		Value	Description
			<p>value is related to the type of parameter (see <i>ParameterType</i>).</p>
		ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> • LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged. • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server. • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See Table 8: Substitutable Special Text for Pending Request Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.
		For example, for a PowerShell handler:	
		<pre> "EventHandlerParameters": [{ "Id": 28, "Key": "cn", "DefaultValue": "rcn", </pre>	

Name	In	Description
		<pre data-bbox="634 268 1409 1066"> "ParameterType": "Token" }, { "Id": 29, "Key": "AppOwnerFirstName", "DefaultValue": "metadata:AppOwnerFirstName", "ParameterType": "Token" }, { "Id": 30, "Key": "Text", "DefaultValue": "Pending Alert: Enterprise Web Server", "ParameterType": "Value" }, { "Id": 31, "Key": "ApprovalLink", "DefaultValue": "apprlink", "ParameterType": "Token" }, { "Id": 32, "Key": "ScriptName", "DefaultValue": "MyScript.ps1", "ParameterType": "Script" }] </pre>
CARequestId		A string containing the CA's reference ID for the certificate request.
CommonName		A string indicating the common name of the certificate.
LogicalName		A string indicating the logical name of the certificate authority.

Table 170: POST Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="532 594 1409 831" style="background-color: #e6f2e6; padding: 10px; border: 1px solid #d4edda;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 171: PUT Alerts Pending Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the pending request alert. Run the
DisplayName	Body	Required. A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="548 604 1409 835" style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANS: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n"</pre> <p>See Table 8: Substitutable Special Text for Pending Request Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>

Name	Description														
	<ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 														
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td>ForestRoot</td> <td>A string indicating the forest root of the template. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td> </tr> <tr> <td>ConfigurationTenant</td> <td>A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.														
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.														
ForestRoot	A string indicating the forest root of the template. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>														
ConfigurationTenant	A string indicating the configuration tenant of the template.														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														

Name	Description										
	<p>For more information about event handlers, see Using Event Handlers on page 194 in the <i>Keyfactor Command Reference Guide</i>.</p>										
<p>EventHandlerParameters</p>	<p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1" data-bbox="537 449 1414 1675"> <thead> <tr> <th data-bbox="537 449 764 506">Value</th> <th data-bbox="764 449 1414 506">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="537 506 764 604">Id</td> <td data-bbox="764 506 1414 604">An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td data-bbox="537 604 764 703">Key</td> <td data-bbox="764 604 1414 703">A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td data-bbox="537 703 764 802">DefaultValue</td> <td data-bbox="764 703 1414 802">A string indicating the value for the parameter. <p>CARequestId</p>	<p>A string containing the CA's reference ID for the certificate request.</p>										

Name	Description
CommonName	A string indicating the common name of the certificate.
LogicalName	A string indicating the logical name of the certificate authority.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST Alerts Pending Test

The POST `/Alerts/Pending/Test` method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

Tip: Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 549](#) in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 549](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 WorkflowManagement: *Read*
 WorkflowManagement: *Test*

Table 173: POST Alerts Pending Test Input Parameters

Parameter	In	Description						
req	Body	<p>Required. An array containing information for the alert test. Alert test detail values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AlertId</td> <td>An integer indicating the Keyfactor Command reference ID for the pending alert.</td> </tr> <tr> <td>SendAlerts</td> <td>A Boolean indicating whether to send alert emails with the test (true), or not (false).</td> </tr> </tbody> </table> <p>For example:</p> <pre>{ "AlertId": 1, "SendAlertEmails": false }</pre>	Value	Description	AlertId	An integer indicating the Keyfactor Command reference ID for the pending alert.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true), or not (false).
Value	Description							
AlertId	An integer indicating the Keyfactor Command reference ID for the pending alert.							
SendAlerts	A Boolean indicating whether to send alert emails with the test (true), or not (false).

3.2.5 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 177: Audit Endpoints

Endpoint	Method	Description	Links
/id	GET	Returns information about the specified audit log entry.	GET Audit ID below
/id/Validate	GET	Validates the specified audit log entry.	GET Audit ID Validate on page 907
/	GET	Returns a list of all audit log entries according to the provided filters and input parameters.	GET Audit on page 908
/Download	GET	Returns a comma separated list of audit log entries according to the provided filters and input parameters.	GET Audit Download on page 913
/RelatedEntities	GET	Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters.	GET Audit Related Entities on page 917

3.2.5.1 GET Audit ID

The GET /Audit/{id} method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Auditing: Read

Table 178: GET Audit {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the audit log entry to retrieve. Use the <i>GET /Audit</i> method (see GET Audit on page 908) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 179: GET Audit {id} Response Data

Name	Description																																																
Id	The ID of the specified audit log entry.																																																
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																																
Message	XML data on the audit event.																																																
Signature	The signature on the audit entry.																																																
Category	<p>An integer identifying the category of the audit entry. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateScheduledReplacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateRequest</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>ExpirationAlertDefinitionContextModel</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlertDefinitionContextModel</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>IssuedAlertDefinitionContextModel</td> <td>Issued Alert</td> </tr> <tr> <td>2009</td> <td>DeniedAlert</td> <td>Denied Alert</td> </tr> <tr> <td>2009</td> <td>DeniedAlertDefinitionContextModel</td> <td>Denied Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	AuditingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert	2009	DeniedAlert	Denied Alert	2009	DeniedAlertDefinitionContextModel	Denied Alert

User	The user who performed the audit event in DOMAIN\username format.																
EntityType	The category of the object being audited (e.g. Template, Certificate).																
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.																
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.																

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.5.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a

value of true or false.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Auditing: *Read*

Table 180: GET Audit {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The ID of the audit log entry to validate. Use the <i>GET /Audit</i> method (see GET Audit below) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 181: GET Audit {id} Validate Response Data

Name	Description
	A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.5.3 GET Audit

The *GET /Audit* method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Auditing: *Read*

Table 182: GET Audit Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature on page 615</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Name</i> (EntityIdentifier) • <i>Category</i> (EntityType) (see Table 183: GET Audit Response Data for codes) • <i>ImmutableIdentifier</i> • <i>Level</i> (see Table 183: GET Audit Response Data for codes) • <i>Operation</i> (see Table 183: GET Audit Response Data for codes) • <i>PropertyChanged</i> • <i>Timestamp</i> • <i>ActingUser</i> <div style="background-color: #e6f2e6; padding: 5px; margin-top: 10px;">  Tip: To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example: <code>category -contains "Agent"</code> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 183: GET Audit Response Data

Name	Description																																																
Id	The ID of the specified audit log entry.																																																
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.

