassword": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Password"</pre>									

Name	Type	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>} },</pre></td></tr></table> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": {   "SecretValue": "P@ssw0rd" }</pre>	Name	Description		<pre>} },</pre>
Name	Description					
	<pre>} },</pre>					

### 2.2.9.12 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.
- F5 bundle and SSL certificates discovered by the Keyfactor Windows Orchestrator on F5 devices using the F5 REST API (v14 and up).
- F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with a custom extension to support F5. For more information about the Keyfactor Universal Orchestrator and custom extensions, see the [Installing Orchestrators](#) guide.
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 466](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 207: PUT Certificate Stores Discovery Job Input Parameters

Name	In	Description
ClientMachine	Body	<b>Required.</b> A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.
Type	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) The default is 0 for a JKS discovery.
JobExecutionTimestamp	Body	The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Dirs	Body	<p><b>Required.</b> A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas.</p> <p><b>Java</b></p> <p>For Java discovery, enter at a minimum either "/" for a Linux server or "c:\" for a Windows server.</p> <p><b>PEM</b></p> <p>For PEM discovery, enter at a minimum either "/" for a Linux server or "c:\" for a Windows server.</p> <p><b>F5</b></p> <p>For F5 discovery, enter "/".</p>
IgnoredDirs	Body	A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.
Extensions	Body	A string containing the file extensions for which to search. For example, search for files with the extension "jks" in order to exclude files with other extensions such as "txt". The dot should not be included when specifying extensions.

Name	In	Description
NamePatterns	Body	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. "myjks").
SymLinks	Body	A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows.
Compatibility	Body	A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.

Name	In	Description								
ServerUsername	Body	<p><b>Required</b>*. The username used to connect to the certificate store server.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See the <a href="#">PAM Provider Configuration in Keyfactor Command</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p><p>This value only needs to be supplied if you're storing your username using a PAM provider.</p></td></tr><tr><td>Parameters</td><td><p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p><p>For example, for Delinea, this might be:</p><pre>"Password": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre><p>For CyberArk, this might be:</p><pre>"Password": {   "Provider": 5,   "Parameters": {     "Folder": "Root",</pre></td></tr></table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.	Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre>"Password": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre> <p>For CyberArk, this might be:</p> <pre>"Password": {   "Provider": 5,   "Parameters": {     "Folder": "Root",</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a> ) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.									
Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 724</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre>"Password": {   "Provider": 2,   "Parameters": {     "SecretId": 5   } },</pre> <p>For CyberArk, this might be:</p> <pre>"Password": {   "Provider": 5,   "Parameters": {     "Folder": "Root",</pre>									

Name	In	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>"Object": "F5Password" } },</pre></td></tr></table> <div> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</div> <p>This field is <b>required</b> only for select certificate store types that require authentication at the server level. These include F5, FTP, NetScaler, and any custom method you've defined to support this.</p>	Name	Description		<pre>"Object": "F5Password" } },</pre>
Name	Description					
	<pre>"Object": "F5Password" } },</pre>					
ServerUseSsl	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .				

### 2.2.9.13 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 208: PUT Certificate Stores Assign Container Input Parameters

Name	In	Description
CertStoreContainerId	Body	<p><b>Required*</b>. An integer that identifies the container into which you want to place the certificate store or stores.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li><i>CertStoreContainerId</i></li> <li><i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>
KeystoreIds	Body	<p><b>Required</b>. An array of certificate store GUIDs for the stores you want to place into the container.</p>
NewContainerName	Body	<p><b>Required*</b>. A string that sets the name of the container if you would like to create a new container while assigning store(s) to it.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li><i>CertStoreContainerId</i></li> <li><i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>
NewContainerType	Body	<p><b>Required*</b>. An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types.</p> <p>Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype -eq 7</i>) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i>.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li><i>CertStoreContainerId</i></li> <li><i>NewContainerName</i> and <i>NewContainerType</i></li> </ul>

Table 209: PUT Certificate Stores Assign Container Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 488</a> ).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy</p>

Name	Description
	<p>methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 441</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="500 604 1036 709">{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="500 919 1174 1024">{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="500 1171 1271 1297">{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 724</a>):</p> <pre data-bbox="500 1518 1295 1707">{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }</pre>

Name	Description
	<div>  <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):           <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <b>Tip:</b> Built-in stores that make use of this field include:           <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	The inventory schedule for this certificate store. The following schedule types are supported:

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																		
Off	Turn off a previously configured schedule.																		
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>																		
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.														
Name	Description																		
Minutes	An integer indicating the number of minutes between each interval.																		
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).

CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> <li>• 0—forbidden</li> <li>• 1—optional</li> <li>• 2—required</li> </ul>						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div>  <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>						

## 2.2.9.14 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores](#)

[Discovery Job on page 453](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 210: POST Certificate Stores Approve Input Parameters

Name	In	Description
Id	Body	<p><b>Required.</b> The GUID of the pending certificate store.</p> <p>Use the <a href="#">GET /CertificateStores</a> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved -eq false" to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.</p>
ContainerId	Body	<p>An integer that identifies the container in which the certificate store should be placed on approval. Use the <a href="#">GET /CertificateStores/Containers</a> method (see <a href="#">GET Certificate Store Containers on page 488</a>) to retrieve a list of your defined certificate store containers to determine the container ID to use.</p>
CertStore-Type	Body	<p><b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</p>
Properties	Body	<p><b>Required*</b>. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>This field is <b>required</b> for certificate store types that store additional properties in this parameter.</p>
Password	Body	<p><b>Required.</b> An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 441</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p>

Name	In	Description												
		<ul style="list-style-type: none"><li>Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li><li>Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li><li>Load the credential information from a PAM provider. See <a href="#">PAM Providers on page 709</a> and the <a href="#">Privileged Access Management (PAM)</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example: "Password": {     "Value": {null} }  To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example: "Password": {     "Value": "MyVerySecurePassword" }</div></td></tr><tr><td>SecretTypeGuid</td><td>A string indicating the Keyfactor Command reference GUID for the type of credentials. 			SecuredAre-ald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and</p>

Provider	An integer indicating the Keyfactor Command reference ID for the PAM provider.																																			
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																																			
This field is <b>required</b> for Java keystores.																																				

2.2.9.15 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Schedule*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 211: POST Certificate Stores Schedule Input Parameters

Name	In	Description																		
StoreIds	Body	<b>Required.</b> An array of strings providing the certificate store GUIDs to schedule.																		
Schedule	Body	<b>Required.</b> The inventory schedule for the certificate store(s). Supported schedules are: <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></tbody></table><p>For example, every hour:</p><pre>"Interval": {  "Minutes": 60  }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></tbody></table><p>For example, daily at 11:30 pm:</p></td></tr></tbody></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></tbody></table> <p>For example, every hour:</p> <pre>"Interval": {  "Minutes": 60  }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></tbody></table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																			
Off	Turn off a previously configured schedule.																			
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>																			
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></tbody></table> <p>For example, every hour:</p> <pre>"Interval": {  "Minutes": 60  }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.															
Name	Description																			
Minutes	An integer indicating the number of minutes between each interval.																			
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></tbody></table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).															
Name	Description																			
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																			

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></td></tr><tr><td>ExactlyOnce</td><td><p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table><p>For example, exactly once at 11:45 am:</p><pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div></td></tr></table> <div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>	Name	Description		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description											
	<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>											
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).							
Name	Description											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).											

## 2.2.9.16 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.
- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 687](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

CertificateEnrollment: *EnrollCSR*

CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

In addition, the either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see [Authorization Methods Tab](#) in the *Keyfactor Command Reference Guide*) must have enrollment permissions configured on the CA and template.

Table 212: POST Certificates Stores Reenrollment Input Parameters

Name	In	Description
KeystoreId	Body	<p><b>Required.</b> The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) to retrieve a list of your certificate stores to determine the GUID of the store.</p>
SubjectName	Body	<p><b>Required.</b> A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>
AgentGuid	Body	<p><b>Required.</b> The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>
Alias	Body	<p><b>Required.</b> The alias of the certificate in the certificate store.</p>
JobProperties	Body	<p>An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [ {"NetscalerVserver": "MyVirtualServerName"} ]</pre> <div> <p><b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.</p> </div>
CertificateAuthority	Body	<p>A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see <a href="#">Application Settings: Agents Tab</a> in the <i>Keyfactor Command Reference Guide</i>).</p>
CertificateTemplate	Body	<p>A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i></p>

Name	In	Description
		application setting will be used (see <a href="#">Application Settings: Agents Tab</a> in the <i>Keyfactor Command Reference Guide</i> ).

## 2.2.9.17 POST Certificate Stores Certificates Add

The POST /CertificateStores/Certificates/Add method is used to add a certificate to one or more certificate stores. The POST request must contain a certificate ID and an array of certificate store GUIDs that identify the stores to which the certificate should be added. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 687](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 213: POST Certificate Stores Certificates Add Input Parameters

Name	In	Description												
CertificateId	Body	<b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).												
CertificateStores	Body	<b>Required.</b> An array of certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CertificateStoreIds</td><td><b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.</td></tr><tr><td>Alias</td><td><b>Required</b>*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See the <a href="#">Add Certificate</a> section of the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</td></tr><tr><td>JobFields</td><td>An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td></tr><tr><td>Overwrite</td><td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>.  Use the <a href="#">GET /Certificates/Locations/{id}</a> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</td></tr><tr><td>EntryPassword</td><td>The password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password</td></tr></table>	Name	Description	CertificateStoreIds	<b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.	Alias	<b>Required</b> *. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See the <a href="#">Add Certificate</a> section of the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.	JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.	Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i> .  Use the <a href="#">GET /Certificates/Locations/{id}</a> method (see <a href="#">GET Certificates Locations ID on page 216</a> ) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.	EntryPassword	The password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password
Name	Description													
CertificateStoreIds	<b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.													
Alias	<b>Required</b> *. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See the <a href="#">Add Certificate</a> section of the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.													
JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>													
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).													
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												

## 2.2.9.18 POST Certificate Stores Certificates Remove

The POST /CertificateStores/Certificates/Remove method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 687](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 214: POST Certificate Stores Certificates Remove Input Parameters

Name	In	Description								
CertificateStores	Body	<b>Required.</b> An array of certificate store GUIDs and related information to identify the certificate to remove from the certificate store(s). Certificate store detail includes:								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Alias</td><td><b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see <a href="#">GET Certificates ID on page 221</a>) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.</td></tr><tr><td>CertificateStoreIds</td><td><b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.</td></tr><tr><td>JobFields</td><td>An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.</td></tr></table>	Name	Description	Alias	<b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see <a href="#">GET Certificates ID on page 221</a> ) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.	CertificateStoreIds	<b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.	JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.
		Name	Description							
		Alias	<b>Required.</b> A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see <a href="#">GET Certificates ID on page 221</a> ) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.							
		CertificateStoreIds	<b>Required.</b> A string containing the GUID for the certificate store from which the certificate should be removed.							
JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.									
For example, to remove from one IIS personal store and one NetScaler store:										
<pre>"CertificateStores": [   {     "Alias": "MyCertificate.pfx",     "CertificateStoreId": "fde12aa7-6643-43db-88e8-5c91c5ce78b3"   },   {     "Alias": "C2107973A928859C21330E566B299CD4A0705AE8",     "CertificateStoreId": "322e12ea-43b2-4aab-80ae-c4ad4569b4e7"   } ]</pre>										
Schedule	Body	<b>Required.</b> The inventory schedule for the removal job. Supported schedules are:								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.				
Name	Description									
Off	Turn off a previously configured schedule.									

