	 <p>Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>														
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).														
ReportParameter	<p>An array containing the parameters for the report. . Report parameters include:</p> <table border="1" data-bbox="435 716 1411 1682"> <thead> <tr> <th data-bbox="435 716 696 772">Name</th> <th data-bbox="696 716 1411 772">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="435 772 696 837">Id</td> <td data-bbox="696 772 1411 837">The Keyfactor Command reference ID of the report parameter.</td> </tr> <tr> <td data-bbox="435 837 696 932">ParameterName</td> <td data-bbox="696 837 1411 932">A string containing the short reference name for the report parameter (e.g. EvalDate).</td> </tr> <tr> <td data-bbox="435 932 696 1467">ParameterType</td> <td data-bbox="696 932 1411 1467"> A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod </td> </tr> <tr> <td data-bbox="435 1467 696 1562">DisplayName</td> <td data-bbox="696 1467 1411 1562">A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).</td> </tr> <tr> <td data-bbox="435 1562 696 1627">Description</td> <td data-bbox="696 1562 1411 1627">A string containing the description for the parameter.</td> </tr> <tr> <td data-bbox="435 1627 696 1682">DefaultValue</td> <td data-bbox="696 1627 1411 1682">A string containing the default value for the parameter.</td> </tr> </tbody> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report parameter .	ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).	ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod 	DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).	Description	A string containing the description for the parameter.	DefaultValue	A string containing the default value for the parameter.
Name	Description														
Id	The Keyfactor Command reference ID of the report parameter .														
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).														
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod 														
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).														
Description	A string containing the description for the parameter.														
DefaultValue	A string containing the default value for the parameter.														

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  Tip: Default values that are integers are also stored as strings in this parameter. </td> </tr> <tr> <td>DisplayOrder</td> <td>An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.</td> </tr> <tr> <td>ParameterVisibility</td> <td>A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i>. The alternative setting is <i>Hidden</i>.</td> </tr> </tbody> </table>	Name	Description		 Tip: Default values that are integers are also stored as strings in this parameter.	DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.	ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .										
Name	Description																		
	 Tip: Default values that are integers are also stored as strings in this parameter.																		
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.																		
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .																		
Schedules	<p>An array containing the configured schedules for running the report, if any. Schedules include the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>The Keyfactor Command reference ID of the report schedule.</td> </tr> <tr> <td>SendReport</td> <td>A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).</td> </tr> <tr> <td>SaveReport</td> <td>A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).</td> </tr> <tr> <td>SaveReportPath</td> <td>A string containing the UNC path to which the report will be written, if configured.</td> </tr> <tr> <td>ReportFormat</td> <td>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV </td> </tr> <tr> <td>KeyfactorSchedule</td> <td> <p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report schedule .	SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).	SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).	SaveReportPath	A string containing the UNC path to which the report will be written, if configured.	ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 	KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	The Keyfactor Command reference ID of the report schedule .																		
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).																		
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).																		
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.																		
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 																		
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Day	The number of the day, in the month, to run the job.																
EmailReceipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																

Name	Description																						
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertAuth</td> <td>The certificate authority or authorities selected to report on.</td> </tr> <tr> <td>EndDate</td> <td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td> </tr> <tr> <td>EvalDate</td> <td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>Metadata</td> <td>The custom metadata fields selected to include in the report.</td> </tr> <tr> <td>MinCertCount</td> <td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td> </tr> <tr> <td>OrchestratorPool</td> <td>The orchestrator pool selected to report on.</td> </tr> <tr> <td>PeriodCount</td> <td>The number of days, weeks or months selected to report on.</td> </tr> <tr> <td>PeriodSize</td> <td>The selected reporting period (day, weeks or months).</td> </tr> <tr> <td>Requesters</td> <td>The certificate requesters selected to include in the report.</td> </tr> <tr> <td>SSHKeyType</td> <td>The SSH key type(s) selected to report on.</td> </tr> </tbody> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.
Name	Description																						
CertAuth	The certificate authority or authorities selected to report on.																						
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																						
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																						
Metadata	The custom metadata fields selected to include in the report.																						
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																						
OrchestratorPool	The orchestrator pool selected to report on.																						
PeriodCount	The number of days, weeks or months selected to report on.																						
PeriodSize	The selected reporting period (day, weeks or months).																						
Requesters	The certificate requesters selected to include in the report.																						
SSHKeyType	The SSH key type(s) selected to report on.

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StartDate</td> <td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td> </tr> <tr> <td>TemplateIds</td> <td>The Keyfactor Command identifiers for the templates to include in the report.</td> </tr> </tbody> </table>	Name	Description	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.										
AcceptedScheduleFormats	An array containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.2 DELETE Reports Custom ID

The DELETE `/Reports/Custom/{id}` method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Reports: *Modify*

Table 409: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link to be deleted. Use the GET /Reports/Custom method (see GET Reports Custom on page 1511) to retrieve a list of your custom report links to determine the report ID to use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.3 GET Reports Custom ID

The GET /Reports/Custom/{id} method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Read*

Table 410: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link that should be retrieved.

Table 411: GET Reports Custom {id} Response Data

Name	Description
CustomURL	A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).  Tip: Custom reports are automatically opened in a new browser tab.
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 412: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1489) to retrieve the details for that report to determine the schedule ID to use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.5 GET Reports Schedules ID

The GET /Reports/Schedules/{id} method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 1516](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Read*

Table 413: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1489) to retrieve the details for that report to determine the schedule ID to use.

Table 414: GET Reports Schedules {id} Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										

Note: Although the Swagger *Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this

Name	Description																										
	<div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  functionality—are valid for this endpoint. </div>																										
EmailRecipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																										
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table border="1" data-bbox="443 579 1411 1650"> <thead> <tr> <th data-bbox="443 579 691 642">Name</th> <th data-bbox="691 579 1411 642">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="443 642 691 705">CertAuth</td> <td data-bbox="691 642 1411 705">The certificate authority or authorities selected to report on.</td> </tr> <tr> <td data-bbox="443 705 691 831">EndDate</td> <td data-bbox="691 705 1411 831">The end date selected for the reporting period to report on. EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Read*

Table 415: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.

Table 416: GET Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	A string containing the default value for the parameter. <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; margin-top: 10px;">  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 4.17: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on the next page) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. The Keyfactor Command reference ID of the report parameter . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1489) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter.  Tip: Default values that are integers are also stored as strings in this parameter.

Table 418: PUT Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	A string containing the default value for the parameter. <div style="border: 1px solid #ccc; border-radius: 5px; padding: 5px; margin-top: 10px;">  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 1489](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Read*

Table 419: GET Reports Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page on page 31</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Categories</i> (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability,SSHKeys) • <i>Custom</i> • <i>Favorite</i> (true, false) • <i>InNavigator</i> (true, false) • <i>Scheduled</i> (Number of schedules) <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Tip: This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category: Categories -contains "PKIOperations"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 420: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <p> Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).</p>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p>

Name	Description
	 Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1073). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon  at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 1520](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 1529](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 1503](#)). This method returns HTTP 200 OK on a success with the details of the report.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 421: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p>Required. The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1073). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 422: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> </div>

Name	Description
	 parameter (see POST Certificate Collections on page 1073). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon  at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Read*

Table 423: GET Reports Custom Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Categories</i> (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability,SSHKeys) • <i>Custom</i> • <i>Favorite</i> (true, false) • <i>InNavigator</i> (true, false) • <i>Scheduled</i> (Number of schedules)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 424: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Reports: *Modify*

Table 425: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p>Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
DisplayName	Body	Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 426: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 427: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).  Tip: Custom reports are automatically opened in a new browser tab.
Id	Body	Required. An integer containing the Keyfactor Command reference ID for the report link. Use the GET /Reports/Custom method (see GET Reports Custom on page 1511) to retrieve a list of your custom report links to determine the report ID to use.
DisplayName	Body	Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 428: PUT Reports Custom Response Data

Name	Description
CustomURL	A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).  Tip: Custom reports are automatically opened in a new browser tab.
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.13 GET Reports ID Schedules

The GET /Reports/{id}/Schedules method is used to return the schedule for the built-in report with the specified **report ID**. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the GET /Reports/Schedules/{id} method to return the schedule based on the **schedule ID** (see [GET Reports Schedules ID on page 1498](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: Read

Table 429: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with. Use the GET /Reports method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.

Table 430: GET Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 431: POST Reports {id} Schedules Input Parameters

Name	In	Description						
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.</p>						
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .						
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .						
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> Note: The path for saved reports must be provided in UNC format (\\server-name\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing "\" in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>						
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 						
KeyfactorSchedule	Body	<p>Required. An array providing the schedule for the report. The schedule can be one of:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Name</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:

TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: *Modify*

Table 433: PUT Reports {id} Schedules Input Parameters

Name	In	Description				
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.</p>				
Id	Body	<p>Required. The Keyfactor Command reference ID of the report schedule.</p> <p>Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1489) to retrieve the details for the desired report to determine the schedule ID to use.</p>				
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .				
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .				
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> Note: The path for saved reports must be provided in UNC format (\\server-name\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing "\" in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>				
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 				
KeyfactorSchedule	Body	<p>Required. An array providing the schedule for the report.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Name</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description					
Off	Turn off a previously configured schedule.

StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description									
SSHKeyType	The SSH key type(s) selected to report on.									
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).									
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.									

Table 434: PUT Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> <tr> <td>Weekly</td> <td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.22 Security Identities

The Security Identities component of the Keyfactor API includes methods necessary to list, add, and delete security identities. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 435: Security Identities Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the security identity with the specified ID.	DELETE Security Identities ID below
/id}	GET	Returns permission details for the security identity with the specified ID.	GET Security Identities ID on the next page
/Lookup	GET	Validates that the identity with the specified name exists.	GET Security Identities Lookup on page 1542
/	GET	Returns all security identities with filtering and output options.	GET Security Identities on page 1543
/	POST	Adds a new security identity into Keyfactor Command.	POST Security Identities on page 1562

3.2.22.1 DELETE Security Identities ID

The DELETE `/Security/Identities/{id}` method is used to delete the security identity with the specified ID from Keyfactor Command. Use the `GET /Security/Identities` method (see [GET Security Identities on page 1543](#)) to determine the ID of the security identity you wish to delete. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 436: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security identity that should be deleted from Keyfactor Command.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.22.2 GET Security Identities ID

The GET /Security/Identities/{id} method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: Read

Table 437: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security identity to retrieve. Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 1543) to retrieve a list of all the security identities to determine the identity's ID.

Table 438: GET Security Identities {id} Response Data

Name	Description						
Identity	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						
SecuredAreaPermissions	<p>An object containing a series of arrays with information about the global permissions granted to the security identity. Global permission information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Permission</td> <td>A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td> </tr> <tr> <td>GrantedByRoles</td> <td>An object containing a list of roles that grant that permission.</td> </tr> </tbody> </table> <p>For example:</p> <pre>"SecuredAreaPermissions": [{ "Permission": "AdminPortal:Read", "GrantedByRoles": ["Read Only", "Staff"] }, { "Permission": "Reports:Read", "GrantedByRoles": ["Read Only"] },]</pre> <p>For more information about global permissions, see the Security Roles and Identities on page 572 page in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
CollectionPermissions	<p>An object containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Permission</td> <td>A string indicating the permission granted. In the case of</td> </tr> </tbody> </table>	Name	Description	Permission	A string indicating the permission granted. In the case of

In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						

Name	Description
	<pre> "GrantedByRoles": ["Power Users", "Staff"] }, { "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_ Schedule", "GrantedByRoles": ["Power Users"] },] </pre> <p>For more information about container permissions, see the Container Permissions on page 586 page in the <i>Keyfactor Command Reference Guide</i>.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.22.3 GET Security Identities Lookup

The GET /Security/Identities/Lookup method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using *POST /Security/Identities* (see [POST Security Identities on page 1562](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: Read

Table 439: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	Required. The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 440: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.22.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: Read

Table 441: GET Security Identities Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .
queryString		<i>Not used.</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 442: GET Security Identities Response Data

Name	Description																											
Id	An integer containing the Keyfactor Command reference ID for the security identity.																											
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators																											
IdentityType	A string indicating the type of identity—User or Group.																											
Roles	<p>An array containing information about the security roles assigned to the security identity. Role information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>In</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Body</td> <td>Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.</td> </tr> <tr> <td>Name</td> <td>Body</td> <td>Required. A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td>Body</td> <td>Required. A string containing the description for the security role.</td> </tr> <tr> <td>Enabled</td> <td>Body</td> <td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Immutable</td> <td>Body</td> <td>A Boolean that indicates whether the security role has been marked as editable (true) or not (false). WorkflowDefinitions	Read	Users can view the configured workflow definitions.	
WorkflowDefinitions	Modify	Users can modify both the built-in and any custom workflow definitions, including the name and description and the configuration for the steps. Users can also add new workflow definitions, delete workflow definitions, publish workflow definitions, and import and export workflow definitions.	
WorkflowInstances	Manage	Users can manage initiated workflow instances, including stopping, restarting, and deleting them.	
WorkflowInstances	ReadAssignedToMe	Users can view the workflow instances that have been initiated and are awaiting input from them.	
		 Tip: There is not a security permission at this level that controls whether users can provide	

Name	Description		
	Name	In	Description
			<pre>"Dashboard:Read"],</pre>
Valid	A Boolean indicating whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.		