3.2.5.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information

requested in comma-delimited form with the property names at the start of the list and then the values.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Auditing: Read

Table 184: GET Audit Download Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature on page 615</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Name</i> (EntityIdentifier) • <i>Category</i> (EntityType) (see Table 183: GET Audit Response Data for codes) • <i>ImmutableIdentifier</i> • <i>Level</i> (see Table 183: GET Audit Response Data for codes) • <i>Operation</i> (see Table 183: GET Audit Response Data for codes) • <i>PropertyChanged</i> • <i>Timestamp</i> • <i>ActingUser</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

EntityType	The category of the object being audited (e.g. Template, Certificate). Also known as the <i>Category</i> in some interfaces.																				
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. Also known as the <i>Name</i> in some interfaces.																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.5.5 GET Audit Related Entities

The GET /Audit/RelatedEntities method returns a list of all audit entries and all audit entries related to those audit entries. This method returns HTTP 200 OK on a success with the information requested.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Auditing: Read

Table 186: GET Audit Related Entities Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature on page 615</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none">• <i>Name</i> (EntityIdentifier)• <i>Category</i> (EntityType) (see Table 183: GET Audit Response Data for codes)• <i>ImmutableIdentifier</i>• <i>Level</i> (see Table 183: GET Audit Response Data for codes)• <i>Operation</i> (see Table 183: GET Audit Response Data for codes)• <i>PropertyChanged</i>• <i>Timestamp</i>• <i>ActingUser</i> <p>Tip: In order to return related entries, your queryString needs to query for the specific immutable identifier of the audit record for which you wish to see related entries. For example:</p> <pre>ImmutableIdentifier -eq 707662</pre>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 187: GET Audit Related Entities Response Data

Name	Description																																																
Id	The ID of the specified audit log entry.																																																
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																																
Message	XML data on the audit event.																																																
Signature	The signature on the audit entry.																																																
Category	<p>An integer identifying the category of the audit entry. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateScheduledReplacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateRequest</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>ExpirationAlertDefinitionContextModel</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlertDefinitionContextModel</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>IssuedAlertDefinitionContextModel</td> <td>Issued Alert</td> </tr> <tr> <td>2009</td> <td>DeniedAlert</td> <td>Denied Alert</td> </tr> <tr> <td>2009</td> <td>DeniedAlertDefinitionContextModel</td> <td>Denied Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	AuditingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert	2009	DeniedAlert	Denied Alert	2009	DeniedAlertDefinitionContextModel	Denied Alert

3.2.6 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 188: Certificates Endpoints

Endpoint	Method	Description	Link
/id}/Security	GET	Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are.	GET Certificates ID Security on the next page
/id}/Validate	GET	Validates that a certificate chain can be built for the specified certificate.	GET Certificates ID Validate on page 925
/Locations/{id}	GET	Returns details about the certificates stores in which the certificate is located.	GET Certificates Locations ID on page 930
/IdentityAudit/{id}	GET	Returns audit identity permissions for certificate.	GET Certificates Identity Audit ID on page 933
/CSV	GET	Returns content, in a CSV format, of certificates from Keyfactor Command that match the query criteria provided in the body.	GET Certificates CSV on page 935
/id}	DELETE	Deletes a certificate from the Keyfactor Command database by its ID.	DELETE Certificates ID on page 937
/id}	GET	Returns certificate details for a specified certificate.	GET Certificates ID on page 938
/Metadata/Compare	GET	Compares the metadata value provided with the metadata value associated with the specified certificate.	GET Certificates Metadata Compare on page 949
/id}/History	GET	Returns the certificate operations history for a specified certificate.	GET Certificates ID History on page 950
/	DELETE	Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.	DELETE Certificates on page 952
/	GET	Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level.	GET Certificates on page 953
/Metadata	PUT	Updates the metadata for a specified certificate.	PUT Certificates Metadata on page 967
/Metadata/All	PUT	Updates the metadata for an array of certificate IDs.	PUT Certificates Metadata All on

Endpoint	Method	Description	Link
			page 968
/Import	POST	Imports a certificate into Keyfactor Command.	POST Certificates Import on page 971
/Revoke	POST	Revokes a certificate.	POST Certificates Revoke on page 975
/Analyze	POST	Reads a base-64 encoded PEM certificates and returns it in human-readable form.	POST Certificates Analyze on page 977
/Recover	POST	Returns a recovered certificate as a PFX.	POST Certificates Recover on page 978
/Download	POST	Downloads a certificate.	POST Certificates Download on page 980
/RevokeAll	POST	Revokes all the certificates in the provided query.	POST Certificates Revoke All on page 982
/Query	DELETE	Deletes multiple certificates from the Keyfactor Command database based on search query.	DELETE Certificates Query on page 984
/PrivateKey	DELETE	Deletes the stored private keys of multiple certificates within the Keyfactor Command database.	DELETE Certificates Private Key on page 985
/PrivateKey/{id}	DELETE	Deletes the stored private key(s) of a certificate within the Keyfactor Command database.	DELETE Certificates Private Key ID on page 985

3.2.6.1 GET Certificates ID Security

The GET /Certificates/{id}/Security method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 Certificates: *Read*
 SecuritySettings: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 189: GET Certificates {id} Security Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to check security permissions.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 190: GET Certificates {id} Security Response Data

Name	Description						
Roles	<p>An array containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short reference name for the security role.</td> </tr> <tr> <td>Permissions</td> <td>An array of strings containing the permissions assigned to the role.</td> </tr> </tbody> </table> <p>For example, the following return snippet shows the response for the "Power Users" security role:</p> <pre> { "Name": "Power Users", "Permissions": ["Read", "EditMetadata", "Recover"] } </pre>	Name	Description	Name	A string containing the short reference name for the security role.	Permissions	An array of strings containing the permissions assigned to the role.
Name	Description						
Name	A string containing the short reference name for the security role.						
Permissions	An array of strings containing the permissions assigned to the role.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 191: GET Certificates {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to be validated.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 192: GET Certificates {id} Validate Response Data

Name	Description															
Valid	A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false).															
Results	<p>An array containing the X509 certificate chain validity fields. The included validity fields are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Keyfactor Command Management Portal Equivalent</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>NotTimeValid</td> <td>Time Valid</td> <td>A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.</td> </tr> <tr> <td>NotTimeNested</td> <td>n/a</td> <td>A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Revoked</td> <td>Active</td> <td>A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.</td> </tr> <tr> <td>NotSignatureValid</td> <td>Signature</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid certificate signature.</td> </tr> </tbody> </table>	Name	Keyfactor Command Management Portal Equivalent	Description	NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.	NotTimeNested	n/a	A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.	Revoked	Active	A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.	NotSignatureValid	Signature	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid certificate signature.

		built up to the root certificate.
CtlNotTimeValid	CTL Time Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired).
CtlNotSignatureValid	CTL Signature Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) contains an invalid signature.
CtlNotValidForUsage	CTL Usage Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.
HasWeakSignature	Strong Signature	A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate.
OfflineRevocation	CRL online	A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.
NoIssuanceChainPolicy	Chain Policy	A value of <i>Pass</i> indicates that there is either no certificate policy by

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.3 GET Certificates Locations ID

The GET /Certificates/Locations/{id} method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 193: GET Certificates Locations {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 194: GET Certificates Locations {id} Response Data

Name	Description										
Details	<p>An array containing the certificate stores in which the certificate is found. 3.2.6.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 195: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 196: GET Certificates {id} History Response Data