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>ExactlyOnce</td><td><p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p></td></tr></table><p>For example, exactly once at 11:45 am:</p><pre>"ExactlyOnce": {  "Time": "2022-02-27T11:45:00Z"}</pre><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div></td></tr></table> <div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p></td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {  "Time": "2022-02-27T11:45:00Z"}</pre> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>
Name	Description											
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>											
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p></td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {  "Time": "2022-02-27T11:45:00Z"}</pre> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>							
Name	Description											
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>											
CollectionId	Body	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>										

## 2.2.10 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 215: Certificate Store Containers Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of certificate store containers.	<a href="#">GET Certificate Store Containers below</a>
/	POST	Adds a certificate store container.	<a href="#">POST Certificate Store Containers on page 491</a>
/id	DELETE	Deletes a certificate store container.	<a href="#">DELETE Certificate Store Containers ID on page 499</a>
/id	GET	Returns details for the specified certificate store container.	<a href="#">GET Certificate Store Containers ID on page 499</a>
/id	PUT	Edits a certificate store container.	<a href="#">PUT Certificate Store Containers on page 495</a>

### 2.2.10.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 216: GET Certificate Store Containers Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Containers Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CertStoreType</i> (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</li> <li>• <i>HasSchedule</i> (True, False)</li> <li>• <i>Id</i></li> <li>• <i>Name</i>(Short Name)</li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 217: GET Certificate Stores Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Over-writeSchedules	A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>
Name	Description				
	<pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>				
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)				
StoreCount	An integer indicating the number of stores of the type referenced by CertStoreType in the container.				

## 2.2.10.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 218: POST Certificate Stores Containers Input Parameters

Name	In	Description																
Name	Body	<b>Required.</b> A string indicating the name of the container.																
Schedule	Body	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description
	 <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)

### 2.2.10.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 220: PUT Certificate Store Containers Input Parameters

Name	In	Description						
Id	Path	<b>Required.</b> An integer indicating the ID of the container.						
Name	Body	<b>Required.</b> A string indicating the name of the container.						
Schedule	Body	A string containing the inventory schedule set for the container. Supported schedules are:						
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.		
		Name	Description					
		Off	Turn off a previously configured schedule.					
		<table><tr><td rowspan="3">Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</td></tr><tr><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td></tr><tr><td>For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre></td></tr></table>	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.							
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name		Description	Minutes	An integer indicating the number of minutes between each interval.		
	Name	Description						
Minutes	An integer indicating the number of minutes between each interval.							
For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>								
<table><tr><td rowspan="2">Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr><tr><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> For example, daily at 11:30 pm: <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre></td></tr></table>	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> For example, daily at 11:30 pm: <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	
Daily		A dictionary that indicates a job scheduled to run every day at the same time with the parameter:						
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> For example, daily at 11:30 pm: <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).			
Name	Description							
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).							

Name	In	Description
		 <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) The default is 0 for a JKS keystore.

Table 221: PUT Certificate Store Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description
	 <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)

## 2.2.10.4 DELETE Certificate Store Containers ID

The DELETE /CertificateStoreContainers/{id} method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 222: DELETE Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string containing the ID of the certificate store container to delete. Use the GET /CertificateStoreContainers method (see <a href="#">GET Certificate Store Containers on page 488</a> ) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

## 2.2.10.5 GET Certificate Store Containers ID

The GET /CertificateStoreContainers/{id} method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 223: GET Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> A string containing the ID of the certificate store container.</p> <p>Use the <i>GET /CertificateStoreContainers</i> method (see <a href="#">GET Certificate Store Containers on page 488</a>) to retrieve a list of all the certificate store containers to determine the certificate store container ID.</p>

Table 224: GET Certificate Stores Containers {id} Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description														
	 <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.														
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)														
CertificateStores	<p>An array of certificate store data for the certificate stores within this container. Certificate store details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the GUID of the certificate store within Keyfactor Command.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name of the certificate store.</td></tr> <tr> <td>ContainerId</td><td>An integer indicating the ID of the certificate store's associated certificate store container.</td></tr> <tr> <td>ClientMachine</td><td>The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Storepath</td><td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>CertStoreInventoryJobId</td><td>A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate</td></tr> </table>	Name	Description	Id	A string indicating the GUID of the certificate store within Keyfactor Command.	DisplayName	A string indicating the display name of the certificate store.	ContainerId	An integer indicating the ID of the certificate store's associated certificate store container.	ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate
Name	Description														
Id	A string indicating the GUID of the certificate store within Keyfactor Command.														
DisplayName	A string indicating the display name of the certificate store.														
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container.														
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate														

Name	Description	
	Name	Description
		store.
	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
	Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
	CreatelfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
	Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 518</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   \"privateKeyPath\": \"\\opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p>

Name	Description	
		<pre>"{   \"privateKeyPath\":{\"value\":\"/- opt/app/mystore.key\"},   \"separatePrivateKey\":{\"value\":\"true\"} }"</pre> <div>  <b>Tip:</b> Built-in stores that make use of this field include: <ul style="list-style-type: none"> <li>AWS stores use this field to store secured versions of the access key and secret.</li> <li>F5 REST stores (all types) use this field to store the primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>IIS stores (all types) use this field to store the port for WinRM communications.</li> <li>PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> </div>
	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.
	AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).
	ContainerName	A string indicating the name of the certificate store's associated container.
	InventorySchedule	The inventory schedule for this certificate store.
	ReenrollmentStatus	An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job.
	SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).
	Password	An array indicating the source for and details of the credential

Name	Description	
	Name	Description
		<p>information Keyfactor Command will use to access the certificates in a specific certificate store (the store password).</p> <div>  <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>

## 2.2.11 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 225: Certificate Store Type Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a certificate store type using StoreType number.	<a href="#">DELETE Certificate Store Types ID below</a>
/id}	GET	Returns certificate store type details for the specified certificate store type using StoreType number.	<a href="#">GET Certificate Store Types ID on the next page</a>
/Name/{name}	GET	Returns certificate store type details for the specified certificate store type using ShortName.	<a href="#">GET CertificateStoreTypes Name Name on page 511</a>
/	DELETE	Delete multiple certificate store types using StoreType number.	<a href="#">DELETE Certificate Store Types on page 517</a>
/	GET	Returns all certificate store types with paging and options to the specified detail level.	<a href="#">GET Certificate Store Types on page 518</a>
/	POST	Creates a new certificate store type.	<a href="#">POST Certificate Store Types on page 523</a>
/	PUT	Updates a certificate store type using StoreType number.	<a href="#">PUT Certificate Store Types on page 535</a>

### 2.2.11.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Table 226: DELETE Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate store type to delete. Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 518</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID.

## 2.2.11.2 GET Certificate Store Types ID

The GET */CertificateStoreTypes/{id}* method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Table 227: GET Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 518</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Table 228: GET Certificate Store Types {id} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> </ul> </td></tr> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> </ul>
Name	Description								
Name	A string containing the short name of the property.

This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description																
Name	A string containing the short name of the entry parameter.																
DisplayName	A string containing the full display name of the entry parameter.																
Type	A string containing the type of the entry parameter: <ul style="list-style-type: none"> <li>String</li> <li>Bool</li> <li>MultipleChoice</li> <li>Secret</li> </ul>																
RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>																
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

### 2.2.11.3 GET CertificateStoreTypes Name Name

The GET /CertificateStoreTypes/Name/{name} method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Table 229: GET Certificate Store Types Name {ShortName} Input Parameters

Name	In	Description
name	Path	<p><b>Required.</b> The short name of the certificate store type.</p> <p>Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 518</a>) to retrieve a list of all the certificate store types to determine the certificate store type short name.</p>

Table 230: GET Certificate Store Types Name {ShortName} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.