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.22.5 POST Security Identities

The POST `/Security/Identities` method is used to create a new security identity in Keyfactor Command. Use the `GET /Security/Identities/Lookup` method (see [GET Security Identities Lookup on page 1542](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Tip: This method cannot be used to assign roles to an identity. Use the `PUT /Security/Roles` method (see [PUT Security Roles on page 1641](#)) to assign roles to an identity.

Table 443: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	<p>Required. A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>

Table 444: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, container and collection-level.

Table 445: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/id/Permissions	GET	Returns all permissions associated with the security role that matches the id	GET Security Roles ID Permissions on the next page
/id/Permissions/Global	GET	Returns all global permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Global on page 1566
/id/Permissions/Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	POST Security Roles ID Permissions Global on page 1567
/id/Permissions/Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	PUT Security Roles ID Permissions Global on page 1587
/id/Permissions/Containers	GET	Returns all container permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Containers on page 1608
/id/Permissions/Containers	POST	Adds container permissions to the security role that matches the ID.	POST Security Roles ID Permissions Containers on page 1609
/id/Permissions/Containers	PUT	Sets container permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Containers on page 1611
/id/Permissions/Collections	GET	Returns all collection permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Collections on

Endpoint	Method	Description	Link
			page 1612
/[id]/Permissions/Collections	POST	Adds collection permissions to the security role that matches the ID.	POST Security Roles ID Permissions Collections on page 1613
/[id]/Permissions/Collections	PUT	Sets collection permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Collections on page 1614

3.2.23.1 GET Security Roles ID Permissions

The GET `/Security/Roles/[id]/Permissions` method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: `SecuritySettings: Read`

Table 446: GET Security Roles [id] Permissions Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve permissions. Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.

Table 447: GET Security Roles {id} Permissions Response Data

Name	Description								
	An object containing information about the permissions granted to the security role. Details include: <table border="1" data-bbox="365 367 1339 682"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Type</td> <td>A string containing the area at which the permission is applied to (global, container, or collection).</td> </tr> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. "Certificates").</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td> </tr> </tbody> </table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. "Certificates").								
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23.2 GET Security Roles ID Permissions Global

The GET /Security/Roles/{id}/Permissions/Global method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: Read

Table 448: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve global permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.

Table 449: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table border="1" data-bbox="365 367 1409 588"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. "Certificates").</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23.3 POST Security Roles ID Permissions Global

The POST /Security/Roles/{id}/Permissions/Global method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: *Modify*

Table 450: POST Security Roles {id}Global Permissions Input Parameters

Name	In	Description

Table 451: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. "Certificates").</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23.4 PUT Security Roles ID Permissions Global

The PUT /Security/Roles/{id}/Permissions/Global method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Warning: Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not

changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 453: PUT Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Area</td> <td>A string containing the name of the permission (e.g. "Certificates").</td> </tr> <tr> <td>Permission</td> <td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td> </tr> </tbody> </table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: Read

Table 454: GET Security Roles {id} Permissions Containers Input Parameters

3.2.23.6 POST Security Roles ID Permissions Containers

The `POST /Security/Roles/{id}/Permissions/Containers` method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 456: POST Security Roles {id} Permissions Containers Input Parameters

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.23.7 PUT Security Roles ID Permissions Containers

The PUT `/Security/Roles/{id}/Permissions/Containers` method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Warning:** Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 458: PUT Security Roles {id} Permissions Containers Input Parameters

3.2.23.10 PUT Security Roles ID Permissions Collections

The PUT */Security/Roles/{id}/Permissions/Collections* method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: *POST /CertificateCollections/{id}/Permissions*. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Warning: Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: *Modify*

Table 464: PUT Security Roles {id} Permissions Collections Input Parameters

Permission	Required. A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 466: Security Roles Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the security role with the specified ID.	DELETE Security Roles ID below
/id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and security identities assigned the role.	GET Security Roles ID on the next page
/id}/Identities	GET	Returns the security identities assigned to the security role with the specified ID.	GET Security Roles ID Identities on page 1620
/id}/Identities	PUT	Updates the security identities assigned to the security role with the specified ID.	PUT Security Roles ID Identities on page 1621
/	GET	Returns all security roles with filtering and output options.	GET Security Roles on page 1622
/	POST	Adds a new security role.	POST Security Roles on page 1624
/	PUT	Updates the security role with the specified ID.	PUT Security Roles on page 1641
/id}/Copy	POST	Adds a new security role by copying the existing security role with the specified ID.	POST Security Roles ID Copy on page 1658

3.2.24.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 1622](#)) to determine the ID of the security role you wish to delete. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: *Modify*

Table 467: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security role that should be deleted from Keyfactor Command.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Read*

Table 468: GET Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.

Table 469: GET Security Roles {id} Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.3 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: Read

Table 470: GET Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the security role for which to retrieve security identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 471: GET Security Roles {id} Identities Response Data

Name	Description						
	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.4 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: *Modify*

Table 472: PUT Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to update identities. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on the next page) to retrieve a list of all the security roles to determine the role's ID.
identities	Body	An array in which you provide a complete list of the identities that are associated with an Security Role Id. Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 1543) to retrieve a list of all the security identities to determine the identity ID(s).

Table 473: PUT Security Roles {id} Identities Response Data

Name	Description						
	An array containing information about the security identities assigned to the security role. Identity details include: <table border="1" data-bbox="365 1390 1411 1648"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>Name</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.5 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: Read

Table 474: GET Security Roles Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Security Role Search Feature on page 595</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <i>Name</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 475: GET Security Roles Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.6 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 476: POST Security Roles Input Parameters

Name	In	Description															
Name	Body	Required. A string containing the short reference name for the security role.															
Description	Body	Required. A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AdminPortal (a.k.a. Management Portal)</td> <td>Read</td> <td>Users can access the Management Portal. Table 477: POST Security Roles Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.7 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SecuritySettings: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 478: PUT Security Roles Input Parameters

Name	In	Description															
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.															
Name	Body	Required. A string containing the short reference name for the security role.															
Description	Body	Required. A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AdminPortal (a.k.a. Table 479: PUT Security Roles Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.24.8 POST Security Roles ID Copy

The POST `/Security/Roles{id}/Copy` method is used to copy an existing security role in Keyfactor Command to create a new security role. This method returns HTTP 200 OK on a success with the details of the new security role.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SecuritySettings: *Modify*

Table 480: POST Security Roles {id} Copy Input Parameters

Name	In	Description						
id	Path	<p>Required. The Keyfactor Command reference ID of the security role from which to copy role information.</p> <p>Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1622) to retrieve a list of all the security roles to determine the role's ID.</p>						
role	Body	<p>An array containing information about the new security role to create. Role details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. A string containing the short reference name for the security role.</td> </tr> <tr> <td>Description</td> <td>Required. A string containing the description for the security role.</td> </tr> </tbody> </table>	Name	Description	Name	Required. A string containing the short reference name for the security role.	Description	Required. A string containing the description for the security role.
Name	Description							
Name	Required. A string containing the short reference name for the security role.							
Description	Required. A string containing the description for the security role.							

Table 481: POST Security Roles {id} Copy Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command identifier for the security identity.</td> </tr> <tr> <td>AccountName</td> <td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code></td> </tr> <tr> <td>IdentityType</td> <td>A string indicating the type of identity—User or Group.</td> </tr> <tr> <td>SID</td> <td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.25 SSH

The SSH component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 482: SSH Endpoints

Endpoint	Method	Description	Link
/Keys/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID on page 1664
/Keys/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on page 1665
/Keys/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 1666
/Keys/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 1669
/Keys/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 1673
/Keys/Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 1674
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1675

Endpoint	Method	Description	Link
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID on page 1678
/Logons/{id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on page 1679
/Logons/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1681
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1682
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1685
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on page 1687
/Servers/{id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 1687
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 1692
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 1694
/Servers/	POST	Creates a new SSH server.	POST SSH Servers on page 1698
/Servers/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1703
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1708
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1710

Endpoint	Method	Description	Link
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on page 1713
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on page 1714
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 1718
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1722
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1723
/ServerGroups/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 1728
/ServerGroups/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1735
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1742
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1743
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID on page 1746
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1748
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key	GET SSH Service

Endpoint	Method	Description	Link
		of an SSH service account with the specified ID.	Accounts Key ID on page 1754
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1758
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1760
/ServiceAccounts/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 1767
/ServiceAccounts/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1776
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1783
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID on page 1787
/Users/{id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on page 1787
/Users/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1792
/Users/	POST	Creates a new SSH user.	POST SSH Users on page 1801
/Users/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1802
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1804

3.2.25.1 SSH Keys

The SSH Keys component of the Keyfactor Web APIs includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference*)

Guide) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 483: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID below
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on the next page
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 1666
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 1669
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 1673
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 1674
Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1675

DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See [Unmanaged SSH Keys on page 504](#) in the *Keyfactor Command Reference Guide* for more information.

Table 484: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1675) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged ID

The *GET /SSH/Keys/Unmanaged/{id}* method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 485: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1675) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 486: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 1669](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *User* OR
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

Table 487: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	<p>Required*. A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>true</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p> Tip: This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.</p> </div>

Table 488: GET SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 1685](#), [POST SSH Server Groups Access on page 1743](#), and [POST SSH Servers Access on page 1710](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

SSH: *User* OR

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

Table 489: POST SSH Keys My Key Input Parameters

Name	In	Description								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	ECDSA	2	Ed25519	3	RSA
Numeric Value	Text Value									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Numeric Value</th> <th>Text Value</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	OpenSSH	2	PKCS8		
Numeric Value	Text Value									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Tip: This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see GET SSH Keys My Key on page 1666) and encrypt it with a different password, if desired.</p> </div>								
Comment	Body	<p>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment</p>								

Name	In	Description
		<p>field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div data-bbox="597 390 1411 554"> Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</div>

Table 490: POST SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *User* OR
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 491: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	Required. The Keyfactor Command reference ID for the SSH key.
Email	Body	Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its life-time.
Comment	Body	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.

Table 492: PUT SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 567 in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See [Unmanaged SSH Keys on page 504](#) in the *Keyfactor Command Reference Guide* for more information.