Name	Description						
Id	An integer containing the Keyfactor ID of the user/group.						
AccountName	A string containing the name of the Keyfactor user/group.						
IdentityType	A string that specifies if the account is a user or a group.						
SID	A string containing the SID of the user/group						
Permissions	An array of the permissions for the certificate. <table border="1" data-bbox="430 1081 990 1470"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td> </tr> <tr> <td>GrantedBy</td> <td>A string containing the list of roles or collections that grant the given permission to the user-/group.</td> </tr> </tbody> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)	GrantedBy	A string containing the list of roles or collections that grant the given permission to the user-/group.
Parameter	Description						
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)						
GrantedBy	A string containing the list of roles or collections that grant the given permission to the user-/group.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.5 GET Certificates CSV

The GET /Certificates/CSV method is used to create content, in a CSV format, of certificates from Keyfactor Command that match the query criteria provided in the body. The content will display in the response body and can be copied from there for use in a file, as needed. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: Global *Read* Users can query with and without collection ID.
Certificate Collection: Users without Global *Read* permissions MUST provide a collection ID for which they have *Read* permissions.¹

Table 197: GET Certificates CSV Input Parameters

Name	In	Description
Sortname	Query	A string of the fieldname by which the results should be sorted.
SortOrder	Query	A Boolean to indicate the field sort direction [0=ascending, 1=descending] to apply to the SortName.
query	Query	A string query, to limit the requested set of certificates, in the form: "CN -contains \"mycertificate.keyexample.com\"" See Certificate Search Page on page 31 section of the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.
CollectionId	Query	An integer of the certificate collection ID (used to determine user access to the certificates).

¹The certificate collection ID is used to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information.

Table 198: GET Certificates CSV Response Body

Description

A comma-separated sting of certificate data as per the criteria supplied. For example:

```

```

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.6 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this private key is also removed. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Tip: Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 199: DELETE Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to delete. Use the <i>GET /Certificates</i> method (see GET Certificates on page 953) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.7 GET Certificates ID

The GET /Certificates/{id} method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 200: GET Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate. Use the <i>GET /Certificates</i> method (see GET Certificates on page 953) to retrieve a list of multiple certificates to determine the desired certificate's ID.
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 201: GET Certificates {id} Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																		
Thumbprint	A string indicating the thumbprint of the certificate.																		
SerialNumber	A string indicating the serial number of the certificate.																		
IssuedDN	A string indicating the distinguished name of the certificate.																		
IssuedCN	A string indicating the common name of the certificate.																		
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.																		
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																		
NotAfter	The date, in UTC, on which the certificate expires.																		
IssuerDN	A string indicating the distinguished name of the issuer.																		
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .																		
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.																		
CertState	An integer specifying the state of the certificate. The possible values are: <table border="1" data-bbox="542 1182 1411 1734"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority

6	Certificate Authority																		
7	Parent Certificate Authority																		

Name	Description																					
KeySizeInBits	An integer specifying the key size in bits.																					
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>RSA</td> </tr> <tr> <td>2</td> <td>DSA</td> </tr> <tr> <td>3</td> <td>ECC</td> </tr> <tr> <td>4</td> <td>DH</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH									
Value	Description																					
0	Unknown																					
1	RSA																					
2	DSA																					
3	ECC																					
4	DH																					
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																					
IssuedOU	A string indicating the organizational unit of the certificate.																					
IssuedEmail	A string indicating the email address of the certificate.																					
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.
Value	Function	Description																				
0	None	No key usage parameters.																				
1	Encipherment Only	The key can be used for encryption only.																				
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																				
4	Key Certificate Signing	The key can be used to sign certificates.																				
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																				
16	Data Encipherment	The key can be used for data encryption.																				

Name	Description															
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description														
32	Key Encipherment	The key can be used for key encryption.														
64	Nonrepudiation	The key can be used for authentication.														
128	Digital Signature	The key can be used as a digital signature.														
32768	Decipherment Only	The key can be used for decryption only.														
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.															
CertStateString	<p>A string containing the certificate state. The possible values are:</p> <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8) 															
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .															
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.															

Name	Description																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation Of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the name of the template that was used when issuing the certificate.																		
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).																		
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)																		
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).																		
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.																		
RequesterName	A string containing the name of the identity that requested the certificate.																		
ContentBytes	A string containing the certificate as bytes.																		
ExtendedKeyUsages	An array containing the extended key usages associated with the certificate. Extended Key data includes:																		

Name	Description									
	<table border="1"> <thead> <tr> <th data-bbox="521 247 751 327">Name</th> <th data-bbox="751 247 1430 327">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="521 327 751 426">Id</td> <td data-bbox="751 327 1430 426">An integer containing the Keyfactor Command reference ID of the extended key usage.</td> </tr> <tr> <td data-bbox="521 426 751 483">Oid</td> <td data-bbox="751 426 1430 483">A string indicating the OID of the extended key usage.</td> </tr> <tr> <td data-bbox="521 483 751 562">DisplayName</td> <td data-bbox="751 483 1430 562">A string indicating the name of the extended key usage.</td> </tr> </tbody> </table>		Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description									
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.									
Oid	A string indicating the OID of the extended key usage.									
DisplayName	A string indicating the name of the extended key usage.									

Name	Description																																				
SubjectAltNameElements	<p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> </td> </tr> <tr> <td>ValueHash</td> <td>A string indicating a hash of the SAN value.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address																																				
4	Directory Name																																				
5	Ediparty Name																																				
6	Uniform Resource Identifier																																				
7	IP Address																																				
8	Registered Id																																				
100	MS_NTPrincipalName																																				
101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description										
CRLDistributionPoints	<p>An array containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td> </tr> <tr> <td>URL</td> <td>A string indicating the URL of the CRL distribution point.</td> </tr> <tr> <td>URLHash</td> <td>A string indicating a hash of the URL.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.		
Name	Description										
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.										
URL	A string indicating the URL of the CRL distribution point.										
URLHash	A string indicating a hash of the URL.										
LocationsCount	<p>An array containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre>"LocationsCount": [{ "Type": "IIS", "Count": 2 }, { "Type": "F5-SL-REST", "Count": 1 }]</pre>										
SSLLocations	<p>An array containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StorePath</td> <td>A string indicating the machine where the certificate was discovered.</td> </tr> <tr> <td>AgentPool</td> <td>A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td> </tr> <tr> <td>IPAddress</td> <td>A string indicating the IP address where the certificate was discovered.</td> </tr> <tr> <td>Port</td> <td>An integer indicating the port on which the certificate was discovered.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.	IPAddress	A string indicating the IP address where the certificate was discovered.	Port	An integer indicating the port on which the certificate was discovered.
Name	Description										
StorePath	A string indicating the machine where the certificate was discovered.										
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.										
IPAddress	A string indicating the IP address where the certificate was discovered.										
Port	An integer indicating the port on which the certificate was discovered.										

Name	Description					
	<table border="1"> <thead> <tr> <th data-bbox="542 264 764 321">Name</th> <th data-bbox="764 264 1414 321">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="542 321 764 457">NetworkName</td> <td data-bbox="764 321 1414 457">A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.</td> </tr> </tbody> </table>	Name	Description	NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.	
Name	Description					
NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.					