PrivateKeyAllowed	<p>A string containing the option for private key requirements for certificates stored in stores with this certificate store type:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li>• <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li>• <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul>				
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a user-name and password to connect to the remote server.				
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).				
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> .				
CustomAliasAllowed	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>				
EntryParameters	An array of unique parameters that are required when performing management jobs on a				

Name	Description																
	<p>certificate store of this type. Entry parameter options include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the entry parameter.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the entry parameter.</td></tr> <tr> <td>Type</td><td> A string containing the type of the entry parameter: <ul style="list-style-type: none"> <li>String</li> <li>Bool</li> <li>MultipleChoice</li> <li>Secret</li> </ul> </td></tr> <tr> <td>RequiredWhen</td><td> An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul> </td></tr> <tr> <td>DependsOn</td><td>A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr> <tr> <td>Options</td><td>A string containing a comma-separated list of multiple choice options for this entry parameter.</td></tr> </table>	Name	Description	Name	A string containing the short name of the entry parameter.	DisplayName	A string containing the full display name of the entry parameter.	Type	A string containing the type of the entry parameter: <ul style="list-style-type: none"> <li>String</li> <li>Bool</li> <li>MultipleChoice</li> <li>Secret</li> </ul>	RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>	DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description																
Name	A string containing the short name of the entry parameter.																
DisplayName	A string containing the full display name of the entry parameter.																
Type	A string containing the type of the entry parameter: <ul style="list-style-type: none"> <li>String</li> <li>Bool</li> <li>MultipleChoice</li> <li>Secret</li> </ul>																
RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>																
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

#### 2.2.11.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. The certificate store type IDs should be supplied in the request body as a JSON array of integers. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Table 231: DELETE Certificate Store Types Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name):</p> <pre>[106,108,109]</pre> <p>Use the <a href="#">GET /CertificateStoreTypes</a> method (see <a href="#">GET Certificate Store Types below</a>) to retrieve a list of all the certificate store types to determine the certificate store type IDs.</p>

## 2.2.11.5 GET Certificate Store Types

The GET /CertificateStoreTypes method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Table 232: GET Certificate Store Types Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 233: GET Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> </td></tr> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.								
Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>								

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>DependsOn</td><td>A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr> <tr> <td>Required</td><td>A Boolean that indicates whether the parameter is required (true) or not (false).</td></tr> </table> <div>  <p><b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>	Name	Description	DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that indicates whether the parameter is required (true) or not (false).
Name	Description								
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.								
DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .								
Required	A Boolean that indicates whether the parameter is required (true) or not (false).								
PasswordOptions	<p>Options for the password in the certificate store type. Password options include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>EntrySupported</td><td>A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).</td></tr> <tr> <td>StoreRequired</td><td>A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).</td></tr> <tr> <td>Style</td><td> A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authen-</li> </ul> </td></tr> </table>	Name	Description	EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).	StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).	Style	A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authen-</li> </ul>
Name	Description								
EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).								
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).								
Style	A string containing the style of password: <ul style="list-style-type: none"> <li>• <i>Default</i>: Keyfactor Command will randomly generate a password.</li> <li>• <i>Custom</i>: Allow a password to be entered and authen-</li> </ul>

DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

### 2.2.11.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Table 234: POST Certificate Store Types Input Parameters

Name	In	Description								
Name	Body	<b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.								
ShortName	Body	<b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.								
Capability	Body	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .								
SupportedOperations	Body	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"><li>• Add</li><li>• Create</li><li>• Discovery</li><li>• Enrollment</li><li>• Remove</li></ul> <p>The default for each value is <i>false</i>.</p>								
Properties	Body	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b>.</td></tr><tr><td>DisplayName</td><td><b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b>.</td></tr><tr><td>Type</td><td><b>Required.</b> A string containing the type of the property:<ul style="list-style-type: none"><li>• String</li><li>• Bool</li><li>• MultipleChoice</li></ul></td></tr></table>	Name	Description	Name	<b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b> .	DisplayName	<b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b> .	Type	<b>Required.</b> A string containing the type of the property: <ul style="list-style-type: none"><li>• String</li><li>• Bool</li><li>• MultipleChoice</li></ul>
Name	Description									
Name	<b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b> .									
DisplayName	<b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b> .									
Type	<b>Required.</b> A string containing the type of the property: <ul style="list-style-type: none"><li>• String</li><li>• Bool</li><li>• MultipleChoice</li></ul>									

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><ul style="list-style-type: none"><li>• Secret</li></ul><p>If you choose to define a property, this field is <b>required</b>.</p></td></tr><tr><td>DependsOn</td><td>A string containing the name of the parameter on which this parameter depends. StorePathType	Body	<div>A string containing the selected store type:<ul style="list-style-type: none"><li><i>Freeform</i>: Users are required to enter a path defining the certificate store location.</li><li><i>Fixed</i>: A store path does not apply, generally one store per device (e.g. IIS).</li><li><i>MultipleChoice</i>: Allow a comma separated list of options to be entered that users will be able to select from when defining the certificate store location.</li></ul></div> <div>This value is unset by default.</div>								

Name	In	Description
StorePathValue	Body	<p>An array containing the value(s) for the certificate store path if the <i>StorePathType</i> is set to Fixed or Multiple Choice.</p> <p>Multiple choice values should be provided in a bracketed comma-delimited list like so:</p> <pre>"StorePathValue": "[\"Apple\\\", \"Cherry\\\", \"Peach\\\", \"Pear\"]"</pre> <p>This value is unset by default.</p>
PrivateKeyAllowed	Body	<p>A string containing the option for private key requirements for certificates stored in stores with this certificate store type:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates).</li> <li>• <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store.</li> <li>• <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization).</li> </ul> <p>The default value is <i>Forbidden</i>.</p>
ServerRequired	Body	<p>A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote server.</p> <p>The default is <i>false</i>.</p>
PowerShell	Body	<p>A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false). The default is <i>false</i>.</p>
BlueprintAllowed	Body	<p>A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i>. The default is <i>false</i>.</p>
CustomAliasAllowed	Body	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p> <p>The default value is <i>Forbidden</i>.</p>
EntryParameters	Body	<p>An array of unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p>

Name	In	Description	
		Name	Description
		Name	<b>Required.</b> A string containing the short name of the entry parameter. If you choose to define an entry parameter, this field is <b>required</b> . The name should be entered without spaces.
		DisplayName	<b>Required.</b> A string containing the full display name of the entry parameter. If you choose to define an entry parameter, this field is <b>required</b> .
		Type	<b>Required.</b> A string containing the type of the entry parameter: <ul style="list-style-type: none"><li>• String</li><li>• Bool</li><li>• MultipleChoice</li><li>• Secret</li></ul> If you choose to define an entry parameter, this field is <b>required</b> .
		RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"><li>• <b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store. The default is <i>false</i>.</li><li>• <b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job. The default is <i>false</i>.</li><li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job. The default is <i>false</i>.</li><li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. The default is <i>false</i>.</li></ul>
		DependsOn	A string containing the name of the parameter on

Name	In	Description								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>which this parameter depends. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .  This value is unset by default.	Options	A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> .  This value is unset by default.
Name	Description									
	which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.									
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .  This value is unset by default.									
Options	A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> .  This value is unset by default.									

Name	In	Description
		 <p>are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>

Table 235: POST Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>								
Properties	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> </ul> </td></tr> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> </ul>

RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>																
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

### 2.2.11.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update,

and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 236: PUT Certificate Store Types Input Parameters

Name	In	Description						
StoreType	Body	<b>Required.</b> The Keyfactor Command reference ID for the certificate store type.						
Name	Body	<b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.						
ShortName	Body	<b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.						
Capability	Body	<p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div> <b>Note:</b> The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list.</div>						
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .						
SupportedOperations	Body	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"><li>• Add</li><li>• Create</li><li>• Discovery</li><li>• Enrollment</li><li>• Remove</li></ul> <p>The default for each value is <i>false</i>.</p>						
Properties	Body	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeID</td><td><b>Required.</b> An integer identifying the certificate store type. This is the same ID referenced by the StoreType parameter, above. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description																
Name	A string containing the short name of the entry parameter.																
DisplayName	A string containing the full display name of the entry parameter.																
Type	A string containing the type of the entry parameter: <ul style="list-style-type: none"> <li>String</li> <li>Bool</li> <li>MultipleChoice</li> <li>Secret</li> </ul>																
RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> <li><b>HasPrivateKey:</b> If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li><b>OnAdd:</b> If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job.</li> <li><b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li> <li><b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li> </ul>																
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul>
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

## 2.2.12 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 238: CSR Generation Endpoints

Endpoint	Method	Description	Link
/Pending/{id}	DELETE	Deletes a pending CSR by ID.	<a href="#">DELETE CSR Generation Pending ID on the next page</a>
/Pending/{id}	GET	Returns the details of a specific CSR request based on the ID number.	<a href="#">GET CSR Generation Pending ID on the next page</a>

Endpoint	Method	Description	Link
/Pending	DELETE	Deletes multiple pending CSRs.	<a href="#">DELETE CSR Generation Pending on the next page</a>
/Pending	GET	Returns a list of all pending CSRs.	<a href="#">GET CSR Generation Pending on the next page</a>
/Generate	POST	Generate and configure a CSR request.	<a href="#">POST CSR Generation Generate on page 551</a>

### 2.2.12.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *PendingCsr*

Table 239: DELETE CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the certificate signing request for the CSR that should be deleted. Use the <i>GET /CSRGeneration/Pending</i> method (see <a href="#">GET CSR Generation Pending on the next page</a> ) to retrieve a list of all the pending CSRs to determine the CSR IDs.

### 2.2.12.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the *GET /CSRGeneration/Pending* method (see [GET CSR Generation Pending on the next page](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *PendingCsr*

Table 240: GET CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the CSR that should be retrieved.

Table 241: GET CSR Generation Pending {id} Response Data

Name	Description
CSRFilePath	The proposed file name for the CSR file. This is considered deprecated and may be removed in a future release.
CSR	The text of the CSR in PEM format.

### 2.2.12.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. The IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: PendingCsr

Table 242: DELETE CSR Generation Pending Input Parameters

Name	In	Description
ids	Body	<b>Required.</b> An array of Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name): [8,14,27] Use the GET /CSRGeneration/Pending method (see <a href="#">GET CSR Generation Pending below</a> ) to retrieve a list of all the pending CSRs to determine the CSR IDs.

### 2.2.12.4 GET CSR Generation Pending

The GET /CSRGeneration/Pending method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: PendingCsr

Table 243: GET CSR Generation Pending Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 244: GET CSR Generation Pending Response Data

Name	Description
Id	A unique integer for the CSR generated.
CSR	A string containing the text of the CSR in PEM format.
RequestTime	A string containing the date and time that the CSR was generated in UTC time.
Subject	An array containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm.