Table 493: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4, 27, 89]</pre> <p>Use the GET /SSH/Keys/Unmanaged method (see GET SSH Keys Unmanaged below) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged

The [GET /SSH/Keys/Unmanaged](#) method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 494: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Unmanaged Keys Search on page 506</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DiscoveredDate</i> • <i>KeyComments</i> • <i>KeyLength</i> • <i>KeyType</i> • <i>ServerId</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 495: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.25.2 SSH Logons

The SSH Logons component of the Keyfactor Web APIs includes methods necessary to view and manage the Linux user accounts associated with authorized_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 496: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH

Endpoint	Method	Description	Link
			Logons ID on the next page
/id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on the next page
/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1681
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1682
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1685

DELETE SSH Logons ID

The DELETE `/SSH/Logons/{id}` method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Note: Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 497: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH logon to be deleted. Use the <code>GET /SSH/Logons</code> method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Logons ID

The GET /SSH/Logons/{id} method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 498: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 499: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 500: GET SSH Logons Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search on page 537</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>Id</i> (Login ID)• <i>LastLogon</i>• <i>Hostname</i> (Logon Server Name)• <i>LogonUserUsername</i>• <i>ServerId</i>• <i>UnmanagedKeyId</i>• <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 501: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 SSH: *ServerAdmin* OR
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 502: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	Required. A string indicating the user's logon name on the Linux server.
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created. Use the GET /SSH/Servers method (see GET SSH Servers on page 1694) to retrieve a list of all the SSH servers to determine the server's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <p>[4, 7, 19]</p> </div> See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts. Use the GET /SSH/Users method (see GET SSH Users on page 1792) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.

Table 503: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td> </tr> <tr> <td>Hostname</td> <td>A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>UnderManagement</td> <td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td> </tr> <tr> <td>GroupName</td> <td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See SSH Servers on page 525 in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Logons Access

The POST `/SSH/Logons/Access` method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 504: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon. Use the GET /SSH/Logons method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: [4, 7, 19] Use the GET /SSH/Users method (see GET SSH Users on page 1792) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.

Table 505: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	<p>An array of key/value pairs providing information about the users mapped to the logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.25.3 SSH Servers

The SSH Servers component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 506: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on the next page
/id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on the next page
/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 1692
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 1694

Endpoint	Method	Description	Link
/	POST	Creates a new SSH server.	POST SSH Servers on page 1698
/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1703
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1708
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1710

DELETE SSH Servers ID

The DELETE `/SSH/Servers/{id}` method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 507: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server to be deleted. Use the <code>GET /SSH/Servers</code> method (see GET SSH Servers on page 1694) to retrieve a list of all the SSH servers to determine the server's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers ID

The GET `/SSH/Servers/{id}` method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 508: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server to be retrieved. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1694) to retrieve a list of all the SSH servers to determine the server's ID.

Table 509: GET SSH Servers {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time												
Name	Description																
Time	The date and time to next run the job. The date and time

Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p data-bbox="440 1432 1360 1495">A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div data-bbox="440 1520 1411 1612"> <p> Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</p> </div>										
Owner	<p data-bbox="440 1648 1385 1774">An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed. For more information about the orchestrator, see Bash Orchestrator on page 2425 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers Access ID

The GET /SSH/Servers/Access/{id} method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 510: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on the next page) to retrieve a list of all the SSH servers to determine the server's ID.

Table 511: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes: <table border="1" data-bbox="402 762 1409 1486"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes: <table border="1" data-bbox="621 1083 1390 1472"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes: <table border="1" data-bbox="621 1083 1390 1472"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes: <table border="1" data-bbox="621 1083 1390 1472"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 512: GET SSH Servers Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search on page 531</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>Agent</i> (Agent ID)• <i>Hostname</i>• <i>Orchestrator</i> (ClientMachine)• <i>ServerGroup</i> (Server Group Id)• <i>ServerGroupName</i>• <i>ServerGroupOwner</i> (Username)• <i>EnforcePublishPolicy</i> (UnderManagement) (true, false)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Hostname</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 513: GET SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>								

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>						
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>						

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed. For more information about the orchestrator, see Bash Orchestrator on page 2425 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1728](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 717](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 514: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	Required. A string indicating the hostname of the SSH server.
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
UnderManagement	Body	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 515: POST SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed. For more information about the orchestrator, see Bash Orchestrator on page 2425 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 516: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	Required. The Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>
Port	Body	The port that is configured for SSH on the SSH server. The default is 22.

Table 517: PUT SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Owner	<p data-bbox="440 1648 1385 1776">An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>												

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed. For more information about the orchestrator, see Bash Orchestrator on page 2425 in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i> .						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a

mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 518: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p>Required. An array containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.							

Table 519: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonId</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Servers Access

The POST /SSH/Servers/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 SSH: *ServerAdmin* OR
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 520: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<p>Required. An array containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 521: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.

3.2.25.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor Web APIs includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 522: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on the

Endpoint	Method	Description	Link
			next page
/id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on the next page
/name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 1718
/Access/id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1722
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1723
/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 1728
/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1735
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1742
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1743

DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *EnterpriseAdmin*

Table 523: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted. Use the GET /SSH/ServerGroups method (see GET SSH Server Groups on page 1723) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups ID

The [GET /SSH/ServerGroups/{id}](#) method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 524: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved. Use the GET /SSH/ServerGroups method (see GET SSH Server Groups on page 1723) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Table 525: GET SSH Server Groups {id} Response Data

Name	Description												
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.												
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.												
GroupName	A string indicating the name of the SSH server group.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>								

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).						
ServerCount	An integer indicating the number of SSH servers that belong to the server group.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 526: GET SSH Server Groups {name} Input Parameters

GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 528: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on the next page) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 529: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td> </tr> </tbody> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to

specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 530: GET SSH Server Groups Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> : Using the Server Group Search on page 524 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>GroupId</i> • <i>GroupName</i> • <i>Owner</i> (Owner ID) • <i>OwnerName</i> (Username) • <i>EnforcePublishPolicy</i> (Under Management) (true, false)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 531: GET SSH Server Groups Response Data

Name	Description												
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.												
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group.												
GroupName	A string indicating the name of the SSH server group.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>		
Name	Description						
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td> </tr> <tr> <td>Days</td> <td> <p>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p> </td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>	Days	<p>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>
Name	Description						
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>						
Days	<p>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>						

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).						
ServerCount	An integer indicating the number of SSH servers that belong to the server group.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *EnterpriseAdmin*

Table 532: POST SSH Server Groups Input Parameters

Name	In	Description																
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</p>																
GroupName	Body	<p>Required. A string indicating the name of the SSH server group.</p>																
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description						
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>						
Days	<p>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</p>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>						

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).						
ServerCount	An integer indicating the number of SSH servers that belong to the server group.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 534: PUT SSH Server Groups Input Parameters

Name	In	Description												
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner. </div>												
GroupName	Body	Required. A string indicating the name of the SSH server group.												
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description							
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).							
Day	The number of the day, in the month, to run the job.							
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).						
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 536: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	An array containing information for the Linux logon(s) to update. The following information should be included: <table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td></tr></tbody></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 537: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 SSH: *ServerAdmin* OR
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 538: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<p>Required. An array containing information for the Linux logon(s) to update. The following information should be included:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td>A string indicating the name of the Linux logon.</td> </tr> <tr> <td>Users</td> <td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td> </tr> </tbody> </table> <p>For example:</p> <pre> "LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\jsmith"] }] </pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 539: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LogonName</td> <td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td> </tr> <tr> <td>Users</td> <td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td> </tr> </tbody> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> <tr> <td>Username</td> <td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td> </tr> </tbody> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See SSH on page 475 in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.25.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 540: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID below
/id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1748
/Key/id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 1754
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1758
/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1760
/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 1767
/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1776
/Rotate/id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1783

DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/id} method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 SSH: *ServerAdmin* OR
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 541: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1760) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <i>GET /SSH/ServiceAccounts</i>:</p> <pre data-bbox="613 583 1325 1556"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } } </pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key. </div>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1754](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 542: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved. Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1760) to retrieve a list of all the SSH service accounts to determine the service account's ID.

Table 543: GET SSH Service Accounts {id} Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 544 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts Key ID

The GET /SSH/ServiceAccounts/Key/{id} method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 544: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on page 1760) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Tip: Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="727 621 1403 1619"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_ access2@appsrvr80.keyexample.com" } } </pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. • ID 7: The service account user's ID. </div>

Name	In	Description
		 <ul style="list-style-type: none"> ID 36: The ID of the service account user's key. Use this one to request the key.
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Phrase header must be supplied.

Table 545: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 567 in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Name	In	Description
ids	Body	<p>Required. An array of Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre>[4,12,17]</pre> <p>Use the GET /SSH/ServiceAccounts method (see GET SSH Service Accounts on the next page) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre>{ "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key. </div>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1754](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 547: GET SSH Service Accounts Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Service Account Key Search on page 502</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CreationDate</i> • <i>Id</i> • <i>Comments</i> (Key comments) • <i>KeyLength</i> • <i>KeyType</i> • <i>ServerGroup</i> (Server Group ID) • <i>ServerGroupName</i> • <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 548: GET SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 544 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.																				
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.																				
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1728](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 717](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 549: POST SSH Service Accounts Input Parameters

Name	In	Description																						
KeyGenerationRequest	Body	<p>Required. An array that set the information to include in the SSH key pair request. Key generation request details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>KeyType</td> <td> <p>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Password	Required. A string that sets a password used to secure the private key of the SSH key pair for download.	Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.									
Password	Required. A string that sets a password used to secure the private key of the SSH key pair for download.									
Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.									
User	Body	<p>Required. An array containing information about the service account user. User details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Username</td> <td>Required. A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i>, is used to build the full user name (e.g. myapp@appsrvr75).</td> </tr> <tr> <td>LogonIds</td> <td>An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.</td> </tr> </tbody> </table>	Name	Description	Username	Required. A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i> , is used to build the full user name (e.g. myapp@appsrvr75).	LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.		
Name	Description									
Username	Required. A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i> , is used to build the full user name (e.g. myapp@appsrvr75).									
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.									
ClientHostname	Body	<p>Required. A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to use the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast).</p>								

Name	In	Description
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 544 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 550: POST SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 544 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td> <p>An array providing the inventory schedule for the SSH server group. LogonCount	<p>An integer indicating the number of Linux logons associated with the SSH key pair.</p>																				
Username	<p>A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).</p>																				

Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 551: PUT SSH Service Accounts Input Parameters

Name	In	Description								
KeyUpdateRequest	Body	<p>Required. An array that sets the information to include in the SSH service account key update request. Key update request information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>Required. The Keyfactor Command reference ID for the service account's key.</td> </tr> <tr> <td>Email</td> <td>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</td> </tr> <tr> <td>Comment</td> <td>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</td> </tr> </tbody> </table>	Name	Description	Id	Required. The Keyfactor Command reference ID for the service account's key.	Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Id	Required. The Keyfactor Command reference ID for the service account's key.									
Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.									
Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<p>Required. The Keyfactor Command reference ID for the service account. Use the GET /SSH/ServiceAccounts method (see GET SSH Service Accounts on page 1760) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>								

Table 552: PUT SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See SSH Permissions on page 544 in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td> </tr> <tr> <td>Owner</td> <td> <p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>GroupName</td> <td>A string indicating the name of the SSH server group.</td> </tr> <tr> <td>SyncSchedule</td> <td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See SSH Server Groups on page 509 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the user who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																				
	generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																				
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																				
CreationDate	The date, in UTC, on which the SSH key pair was created.																				
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 567 in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.																				
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.																				
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.																				
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).																				

Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Service Accounts Rotate ID

The POST `/SSH/ServiceAccounts/Rotate/{id}` method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 553: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on page 1760) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre data-bbox="719 653 1393 1654"> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAln+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_ access2@appsrvr80.keyexample.com" } } </pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one to rotate the key. • ID 7: The service account user's ID. </div>

Name	In	Description								
		 <ul style="list-style-type: none"> ID 36: The ID of the service account user's key. 								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>ECDSA</td> </tr> <tr> <td>2</td> <td>Ed25519</td> </tr> <tr> <td>3</td> <td>RSA</td> </tr> </tbody> </table>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>OpenSSH</td> </tr> <tr> <td>2</td> <td>PKCS8</td> </tr> </tbody> </table>	Value	Description	1	OpenSSH	2	PKCS8		
Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p>								
Comment	Body	<p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p>								

Table 554: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.25.6 SSH Users

The SSH Users component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 555: SSH Users Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID below
/id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID below
/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1792
/	POST	Creates a new SSH user.	POST SSH Users on page 1801
/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1802
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1804

DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin*

Table 556: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1792) to retrieve a list of all the SSH users to determine the user's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See [SSH on page 475](#) in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET

/SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1666](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1754](#)) for a service account.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 711](#).

Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 557: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1792) to retrieve a list of all the SSH users to determine the user's ID.

Table 558: GET SSH Users {id} v2 Response Data

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Users

The GET */SSH/Users* method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See [SSH on page 475](#) in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET */SSH/Keys/MyKey* method (see [GET SSH Keys My Key on page 1666](#)) for user accounts and the GET */SSH/ServiceAccounts/Key/{id}* method (see [GET SSH Service Accounts Key ID on page 1754](#)) for service accounts.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 711](#).

Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 561: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1694) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1723) to determine ownership of a server or server group.</p> <div data-bbox="618 621 1411 1188" style="background-color: #fff9c4; padding: 10px;"> <p> Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div data-bbox="618 1220 1411 1730" style="background-color: #fff9c4; padding: 10px;"> <p> Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> </div>

Name	In	Description
		 Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search on page 531</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Email</i> • <i>Fingerprint</i> • <i>IsServiceAccount</i> • <i>KeyLength</i> • <i>KeyType</i> • <i>LogonCount</i> • <i>LogonServerGroupId</i> • <i>LogonServerId</i> • <i>ServiceAccountId</i> • <i>StaleDate</i> • <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 562: GET SSH Users v2 Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																				
Key	<p>An array containing information about the key for the user. Key details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td> </tr> <tr> <td>Fingerprint</td> <td>A string indicating the fingerprint of the public key. Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.		
Name	Description								
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.								
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.								
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).								
Access	<p>An array containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An array containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An array containing information about the users mapped to the Linux logon.
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.								
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.								
Access	An array containing information about the users mapped to the Linux logon.								
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).								

Version 1

Version 1 of the GET */SSH/Users* method includes the same capabilities as version 2, but offers more limited information on returned logons for the user.

Table 563: GET SSH Users v1 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1694) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1723) to determine ownership of a server or server group.</p> <div data-bbox="618 617 1411 1188" style="background-color: #fff9c4; padding: 10px; border: 1px solid #ccc;"> <p> Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div data-bbox="618 1213 1411 1732" style="background-color: #fff9c4; padding: 10px; border: 1px solid #ccc;"> <p> Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> </div>

Name	In	Description
		 Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search on page 531</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 564: GET SSH Users v1 Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.

Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>																				

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Users

The POST */SSH/Users* method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 565: POST SSH Users Input Parameters

Name	In	Description
Username	Body	Required. A string indicating the full username of the <i>user</i> or <i>service account</i> . For a <i>user</i> account, the username is given in DOMAIN\\username format (e.g. KEYEXAMPLE\\jsmith). For a <i>service account</i> , the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. chee-setoast). The full service account name is given in the form username@clienthostname (e.g. svc_myapp@appsvr75).
LogonIds	Body	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: <pre>[12, 27, 39]</pre> Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID(s).

Table 566: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Table 567: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID of the SSH user. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1792) to retrieve a list of all the SSH users to determine the user's ID.
LogonIds	Body	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: [12, 27, 39] Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID(s). Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1792) before updating and provide both existing and new logon IDs.

Table 568: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Users Access

The POST `/SSH/Users/Access` method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SSH: `ServerAdmin` OR
SSH: `EnterpriseAdmin`

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the `ServerAdmin` role. For more information, see [SSH Permissions on page 544](#) in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 569: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID of the SSH user. Use the <code>GET/SSH/Users</code> method (see GET SSH Users on page 1792) to retrieve a list of all the SSH users to determine the user's ID.
LogonIds	Body	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: [12, 27, 39] Use the <code>GET/SSH/Logons</code> method (see GET SSH Logons on page 1681) to retrieve a list of all the SSH logons to determine the logon's ID(s). Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1792) before updating and provide both existing and new logon IDs.

Table 570: POST SSH Users Access Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.

See Application Settings: SSH Tab on page 567 in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																				
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																				
PublicKey	A string indicating the public key of the key pair for the SSH user.																				
KeyType	<p>A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																				
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																				
CreationDate	The date, in UTC, on which the SSH key pair was created.																				
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See Application Settings: SSH Tab on page 567 in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																				
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>																				

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td> </tr> <tr> <td>LogonCount</td> <td>An integer indicating the number of Linux logons associated with the SSH key pair.</td> </tr> </tbody> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description										
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
Access	<p>An array containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td> </tr> <tr> <td>Username</td> <td>A string indicating the user's logon name on the Linux server.</td> </tr> <tr> <td>KeyCount</td> <td>An integer indicating the number of SSH keys associated with the Linux logon.</td> </tr> <tr> <td>Access</td> <td>An array containing information about the users mapped to the Linux logon.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	Username	A string indicating the user's logon name on the Linux server.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An array containing information about the users mapped to the Linux logon.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.										
Username	A string indicating the user's logon name on the Linux server.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.										
Access	An array containing information about the users mapped to the Linux logon.										
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.26 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 571: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	GET SMTP on the next page

Endpoint	Method	Description	Link
/	PUT	Updates settings for the SMTP configuration profile.	PUT SMTP on page 1809
/Test	POST	Sends a test email message to confirm SMTP configuration.	POST SMTP Test on page 1811

3.2.26.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SystemSettings: *Read*

Table 572: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future release.</p>						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.26.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SystemSettings: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 573: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="667 653 1411 848"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	Required* . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	Required* . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	Required. A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Table 574: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.26.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SystemSettings: *Modify*

Table 575: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	Required. An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	An integer indicating the type of authentication used to connect to the mail server. Possible values are: <table border="1" data-bbox="667 653 1411 848"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	Required* . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2. No data is output in this field on a GET.						
RelayUsername	Body	Required* . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2. For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	Body	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). This is considered deprecated and may be removed in a future release.						
SenderName	Body	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						

Name	In	Description
TestRecipient	Body	Required. A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 576: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Anonymous</td> </tr> <tr> <td>2</td> <td>Explicit Credentials</td> </tr> </tbody> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
TestRecipient	A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 577: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	GET SSL Parts ID on the next page
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	GET SSL Endpoints ID on page 1820
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	DELETE SSL NetworkRanges ID on page 1821
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	GET SSL NetworkRanges ID on page 1822
/Networks/{identifier}	GET	Returns information about the specified SSL network.	GET SSL Networks Identifier on page 1823
/	GET	Returns the results of an SSL scan based on query information.	GET SSL on page 1831
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	GET SSL Networks on page 1833
/Networks	POST	Creates a new SSL network.	POST SSL Networks on page 1842
/Networks	PUT	Updates an existing SSL network.	PUT SSL Networks on page 1854
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	GET SSL Endpoints ID History on page 1866
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	GET SSL Networks ID Parts on page 1872
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	POST SSL NetworkRanges on page 1873

Endpoint	Method	Description	Link
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	PUT SSL NetworkRanges on page 1874
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	PUT SSL Endpoints Review Status on page 1875
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	PUT SSL Endpoints Monitor Status on page 1876
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Review All on page 1876
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Monitor All on page 1877
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	POST SSL Networks ID Scan on page 1877
/NetworkRanges/Validate	POST	Validates all SSL networks given.	POST SSL NetworkRanges Validate on page 1878
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	DELETE SSL Networks ID on page 1879

3.2.27.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 1872](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 578: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved. Use the <i>GET /SSL/Networks/{id}/Parts</i> method (see GET SSL Networks ID Parts on page 1872) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.

Table 579: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	The Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	The Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	The Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning. The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in Application Settings: Agents Tab on page 560 in the <i>Keyfactor Command Reference Guide</i>).								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="613 823 1411 1073"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.								
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 580: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see GET SSL on page 1831) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 581: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
NetworkId	The Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	The Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	The IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.3 DELETE SSL NetworkRanges ID

The DELETE /SSL/NetworkRanges/{id} method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Tip: To delete some but not all of the network ranges for a network, use the *PUT /SSL/Networks* method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 1854](#)).

Table 582: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.4 GET SSL NetworkRanges ID

The GET /SSL/NetworkRanges/{id} method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 583: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 584: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table border="1" data-bbox="381 1150 1411 1459"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>IP Address</td> </tr> <tr> <td>2</td> <td>Host Name</td> </tr> <tr> <td>3</td> <td>Network Notation</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.5 GET SSL Networks Identifier

The GET /SSL/Networks/{identifier} method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 585: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 586: GET SSL Networks {id} Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 430 in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>} </td> </tr> </tbody> </table>	Name	Description		}		
Name	Description						
	}						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description		<pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre>		
Name	Description						
	<pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre> "Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre> "ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" } </pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						

Name	Description																
MonitorSchedule	<p>An array providing the monitoring schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<pre>"Time": "2022-02-27T17:30:00Z" }</pre>								
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled		
Value	Description								
0	Unknown								
1	Not Scheduled								

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours				
Value	Description																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																

Name	Description
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 587: GET SSL Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Using the Discovery Results Search Feature on page 433</i> section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentPoolName</i> • <i>CertificateCN</i> • <i>CertificateFound</i> (True, False) • <i>Status</i> (6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4- Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown) • <i>IpAddress</i> • <i>IsMonitored</i> (True, False) • <i>IssuerDN</i> • <i>NetworkName</i> • <i>Port</i> • <i>ReverseDNS</i> • <i>Reviewed</i> (True, False) • <i>SelfSigned</i> (True, False) • <i>SNIName</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 588: GET SSL Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 589: GET SSL Networks Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search on page 427</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Name</i> • <i>Pool</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 590: GET SSL Networks Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 430 in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; background-color: #e6ffe6; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; background-color: #e6ffe6; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; background-color: #e6ffe6; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>} </td> </tr> </tbody> </table>	Name	Description		}		
Name	Description						
	}						
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Days</td> <td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description		<pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre>		
Name	Description						
	<pre> "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre>						
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre> "Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre> "ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" } </pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						

Name	Description																
MonitorSchedule	<p>An array providing the monitoring schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<pre>"Time": "2022-02-27T17:30:00Z" }</pre>								
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled		
Value	Description								
0	Unknown								
1	Not Scheduled								

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours				
Value	Description																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																

Name	Description
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.8 POST SSL Networks

The POST /SSL/Networks method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 591: POST SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>} </td> </tr> </tbody> </table>	Name	Description		}		
Name	Description							
	}							
	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Name	Description																			
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																			
DiscoverPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																		
Monit-	Body	An integer indicating the percentage complete for a monitoring job. The percentage																		

Name	In	Description																
orPercentComplete		complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Body	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Body	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
DiscoverLastScanned	Body	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
MonitorLastScanned	Body	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																

Name	In	Description
		This field is for reference and is not configurable.
SslAlertRecipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Body	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Body	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> "QuietHours": [{ "StartDay": "Monday", "StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", </pre>

Name	In	Description
		<pre data-bbox="553 268 1409 405"> "EndTime": "2022-11-27T16:00:08Z" }]</pre>

Table 592: POST SSL Networks Response Data

Name	Description								
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.								
Name	A string indicating the name for the SSL network.								
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 430 in the <i>Keyfactor Command Reference Guide</i> for more information.								
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.								
Description	A string indicating the description of the SSL network.								
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.								
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.								
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="544 1459 1412 1701"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running
Value	Description								
0	Unknown								
1	Not Scheduled								
2	Running								

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours						
Value	Description																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.</p> </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network																

Name	Description
	activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔗) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.9 PUT SSL Networks

The PUT /SSL/Networks method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 593: PUT SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description

Name	Description																			
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																			
DiscoverPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																		
Monit-	Body	An integer indicating the percentage complete for a monitoring job. The percentage																		

Name	In	Description																
orPercentComplete		complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Body	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours

3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Body	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> <tr> <td>3</td> <td>Previously Scanned</td> </tr> <tr> <td>4</td> <td>Scheduled</td> </tr> <tr> <td>5</td> <td>Disabled</td> </tr> <tr> <td>6</td> <td>In Quiet Hours</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
DiscoverLastScanned	Body	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
MonitorLastScanned	Body	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																