Name	Description																																										
Locations	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. 11	F5 CA Bundles REST																																										
100	Amazon Web Services																																										
101	File Transfer Protocol																																										
1xx	User-defined certificate stores will be given a type ID over 101.																																										
Alias	A string indicating the alias of the certificate in the certificate store.																																										
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																										

Name	Description																		
Metadata	An array containing the metadata fields populated for the certificate.																		
CertificateKeyld	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.																		
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The <i>CARowIndex</i> has been replaced by <i>CAREcordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CAREcordId</i> value parsed to an integer. </div>																		
CAREcordId	A string containing the CA's reference ID for certificate.																		
DetailedKeyUsage	<p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CrlSign</td> <td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DataEncipherment</td> <td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DecipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td> </tr> <tr> <td>DigitalSignature</td> <td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>EncipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td> </tr> <tr> <td>KeyAgreement</td> <td>A Boolean that indicates whether the certificate is configured for key agreement.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is</td> </tr> </tbody> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is
Name	Description																		
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).																		
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).																		
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).																		
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).																		
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).																		
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.																		
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.																		
KeyEncipherment	A Boolean that indicates whether the certificate is																		

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td> </tr> </tbody> </table>	Name	Description		configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description								
	configured for key encipherment.								
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.								
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .								
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.8 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 202: GET Certificates Metadata Compare Input Parameters

Name	In	Description
certificateId	Query	Required. An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.
metadataFieldName	Query	Required. A string containing the name of the metadata field whose value should be compared.
value	Query	Required. A string containing the value for comparison.
collectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.9 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see [Certificate Details on page 18](#) in the *Keyfactor Command Reference Guide*. This method returns HTTP 200 OK on a success with certificate history details in the message body.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 203: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.
query.pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
query.returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
query.sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .
query.sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 204: GET Certificates {id} History Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID of the certificate.
OperationStart	The date, in UTC, on which the operation begin.
OperationEnd	The date, in UTC, on which the operation completed.
Username	The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.
Comment	A string containing a comment that provides more information about the history record. For example (for a metadata field): AppOwnerEmailAddress has been updated from 'john.smith@keyexample.com' to 'martha.jones@keyexample.com'
Action	A string naming the action that was taken. For example: Metadata Update

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.10 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Tip: Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 205: DELETE Certificates Input Parameters

Name	In	Description
ids	Body	Required. Array of Keyfactor Command certificate IDs for certificates that should be deleted in the form: [123, 789, 567]
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.11 GET Certificates

The GET /Certificates method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: Global *Read*, or Collection ID *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 206: GET Certificates Input Parameters

Name	In	Description
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
includeHasPrivateKey	Query	A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.
includeRevoked	Query	A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .
includeExpired	Query	A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .

Name	In	Description
queryString	Query	<ul style="list-style-type: none"> • <i>ArchivedKey</i> • <i>CertId</i> • <i>CA</i> • <i>CertState</i> • <i>CertStoreFQDN</i> (alias: <i>JavaKeyStoreFQDN</i>) • <i>CertStorePath</i> (alias: <i>JavaKeyStorePath</i>) • <i>CN</i> (alias: <i>IssuedCN</i>) • <i>DN</i> (alias: <i>IssuedDN</i>) • <i>ExpirationDate</i> (alias: <i>NotAfter</i>) <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> • <i>CARequestID</i> • <i>CertRequestID</i> • <i>IssuedDate</i> • <i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>) • <i>IssuerDN</i> • <i>KeySize</i> (alias: <i>KeySizeInBits</i>) • <i>KeyType</i> • <i>KeyUsage</i> • <i>EKU</i> • <i>EKUName</i> • <i>HasPrivateKey</i> • <i>ImportDate</i> • <i>IssuedDate</i> • <i>KeySize</i> • <i>KeyType</i> • <i>KeyUsage</i> • <i>OU</i> • <i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>) • <i>PublicKey</i> • <i>NetBIOSRequester</i> (alias: <i>RequesterName</i>) • <i>RevocationDate</i> (alias: <i>RevocationEffDate</i>) • <i>Revoker</i> • <i>RFC2818Compliant</i> • <i>SelfSigned</i> • <i>SerialNumber</i> • <i>SigningAlgorithm</i> • <i>SSLDNSName</i> • <i>SSLIPAddress</i> (alias: <i>SslHostName</i>) • <i>SSLNetworkName</i> • <i>SSLPort</i> • <i>SAN</i> • <i>TemplateDisplayName</i> (alias: <i>TemplateName</i>) • <i>TemplateShortName</i> • <i>Thumbprint</i>

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 207: GET Certificates Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																		
Thumbprint	A string indicating the thumbprint of the certificate.																		
SerialNumber	A string indicating the serial number of the certificate.																		
IssuedDN	A string indicating the distinguished name of the certificate.																		
IssuedCN	A string indicating the common name of the certificate.																		
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.																		
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																		
NotAfter	The date, in UTC, on which the certificate expires.																		
IssuerDN	A string indicating the distinguished name of the issuer.																		
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .																		
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.																		
CertState	An integer specifying the state of the certificate. The possible values are: <table border="1" data-bbox="542 1182 1411 1734"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		

Name	Description																					
KeySizeInBits	An integer specifying the key size in bits.																					
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>RSA</td> </tr> <tr> <td>2</td> <td>DSA</td> </tr> <tr> <td>3</td> <td>ECC</td> </tr> <tr> <td>4</td> <td>DH</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH									
Value	Description																					
0	Unknown																					
1	RSA																					
2	DSA																					
3	ECC																					
4	DH																					
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																					
IssuedOU	A string indicating the organizational unit of the certificate.																					
IssuedEmail	A string indicating the email address of the certificate.																					
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> <td>No key usage parameters.</td> </tr> <tr> <td>1</td> <td>Encipherment Only</td> <td>The key can be used for encryption only.</td> </tr> <tr> <td>2</td> <td>CRL Signing</td> <td>The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td>4</td> <td>Key Certificate Signing</td> <td>The key can be used to sign certificates.</td> </tr> <tr> <td>8</td> <td>Key Agreement</td> <td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td>16</td> <td>Data Encipherment</td> <td>The key can be used for data encryption.</td> </tr> </tbody> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.
Value	Function	Description																				
0	None	No key usage parameters.																				
1	Encipherment Only	The key can be used for encryption only.																				
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																				
4	Key Certificate Signing	The key can be used to sign certificates.																				
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																				
16	Data Encipherment	The key can be used for data encryption.																				

Name	Description															
	<table border="1"> <thead> <tr> <th>Value</th> <th>Function</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>32</td> <td>Key Encipherment</td> <td>The key can be used for key encryption.</td> </tr> <tr> <td>64</td> <td>Nonrepudiation</td> <td>The key can be used for authentication.</td> </tr> <tr> <td>128</td> <td>Digital Signature</td> <td>The key can be used as a digital signature.</td> </tr> <tr> <td>32768</td> <td>Decipherment Only</td> <td>The key can be used for decryption only.</td> </tr> </tbody> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description														
32	Key Encipherment	The key can be used for key encryption.														
64	Nonrepudiation	The key can be used for authentication.														
128	Digital Signature	The key can be used as a digital signature.														
32768	Decipherment Only	The key can be used for decryption only.														
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.															
CertStateString	<p>A string containing the certificate state. The possible values are:</p> <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8) 															
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .															
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.															