### 2.2.12.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 600](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 261](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *CsrGeneration*

**Note:** This endpoint no longer includes the CSRFilePath return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 245: POST CSR Generation Generate Input Parameters

Name	In	Description																								
Subject	Body	<b>Required.</b> A string containing the subject name for the certificate using X.500 format for the full distinguished name (DN). For example:  "Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=L=Independence,ST=OH,C=US"  Supported subject name fields are:																								
		<table><tr><th>Name</th><th>Abbreviation</th><th>Description</th></tr><tr><td>CommonName</td><td>CN</td><td><b>Required*</b>. The desired common name of the certificate to be requested with the CSR.  This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of .+. See the <a href="#">Application Settings: Enrollment Tab</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Organization</td><td>O</td><td>The desired organization of the certificate to be requested with the CSR.</td></tr><tr><td>OrganizationalUnit</td><td>OU</td><td>The desired organizational unit of the certificate to be requested with the CSR.</td></tr><tr><td>Locality</td><td>L</td><td>The desired city of the certificate to be requested with the CSR.</td></tr><tr><td>State</td><td>ST</td><td>The desired state of the certificate to be requested with the CSR.</td></tr><tr><td>Country</td><td>C</td><td>The desired country (two characters) of the certificate to be requested with the CSR.</td></tr><tr><td>Email</td><td>E</td><td>The desired email address of the certificate to be requested with the CSR.</td></tr></table>	Name	Abbreviation	Description	CommonName	CN	<b>Required*</b> . The desired common name of the certificate to be requested with the CSR.  This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of .+. See the <a href="#">Application Settings: Enrollment Tab</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.	Organization	O	The desired organization of the certificate to be requested with the CSR.	OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.	Locality	L	The desired city of the certificate to be requested with the CSR.	State	ST	The desired state of the certificate to be requested with the CSR.	Country	C	The desired country (two characters) of the certificate to be requested with the CSR.	Email	E	The desired email address of the certificate to be requested with the CSR.
		Name	Abbreviation	Description																						
		CommonName	CN	<b>Required*</b> . The desired common name of the certificate to be requested with the CSR.  This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of .+. See the <a href="#">Application Settings: Enrollment Tab</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.																						
		Organization	O	The desired organization of the certificate to be requested with the CSR.																						
		OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.																						
		Locality	L	The desired city of the certificate to be requested with the CSR.																						
		State	ST	The desired state of the certificate to be requested with the CSR.																						
		Country	C	The desired country (two characters) of the certificate to be requested with the CSR.																						
Email	E	The desired email address of the certificate to be requested with the CSR.																								
KeyType	Body	<b>Required.</b> A string indicating the desired key encryption of the certificate. Accepted key types are: <ul style="list-style-type: none"><li>• RSA</li></ul>																								

Name	In	Description																				
		<ul style="list-style-type: none"><li>ECC</li></ul>																				
KeyLength	Body	<p><b>Required.</b> An integer indicating the desired key size of the certificate. Accepted key sizes are:</p> <ul style="list-style-type: none"><li>256</li><li>384</li><li>521</li><li>2048</li><li>4096</li><li>8192</li></ul>																				
Template	Body	<p>A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional.</p> <div> <b>Tip:</b> Although you can include a template in your CSR, template handling in CSRs is future functionality, and the template will not be parsed back out of the CSR. Instead, submit a template directly with your CSR enrollment (see <a href="#">POST Enrollment CSR on page 600</a>).</div>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					

Name	In	Description
		<pre> "SANs": {   "dns": [     "dnssan1.keyexample.com",     "dnssan2.keyexample.com",     "dnssan3.keyexample.com"   ],   "ip4": [     "192.168.2.73"   ] } </pre>

Table 246: POST CSR Generation Generate Response Data

Name	Description
CSR	The text of the CSR in PEM format.

## 2.2.13 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 247: Custom Job Types Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the custom job type for the specified ID.	<a href="#">DELETE Custom Job Types ID on the next page</a>
/id}	GET	Returns details for the custom job type for the specified ID.	<a href="#">GET Custom Job Types ID on the next page</a>
/	GET	Returns all the custom job types.	<a href="#">GET Custom Job Types on page 556</a>
/	POST	Creates a custom job type.	<a href="#">POST Custom Job Types on page 558</a>
/	PUT	Updates an existing custom job type.	<a href="#">PUT Custom Job Types on page 561</a>

### 2.2.13.1 DELETE Custom Job Types ID

The DELETE /JobTypes/Custom/{id} method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 248: DELETE JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on the next page</a> ) to retrieve a list of all the custom job types to determine the job type GUID.

### 2.2.13.2 GET Custom Job Types ID

The GET /JobTypes/Custom/{id} method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 249: GET JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on the next page</a> ) to retrieve a list of all the custom job types to determine the job type GUID.

Table 250: GET JobTypes Custom {id} Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field.</div><div>Possible values are:</div><table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></td></tr><tr><td>DefaultValue</td><td><div>A string containing the default value of the job type field.</div><div>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</div></td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table>	Name	Description	Name	A string that indicates the name for the job type field. Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

### 2.2.13.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: Read

Table 251: GET JobTypes Custom Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 252: GET JobTypes Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

## 2.2.13.4 POST Custom Job Types

The POST /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of custom job type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 253: POST JobTypes Custom Input Parameters

Name	In	Description																									
JobTypeName	Body	<b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
JobTypeFields	Body	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><b>Required.</b> A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><b>Required.</b> A value that indicates the data type of the job type field. It may be entered as either an integer or the matching enum value. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></td></tr><tr><td>DefaultValue</td><td><b>Required*</b>. A string containing the default value of the job type field.  If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This field is <b>required</b> if the <i>Required</i> parameter is set to <i>true</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i>.</td></tr></table><div>For example:<pre>"JobTypeFields": [   {     "Name": "Favorite Type of Pet",</pre></div></div>	Name	Description	Name	<b>Required.</b> A string that indicates the name for the job type field. 4	Bool	Boolean																								
DefaultValue	<div>A string containing the default value of the job type field.</div> <div>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</div>																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

### 2.2.13.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 255: PUT JobTypes Custom Input Parameters

Name	In	Description																									
Id	Body	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	Body	<b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
JobTypeFields	Body	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><b>Required.</b> A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><b>Required.</b> A value that indicates the data type of the job type field.  It may be entered as either an integer or the matching enum value. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></td></tr><tr><td>DefaultValue</td><td><b>Required*</b>. Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

## 2.2.14 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFxs).

Table 257: Enrollment Endpoints

Endpoint	Method	Description	Link
/Settings/{id}	GET	Returns the template settings to use during enrollment.	<a href="#">GET Enrollment Settings ID below</a>
/CSR/Context/My	GET	Returns the templates available for CSR enrollment by the current user.	<a href="#">GET Enrollment CSR Content My on page 573</a>
/PFX/Context/My	GET	Returns the templates available for PFX enrollment by the current user.	<a href="#">GET Enrollment PFX Content My on page 585</a>
/AvailableRenewal/Id/{id}	GET	Returns the type of renewals available for the referenced certificate ID.	<a href="#">GET Enrollment Available Renewal ID on page 597</a>
/AvailableRenewal/Thumbprint/{thumbprint}	GET	Returns the type of renewals available for the referenced certificate thumbprint.	<a href="#">GET Enrollment Available Renewal Thumbprint on page 598</a>
/CSR	POST	Performs a CSR enrollment.	<a href="#">POST Enrollment CSR on page 600</a>
/PFX	POST	Performs a PFX enrollment.	<a href="#">POST Enrollment PFX on page 605</a>
/CSR/Parse	POST	Returns information found in a CSR in a human friendly form.	<a href="#">POST Enrollment CSR Parse on page 618</a>
/PFX/Deploy	POST	Adds a certificate into a certificate store following a PFX enrollment or certificate renewal.	<a href="#">POST Enrollment PFX Deploy on page 619</a>
/PFX/Replace	POST	Replaces a certificate in a certificate store following a PFX enrollment.	<a href="#">POST Enrollment PFX Replace on page 625</a>
/Renew	POST	Performs a certificate renewal.	<a href="#">POST Enrollment Renew on page 627</a>

### 2.2.14.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollCSR* or CertificateEnrollment: *EnrollPFX* or CertificateEnrollment: *CsrGeneration*

Table 258: GET Enrollment Settings {id} Input Parameters

Name	Description
id	The enrollment template Id. Use the <i>GET /Templates</i> method (see <a href="#">GET Templates on page 1185</a> ) to retrieve a list of all the templates to determine the template ID.

Table 259: GET Enrollment Settings {id} Response Body

Name	Description												
TemplateRegexes	<p>An object containing the regular expressions resolved for the template. Regular expression details are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr><tr><td>RegEx</td><td><p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p><p>Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1184</a>) to retrieve a list of all the supported subject parts.</p><p>The following are some regular expression examples:</p><table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>CN (Common Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre><p>The default value for the Common Name regular expression is:</p><pre>.+</pre><p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p></td></tr><tr><td>O (Organization)</td><td><p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p><pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre><p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression</p></td></tr></table></td></tr></table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). Name	Description												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1184</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>CN (Common Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre><p>The default value for the Common Name regular expression is:</p><pre>.+</pre><p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p></td></tr><tr><td>O (Organization)</td><td><p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p><pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre><p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression</p></td></tr></table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression</p>						
Subject Part	Example												
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>												
O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression</p>

Name	Description						
	part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.						
TemplateDefaults	<p>An object containing the template defaults resolved for the template. Template-level defaults, if defined, take precedence over global-level template defaults. For more information about global-level template defaults, see <a href="#">GET Templates Settings on page 1165</a>. The template default object contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SubjectPart</td><td> <p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1184</a>) to retrieve a list of all the supported subject parts.</p> </td></tr> <tr> <td>Value</td><td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td></tr> </table> <p>For example:</p> <pre> "TemplateDefaults": [   {     "SubjectPart": "L",     "Value": "Denver"   },   {     "SubjectPart": "ST",     "Value": "Colorado"   } ] </pre>	Value	Description	SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1184</a>) to retrieve a list of all the supported subject parts.</p>	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).
Value	Description						
SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1184</a>) to retrieve a list of all the supported subject parts.</p>						
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).						
TemplatePolicy	<p>An array containing the template policy settings. The template policy array contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RSASupportedKeySizes</td><td>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</td></tr> </table>	Value	Description	RSASupportedKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:		
Value	Description						
RSASupportedKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:						