Name	In	Description
		This field is for reference and is not configurable.
SslAlertRecipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Body	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Body	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> "QuietHours": [{ "StartDay": "Monday", "StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", </pre>

Name	In	Description

Table 594: PUT SSL Networks Response Data

Name	Description								
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.								
Name	A string indicating the name for the SSL network.								
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See Orchestrator Pools Definition on page 430 in the <i>Keyfactor Command Reference Guide</i> for more information.								
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.								
Description	A string indicating the description of the SSL network.								
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.								
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.								
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are: <table border="1" data-bbox="544 1459 1412 1701"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Not Scheduled</td> </tr> <tr> <td>2</td> <td>Running</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running

AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network																

Name	Description
	activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.10 GET SSL Endpoints ID History

The GET /SSL/Endpoints/{id}/History method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the specified endpoint.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 595: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint for which to return history information. Use the <i>GET/SSL</i> method (see GET SSL on page 1831) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 596: GET SSL Endpoints {id} History Response Data

Name	Description																																
HistoryId	The Keyfactor Command reference GUID for the history entry.																																
EndpointId	The Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	The Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	The date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>TimeOutConnecting</td> </tr> <tr> <td>2</td> <td>ExceptionConnecting</td> </tr> <tr> <td>3</td> <td>TimeoutDownloading</td> </tr> <tr> <td>4</td> <td>ExceptionDownloading</td> </tr> <tr> <td>5</td> <td>NotSsl</td> </tr> <tr> <td>6</td> <td>CertificateFound</td> </tr> <tr> <td>7</td> <td>ExceptionInSql</td> </tr> <tr> <td>8</td> <td>InvalidOrUnreachableHost</td> </tr> <tr> <td>9</td> <td>ConnectionRefused</td> </tr> <tr> <td>10</td> <td>BadSslHandshake</td> </tr> <tr> <td>11</td> <td>ClientAuthenticationFailed</td> </tr> <tr> <td>12</td> <td>NoCertificate</td> </tr> <tr> <td>13</td> <td>SslRefused</td> </tr> <tr> <td>14</td> <td>NotProbed</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	TimeOutConnecting	2	ExceptionConnecting	3	TimeoutDownloading	4	ExceptionDownloading	5	NotSsl	6	CertificateFound	7	ExceptionInSql	8	InvalidOrUnreachableHost	9	ConnectionRefused	10	BadSslHandshake	11	ClientAuthenticationFailed	12	NoCertificate	13	SslRefused	14	NotProbed
Value	Description																																
0	Unknown																																
1	TimeOutConnecting																																
2	ExceptionConnecting																																
3	TimeoutDownloading																																
4	ExceptionDownloading																																
5	NotSsl																																
6	CertificateFound																																
7	ExceptionInSql																																
8	InvalidOrUnreachableHost																																
9	ConnectionRefused																																
10	BadSslHandshake																																
11	ClientAuthenticationFailed																																
12	NoCertificate																																
13	SslRefused																																
14	NotProbed																																
JobType	An integer containing the type of scan job from which the history entry was created. The possible values are:																																

Name	Description																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Discovery</td> </tr> <tr> <td>2</td> <td>Monitoring</td> </tr> <tr> <td>3</td> <td>Compliance</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance						
Value	Description																
0	Unknown																
1	Discovery																
2	Monitoring																
3	Compliance																
ProbeType	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>SSLv2</td> </tr> <tr> <td>3</td> <td>TLS</td> </tr> </tbody> </table>	Value	Description	2	SSLv2	3	TLS										
Value	Description																
2	SSLv2																
3	TLS																
ReverseDNS	A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.																
HistoryCertificates	<p>An array of certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>NotBefore</td> <td>The date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>NotAfter</td> <td>The date, in UTC, on which the certificate expires.</td> </tr> <tr> <td>SigningAlgorithm</td> <td>A string indicating the algorithm used to sign the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	The date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																
IssuedDN	A string indicating the distinguished name of the certificate.																
SerialNumber	A string indicating the serial number of the certificate.																
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																
NotAfter	The date, in UTC, on which the certificate expires.																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																

Name	Description						
	<table border="1"><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>IssuerDN</td><td>A string indicating the distinguished name of the issuer.</td></tr><tr><td>IssuedCN</td><td>A string indicating the common name of the certificate.</td></tr></tbody></table>	Name	Description	IssuerDN	A string indicating the distinguished name of the issuer.	IssuedCN	A string indicating the common name of the certificate.
Name	Description						
IssuerDN	A string indicating the distinguished name of the issuer.						
IssuedCN	A string indicating the common name of the certificate.						

Name	Description																																				
SubjectAltNameElements	<p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address																																				
4	Directory Name																																				
5	Ediparty Name																																				
6	Uniform Resource Identifier																																				
7	IP Address																																				
8	Registered Id																																				
100	MS_NTPrincipalName																																				
101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in [Application Settings: Agents Tab on page 560](#) in the *Keyfactor Command Reference Guide*). The results from this method are of the currently in progress job or the latest completed job.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 597: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search on page 427</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 598: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	An integer indicating the status of the scan job segment. Possible values are: <table border="1" data-bbox="436 491 1411 737"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Not Started</td> </tr> <tr> <td>2</td> <td>In Progress</td> </tr> <tr> <td>3</td> <td>Complete</td> </tr> </tbody> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 599: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	Required. The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see GET SSL Networks on page 1833) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 600: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	Required. The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see GET SSL Networks on page 1833) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 601: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the GET /SSL method (see GET SSL on page 1831) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 602: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the <i>GET /SSL</i> method (see GET SSL on page 1831) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 603: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature on page 433 section.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 604: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature on page 433 section.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.18 POST SSL Networks ID Scan

The POST /SSL/Networks/{id}/Scan method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 605: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the GET /SSL/Networks method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.19 POST SSL Networks ID Reset

The POST `/SSL/Networks/{id}/Reset` method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 606: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the GET /SSL/Networks method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.20 POST SSL NetworkRanges Validate

The POST `/SSL/NetworkRanges/Validate` method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network

range before using POST /SSL/NetworkRanges or PUT /SSL/NetworkRanges to configure it for an SSL network.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Read*

Table 607: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
networkRangesToVerify	Body	Required. An array of network ranges to validate. For example: <code>["10.5.4.0/24:443", "192.168.12.0/16:443,22", "keyexample.com:443"]</code>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.27.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SslManagement: *Modify*

Table 608: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1833) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.28 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 609: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	GET Status Endpoints below

3.2.28.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. There are no input parameters for this method. This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
None

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 610: Templates Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns information about the specified template.	GET Templates ID on the next page
/Settings	GET	Returns the global template policy settings.	GET Templates Settings on page 1894
/Settings	PUT	Sets global values for template policy.	PUT Templates Settings on page 1900
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	GET Templates Subject Parts on page 1913
/	GET	Returns a list of templates.	GET Templates on page 1914
/	PUT	Updates selected settings for the specified template.	PUT Templates on page 1924

Endpoint	Method	Description	Link
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	POST Templates/Import on page 1951

3.2.29.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

Table 611: GET Templates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see GET Templates on page 1914) to retrieve a list of all the templates to determine the template ID.

Table 612: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name>_<certificate profile name>. This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name> (<certificate profile name>). This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description														
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.														
Options	For multiple choice values, an array of strings containing the value choices.														
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.								
Value	Description														
1	String: A free-form data entry field.														
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.														
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>The Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>MetadataId</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> </tbody> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.						
Name	Description														
Id	The Keyfactor Command reference ID of the template-specific metadata setting.														
DefaultValue	A string containing the default value defined for the metadata field for the specific template.														
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.														

Name	Description								
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>								
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple</i></p>								

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>choice.</i></td> </tr> </tbody> </table>	Name	Description		<i>choice.</i>														
Name	Description																		
	<i>choice.</i>																		
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment & PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> <tr> <td>5</td> <td>CSR Generation & PFX Enrollment</td> </tr> <tr> <td>6</td> <td>CSR Generation & CSR Enrollment</td> </tr> <tr> <td>7</td> <td>CSR Enrollment, PFX Enrollment & CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	<p>An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1894. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Templateld</td> <td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> </tbody> </table>	Name	Description	Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Name	Description																		
Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		

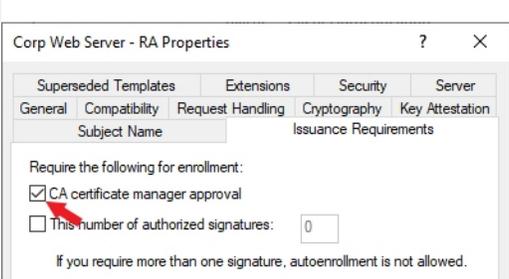

Name	Description												
	<table border="1"> <thead> <tr> <th data-bbox="472 268 630 325">Name</th> <th data-bbox="630 268 1430 325">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 325 630 1711">RegEx</td> <td data-bbox="630 325 1430 1711"> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the Value	Description														
	<p>algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>														
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.														
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.														
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.														
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).														
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).														
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the														

Name	Description												
	Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.												
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.												
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.												
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft CA <i>certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p> Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 425: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>												
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="472 1423 1414 1703"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
Value	Function	Description											
0	None	No key usage parameters.											
1	Encipherment Only	The key can be used for encryption only.											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).											

Name	Description																								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
4	Key Certificate Signing	The key can be used to sign certificates.																							
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 																								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings.

Tip: Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1924](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

There are no input parameters for this method.

Table 613: GET Templates Settings Response Data

Value	Description												
TemplateRegexes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organization)</td> <td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example,</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). RSASValidKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are: <ul style="list-style-type: none"> • 2048 • 4096 												
ECCValidCurves	An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").												
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.												

Value	Description
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).

For example:

```

"TemplatePolicy": {
  "RSASValidKeySizes": [
    2048,
    4096
  ],
  "ECCValidCurves": [
    "1.2.840.10045.3.1.7",
    "1.3.132.0.34"
    "1.3.132.0.35"
  ],
  "AllowKeyReuse": false,
  "AllowWildcards": true,
  "RFCEnforcement": true,
  "AllowEd448": false,
  "AllowEd25519": false
}

```

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

Tip: Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1924](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Note: Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 614: PUT Templates Settings Input Parameters

Value	Description												
TemplateRegexes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organization)</td> <td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example,</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p>												

Value	Description
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).