Name	Description																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation Of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the name of the template that was used when issuing the certificate.																		
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).																		
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)																		
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).																		
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.																		
RequesterName	A string containing the name of the identity that requested the certificate.																		
ContentBytes	A string containing the certificate as bytes.																		
ExtendedKeyUsages	An array containing the extended key usages associated with the certificate. Extended Key data includes:																		

Name	Description									
	<table border="1"> <thead> <tr> <th data-bbox="521 247 751 327">Name</th> <th data-bbox="751 247 1430 327">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="521 327 751 426">Id</td> <td data-bbox="751 327 1430 426">An integer containing the Keyfactor Command reference ID of the extended key usage.</td> </tr> <tr> <td data-bbox="521 426 751 485">Oid</td> <td data-bbox="751 426 1430 485">A string indicating the OID of the extended key usage.</td> </tr> <tr> <td data-bbox="521 485 751 560">DisplayName</td> <td data-bbox="751 485 1430 560">A string indicating the name of the extended key usage.</td> </tr> </tbody> </table>		Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description									
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.									
Oid	A string indicating the OID of the extended key usage.									
DisplayName	A string indicating the name of the extended key usage.									

Name	Description																																				
SubjectAltNameElements	<p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> </td> </tr> <tr> <td>ValueHash</td> <td>A string indicating a hash of the SAN value.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description

101	MS_NTDSReplication																																				
999	Unknown																																				
ValueHash	A string indicating a hash of the SAN value.																																				

Name	Description										
CRLDistributionPoints	<p>An array containing the distribution points for the certificate revocation lists the certificate could be in. CRL distribution point data includes:</p> <table border="1" data-bbox="542 352 1409 632"> <thead> <tr> <th data-bbox="542 352 711 415">Name</th> <th data-bbox="711 352 1409 415">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="542 415 711 512">Id</td> <td data-bbox="711 415 1409 512">An integer containing the Keyfactor Command reference ID of the CRL distribution point.</td> </tr> <tr> <td data-bbox="542 512 711 569">URL</td> <td data-bbox="711 512 1409 569">A string indicating the URL of the CRL distribution point.</td> </tr> <tr> <td data-bbox="542 569 711 632">URLHash</td> <td data-bbox="711 569 1409 632">A string indicating a hash of the URL.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.	URL	A string indicating the URL of the CRL distribution point.	URLHash	A string indicating a hash of the URL.		
Name	Description										
Id	An integer containing the Keyfactor Command reference ID of the CRL distribution point.										
URL	A string indicating the URL of the CRL distribution point.										
URLHash	A string indicating a hash of the URL.										
LocationsCount	<p>An array containing a count of how many certificates are in each location type. This returns a list of type and count combination. For example:</p> <pre data-bbox="542 758 1409 1083"> "LocationsCount": [{ "Type": "IIS", "Count": 2 }, { "Type": "F5-SL-REST", "Count": 1 }] </pre>										
SSLLocations	<p>An array containing the locations where the certificate is found using SSL discovery. SSL location data includes:</p> <table border="1" data-bbox="542 1205 1409 1682"> <thead> <tr> <th data-bbox="542 1205 764 1268">Name</th> <th data-bbox="764 1205 1409 1268">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="542 1268 764 1360">StorePath</td> <td data-bbox="764 1268 1409 1360">A string indicating the machine where the certificate was discovered.</td> </tr> <tr> <td data-bbox="542 1360 764 1488">AgentPool</td> <td data-bbox="764 1360 1409 1488">A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.</td> </tr> <tr> <td data-bbox="542 1488 764 1585">IPAddress</td> <td data-bbox="764 1488 1409 1585">A string indicating the IP address where the certificate was discovered.</td> </tr> <tr> <td data-bbox="542 1585 764 1682">Port</td> <td data-bbox="764 1585 1409 1682">An integer indicating the port on which the certificate was discovered.</td> </tr> </tbody> </table>	Name	Description	StorePath	A string indicating the machine where the certificate was discovered.	AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.	IPAddress	A string indicating the IP address where the certificate was discovered.	Port	An integer indicating the port on which the certificate was discovered.
Name	Description										
StorePath	A string indicating the machine where the certificate was discovered.										
AgentPool	A string indicating the GUID of the orchestrator pool that performed the SSL scan on the endpoint where the certificate was discovered.										
IPAddress	A string indicating the IP address where the certificate was discovered.										
Port	An integer indicating the port on which the certificate was discovered.										

Name	Description	
	Name	Description
	NetworkName	A string indicating the name of the SSL network that performed the SSL scan (discovery or monitoring) on the endpoint where the certificate was discovered.

Name	Description																																										
Locations	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreMachine</td> <td>A string indicating the machine on which the certificate store is located.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td> </tr> <tr> <td>StoreType</td> <td> <p>An integer indicating the type of certificate store the certificate is located in. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Java Keystore</td> </tr> <tr> <td>2</td> <td>PEM File</td> </tr> <tr> <td>3</td> <td>F5 SSL Profiles</td> </tr> <tr> <td>4</td> <td>IIS Roots</td> </tr> <tr> <td>5</td> <td>NetScaler</td> </tr> <tr> <td>6</td> <td>IIS Personal</td> </tr> <tr> <td>7</td> <td>F5 Web Server</td> </tr> <tr> <td>8</td> <td>IIS Revoked</td> </tr> <tr> <td>9</td> <td>F5 Web Server REST</td> </tr> <tr> <td>10</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>11</td> <td>F5 CA Bundles REST</td> </tr> <tr> <td>100</td> <td>Amazon Web Services</td> </tr> <tr> <td>101</td> <td>File Transfer Protocol</td> </tr> <tr> <td>1xx</td> <td>User-defined certificate stores will be given a type ID over 101.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Alias</td> <td>A string indicating the alias of the certificate in the certificate store.</td> </tr> <tr> <td>ChainLevel</td> <td>An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.</td> </tr> </tbody> </table>	Name	Description	StoreMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.	StoreType	<p>An integer indicating the type of certificate store the certificate is located in. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Java Keystore</td> </tr> <tr> <td>2</td> <td>PEM File</td> </tr> <tr> <td>3</td> <td>F5 SSL Profiles</td> </tr> <tr> <td>4</td> <td>IIS Roots</td> </tr> <tr> <td>5</td> <td>NetScaler</td> </tr> <tr> <td>6</td> <td>IIS Personal</td> </tr> <tr> <td>7</td> <td>F5 Web Server</td> </tr> <tr> <td>8</td> <td>IIS Revoked</td> </tr> <tr> <td>9</td> <td>F5 Web Server REST</td> </tr> <tr> <td>10</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>11</td> <td>F5 CA Bundles REST</td> </tr> <tr> <td>100</td> <td>Amazon Web Services</td> </tr> <tr> <td>101</td> <td>File Transfer Protocol</td> </tr> <tr> <td>1xx</td> <td>User-defined certificate stores will be given a type ID over 101.</td> </tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.	Alias	A string indicating the alias of the certificate in the certificate store.	ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.
Name	Description																																										
StoreMachine	A string indicating the machine on which the certificate store is located.																																										
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.