Name	Description	
	Value	Description
		<ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>
	ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>
	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.
	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).
	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor CommandManagement Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.
For example:		
<pre> "TemplatePolicy": {   "RSAValidKeySizes": [     2048,     4096   ],   "ECCValidCurves": [     "1.2.840.10045.3.1.7",     "1.3.132.0.34",     "1.3.132.0.35"   ],   "AllowKeyReuse": false,   "AllowWildcards": true,   "RFCEnforcement": true, </pre>		

Name	Description
	<pre>       "AllowEd448": false,       "AllowEd25519": false     } </pre>

### 2.2.14.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollCSR*

Table 260: GET Enrollment CSR Content My Response Body

Name	Description																						
Templates	<p>An array containing the templates available for enrollment by the user. The array contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td></tr> <tr> <td>Name</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td></tr> <tr> <td>DisplayName</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td></tr> <tr> <td>Forest</td><td>A string containing the name of the configuration tenant the template is associated with.</td></tr> <tr> <td>KeySize</td><td>A string indicating the minimum supported key size of the template.</td></tr> <tr> <td>RequiresApproval</td><td>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td></tr> <tr> <td>CAs</td><td> <p>An array of certificate authorities from which the template is available for enrollment, that are configured for enrollment in Keyfactor Command, and on which the requesting user has enrollment permissions. 		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Error</td><td>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</td></tr></table>	Name	Description	Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.
	Name	Description				
	Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.				
	ExtendedKeyUsages	Currently not in use.				
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.					
StandaloneCAs	An array containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:					
	Name	Description				
	Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.				
	RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.				
	SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). <div> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div>				

### 2.2.14.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollPFX*

Table 261: GET Enrollment PFX Content My Response Body

Name	Description																						
Templates	<p>An array containing the templates available for enrollment by the user. The array contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td></tr> <tr> <td>Name</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. 			<p>between 1 and 3 numbers separated by periods:</p> <pre>^(?:[0-9]{1,3}\.){3}[0-9]{1,3}\$</pre>
		IPv6 (Subject Alternative Name: IPv6 Address)	<p>This regular expression specifies that the data entered in the field must be made up of eight sets of between one and four numbers and/or uppercase letters separated by colons:</p> <pre>^(?:[A-F0-9]{1,4}:){7}[A-F0-9]{1,4}\$</pre>
		MAIL (Subject Alternative Name: Email)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_.\-\-]*@keyexample\.com\$</pre>
		UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_.\-\-]*@keyexample\.com\$</pre>

Name	Description					
	Name	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Error</td><td>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</td></tr></table>	Name	Description	Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.
	Name	Description				
	Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.				
	ExtendedKeyUsages	Currently not in use.				
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.					
StandaloneCAs	An array containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:					
	Name	Description				
	Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.-com\\CorpStandaloneCA1.				
	RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN ( <i>true</i> ) or not ( <i>false</i> ). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.				
	SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). <div> <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div>				

## 2.2.14.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 262: GET Enrollment Available Renewal ID {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status.  Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 263: GET Enrollment Available Renewal ID {id} Response Body

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—renewal is not supported for this certificate.</td></tr> <tr> <td>1</td><td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td></tr> <tr> <td>2</td><td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> </td></tr> </table> <p> <b>Tip:</b> If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>								
Message	A message providing more details about the available renewal type result (e.g. "One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.").								

### 2.2.14.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 264: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

Name	In	Description
thumbprint	Path	<b>Required.</b> The thumbprint of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 265: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Body

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—renewal is not supported for this certificate.</td></tr> <tr> <td>1</td><td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td></tr> <tr> <td>2</td><td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> </td></tr> </table> <p> <b>Tip:</b> If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>								
Message	A message providing more details about the available renewal type result (e.g. "One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.").								

## 2.2.14.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollCSR*

**Tip:** Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 266: POST Enrollment CSR Input Parameters

Name	In	Description
CSR	Body	<b>Required.</b> The base-64 encoded CSR that will be passed in for enrollment.
Timestamp	Body	<b>Required.</b> The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Template	Body	<p><b>Required</b>*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is <b>required</b> unless the enrollment is being done against a standalone CA.</p>
CertificateAuthority	Body	<p><b>Required</b>*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": {   "AppOwnerFirstName": "William", // This is a String field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "william.smith@keyexample.com",   "BusinessCritical": "true", // This is a Boolean field.   "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value.</pre>

Name	In	Description																				
		<div><pre>"Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3,                      // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre></div> <p>See the <a href="#">Certificate Metadata</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <div><pre>"SANs": {   "dns": [     "dnssan1.keyexample.com",     "dnssan2.keyexample.com",     "dnssan3.keyexample.com"   ],   "ip4": [     "192.168.2.73"   ] }</pre></div>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					

Name	In	Description
		 <b>Note:</b> Entering SANs with this option may either append or overwrite the SANs in the CSR request depending on how the issuing CA is configured. Please be sure to check that the certificate has the correct SANs after issuance. Any SAN added automatically as a result of the RFC 2818 compliance settings (see <a href="#">GET Templates on page 1185</a> ) will still be added alongside anything you add here. Review the SAN Attribute Policy Handler for the Keyfactor CA Policy Module (see <i>Installing the Keyfactor CA Policy Module Handlers</i> in the <i>Keyfactor Command Server Installation Guide</i> ) for more information.
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "ValueOne", "CustomMultiChoiceTwo": "ValueTwo" }</pre> <p>See <i>Configuring Template Options</i> of the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-CertificateFormat	Header	<p><b>Required.</b> The desired output format for the certificate. Available options are DER and PEM.</p>

Table 267: POST Enrollment CSR Response Data

Value	Description																				
CertificateInformation	<p>Information about the certificate that was requested. CSR information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>Serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>Issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>Thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>ID of the certificate in Keyfactor Command.</td></tr> <tr> <td>KeyfactorRequestID</td><td>ID of the request in Keyfactor Command.</td></tr> <tr> <td>Certificates</td><td>An array of certificates in the order of: end entity, intermediate CA, Root CA. Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</td></tr> <tr> <td>RequestDisposition</td><td>State of the request (e.g. issued).</td></tr> <tr> <td>DispositionMessage</td><td>Enrollment message (e.g. issued).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description	SerialNumber	Serial number of the certificate.	IssuerDN	Issuer DN of the certificate.	Thumbprint	Thumbprint of the certificate.	KeyfactorID	ID of the certificate in Keyfactor Command.	KeyfactorRequestID	ID of the request in Keyfactor Command.	Certificates	An array of certificates in the order of: end entity, intermediate CA, Root CA. Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i> .	RequestDisposition	State of the request (e.g. issued).	DispositionMessage	Enrollment message (e.g. issued).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description																				
SerialNumber	Serial number of the certificate.																				
IssuerDN	Issuer DN of the certificate.																				
Thumbprint	Thumbprint of the certificate.																				
KeyfactorID	ID of the certificate in Keyfactor Command.																				
KeyfactorRequestID	ID of the request in Keyfactor Command.																				
Certificates	An array of certificates in the order of: end entity, intermediate CA, Root CA. Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i> .																				
RequestDisposition	State of the request (e.g. issued).																				
DispositionMessage	Enrollment message (e.g. issued).																				
EnrollmentContext	An internally used Keyfactor Command field.																				
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>The name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See the <i>Certificate Metadata</i> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldTypeName	The name of the metadata field in Keyfactor Command.	Value	The value of the metadata.														
Name	Description																				
MetadataFieldTypeName	The name of the metadata field in Keyfactor Command.																				
Value	The value of the metadata.																				

## 2.2.14.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 616](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 619](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 625](#)).

**Tip:** Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 6](#).

## Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

**Note:** The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 268: POST Enrollment PFX v2 Input Parameters

Name	In	Description										
Stores	Body	<p>An object containing a comma delimited set of arrays indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved - eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Override</i> flag is selected. See <a href="#">PFX Enrollment</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p></td></tr><tr><td>Override</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td><p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p><pre>"JobProperties": [ "NetscalerVserver" ]</pre></td></tr></table>	Name	Description	StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved - eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Override</i> flag is selected. See <a href="#">PFX Enrollment</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Override	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre>
Name	Description											
StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved - eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>											
Alias	<p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Override</i> flag is selected. See <a href="#">PFX Enrollment</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>											
Override	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>											
Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre>

Name	Description					
	<p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre> <div> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div>					
CustomFriendlyName	Body	<p><b>Required</b>*. A string that sets a custom friendly name for the certificate.</p> <p>This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Password	Body	<p><b>Required</b>. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Subject	Body	<p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i>.</p>				
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to</p>				

Name	In	Description
		distribution of the certificate to certificate stores. If <i>InstallIn-toExistingCertificateStores</i> is <i>true</i> , the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.
CertificateAuthority	Body	<p><b>Required</b>*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR Corpls- suingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": {   "AppOwnerFirstName": "William", // This is a String   field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "william.smith@keyexample.com",   "BusinessCritical": "true",    // This is a Boolean   field.   "BusinessUnit": "E-Business",  // This is a Multiple   Choice field with a pre-defined value.   "Notes": "Here are some notes.", // This is a BigText   field.   "SiteCode": 3,                // This is an integer   field.   "TicketResolutionDate": "2021-07-23" // This is a   Date field in yyyy-mm-dd format. }</pre> <p>See <a href="#">Certificate Metadata</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Timestamp	Body	The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Template	Body	<b>Required</b> *. A string that sets the name of the certificate template that

Name	In	Description																				
		<p>should be used to issue the certificate. The template short name should be used.</p> <p>This field is <b>required</b> unless the enrollment is being done against a standalone CA.</p>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <pre>"SANs": {   "dns": [     "dnssan1.keyexample.com",     "dnssan2.keyexample.com",     "dnssan3.keyexample.com"   ],   "ip4": [     "192.168.2.73"   ] }</pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
InstallIn- toExistingCertificateStores	Body	<p>A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i>.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIn-toExistingCertificateStores</i> parameter to make the determination as to</p>																				

Name	In	Description
		distribution of the certificate to certificate stores. If <i>InstallIn-toExistingCertificateStores</i> is <i>true</i> , the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See <a href="#">Configuring Template Options</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-CertificateFormat	Header	<p><b>Required.</b> The desired output format for the certificate. Available options are PFX, Zip, and Store. If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 619</a>).</p>

Table 269: POST Enrollment PFX v2 Response Data

Value	Description																				
SuccessfulStores	An object containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.																				
CertificateInformation	<p>Information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. Value	The value of the metadata.
Name	Description							
MetadataFieldTypeName	The name of the metadata field in Keyfactor Command.							
Value	The value of the metadata.							

Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 270: POST Enrollment PFX v1 Input Parameters

Name	In	Description
CustomFriendlyName	Body	<p><b>Required</b>*. A string that sets a custom friendly name for the certificate.</p> <p>This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Password	Body	<p><b>Required</b>. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
PopulateMissingValuesFromAD	Body	<p>A Boolean that sets whether to populate the information in the subject from Active Directory (true) or not (false). The default is <i>false</i>.</p>
Subject	Body	<p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=we-ebsrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i>.</p>
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p>
CertificateAuthority	Body	<p><b>Required</b>*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorplssuingCA1 OR CorplssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p>

Name	In	Description
		This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b> .
Timestamp	Body	The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Template	Body	<p><b>Required*</b>. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is <b>required</b> unless the enrollment is being done against a standalone CA.</p>
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre> "Metadata": {   "AppOwnerFirstName": "William", // This is a String field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "willi- am.smith@keyexample.com",   "BusinessCritical": "true",      // This is a Boolean field.   "BusinessUnit": "E-Business",    // This is a Multiple Choice field with a pre-defined value.   "Notes": "Here are some notes.", // This is a BigText field.   "SiteCode": 3,                  // This is an integer field.   "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre> <p>See <a href="#">Certificate Metadata</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
SANs	Body	An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:

Name	In	Description																				
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <pre>"SANS": {   "dns": [     "dnssan1.keyexample.com",     "dnssan2.keyexample.com",     "dnssan3.keyexample.com"   ],   "ip4": [     "192.168.2.73"   ] }</pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)

ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See <a href="#">Configuring Template Options</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
x-CertificateFormat	Header	<p><b>Required.</b> The desired output format for the certificate. Available options are PFX, Zip, and Store. If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 619</a>).</p>																				

Table 271: POST Enrollment PFX v1 Response Data

Value	Description																						
CertificateInformation	<p>Information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>Serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>Issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>Thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>ID of the certificate in Keyfactor Command.</td></tr> <tr> <td>KeyfactorRequestID</td><td>ID of the request in Keyfactor Command.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>The base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p><b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 619</a>).</p> </td></tr> <tr> <td>RequestDisposition</td><td>State of the request (e.g. issued).</td></tr> <tr> <td>DispositionMessage</td><td>Enrollment message (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> <tr> <td>Password</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description	SerialNumber	Serial number of the certificate.	IssuerDN	Issuer DN of the certificate.	Thumbprint	Thumbprint of the certificate.	KeyfactorID	ID of the certificate in Keyfactor Command.	KeyfactorRequestID	ID of the request in Keyfactor Command.	PKCS12Blob	<p>The base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p><b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 619</a>).</p>	RequestDisposition	State of the request (e.g. issued).	DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.	Password	An internally used Keyfactor Command field.
Value	Description																						
SerialNumber	Serial number of the certificate.																						
IssuerDN	Issuer DN of the certificate.																						
Thumbprint	Thumbprint of the certificate.																						
KeyfactorID	ID of the certificate in Keyfactor Command.																						
KeyfactorRequestID	ID of the request in Keyfactor Command.																						
PKCS12Blob	<p>The base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p><b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 619</a>).</p>																						
RequestDisposition	State of the request (e.g. issued).																						
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).																						
EnrollmentContext	An internally used Keyfactor Command field.																						
Password	An internally used Keyfactor Command field.																						
Metadata	An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:																						

Value	Description	
	Name	Description
	MetadataFieldName	The name of the metadata field in Keyfactor Command.
	Value	The value of the metadata.
See <a href="#">Certificate Metadata</a> in the <i>Keyfactor Command Reference Guide</i> for more information.		

### 2.2.14.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

Table 272: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	<b>Required.</b> Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 273: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	<p>An array containing key/value pairs representing all the elements in the CSR. Possible values include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Key Length</td><td>An integer indicating the desired key size of the certificate.</td></tr> <tr> <td>Key Type</td><td>A string indicating the desired key encryption of the certificate.</td></tr> <tr> <td>CN</td><td>The common name of the certificate.</td></tr> <tr> <td>O</td><td>The organization of the certificate.</td></tr> <tr> <td>OU</td><td>The organizational unit of the certificate.</td></tr> <tr> <td>L</td><td>The city of the certificate.</td></tr> <tr> <td>ST</td><td>The state of the certificate.</td></tr> <tr> <td>C</td><td>The country (two characters) of the certificate.</td></tr> <tr> <td>E</td><td>The email address of the certificate.</td></tr> <tr> <td>DNS Name</td><td>A SAN value containing a DNS name.</td></tr> <tr> <td>IP Address</td><td>A SAN value containing an IP v4 or IP v6 address.</td></tr> <tr> <td>RFC822 Name</td><td>A SAN value containing an email message.</td></tr> <tr> <td>URL</td><td>A SAN value containing a uniform resource identifier.</td></tr> <tr> <td>Directory Name</td><td>A SAN value containing a directory name.</td></tr> <tr> <td>Registered ID</td><td>A SAN value containing a registered ID.</td></tr> <tr> <td>Other name:Principal Name</td><td>A SAN value containing a user principal name (UPN) value.</td></tr> <tr> <td>Other name:DS Object Guid</td><td>A SAN value containing the MS_NTDSReplication value.</td></tr> </table> <p> <b>Note:</b> Some of these fields cannot be added to a CSR generated within Keyfactor Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.</p>	Name	Description	Key Length	An integer indicating the desired key size of the certificate.	Key Type	A string indicating the desired key encryption of the certificate.	CN	The common name of the certificate.	O	The organization of the certificate.	OU	The organizational unit of the certificate.	L	The city of the certificate.	ST	The state of the certificate.	C	The country (two characters) of the certificate.	E	The email address of the certificate.	DNS Name	A SAN value containing a DNS name.	IP Address	A SAN value containing an IP v4 or IP v6 address.	RFC822 Name	A SAN value containing an email message.	URL	A SAN value containing a uniform resource identifier.	Directory Name	A SAN value containing a directory name.	Registered ID	A SAN value containing a registered ID.	Other name:Principal Name	A SAN value containing a user principal name (UPN) value.	Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.
Name	Description																																				
Key Length	An integer indicating the desired key size of the certificate.																																				
Key Type	A string indicating the desired key encryption of the certificate.																																				
CN	The common name of the certificate.																																				
O	The organization of the certificate.																																				
OU	The organizational unit of the certificate.																																				
L	The city of the certificate.																																				
ST	The state of the certificate.																																				
C	The country (two characters) of the certificate.																																				
E	The email address of the certificate.																																				
DNS Name	A SAN value containing a DNS name.																																				
IP Address	A SAN value containing an IP v4 or IP v6 address.																																				
RFC822 Name	A SAN value containing an email message.																																				
URL	A SAN value containing a uniform resource identifier.																																				
Directory Name	A SAN value containing a directory name.																																				
Registered ID	A SAN value containing a registered ID.																																				
Other name:Principal Name	A SAN value containing a user principal name (UPN) value.																																				
Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				

### 2.2.14.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the x-

*certificateformat* header (see [POST Enrollment PFX on page 605](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

CertificateStoreManagement: *Schedule*

CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 274: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p><b>Required</b>*. An array indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See the <a href="#">PFX Enrollment</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p></td></tr><tr><td>Overwrite</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td><p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p><pre>"JobProperties": [ "NetscalerVserver" ]</pre><p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p></td></tr></table>	Name	Description	StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See the <a href="#">PFX Enrollment</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p>
Name	Description											
StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 377</a>) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>											
Alias	<p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See the <a href="#">PFX Enrollment</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>											
Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 216</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>											
Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p>											

Name	Type	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><p>The setting is referenced using the following format:</p><pre>"Properties": {"NetscalerVserver": "MyVirtualServerName"}</pre><div> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div></td></tr></table> <p>This replaces the StoresIDs and StoreTypes parameters as of Keyfactor Command version 9.4.</p>	Name	Description		<p>The setting is referenced using the following format:</p> <pre>"Properties": {"NetscalerVserver": "MyVirtualServerName"}</pre> <div> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div>
Name	Description					
	<p>The setting is referenced using the following format:</p> <pre>"Properties": {"NetscalerVserver": "MyVirtualServerName"}</pre> <div> <b>Note:</b> The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div>					
Password	Body	<b>Required</b> <sup>*</sup> . A string with a password used to secure the certificate in the certificate store. This field is <b>required</b> for store types that require an entry password, such as PEM stores.				
CertificateId	Body	<b>Required</b> <sup>*</sup> . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> . <div> <b>Note:</b> For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is <b>required</b>. The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.</div>				
RequestId	Body	<b>Required</b> <sup>*</sup> . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> . See the note under <i>CertificateId</i> regarding when this field is required and when it is not.				
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.				
StoreIds	Body	An array of the certificate store GUIDs for the stores to which the certificate should be added.				

Name	Type	Description																														
		The <b>StoreIds</b> parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the <b>Stores</b> parameter. It is still supported for backward compatibility, but no longer required.																														
StoreTypes	Body	<p>An array of store types used with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. The <b>StoreTypes</b> parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the <b>Stores</b> parameter. It is still supported for backward compatibility, but is no longer required.</p> <p>Store type parameters are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeId</td><td><p>The type of certificate store the certificate is being deployed to. Table 275: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <code>GET /Certificates/{id}</code> method with <code>includeLocations=true</code> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

## 2.2.14.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 605](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

CertificateStoreManagement: *Schedule*  
CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** You could achieve the same end using the *POST /Enrollment/PFX/Deploy* method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the *POST /Enrollment/PFX/Replace* method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the *POST /Enrollment/PFX/Deploy* method (see [POST Enrollment PFX Deploy on page 619](#)).