For example:

```

"TemplatePolicy": {
  "RSASValidKeySizes": [
    2048,
    4096
  ],
  "ECCValidCurves": [
    "1.2.840.10045.3.1.7",
    "1.3.132.0.34",
    "1.3.132.0.35"
  ],
  "AllowKeyReuse": false,
  "AllowWildcards": true,
  "RFCEnforcement": true,
  "AllowEd448": false,
  "AllowEd25519": false
}

```

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: Read

Table 616: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

Table 617: GET Templates Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Template Search Feature on page 352</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AllowedEnrollmentType</i> (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None) • <i>DisplayName</i> • <i>FriendlyName</i> • <i>ForestRoot</i> (deprecated) • <i>ConfigurationTenant</i> • <i>HasPrivateKeyRetention</i> (True, False) • <i>IsDefaultTemplate</i> (True, False) • <i>KeyType</i> (Unknown, RSA, DSA, ECC, DH) • <i>ShortName</i> <div style="background-color: #e6f2e6; padding: 10px; margin-top: 10px;"> <p> Tip: To filter out all the built-in Active Directory templates and display only your custom templates, use the following query: <code>IsDefaultTemplate -eq "false"</code> To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query: <code>AllowedEnrollmentType -eq "3"</code> A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment.</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 618: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name>_<certificate profile name>. This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name> (<certificate profile name>). This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.				
Name	Description																		
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																		
Options	For multiple choice values, an array of strings containing the value choices.																		
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.												
Value	Description																		
1	String: A free-form data entry field.																		
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																		
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment & PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> <tr> <td>5</td> <td>CSR Generation & PFX Enrollment</td> </tr> <tr> <td>6</td> <td>CSR Generation & CSR Enrollment</td> </tr> <tr> <td>7</td> <td>CSR Enrollment, PFX Enrollment & CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide																		

Name	Description												
	<p>regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1894. The template regular expression object contains the following parameters:</p> <table border="1" data-bbox="472 390 1412 640"> <thead> <tr> <th data-bbox="472 390 630 447">Name</th> <th data-bbox="630 390 1412 447">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 447 630 548">TemplatedId</td> <td data-bbox="630 447 1412 548">The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td data-bbox="472 548 630 640">SubjectPart</td> <td data-bbox="630 548 1412 640">A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> </tbody> </table> <p>RegEx</p> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1" data-bbox="651 926 1393 1661"> <thead> <tr> <th data-bbox="651 926 857 982">Subject Part</th> <th data-bbox="857 926 1393 982">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="651 982 857 1497">CN (Common Name)</td> <td data-bbox="857 982 1393 1497"> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre data-bbox="922 1247 1373 1310">^[a-zA-Z0-9' _ \. \-]*\keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="922 1388 1373 1409">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td data-bbox="651 1497 857 1661">O (Organization)</td> <td data-bbox="857 1497 1393 1661"> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> </td> </tr> </tbody> </table>	Name	Description	TemplatedId	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre data-bbox="922 1247 1373 1310">^[a-zA-Z0-9' _ \. \-]*\keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="922 1388 1373 1409">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p>
Name	Description												
TemplatedId	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Subject Part	Example												
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre data-bbox="922 1247 1373 1310">^[a-zA-Z0-9' _ \. \-]*\keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre data-bbox="922 1388 1373 1409">.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>												
O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p>												

Name	Description																				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td></td> <td> <code>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</code> The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash ("\") but the comma does not. </td> </tr> <tr> <td>OU (Organization Unit)</td> <td> This regular expression requires that the organizational unit entered in the field be one of these four departments: <code>^(?:IT HR Accounting E-Commerce)\$</code> </td> </tr> <tr> <td>L (City/Locality)</td> <td> This regular expression requires that the city entered in the field be one of these five cities: <code>^(?:Boston Chicago New York London Dallas)\$</code> </td> </tr> <tr> <td>ST (State/Province)</td> <td> This regular expression requires that the state entered in the field be one of these eight states: <code>^(?:Massachusetts Illinois New York Ontario Texas)\$</code> </td> </tr> <tr> <td>C (Country)</td> <td> This regular expression requires that the country entered in the field be either US or CA: <code>^(?:US CA)\$</code> </td> </tr> <tr> <td>E (Email)</td> <td> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com": <code>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</code> </td> </tr> <tr> <td>DNS (Subject Alternative Name: DNS)</td> <td> This regular expression specifies that the data entered in the field must consist of some number </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td></td> <td> <code>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</code> The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash ("\") but the comma does not. </td> </tr> <tr> <td>OU (Organization Unit)</td> <td> This regular expression requires that the organizational unit entered in the field be one of these four departments: <code>^(?:IT HR Accounting E-Commerce)\$</code> </td> </tr> <tr> <td>L (City/Locality)</td> <td> This regular expression requires that the city entered in the field be one of these five cities: <code>^(?:Boston Chicago New York London Dallas)\$</code> </td> </tr> <tr> <td>ST (State/Province)</td> <td> This regular expression requires that the state entered in the field be one of these eight states: <code>^(?:Massachusetts Illinois New York Ontario Texas)\$</code> </td> </tr> <tr> <td>C (Country)</td> <td> This regular expression requires that the country entered in the field be either US or CA: <code>^(?:US CA)\$</code> </td> </tr> <tr> <td>E (Email)</td> <td> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com": <code>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</code> </td> </tr> <tr> <td>DNS (Subject Alternative Name: DNS)</td> <td> This regular expression specifies that the data entered in the field must consist of some number </td> </tr> </tbody> </table>	Subject Part	Example		<code>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</code> The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash ("\") but the comma does not.	OU (Organization Unit)	This regular expression requires that the organizational unit entered in the field be one of these four departments: <code>^(?:IT HR Accounting E-Commerce)\$</code>	L (City/Locality)	This regular expression requires that the city entered in the field be one of these five cities: <code>^(?:Boston Chicago New York London Dallas)\$</code>	ST (State/Province)	This regular expression requires that the state entered in the field be one of these eight states: <code>^(?:Massachusetts Illinois New York Ontario Texas)\$</code>	C (Country)	This regular expression requires that the country entered in the field be either US or CA: <code>^(?:US CA)\$</code>	E (Email)	This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com": <code>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</code>	DNS (Subject Alternative Name: DNS)	This regular expression specifies that the data entered in the field must consist of some number
Name	Description																				
	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td></td> <td> <code>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</code> The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash ("\") but the comma does not. </td> </tr> <tr> <td>OU (Organization Unit)</td> <td> This regular expression requires that the organizational unit entered in the field be one of these four departments: <code>^(?:IT HR Accounting E-Commerce)\$</code> </td> </tr> <tr> <td>L (City/Locality)</td> <td> This regular expression requires that the city entered in the field be one of these five cities: <code>^(?:Boston Chicago New York London Dallas)\$</code> </td> </tr> <tr> <td>ST (State/Province)</td> <td> This regular expression requires that the state entered in the field be one of these eight states: <code>^(?:Massachusetts Illinois New York Ontario Texas)\$</code> </td> </tr> <tr> <td>C (Country)</td> <td> This regular expression requires that the country entered in the field be either US or CA: <code>^(?:US CA)\$</code> </td> </tr> <tr> <td>E (Email)</td> <td> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com": <code>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</code> </td> </tr> <tr> <td>DNS (Subject Alternative Name: DNS)</td> <td> This regular expression specifies that the data entered in the field must consist of some number </td> </tr> </tbody> </table>	Subject Part	Example		<code>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</code> The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash ("\") but the comma does not. Name	Description										
	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>UPN (Subject Alternative Name: User Principal Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example	UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre>						
Subject Part	Example										
UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*@keyexample\.com\$</pre>										
Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:") depending on the interface used). Your custom message follows this.										
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.										
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.										
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.										
RequiresApproval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).										

Name	Description
------	-------------

 **Important:** Any templates that are configured on the Microsoft CA Issuance Requirements tab for *CA certificate manager approval* cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for *KeyRetention*) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.

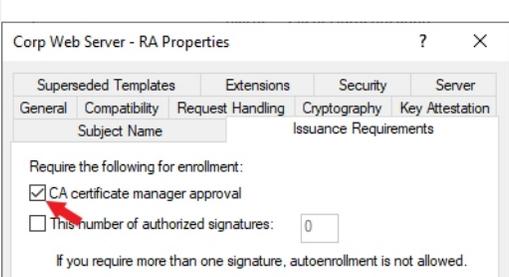

Figure 426: Microsoft Issuance Requirements on a Template for Manager Approval

KeyUsage An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:

Value	Function	Description
0	None	No key usage parameters.
1	Encipherment Only	The key can be used for encryption only.
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
4	Key Certificate Signing	The key can be used to sign certificates.
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.
16	Data Encipherment	The key can be used for data encryption.
32	Key Encipherment	The key can be used for key encryption.
64	Nonrepudiation	The key can be used for authentication.

Name	Description											
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.		
Value	Function	Description										
128	Digital Signature	The key can be used as a digital signature.										
32768	Decipherment Only	The key can be used for decryption only.										
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>			Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).	
Name	Description											
Id	An integer indicating the ID of the extended key usage in Active Directory.											
Oid	A string containing the object ID of the extended key usage.											
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).											

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 619: PUT Templates Input Parameters

Name	In	Description										
Id	Body	Required. An integer indicating the ID of the template in Keyfactor Command.										
KeySize	Body	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.										
KeyType	Body	A string indicating the key type of the template as defined by the CA. The field is not configurable.										
FriendlyName	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	Body	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
KeyRetentionDays	Body	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	Body	An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:										

Name	In	Description																
		<ul style="list-style-type: none"> Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;">  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Name</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are: <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table> <p>For example:</p> <pre style="background-color: #f9f9f9; padding: 10px; border: 1px solid #ccc;"> "EnrollmentFields": [{ "Id": 3, "Name": "MyCustomField", "Options": ["Green", "Red", "Yellow", "Blue"], "DataType": 2 }] </pre>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																	
Id	An integer indicating the ID of the custom enrollment field.																	
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																	
Options	For multiple choice values, an array of strings containing the value choices.																	
DataType	An integer indicating the parameter type. The options are: <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.											
Value	Description																	
1	String: A free-form data entry field.																	
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																	

Name	In	Description										
]										
MetadataFields	Body	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #4b4b8b; color: white;">Name</th> <th style="background-color: #4b4b8b; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>The Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>MetadataId</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> <tr> <td>Validation</td> <td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;">^[a-zA-Z0-9'_\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> </td> </tr> </tbody> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;">^[a-zA-Z0-9'_\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p>
Name	Description											
Id	The Keyfactor Command reference ID of the template-specific metadata setting.											
DefaultValue	A string containing the default value defined for the metadata field for the specific template.											
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.											
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;">^[a-zA-Z0-9'_\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p>

AllowedEnrollmentTypes	Body	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1" data-bbox="548 1108 1409 1661"> <thead> <tr> <th data-bbox="548 1108 740 1167">Value</th> <th data-bbox="740 1108 1409 1167">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 1167 740 1230">0</td> <td data-bbox="740 1167 1409 1230">None</td> </tr> <tr> <td data-bbox="548 1230 740 1293">1</td> <td data-bbox="740 1230 1409 1293">PFX Enrollment</td> </tr> <tr> <td data-bbox="548 1293 740 1356">2</td> <td data-bbox="740 1293 1409 1356">CSR Enrollment</td> </tr> <tr> <td data-bbox="548 1356 740 1419">3</td> <td data-bbox="740 1356 1409 1419">CSR Enrollment & PFX Enrollment</td> </tr> <tr> <td data-bbox="548 1419 740 1482">4</td> <td data-bbox="740 1419 1409 1482">CSR Generation</td> </tr> <tr> <td data-bbox="548 1482 740 1545">5</td> <td data-bbox="740 1482 1409 1545">CSR Generation & PFX Enrollment</td> </tr> <tr> <td data-bbox="548 1545 740 1608">6</td> <td data-bbox="740 1545 1409 1608">CSR Generation & CSR Enrollment</td> </tr> <tr> <td data-bbox="548 1608 740 1661">7</td> <td data-bbox="740 1608 1409 1661">CSR Enrollment, PFX Enrollment & CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation

	<table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>MAIL (Subject Alternative Name: Email)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre> </td> </tr> <tr> <td>UPN (Subject Alternative Name: User Principal Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre> </td> </tr> </tbody> </table>	Subject Part	Example	MAIL (Subject Alternative Name: Email)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre>	UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre>							
Subject Part	Example													
MAIL (Subject Alternative Name: Email)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre>													
UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*@keyexample\.com\$</pre>													
Error	<p>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</p>													
TemplateDefaults	Body	An object containing individual template-level template default settings. Template												

Name	In	Description						
		<p>defaults defined on a template apply to enrollments made with that template only. Template-level defaults, if defined, take precedence over system-wide template defaults. For more information about system-wide template defaults, see GET Templates Settings on page 1894. The template default object contains the following parameters:</p> <table border="1" data-bbox="548 422 1411 779"> <thead> <tr> <th data-bbox="548 422 740 485">Value</th> <th data-bbox="740 422 1411 485">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 485 740 688">SubjectPart</td> <td data-bbox="740 485 1411 688"> A string indicating the portion of the subject the default applies to (e.g. L for City/Locality). Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts. </td> </tr> <tr> <td data-bbox="548 688 740 779">Value</td> <td data-bbox="740 688 1411 779"> A string containing the value to assign as the default for that subject part (e.g. Chicago). </td> </tr> </tbody> </table> <p>For example:</p> <pre data-bbox="548 869 1411 1199"> "TemplateDefaults": [{ "SubjectPart": "L", "Value": "Denver" }, { "SubjectPart": "ST", "Value": "Colorado" }] </pre>	Value	Description	SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality). Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).
Value	Description							
SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality). Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.							
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).							
TemplatePolicy	Body	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see GET Templates Settings on page 1894. The template policy object contains the following parameters:</p> <table border="1" data-bbox="548 1419 1411 1705"> <thead> <tr> <th data-bbox="548 1419 797 1482">Value</th> <th data-bbox="797 1419 1411 1482">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 1482 797 1577">Tempalteld</td> <td data-bbox="797 1482 1411 1577"> The Keyfactor Command reference ID of the certificate template the policy is associated with. </td> </tr> <tr> <td data-bbox="548 1577 797 1705">RSAValidKeySizes</td> <td data-bbox="797 1577 1411 1705"> An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are: </td> </tr> </tbody> </table>	Value	Description	Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.	RSAValidKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:
Value	Description							
Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.							
RSAValidKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:							