Alias	A string indicating the alias of the certificate in the certificate store.																																										
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																										

Name	Description																		
Metadata	An array containing the metadata fields populated for the certificate.																		
CertificateKeyld	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.																		
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: The <i>CARowIndex</i> has been replaced by <i>CAREcordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CAREcordId</i> value parsed to an integer. </div>																		
CAREcordId	A string containing the CA's reference ID for certificate.																		
DetailedKeyUsage	<p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CrlSign</td> <td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DataEncipherment</td> <td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DecipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td> </tr> <tr> <td>DigitalSignature</td> <td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>EncipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td> </tr> <tr> <td>KeyAgreement</td> <td>A Boolean that indicates whether the certificate is configured for key agreement.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is</td> </tr> </tbody> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is
Name	Description																		
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).																		
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).																		
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).																		
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).																		
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).																		
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agreement.																		
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.																		
KeyEncipherment	A Boolean that indicates whether the certificate is																		

Name	Description								
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description								
	configured for key encipherment.								
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.								
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .								
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).								
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.12 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the PUT /Certificates/Metadata/All method (see [PUT Certificates Metadata All on the next page](#)). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 208: PUT Certificates Metadata Input Parameters

Name	In	Description
Id	Body	Required. An integer specifying the Keyfactor Command reference ID for the certificate

Name	In	Description
		to update.
Metadata	Body	<p>Required. An array containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example:</p> <pre> "Metadata": { "AppOwnerEmailAddress":"john.smith@keyexample.com", // This is String field. "SiteCode":23, // This is "BusinessCritical":true, // This is "Notes":"Here are some notes about this certificate.", // This is a BigText field. "BusinessUnit":"E-Business", // This is a Multiple Choic with a pre-defined value. "TicketResolutionDate":"2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.13 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of active certificates. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 209: PUT Certificates Metadata All Input Parameters

Name	In	Description
Query	Body	<p>Required*. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Certificate Search Page on page 31 section. A value for one of <i>Certificatelds</i>, <i>Query</i>, or <i>CollectionId</i> is required.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>ArchivedKey</i> • <i>CertId</i> • <i>CA</i> • <i>CertState</i> • <i>CertStoreFQDN</i> (alias: <i>JavaKey-storeFQDN</i>) • <i>CertStorePath</i> (alias: <i>JavaKey-storePath</i>) • <i>CN</i> (alias: <i>IssuedCN</i>) • <i>DN</i> (alias: <i>IssuedDN</i>) • <i>ExpirationDate</i> (alias: <i>NotAfter</i>) • <i>EKU</i> • <i>EKUName</i> • <i>HasPrivateKey</i> • <i>ImportDate</i> • <i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>) • <i>IssuerDN</i> • <i>KeySize</i> (alias: <i>KeySizeInBits</i>) • <i>KeyType</i> • <i>KeyUsage</i> • <i>OU</i> • <i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>) • <i>PublicKey</i> • <i>NetBIOSRequester</i> (alias: <i>RequesterName</i>) • <i>RevocationDate</i> (alias: <i>RevocationEffDate</i>) • <i>Revoker</i> • <i>RFC2818Compliant</i> • <i>SelfSigned</i> • <i>SerialNumber</i> • <i>SigningAlgorithm</i> • <i>SSLDNSName</i> • <i>SSLIPAddress</i> (alias: <i>SslHostName</i>) • <i>SSLNetworkName</i> • <i>SSLPort</i> • <i>SAN</i> • <i>TemplateDisplayName</i> (alias: <i>TemplateName</i>) • <i>TemplateShortName</i> • <i>Thumbprint</i> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> • <i>CARequestID</i> • <i>CertRequestID</i>

Name	In	Description								
		<ul style="list-style-type: none"> • <i>IsPfx</i> • <i>RequestResolutionDate</i> <p> Note: Queries may be done using either the primary field name or the field alias(es).</p> <p> Tip: To exclude revoked certificates from the update, include a query of: CertState -ne \"2\" To exclude expired certificates from the update, include a query of: ExpirationDate -ge \"%TODAY%\"</p>								
Certificates	Body	Required* . An array of Keyfactor Command certificate IDs to update. A value for one of <i>CertificateIds</i> , <i>Query</i> , or <i>CollectionId</i> is required .								
Metadata	Body	<p>Required. An array containing information about the metadata field(s) to update. The parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>Required. The value that should be set for the metadata field.</td> </tr> <tr> <td>MetadataName</td> <td>Required. The name of the metadata field that should be updated for the certificates.</td> </tr> <tr> <td>OverwriteExisting</td> <td>A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example:</p> <pre>"Metadata": [{ "MetadataName": "AppOwnerEmailAddress", // This is a String field. "Value": "john.smith@keyexample.com", "OverwriteExisting": true }, { "MetadataName": "SiteCode", // This is an Integer field. "Value": 5, "OverwriteExisting": true }]</pre>	Name	Description	Value	Required. The value that should be set for the metadata field.	MetadataName	Required. The name of the metadata field that should be updated for the certificates.	OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .
Name	Description									
Value	Required. The value that should be set for the metadata field.									
MetadataName	Required. The name of the metadata field that should be updated for the certificates.									
OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .									

Name	In	Description
		<pre> }, { "MetadataName": "BusinessCritical", // This is a Boolean field. "Value": true, "OverwriteExisting": true }, { "MetadataName": "Notes", // This is a BigText field. "Value": "Here are some notes about this certificate.", "OverwriteExisting": true }, { "MetadataName": "BusinessUnit", // This is a Multiple Choice field. "Value": "E-Business", // This is a value pre-defined for the field. "OverwriteExisting": true }, { "MetadataName": "TicketResolutionDate", // This is a Date field in yyyy-mm-dd format. "Value": "2021-07-23", "OverwriteExisting": true }] </pre>
CollectionId	Query	<p>Required*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is required.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.14 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Import*

Table 210: POST Certificates Import Input Parameters

Name	In	Description
Certificate	Body	Required. The base-64 encoded contents of the certificate that is to be imported into Keyfactor Command.
Password	Body	Required* . The password used to decrypt the imported PFX. This field is required if a PFX certificate is provided in the <i>Certificate</i> field.
Metadata	Body	A list of certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example: <pre>"Metadata": { "AppOwnerFirstName": "John", "AppOwnerLastName": "Smith" }</pre>
StoreIds	Body	A list of the certificate store GUIDs that the imported certificate will be installed into.

Name	In	Description
------	----	-------------

StoreTypes	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeId</td> <td> <p>The ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> <tr><td>101</td><td>File Transfer Protocol</td></tr> <tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr> </tbody> </table> </td> </tr> <tr> <td>Alias</td> <td> <p>Required*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 64 in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p> </td> </tr> </tbody> </table>	Name	Description	StoreTypeId	<p>The ID of the store type being used. Alias	<p>Required*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 64 in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.</p>																																							
Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p>																																							

Use the *GET Certificates/Locations/{id}* method (see [GET Certificates Locations ID on page 930](#)) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.

Name	In	Description
Schedule	Body	The time the imported certificate should be scheduled to be installed into the certificate store. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).