**Tip:** The *POST /Enrollment/PFX/Replace* method must be used within 5 minutes of acquiring a certificate with the *POST /Enrollment/PFX* or *POST /Enrollment/Renew* method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 276: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	<b>Required.</b> The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found.  Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	<b>Required*</b> The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request.  Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.
RequestId	Body	<b>Required*</b> The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request.  Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.
Password	Body	<b>Required*</b> A string with a password used to secure the certificate in the certificate store.  This field is <b>required</b> for store types that require an entry password, such as PEM stores.
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 277: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	<p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <code>GET /Certificates/{id}</code> method with <code>includeLocations=true</code> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

### 2.2.14.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

Certificates: *Read*

CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 619](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 625](#)).

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 278: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	<b>Required*</b> . The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.
Thumbprint	Body	<b>Required*</b> . The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.
Timestamp	Body	<b>Required</b> . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
CertificateAuthority	Body	<b>Required*</b> . A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>host-name\\logical name</i> format. For example: <code>corpca01.keyexample.com\\CorpIssuingCA1</code> This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 597</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 598</a> ).
Template	Body	<b>Required*</b> . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 597</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 598</a> ).

Table 279: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

## 2.2.15 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 280: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	<a href="#">GET License below</a>

### 2.2.15.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters. For more information regarding licensing, see the [Licensing](#) section of the *Keyfactor Command Reference Guide*.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: Read

Table 281: GET License Response Data

Name	Description												
KeyfactorVersion	A string indicating the Keyfactor Command version number in the format: majorversion.incrementalversion.patchnumber												
LicenseData	<p>An object containing your Keyfactor customer information. License data details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LicenseId</td><td>A string indicating the internal reference GUID of your Keyfactor license.</td></tr> <tr> <td>Customer</td><td> <p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table> </td></tr> </table>	Name	Description	LicenseId	A string indicating the internal reference GUID of your Keyfactor license.	Customer	<p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.
Name	Description												
LicenseId	A string indicating the internal reference GUID of your Keyfactor license.												
Customer	<p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.						
Name	Description												
Name	A string containing your company name as per your Keyfactor account.												
Id	An integer containing your Keyfactor account number.												
IssuedDate	A string indicating the valid issue date of the license, in UTC.												
ExpirationDate	A string indicating the valid expiration date of the license, in UTC.												
LicensedProducts	<p>An array containing details of the products and features included in the license. License product and feature details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>ProductId</td><td>A string indicating the Keyfactor Command product GUID for the product(s) included in the license.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".</td></tr> <tr> <td>MajorRev</td><td>A string indicating the valid major release version of the license.</td></tr> <tr> <td>MinorRev</td><td>A string indicating the valid incremental release version of the license.</td></tr> </table>	Name	Description	ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.	DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".	MajorRev	A string indicating the valid major release version of the license.	MinorRev	A string indicating the valid incremental release version of the license.		
Name	Description												
ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.												
DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".												
MajorRev	A string indicating the valid major release version of the license.												
MinorRev	A string indicating the valid incremental release version of the license.												

Name	Description													
	Name	Description												
	LicensedFeatures	An array containing the Keyfactor Command features included in the license. <table><tr><th>Name</th><th>Description</th></tr><tr><td>FeatureID</td><td>A string indicating the ID code of feature.</td></tr><tr><td>DisplayName</td><td>A string indicating the name of the feature as displayed on the license page in the Management Portal.</td></tr><tr><td>Enabled</td><td>A Boolean that indicates whether the feature is enabled (true) or not (false).</td></tr><tr><td>Quantity</td><td>An integer indicating one of:<ul style="list-style-type: none"><li>How many of the elements you are licensed for.</li><li>For those features which have no licensing limits, <i>null</i>.</li></ul>Unlimited is indicated by 999999999.</td></tr><tr><td>ExpirationDate</td><td>This field is unused and will always return <i>null</i>.</td></tr></table>	Name	Description	FeatureID	A string indicating the ID code of feature.	DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).	Quantity	An integer indicating one of: <ul style="list-style-type: none"><li>How many of the elements you are licensed for.</li><li>For those features which have no licensing limits, <i>null</i>.</li></ul> Unlimited is indicated by 999999999.	ExpirationDate	This field is unused and will always return <i>null</i> .
	Name	Description												
	FeatureID	A string indicating the ID code of feature.												
	DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.												
	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).												
	Quantity	An integer indicating one of: <ul style="list-style-type: none"><li>How many of the elements you are licensed for.</li><li>For those features which have no licensing limits, <i>null</i>.</li></ul> Unlimited is indicated by 999999999.												
ExpirationDate	This field is unused and will always return <i>null</i> .													

 **Tip:** Currently there is only one licensed product offered, which is Keyfactor Command.

## 2.2.16 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 282: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	<a href="#">GET MacEnrollment below</a>
/	PUT	Updates the Mac auto-enrollment configuration.	<a href="#">PUT MacEnrollment on the next page</a>

### 2.2.16.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: Read

Table 283: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

## 2.2.16.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 284: PUT MacEnrollment Response Data

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 285: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

## 2.2.17 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 286: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes an existing metadata field.	<a href="#">DELETE MetadataFields ID on the next page</a>
/id	GET	Returns detailed information for the specified metadata field.	<a href="#">GET MetadataFields ID on the next page</a>
/name	GET	Returns detailed information for the specified metadata field.	<a href="#">GET MetadataFields Name on page 639</a>
/id/InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	<a href="#">GET MetadataFields ID InUse on page 642</a>
/	DELETE	Deletes multiple metadata fields specified in the request	<a href="#">DELETE</a>

Endpoint	Method	Description	Link
		body.	<a href="#">MetadataFields on page 643</a>
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	<a href="#">GET MetadataFields on page 643</a>
/	POST	Creates a new metadata field using values supplied in the request body.	<a href="#">POST MetadataFields on page 647</a>
/	PUT	Updates an existing metadata field using values supplied in the request body.	<a href="#">PUT MetadataFields on page 653</a>

### 2.2.17.1 DELETE MetadataFields ID

The DELETE `/MetadataFields/{id}` method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 287: DELETE `/MetadataFields/{id}` Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the metadata field to be deleted. Use the <code>GET /MetadataFields</code> method (see <a href="#">GET MetadataFields on page 643</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the <code>GET /MetadataFields/{id}/InUse</code> method (see <a href="#">GET MetadataFields ID InUse on page 642</a> ) to determine whether a metadata field is in use.

### 2.2.17.2 GET MetadataFields ID

The GET `/MetadataFields/{id}` method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 288: GET MetadataFields {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields on page 643</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 289: GET MetadataFields {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>														

Name	Description								
	 <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
DefaultValue	A string containing a default value with which to pre-populate the metadata field for new certificate								

Name	Description
	<p>requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

### 2.2.17.3 GET MetadataFields Name

The GET /MetadataFields/{name} method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 290: GET MetadataFields {name} Input Parameters

Name	In	Description
name	Path	<b>Required.</b> A string that indicates the name of the metadata field. This value is not case sensitive.

Table 291: GET MetadataFields {name} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>														

Name	Description								
	 <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
DefaultValue	A string containing a default value with which to pre-populate the metadata field for new certificate								

Name	Description
	<p>requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

## 2.2.17.4 GET MetadataFields ID InUse

The GET `/MetadataFields/{id}/InUse` method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 292: GET MetadataFields {id} In Use Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID for the metadata field.</p> <p>Use the <code>GET /MetadataFields</code> method (see <a href="#">GET MetadataFields on the next page</a>) to retrieve a list of all the metadata fields to determine the metadata field's ID.</p>

Table 293: GET MetadataFields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

### 2.2.17.5 DELETE MetadataFields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. The metadata fields IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 294: DELETE MetadataFields Input Parameters

Name	In	Description
ids	Body	<b>Required.</b> An array of Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields below</a> ) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see <a href="#">GET MetadataFields ID InUse on the previous page</a> ) to determine whether a metadata field is in use.

### 2.2.17.6 GET MetadataFields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 295: GET MetadataFields Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 296: GET MetadataFields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>														

Name	Description								
	 <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
DefaultValue	A string containing a default value with which to pre-populate the metadata field for new certificate								

Name	Description
	<p>requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

## 2.2.17.7 POST MetadataFields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 297: POST MetadataFields Input Parameters

Name	In	Description														
Name	Body	<b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	<b>Required.</b> A string indicating the description for the metadata field.														
DataType	Body	<b>Required.</b> An integer indicating the data type of the metadata field. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.  This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	Body	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</div> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".  This field is only supported for metadata fields with data type <i>string</i> . <div> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression</div>														

Name	In	Description								
		<div> will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr><tr><td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr></table> <p>The default is <i>optional</i>.</p> <div> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description									
0	Optional Users have the option to either enter a value or not enter a value in the field.									
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.									
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.									
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>								
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is <b>required</b> for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p> <div> <b>Tip:</b> If a template-specific options are set for a given metadata field, these</div>								

Name	In	Description
		 takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).         </div>

Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
DefaultValue	A string containing a default value with which to pre-populate the metadata field for new certificate								

Name	Description
	<p>requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

## 2.2.17.8 PUT MetadataFields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 299: PUT MetadataFields Input Parameters

Name	In	Description														
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	Body	<b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	<b>Required.</b> A string indicating the description for the metadata field.														
DataType	Body	<b>Required.</b> An integer indicating the data type of the metadata field. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.  This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	Body	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</div> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".  This field is only supported for metadata fields with data type <i>string</i> .														