Name	In	Description				
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <ul style="list-style-type: none"> • 2048 • 4096 </td> </tr> </tbody> </table>	Value	Description		<ul style="list-style-type: none"> • 2048 • 4096
Value	Description					
	<ul style="list-style-type: none"> • 2048 • 4096 					
		<p>ECCValidCurves</p> <p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>				
		<p>AllowKeyReuse</p> <p>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.</p>				
		<p>AllowWildcards</p> <p>A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.</p>				
		<p>RFCEnforcement</p> <p>A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</p>				
		<p>AllowEd448</p> <p>A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).</p>				
		<p>AllowEd25519</p> <p>A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).</p>				
		<p>For example:</p>				

Name	In	Description
		<pre data-bbox="552 273 1404 787"> "TemplatePolicy": { "TemplateId": 17, "RSAValidKeySizes": [2048, 4096], "ECCValidCurves": ["1.2.840.10045.3.1.7", "1.3.132.0.34", "1.3.132.0.35"], "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "AllowEd448": false, "AllowEd25519": false } </pre>
UseAllowedRequesters	Body	<p data-bbox="544 829 1412 1228">A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	Body	<p data-bbox="544 1260 1412 1323">An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p> <p data-bbox="544 1333 673 1354">For example:</p> <pre data-bbox="552 1386 1404 1575"> "AllowedRequesters": ["Administrator", "Power Users", "Revokers"] </pre>
RequiresApproval	Body	<p data-bbox="544 1612 1396 1675">A Boolean indicating whether the template has been configured with the Microsoft CA <i>certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="544 1690 1404 1753" style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p data-bbox="560 1711 1388 1743"> Important: Any templates that are configured on the Microsoft CA Issuance</p> </div>

Name	In	Description
		<p> Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 427: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>

KeyUsage	Body	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="548 949 1412 1759"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																	
0	None	No key usage parameters.																																	
1	Encipherment Only	The key can be used for encryption only.																																	
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																	
4	Key Certificate Signing	The key can be used to sign certificates.																																	
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																	
16	Data Encipherment	The key can be used for data encryption.																																	
32	Key Encipherment	The key can be used for key encryption.																																	
64	Nonrepudiation	The key can be used for authentication.																																	
128	Digital Signature	The key can be used as a digital signature.																																	
32768	Decipherment Only	The key can be used for decryption only.																																	

Name	In	Description
		For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i> . A value of 224 would add <i>nonrepudiation</i> to those.
Curve	Body	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1

Table 620: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name>_<certificate profile name>. This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name> (<certificate profile name>). This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable. <div data-bbox="472 1213 1409 1310" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>None</td> <td>The private key will not be retained.</td> </tr> <tr> <td>Indefinite</td> <td>The private key will be retained until it is explicitly deleted.</td> </tr> <tr> <td>AfterExpiration</td> <td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> <tr> <td>FromIssuance</td> <td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td> </tr> </tbody> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The enrollment fields object contains the following parameters:</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td> An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description														
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.														
Options	For multiple choice values, an array of strings containing the value choices.														
DataType	An integer indicating the parameter type. The options are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String: A free-form data entry field.</td> </tr> <tr> <td>2</td> <td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td> </tr> </tbody> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.								
Value	Description														
1	String: A free-form data entry field.														
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.														
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>The Keyfactor Command reference ID of the template-specific metadata setting.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value defined for the metadata field for the specific template.</td> </tr> <tr> <td>MetadataId</td> <td>An integer indicating the global metadata field associated with the template-specific settings.</td> </tr> </tbody> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.						
Name	Description														
Id	The Keyfactor Command reference ID of the template-specific metadata setting.														
DefaultValue	A string containing the default value defined for the metadata field for the specific template.														
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.														

Name	Description																		
	<table border="1"> <thead> <tr> <th data-bbox="472 264 678 323">Name</th> <th data-bbox="678 264 1430 323">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 323 678 793">Validation</td> <td data-bbox="678 323 1430 793"> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre data-bbox="743 512 1393 575">^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td> </tr> <tr> <td data-bbox="472 793 678 1493">Enrollment</td> <td data-bbox="678 793 1430 1493"> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th data-bbox="699 898 849 957">Value</th> <th data-bbox="849 898 1430 957">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="699 957 849 1087">0</td> <td data-bbox="849 957 1430 1087"> <p>Optional Users have the option to either enter a value or not enter a value in the field.</p> </td> </tr> <tr> <td data-bbox="699 1087 849 1283">1</td> <td data-bbox="849 1087 1430 1283"> <p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. Value	Description																		
0	<p>Optional Users have the option to either enter a value or not enter a value in the field.</p>																		
1	<p>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>																		
2	<p>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>																		
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</p>																		
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple</i></p>																		

Name	Description																		
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td><i>choice.</i></td> </tr> </tbody> </table>	Name	Description		<i>choice.</i>														
Name	Description																		
	<i>choice.</i>																		
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>CSR Enrollment & PFX Enrollment</td> </tr> <tr> <td>4</td> <td>CSR Generation</td> </tr> <tr> <td>5</td> <td>CSR Generation & PFX Enrollment</td> </tr> <tr> <td>6</td> <td>CSR Generation & CSR Enrollment</td> </tr> <tr> <td>7</td> <td>CSR Enrollment, PFX Enrollment & CSR Generation</td> </tr> </tbody> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	<p>An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1894. The template regular expression object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Templateld</td> <td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td> </tr> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> </tbody> </table>	Name	Description	Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Name	Description																		
Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		

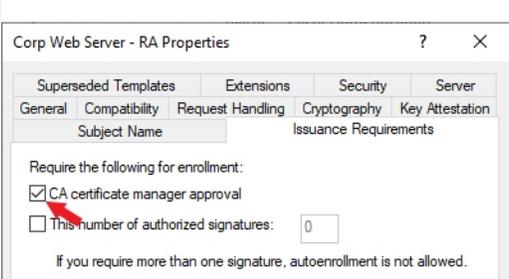

Name	Description												
	<table border="1"> <thead> <tr> <th data-bbox="472 268 630 325">Name</th> <th data-bbox="630 268 1409 325">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 325 630 1713">RegEx</td> <td Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match																

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</td> </tr> </tbody> </table>	Name	Description		the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.				
Name	Description								
	the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.								
TemplateDefaults	<p>An object containing individual template-level template default settings. Template defaults defined on a template apply to enrollments made with that template only. Template-level defaults, if defined, take precedence over system-wide template defaults. For more information about system-wide template defaults, see GET Templates Settings on page 1894. The template default object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td> <p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p> </td> </tr> <tr> <td>Value</td> <td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td> </tr> </tbody> </table>	Value	Description	SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p>	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).		
Value	Description								
SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <code>GET /Templates/SubjectParts</code> method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p>								
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).								
TemplatePolicy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see GET Templates Settings on page 1894. The template policy object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Tempalteld</td> <td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td> </tr> <tr> <td>RSASValidKeySizes</td> <td> <p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> • 2048 • 4096 </td> </tr> <tr> <td>ECCValidCurves</td> <td>An object containing a list of strings defining the valid elliptic curve</td> </tr> </tbody> </table>	Value	Description	Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.	RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> • 2048 • 4096 	ECCValidCurves	An object containing a list of strings defining the valid elliptic curve
Value	Description								
Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.								
RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> • 2048 • 4096 								
ECCValidCurves	An object containing a list of strings defining the valid elliptic curve								

Name	Description			
	<table border="1"> <thead> <tr> <th data-bbox="451 247 721 327">Value</th> <th data-bbox="721 247 1430 327">Description</th> </tr> </thead> </table>	Value	Description	<p>algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>
Value	Description			
UseAllowedRequesters	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.		
	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.		
	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.		
	AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).		
	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).		

Name	Description												
	Restrict Allowed Requesters option to grant permissions at the CA level. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.												
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.												
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.												
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft CA <i>certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="472 709 1414 1276" style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p> Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 428: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>												
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="472 1423 1414 1703"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
Value	Function	Description											
0	None	No key usage parameters.											
1	Encipherment Only	The key can be used for encryption only.											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).											

Name	Description																								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
4	Key Certificate Signing	The key can be used to sign certificates.																							
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the extended key usage in Active Directory.</td> </tr> <tr> <td>Oid</td> <td>A string containing the object ID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 																								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.29.7 POST Templates/Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: PkiManagement: *Modify*

Table 621: POST Templates/Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Table 622: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	GET Workflow Certificates ID on the next page
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	GET Workflow Certificates Denied on page 1954

Endpoint	Method	Description	Link
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	GET Workflow Certificates Pending on page 1957
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	GET Workflow Certificates External Validation on page 1960
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	POST Workflow Certificates Approve on page 1965
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	POST Workflow Certificates Deny on page 1963

3.2.30.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 623: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1957) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 624: GET Workflow Certificates {id} Input Parameters

Name	Description								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An object containing a comma delimited list of strings listing the subject alternative name elements of the certificate request.								
CertStores	<p>An object containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EntryName</td> <td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td> </tr> </tbody> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 								
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command. </div>								
CARquestId	An integer indicating the row index of the certificate request in the certificate authority.								
CommonName	A string indicating the common name of the requested certificate.								

Name	Description
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. The possible values are: <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8)
StateString	A string indicating the request state of the certificate (e.g. Pending).
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30.2 GET Workflow Certificates Denied

The GET `/Workflow/Certificates/Denied` method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint.

Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 625: GET Workflow Certificates Denied Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 3. • <i>SubmissionDate</i> • <i>Template</i> <div style="background-color: #e6f2e6; padding: 5px; margin-top: 10px;"> <p> Tip: For example, for recent denied requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 626: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: corpca01.keyexample.com\CorpIssuingCA1
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 3 (denied).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Denied state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 627: GET Workflow Certificates Pending Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 5. • <i>SubmissionDate</i> • <i>Template</i> <p> Tip: For example, for recent pending requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</p>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 628: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: corpca01.keyexample.com\CorpIssuingCA1
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 5 (pending).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Pending state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of

information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 629: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8. • <i>SubmissionDate</i> • <i>Template</i> <div style="background-color: #e6f2e6; padding: 5px; margin-top: 10px;"> <p> Tip: For example, for recent external validation requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 630: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: corpca01.keyexample.com\CorpIssuingCA1
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 8 (external validation).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with an External Validation state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30.5 POST Workflow Certificates Deny

The POST /Workflow/Certificates/Deny method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Participate*

Table 631: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	Required. An array of Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: [23, 45, 12] Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1957) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 632: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of the successful denial response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARequestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARequestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARequestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denials will have alternate comments (see below).												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.30.6 POST Workflow Certificates Approve

The POST */Workflow/Certificates/Approve* method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1967](#) and [Workflow Instances on page 2062](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Participate*

Table 633: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	Required. An array of Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name): [23,45,12] Use the GET /Workflow/Certificates/Pending method (see GET Workflow Certificates Pending on page 1957) to retrieve a list of all the certificate requests to determine the certificate request's IDs.