Table 211: POST Certificates Import Response Data

Name	Description														
ImportStatus	The status of the import job indicating, for example, whether the certificate was newly created in Keyfactor Command or already existed in Keyfactor Command and was just updated based on provided private key, metadata, or location information.														
InvalidKeyStores	Which key store items failed with some information. Included parameters are: <table border="1" data-bbox="451 716 1409 1150"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>KeystoreId</td> <td>The ID of the store that failed.</td> </tr> <tr> <td>ClientMachine</td> <td>The client machine of the store that failed.</td> </tr> <tr> <td>StorePath</td> <td>The path to the location of the certificate store that failed.</td> </tr> <tr> <td>Alias</td> <td>The alias for the certificate in the store that failed.</td> </tr> <tr> <td>Reason</td> <td>The simple reason why it failed.</td> </tr> <tr> <td>Explanation</td> <td>A more specific reason for the failure.</td> </tr> </tbody> </table>	Name	Description	KeystoreId	The ID of the store that failed.	ClientMachine	The client machine of the store that failed.	StorePath	The path to the location of the certificate store that failed.	Alias	The alias for the certificate in the store that failed.	Reason	The simple reason why it failed.	Explanation	A more specific reason for the failure.
Name	Description														
KeystoreId	The ID of the store that failed.														
ClientMachine	The client machine of the store that failed.														
StorePath	The path to the location of the certificate store that failed.														
Alias	The alias for the certificate in the store that failed.														
Reason	The simple reason why it failed.														
Explanation	A more specific reason for the failure.														
JobStatus	The state of all certificate store jobs.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.15 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 205](#)).

Table 212: POST Certificates Revoke Input Parameters

Name	In	Description																				
CertificateIDs	Body	Required. An array containing the list of Keyfactor Command reference IDs for certificates that should be revoked.																				
Reason	Body	<p>An integer containing the specific reason that the certificate is being revoked. Available values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																					
Comment	Body	Required. A string containing a freeform reason or comment on why the certificate is being revoked.																				
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.																				
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a																				

Name	In	Description
		certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.16 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. This method returns HTTP 200 OK on a success with a list of the contents of the certificate.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 Certificates: *Read*
 OR
 Certificates: *Import*

Table 213: POST Certificates Analyze Input Parameters

Name	In	Description
Certificate	Body	Required. The base-64 encoded PEM string of the certificate, not including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----).
Password	Body	The password used to encrypt the private key of the certificate for a base-64 encoded PEM containing the certificate's private key (-----BEGIN ENCRYPTED PRIVATE KEY-----).

Table 214: POST Certificates Analyze Response Data

Name	Description
IssuedDN	A string containing the distinguished name of the certificate.
IssuerDN	A string containing the distinguished name of the issuer.
Thumbprint	A string containing the thumbprint of the certificate.
NotAfter	The date/time, in UTC, on which the certificate expires.
NotBefore	The date/time, in UTC, on which the certificate was issued by the certificate authority.
Metadata	An array containing the metadata fields populated for the certificate.
IsEndEntity	A boolean flag is marked true if the certificate is the end entity of the chain.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.17 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 980](#)).

Tip: CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see [Details Tab on page 336](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Recover*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 215: POST Certificates Recover Input Parameters

Name	In	Description
Password	Body	Required . The password to set on the certificate.
CertID	Body	Required *. The Keyfactor Command reference ID of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	Required *. The serial number of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	Required *. The distinguished name of the issuer of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	Required *. The thumbprint of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	The desired output format for the certificate. Supported options are: <ul style="list-style-type: none"> • PEM • PFX

Table 216: POST Certificates Recover Response Data

Name	Description
PFX	<p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content ConvertFrom-Json \$targetFile = 'C:\path_to_target_file\'+\$ResponseContent.FileName \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p>
FileName	The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.18 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the [POST /Certificates/Recover](#) method (see [POST Certificates Recover on page 978](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: Recover

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 217: POST Certificates Download Input Parameters

Name	In	Description
CertID	Body	Required* . The Keyfactor Command reference ID of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	Required* . The serial number of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	Required* . The distinguished name of the issuer of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	Required* . The thumbprint of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	The desired output format for the certificate. Supported options are: <ul style="list-style-type: none"> • DER Not supported if IncludeChain is set to <i>true</i>. • PEM

Name	In	Description
		<ul style="list-style-type: none"> P7B Only supported if IncludeChain is set to <i>true</i>

Table 218: POST Certificates Download Response Data

Name	Description
Content	The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.19 POST Certificates Revoke All

The POST /Certificates/RevokeAll method is used to revoke all the certificates in the specified query or collection ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 205](#)).

Table 219: POST Certificates Revoke All Input Parameters

Name	In	Description
Query	Body	Required* . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Certificate Search Page on page 31</i> section. A value for either <i>Query</i> or <i>CollectionId</i> is required . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.
Reason	Body	An integer containing the specific reason that the certificates are being revoked.

Name	In	Description																						
		<p>Available values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL	999	Unknown
Value	Description																							
-1	Remove from Hold																							
0	Unspecified																							
1	Key Compromised																							
2	CA Compromised																							
3	Affiliation Changed																							
4	Superseded																							
5	Cessation of Operation																							
6	Certificate Hold																							
7	Remove from CRL																							
999	Unknown																							
Comment	Body	Required. A string containing a freeform reason or comment on why the certificates are being revoked.																						
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.																						
IncludeRevoked	Body	A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																						
IncludeExpired	Body	A Boolean that indicates whether expired certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																						
CollectionId	Query	Required* . An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more																						

Name	In	Description
		information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is required . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.20 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of active certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under *CollectionId*, below.

Table 220: DELETE Certificates Query Input Parameters

Name	In	Description
sq	Body	<p>Required. Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>"CN –contains \"mycertificate.keyexample.com\""</pre> <p>See Certificate Search Page on page 31 in the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.</p> <p> Tip: Revoked and expired certificates are excluded from the selection regardless of the query you enter.</p>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.21 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 221: DELETE Certificates Private Key Input Parameters

Name	In	Description
ids	Body	Required. An array of Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form: [123, 789, 567]
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.6.22 DELETE Certificates Private Key ID

The DELETE /Certificates/PrivateKey/{id} method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 222: DELETE Certificates Private Key {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate whose private key should be deleted. Use the <i>GET /Certificates</i> method (see GET Certificates on page 953) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 223: Certificate Authority Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the certificate authority record for the specified ID.	DELETE Certificate Authority ID on the next page
/id}	GET	Returns details for the certificate authority identified by the specified ID.	GET Certificate Authority ID on the next page
/	GET	Returns a list of all certificate authorities.	GET Certificate Authority on page 1000

Endpoint	Method	Description	Link
/	POST	Creates a new certificate authority record.	POST Certificate Authority on page 1013
/	PUT	Updates an existing certificate authority record.	PUT Certificate Authority on page 1038
/Test	POST	Validates that the certificate authority with the provided information can be reached.	POST Certificate Authority Test on page 1064
/PublishCRL	POST	Publishes the Certificate Revocation List of the given certificate authority.	POST Certificate Authority PublishCRL on page 1066

3.2.7.1 DELETE Certificate Authority ID

The DELETE `/CertificateAuthority/{id}` endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Modify*

Note: You can't delete a CA from Keyfactor Command that has active records associated with it (e.g. certificates, certificate requests).