Name	In	Description								
		<div> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr><tr><td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr></table> <p>The default is <i>optional</i>.</p> <div> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description									
0	Optional Users have the option to either enter a value or not enter a value in the field.									
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.									
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.									
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).</div>								
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is <b>required</b> for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p>								

Name	In	Description
		 <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>).         </div>
AllowAPI	Body	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	Body	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	Body	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

Table 300: PUT MetadataFields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>														

Name	Description								
	 <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a> ).								
DefaultValue	A string containing a default value with which to pre-populate the metadata field for new certificate								

Name	Description
	<p>requests made using PFX or CSR enrollment.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i> or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1152</a>). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

## 2.2.18 Monitoring Revocation

The Monitoring Revocation component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 301: Monitoring Revocation Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the revocation monitoring location with the specified ID.	<a href="#">DELETE Monitoring Revocation ID on the next page</a>
/ {id}	GET	Returns details for the revocation monitoring location with the specified ID.	<a href="#">GET Monitoring Revocation ID on the next page</a>
/	PUT	Edits the revocation monitoring location with the specified ID.	<a href="#">PUT Monitoring Revocation on page 674</a>
/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	<a href="#">GET Monitoring Revocation on page 664</a>

Endpoint	Method	Description	Link
/	POST	Creates a new revocation monitoring location.	<a href="#">POST Monitoring Revocation on page 668</a>
/ResolveOSCP	POST	Resolves the given OSCP certificate authority.	<a href="#">POST Monitoring Resolve OSCP on page 680</a>
/Test	POST	Tests the revocation monitoring alert with the specified ID.	<a href="#">POST Monitoring Revocation Test on page 681</a>
/TestAll	POST	Tests the revocation monitoring alerts.	<a href="#">POST Monitoring Revocation Test All on page 683</a>

### 2.2.18.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 302: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 664</a> ) to retrieve a list of all the revocation monitoring locations to determine the ID.

### 2.2.18.2 GET Monitoring Revocation ID

The GET /Monitoring/Revocation/{id} method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 303: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer that specifies the ID of the revocation monitoring location.</p> <p>Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 664</a>) to retrieve a list of all the revocation monitoring locations to determine the ID.</p>

Table 304: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr> </table>	Value	Description		If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.												
Value	Description																
	If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.																
Schedule	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description												
	 <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.												
OCSPParameters	<p>For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p> </td></tr> <tr> <td>AuthorityName</td><td>A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com</td></tr> <tr> <td>AuthorityNameId</td><td>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</td></tr> <tr> <td>AuthorityKeyId</td><td>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</td></tr> <tr> <td>SampleSerialNumber</td><td>A string indicating the serial number of the CA.</td></tr> </table>	Value	Description	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).	SampleSerialNumber	A string indicating the serial number of the CA.
Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com												
AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .												
AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).												
SampleSerialNumber	A string indicating the serial number of the CA.												

### 2.2.18.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 305: GET Monitoring Revocation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DashboardWarningValue</i> (WarningHours value)</li> <li>• <i>DisplayName</i> (Name)</li> <li>• <i>EndpointType</i> (1-CRL, 2-OCSP)</li> <li>• <i>SendWarning</i> (emailreminder) (true, false)</li> <li>• <i>ShowOnDashboard</i> (true, false)</li> <li>• <i>Url</i></li> <li>• <i>WarningDays</i></li> </ul> <div>  <p><b>Tip:</b> To return all revocation monitoring locations of type CRL, use the following query:  EndpointType -eq 1  To return locations of type OCSP, use this query:  EndpointType -eq 2</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 306: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr> </table>	Value	Description		If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.												
Value	Description																
	If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.																
Schedule	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. SampleSerialNumber	A string indicating the serial number of the CA.
Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com												
AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .												
AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).												
SampleSerialNumber	A string indicating the serial number of the CA.												

## 2.2.18.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 307: POST Monitoring Revocation Input Parameters

Name	In	Description								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
EndpointType	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<b>Required.</b> A string indicating the location for the revocation monitoring endpoint. For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.  For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.								
Email	Body	<b>Required*</b> . for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	<b>Required.</b> An array indicating the configuration for display on the dashboard. Dashboard details are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td><b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td></tr><tr><td>WarningHours</td><td><b>Required*</b>. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.  <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.  If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr></table>	Value	Description	Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> .  <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> .  If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.		
Value	Description									
Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.									
WarningHours	<b>Required*</b> . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  <i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> .  <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> .  If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.									

Name	In	Description				
Schedule	Body	An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.
		Name	Description			
		Off	Turn off a previously configured schedule.			
		Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div> <p>For example, every hour:</p> <div><pre>"Interval": {  "Minutes": 60  }</pre></div>	Name	Description	Minutes
Name	Description					
Minutes	An integer indicating the number of minutes between each interval.					
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table></div> <p>For example, daily at 11:30 pm:</p> <div><pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"  }</pre></div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	
Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
<div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>						

Name	In	Description						
OCSPParameters	Body	<b>Required*</b> . for OCSP endpoints. For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:						
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>CertificateContents</td><td>A string indicating the certificate contents.</td></tr><tr><td>CertificateAuthorityId</td><td>An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</td></tr></table>	Value	Description	CertificateContents	A string indicating the certificate contents.	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a> ) to retrieve a list of all the CAs to determine the ID.
		Value	Description					
CertificateContents	A string indicating the certificate contents.							
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a> ) to retrieve a list of all the CAs to determine the ID.							

Table 308: POST Monitoring Revocation Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details																

Name	Description
	are:
Value	Description
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>
AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
SampleSerialNumber	A string indicating the serial number of the CA.

### 2.2.18.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 309: PUT Monitoring Revocation {id}Input Parameters

Name	In	Description								
Id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
EndpointType	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<b>Required.</b> A string indicating the location for the revocation monitoring endpoint. For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location. For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.								
Email	Body	<b>Required*</b> . for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). Value	Description							
CertificateContents	A string indicating the certificate contents.							
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a> ) to retrieve a list of all the CAs to determine the ID.							

Table 310: PUT Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>

SampleSerialNumber	A string indicating the serial number of the CA.
Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com												
AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .												
AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).												
SampleSerialNumber	A string indicating the serial number of the CA.												

### 2.2.18.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 311: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	<b>Required*</b> . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve.  One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	<b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 283</a> ) to retrieve a list of all the CAs to determine the ID.  One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 312: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameld	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

## 2.2.18.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that

are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowManagement: *Read*

WorkflowManagement: *Test*

Table 313: POST Monitoring Revocation Test Input Parameters

Name	In	Description								
revocationMonitoringAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AlertId</td><td><b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.</td></tr><tr><td>EvaluationDate</td><td><b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</td></tr><tr><td>SendAlerts</td><td>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>{  "EvaluationDate": "2022-08-31T20:51:33.528Z"  "SendAlerts": true}</pre>	Name	Description	AlertId	<b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.	EvaluationDate	<b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .
Name	Description									
AlertId	<b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.									
EvaluationDate	<b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.									
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .									

Table 314: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

## 2.2.18.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowManagement: *Read*

WorkflowManagement: *Test*

RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

## 2.2.19 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 317: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	<a href="#">GET Orchestrator Jobs Job Status Data on the next page</a>
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Job History on page 687</a>
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Scheduled Jobs on page 692</a>
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Custom on page 696</a>
/Reschedule	POST	Reschedules a failed orchestrator job.	<a href="#">POST Orchestrator Jobs Reschedule on page 700</a>
/Unschedule	POST	Unschedules an active orchestrator job.	<a href="#">POST Orchestrator Jobs Unschedule on page 702</a>
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	<a href="#">POST Orchestrator Jobs Acknowledge on page 703</a>

Endpoint	Method	Description	Link
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Reschedule on page 700</a>

## 2.2.19.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

**Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

**Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:  
2021-08-05 10:47:23.1940  
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response status code does not indicate success: 413 (Request Entity Too Large).  
  
at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /\_/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172  
  
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri, Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\work\24\s\src\OrchestratorServices\HttpService.cs:line 38

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See the [Fetch Logs](#) section of the *Keyfactor Command Reference Guide* for more information.

Table 318: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	<b>Required.</b> The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see <a href="#">GET Orchestrator Jobs Job History on the next page</a> ) to retrieve a list of jobs to determine the job's history ID.

Table 319: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

### 2.2.19.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 320: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 12</a> to find the ID)</li> <li>• <i>Agent</i> (ClientMachine)</li> <li>• <i>JobId</i></li> <li>• <i>Result</i> (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)</li> <li>• <i>Status</i> (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>Message</i></li> <li>• <i>OperationStart</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once) )</li> <li>• <i>TargetPath</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 321: GET Orchestrator Jobs Job History Response Data

Name	Description												
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.												
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.												
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.												
Schedule	<div>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</div><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><div>For example, every hour:</div><div><pre>"Interval": {   "Minutes": 60 }</pre></div></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Immediate	<div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</div> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <div>For example, every hour:</div> <div><pre>"Interval": {   "Minutes": 60 }</pre></div>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Immediate	<div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</div> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>												
Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <div>For example, every hour:</div> <div><pre>"Interval": {   "Minutes": 60 }</pre></div>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>								

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>ExactlyOnce</td><td> <p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.	ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Day	The number of the day, in the month, to run the job.																
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
JobType	A string indicating the job type (e.g. IISInventory).																
OperationStart	The time, in UTC, at which the orchestrator job started.																
OperationEnd	The time, in UTC, at which the orchestrator job finished.																
Message	A string providing the error message for the operation, if any.																
Result	<p>A string indicating the result of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>Unknown</li> </ul>																

Name	Description
	<ul style="list-style-type: none"> <li>• Success</li> <li>• Warning</li> <li>• Failure</li> </ul>
Status	<p>A string indicating the status of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>• Unknown</li> <li>• Waiting</li> <li>• In Process</li> <li>• Completed</li> <li>• Acknowledged</li> <li>• Completed Will Retry</li> </ul>
StorePath	<p>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ClientMachine	<p>A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.</p>

### 2.2.19.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 322: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 12</a> to find the ID)</li> <li>• <i>Agent Machine</i> (ClientMachine)</li> <li>• <i>AgentPlatform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>AgentType</i> *Use -contains comparison (Capabilities in <a href="#">GET Agents on page 12</a>)</li> <li>• <i>Requested</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once) )</li> <li>• <i>TargetPath</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 323: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsr-vr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See the <a href="#">Adding or Modifying a Certificate Store</a> section of the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

## 2.2.19.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 687](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 686](#)) to retrieve the data.

Table 324: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description												
AgentId	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>												
JobTypeName	Body	<p><b>Required.</b> A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 556</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>													
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