Table 634: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of the successful approval response details. Response details contain the following information:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CAHost</td> <td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CALogicalName</td> <td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td> </tr> <tr> <td>CARquestId</td> <td>The row index of the certificate request in the certificate authority.</td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td> </tr> <tr> <td>Comment</td> <td>A reason or description about why the request denials succeeded, failed or were denied.</td> </tr> </tbody> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow's type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven't created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used.

For more information about workflows, see [Workflow Definitions on page 205](#) in the *Keyfactor Command Reference Guide*.

Table 635: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	GET Workflow Definitions Steps Extension Name on the next page
/definitionId	DELETE	Deletes the workflow definition with the specified GUID.	DELETE Workflow Definitions Definition ID on page 1971
/definitionId	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	GET Workflow Definitions Definition ID on page 1971
/definitionId	PUT	Updates the name and description of the workflow definition with the specified GUID.	PUT Workflow Definitions Definition ID on page 1988
/	GET	Returns a list of workflow definitions, without steps.	GET Workflow Definitions on page 2005
/	POST	Creates a new workflow definition, without steps.	POST Workflow Definitions on page 2007
/Steps	GET	Returns information about the structure of the workflow definitions.	GET Workflow Definitions Steps on page 2024
/Types	GET	Returns a list of the defined workflow definition types.	GET Workflow Definitions Types on page 2026
/definitionId/Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	PUT Workflow Definitions Definition ID Steps on page 2027
/definitionId/Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	POST Workflow Definitions Definition ID Publish on page 2046

3.2.31.1 GET Workflow Definitions Steps Extension Name

The GET `/Workflow/Definitions/Steps/{extensionName}` method is used to retrieve the workflow definition step structure for the step with the specified `extensionName`. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 636: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	Required. A string indicating the <i>extensionName</i> of the workflow definition step to retrieve. Use the <code>GET /Workflow/Definitions/Steps</code> method (see GET Workflow Definitions Steps on page 2024) to retrieve a list of all the workflow definition steps to determine the <code>extensionName</code> .

Table 637: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> • Email—Send an email message. This is a separate email message from those typically sent as part of a <i>RequireApproval</i> step. • EnrollStep—Enroll for a certificate through Keyfactor Command. • NOOPStep—An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. • PowerShell—Run a PowerShell script. The script contents are embedded within the step. It does not call out to an external file. • RequireApproval—Require approval for a workflow step before the step can be completed. This step includes logic to gather the correct number of approvals from the users with the correct security roles and to send an email message indicating whether the step was approved or denied. This step does not include logic to send an email initiating the approval process. Use an <i>Email</i> type for this. <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 318 in the <i>Keyfactor Command Reference Guide</i>.</p> </div> <ul style="list-style-type: none"> • RestRequest—Run a REST request. The REST request contents are embedded within the step. It does not call out to an external file. • RevokeStep—Revoke a certificate through Keyfactor Command.
Outputs	An object containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Modify*

Note: The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 638: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to delete. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2005) to retrieve a list of all the workflow definitions to determine the GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.3 GET Workflow Definitions Definition ID

The GET /Workflow/Definitions/{definitionid} method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 639: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2005) to retrieve a list of all the workflow definitions to determine the GUID.
definitionVersion	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see Security Roles on page 1616) in the workflow definition should be removed from the response (true) or not (false). A value of <i>true</i> allows for the workflow definition to be exported without role-specific data. The default is <i>false</i> .

Table 640: GET Workflow Definitions {definitionsid} Response Data

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> Enrollment Revocation 										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>UniqueName</td> <td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td>ExtensionName</td> <td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".						
Value	Description												
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.												
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".												
<p> Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.</p>													
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference ID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).						
Value	Description												
Id	A string indicating the Keyfactor Command reference ID of the condition.												
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).												
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
Value	Description												
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.4 PUT Workflow Definitions Definition ID

The PUT /Workflow/Definitions/{definitionid} method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Modify*

Note: Only one workflow definition can be created for each combination of **Workflow Type** and **Key (Template)**. In other words, you cannot have two enrollment or revocation workflow definitions for the same template, though you can have one enrollment workflow definition and one revocation workflow definition for a given template.

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 641: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 642: PUT Workflow Definitions {definitionid} Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> Enrollment Revocation 										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>UniqueName</td> <td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td>ExtensionName</td> <td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs

ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.																
ApprovalEmailMessage	<p>A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See Table 13: Tokens for Workflow Definitions in the <i>Keyfactor Command Reference Guide</i> for a</p>																

Name	Description														
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>complete list of available tokens.</td> </tr> <tr> <td>ApprovalEmailRecipients</td> <td> <p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> • <code>\$(requester:mail)</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to <code>\$(metadata:AppOwnerEmailAddress)</code>. </td> </tr> </tbody> </table> </td> </tr> </tbody> </table> <p> Tip: Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select <code>\$(requester)</code> in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable <code>\$(requester)</code>.</p> <p>Possible RestRequest parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Headers</td> <td>An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see Table 62: Common Request Headers and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>complete list of available tokens.</td> </tr> <tr> <td>ApprovalEmailRecipients</td> <td> <p>An array of strings containing the recipients for the approval email. SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".						
Value	Description												
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.												
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".												
<p> Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.</p>													
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference ID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).						
Value	Description												
Id	A string indicating the Keyfactor Command reference ID of the condition.												
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).												
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
Value	Description												
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 1971](#)) to return details including the workflow steps.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 643: GET Workflow Definitions Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature on page 261</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DisplayName</i> • <i>Id</i> • <i>IsPublished</i> (true or false) • <i>WorkflowType</i> (Enrollment or Revocation)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 644: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> • Enrollment • Revocation
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 2027](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Modify*

Note: Only one workflow definition can be created for each combination of **Workflow Type** and **Key (Template)**. In other words, you cannot have two enrollment or revocation workflow definitions for the same template, though you can have one enrollment workflow definition and one revocation workflow definition for a given template.

Table 645: POST Workflow Definitions Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p>Required. A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template.</p> <p>Use the GET /Templates method (see GET Templates on page 1914) to retrieve a list or your certificate templates to determine the template ID.</p> <p>This field cannot be modified on an edit.</p>
KeyDisplayName	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template.
WorkflowType	Body	<p>Required. A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> • Enrollment • Revocation <p>This field cannot be modified on an edit.</p>

Table 646: POST Workflow Definitions Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> Enrollment Revocation 										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>UniqueName</td> <td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td>ExtensionName</td> <td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> Email Send an email message. A sample PowerShell script is provided in the Workflow directory (CustomPowershellExample.ps1). RequireApproval Require approval for a workflow step before the step can be completed. The require approval step applies to certificate enrollments, renewals, and revocations and can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="618 1549 1377 1713" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 318 in the <i>Keyfactor Command Reference Guide</i>.</p> </div>
Name	Description				
	<p>approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> <ul style="list-style-type: none"> PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including: <ul style="list-style-type: none"> Where-Object ForEach-Object Get-Command CustomPowerShell Run a PowerShell script. The script contents are in a file placed in the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is: <pre>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</pre> The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPowershellExample.ps1). RequireApproval Require approval for a workflow step before the step can be completed. The require approval step applies to certificate enrollments, renewals, and revocations and can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. Value	Description												
	<pre>{ "Provider": "1", "Parameters":{ "SecretId": "MyUsernameId" } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>												
BasicPassword	<p>An array indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>												
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of <code>KEYFACTOR_BLOCKED_OUTBOUND_IPS</code> on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> </div>

SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".						
Value	Description												
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.												
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".												
<p> Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances.</p>													
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference ID of the condition.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).</td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).						
Value	Description												
Id	A string indicating the Keyfactor Command reference ID of the condition.												
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see Adding or Modifying a Workflow Definition on page 209 in the <i>Keyfactor Command Reference Guide</i> for an example).												
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>continue</td> <td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td> </tr> </tbody> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
Value	Description												
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.												

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 647: GET Workflow Definitions Steps Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature on page 261</i> . The query fields supported for this endpoint are <i>DisplayName</i> , <i>ExtensionName</i> , and <i>SupportedWorkflowTypes</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 648: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> • Email—Send an email message. This is a separate email message from those typically sent as part of a <i>RequireApproval</i> step. • EnrollStep—Enroll for a certificate through Keyfactor Command. • NOOPStep—An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. • PowerShell—Run a PowerShell script. The script contents are embedded within the step. It does not call out to an external file. • RequireApproval—Require approval for a workflow step before the step can be completed. This step includes logic to gather the correct number of approvals from the users with the correct security roles and to send an email message indicating whether the step was approved or denied. This step does not include logic to send an email initiating the approval process. Use an <i>Email</i> type for this. <div data-bbox="695 926 1395 1089" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration Authorization Methods Tab on page 318 in the <i>Keyfactor Command Reference Guide</i>.</p> </div> <ul style="list-style-type: none"> • RestRequest—Run a REST request. The REST request contents are embedded within the step. It does not call out to an external file. • RevokeStep—Revoke a certificate through Keyfactor Command.
SupportedWorkflowTypes	<p>An array containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> • Enrollment • Revocation
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 649: GET Workflow Definitions Types Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature on page 261</i> . The query field supported for this endpoint is <i>Name</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>WorkflowType</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 650: GET Workflow Definitions Types Response Data

Name	Description												
WorkflowType	A string indicating the display name of the workflow type.												
KeyType	A string indicating the key type for the workflow. The built-in enrollment and revocation workflows use <i>Templates</i> as the key type.												
ContextParameters	An object containing the tokens that the workflow type provider has the ability to replace. These will vary depending on the workflow type.												
BuiltInSteps	<p>An object containing the information about the built-in step(s) for the workflow type (e.g. the enrollment step of the enrollment type). Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>ExtensionName</td> <td> A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep </td> </tr> <tr> <td>Outputs</td> <td>An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.</td> </tr> <tr> <td>ConfigurationParametersDefinition</td> <td>An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.</td> </tr> <tr> <td>SignalsDefinition</td> <td>An array containing the signals defined for the workflow definition step. These will vary depending on the step.</td> </tr> </tbody> </table>	Name	Description	DisplayName	A string indicating the display name for the step.	ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep 	Outputs	An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.	ConfigurationParametersDefinition	An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.	SignalsDefinition	An array containing the signals defined for the workflow definition step. These will vary depending on the step.
Name	Description												
DisplayName	A string indicating the display name for the step.												
ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep 												
Outputs	An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.												
ConfigurationParametersDefinition	An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.												
SignalsDefinition	An array containing the signals defined for the workflow definition step. These will vary depending on the step.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.31.9 PUT Workflow Definitions Definition ID Steps

The PUT /Workflow/Definitions/{definitionid}/Steps method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowDefinitions: *Modify*

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 651: PUT Workflow Definitions {definitionid} Steps Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to update. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 2005) to retrieve a list of all the workflow definitions to determine the GUID.

Name	In	Description								
request	Body	<table border="1"> <thead> <tr> <th data-bbox="386 352 566 415">Name</th> <th data-bbox="566 352 1408 415">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="386 415 566 478">DisplayName</td> <td data-bbox="566 415 1408 478">A string indicating the display name for the step.</td> </tr> <tr> <td data-bbox="386 478 566 604">UniqueName</td> <td data-bbox="566 478 1408 604">A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td data-bbox="386 604 566 1892">ExtensionName</td> <td data-bbox="566 604 1408 1892"> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request. PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including: <ul style="list-style-type: none"> Where-Object ForEach-Object Get-Command CustomPowerShell Run a PowerShell script. The script contents are in a file placed in the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is: <pre>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</pre> The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPowershellExample.ps1). RequireApproval Require approval for a workflow step before the step can be completed. The require approval step applies to certificate enrollments, renewals, and revocations and can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or not. Typically, the approver is the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. </td> </tr> </tbody> </table>	Name	Description	DisplayName	A string indicating the display name for the step. The require approval step applies to certificate enrollments, renewals, and revocations and can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or not. Typically, the approver is the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. 									

Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the Keyfactor Command documentation.

Table 652: PUT Workflow Definitions {definitionid} Steps Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> Enrollment Revocation 										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the step.</td> </tr> <tr> <td>UniqueName</td> <td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td> </tr> <tr> <td>ExtensionName</td> <td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.