Table 224: DELETE Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.2 GET Certificate Authority ID

The POST `/CertificateAuthority` method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

Table 225: GET Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve.

Table 226: GET Certificate Authority {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>

Name	Description
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description										
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924).</p>										
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>										
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										

Name	Description
	<p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery

Name	Description
	<p> • Certificate request approval and denial</p> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).</p>
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="480 1583 1409 1745">"AllowedRequesters": ["Power Users", "Read Only"]</pre>

Name	Description												
	<p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description
	 <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>

IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 890 1414 1640"> <thead> <tr> <th data-bbox="477 890 607 947">Name</th> <th data-bbox="607 890 1414 947">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 947 607 1010">Off</td> <td data-bbox="607 947 1414 1010">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1010 607 1541">Interval</td> <td data-bbox="607 1010 1414 1541"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description												
Off	Turn off a previously configured schedule.												
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
CAType	An integer indicating the type of CA:												

Name	Description								
	<ul style="list-style-type: none"> 0—DCOM 1—HTTPS 								
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA. Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <table border="1" data-bbox="479 688 1411 1108"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table border="1" data-bbox="479 1360 1411 1682"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.		
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								

Name	Description						
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td> </tr> <tr> <td>ExpirationDate</td> <td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td> </tr> </tbody> </table>	Value	Description	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description						
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.						
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.						
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>						
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

Table 227: GET Certificate Authority Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 228: GET Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>

Name	Description
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description										
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924).</p> </div>										
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>										
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" data-bbox="477 940 1412 1186"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1" data-bbox="477 1367 1412 1675"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										

Name	Description
	<p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery

Name	Description
	<p> • Certificate request approval and denial</p> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).</p>
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="480 1583 1409 1745">"AllowedRequesters": ["Power Users", "Read Only"]</pre>

Name	Description												
	<p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 905 1411 1661"> <thead> <tr> <th data-bbox="477 905 607 968">Name</th> <th data-bbox="607 905 1411 968">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 968 607 1031">Off</td> <td data-bbox="607 968 1411 1031">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1031 607 1562">Interval</td> <td data-bbox="607 1031 1411 1562"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1413 1390 1549"> "Interval": { "Minutes": 60 } </pre> </td> </tr> <tr> <td data-bbox="477 1562 607 1661">Daily</td> <td data-bbox="607 1562 1411 1661">A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1413 1390 1549"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1413 1390 1549"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.

Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								

Name	Description
	 <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>

IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 890 1414 1640"> <thead> <tr> <th data-bbox="477 890 607 947">Name</th> <th data-bbox="607 890 1414 947">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 947 607 1010">Off</td> <td data-bbox="607 947 1414 1010">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1010 607 1541">Interval</td> <td data-bbox="607 1010 1414 1541"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="630 1150 1393 1304"> <thead> <tr> <th data-bbox="630 1150 789 1207">Name</th> <th data-bbox="789 1150 1393 1207">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 1207 789 1304">Minutes</td> <td data-bbox="789 1207 1393 1304">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="630 1394 1393 1528"> "Interval": { "Minutes": 60 } </pre> </td> </tr> <tr> <td data-bbox="477 1541 607 1640">Daily</td> <td data-bbox="607 1541 1414 1640">A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="630 1150 1393 1304"> <thead> <tr> <th data-bbox="630 1150 789 1207">Name</th> <th data-bbox="789 1150 1393 1207">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 1207 789 1304">Minutes</td> <td data-bbox="789 1207 1393 1304">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="630 1394 1393 1528"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description						
	<table border="1"> <thead> <tr> <th data-bbox="477 268 607 325">Name</th> <th data-bbox="607 268 1411 325">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 346 781 403">Time</td> <td data-bbox="781 346 1411 403">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="628 569 935 594">For example, daily at 11:30 pm:</p> <pre data-bbox="628 646 1390 753"> { "Daily": { "Time": "2022-02-25T23:30:00Z" } } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p data-bbox="628 793 1349 852">A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th data-bbox="628 877 781 934">Name</th> <th data-bbox="781 877 1390 934">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 955 781 1066">Time</td> <td data-bbox="781 955 1390 1066">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td data-bbox="628 1087 781 1230">Days</td> <td data-bbox="781 1087 1390 1230">An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p data-bbox="628 1266 1252 1291">For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre data-bbox="628 1323 1390 1581"> { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" } } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						
	<p data-bbox="488 1640 1349 1738">  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </p>						

Name	Description												
ThresholdCheck	<p>The schedule for threshold monitoring checks on this certificate authority (see <i>MonitorThresholds</i>). The following schedule types are supported:</p> <table border="1" data-bbox="477 352 1411 478"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table> <p>Interval</p> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="630 613 1390 768"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="630 856 1390 995">"Interval": { "Minutes": 60 }</pre> <p>Daily</p> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="630 1108 1390 1306"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="630 1394 1390 1533">"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Off	Turn off a previously configured schedule.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description												
Off	Turn off a previously configured schedule.												
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
CAType	An integer indicating the type of CA:												

Name	Description								
	<ul style="list-style-type: none"> • 0—DCOM • 1—HTTPS 								
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA. Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.		
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								

Name	Description						
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td> </tr> <tr> <td>ExpirationDate</td> <td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td> </tr> </tbody> </table>	Value	Description	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description						
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.						
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.						
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>						
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Modify*

Table 229: POST Certificate Authority Input Parameters

Name	In	Description
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #f0e68c; padding: 10px; margin-top: 10px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #f0e68c; padding: 10px; margin-top: 10px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #d9d9d9; padding: 10px; margin-top: 10px;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	Body	<p>Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #f0e68c; padding: 10px; margin-top: 10px;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>

Name	In	Description
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	In	Description										
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). </div>										
Properties	Body	<p>Required. Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>										
AllowedEnrollmentTypes	Body	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1</td> <td>PFX Enrollment</td> </tr> <tr> <td style="text-align: center;">2</td> <td>CSR Enrollment</td> </tr> <tr> <td style="text-align: center;">3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Key Retention Disabled</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Indefinite</td> </tr> <tr> <td style="text-align: center;">2</td> <td>After Expiration</td> </tr> <tr> <td style="text-align: center;">3</td> <td>From Issuance</td> </tr> </tbody> </table>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											

Name	In	Description
		<p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft</p>

Name	In	Description
		<p> CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	Body	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).</p>
AllowedRequesters	Body	An array of Keyfactor Command security roles that are allowed to enroll for certificates

Name	In	Description										
		<p>via Keyfactor Command for this CA. For example:</p> <pre data-bbox="553 323 1411 489">"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>										
FullScan	Body	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="553 1188 1411 1682"> <thead> <tr> <th data-bbox="553 1188 675 1251">Name</th> <th data-bbox="675 1188 1411 1251">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 1251 675 1314">Off</td> <td data-bbox="675 1251 1411 1314">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="553 1314 675 1682">Interval</td> <td data-bbox="675 1314 1411 1682"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a </p>	Name	Description		<pre data-bbox="695 348 1166 510"> "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" } </pre>

Name	In	Description																
		 long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.																
IncrementalScan	Body	<p>The schedule for the incremental synchronization of this certificate authority. Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																	
CAType	Body	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> 0—DCOM 																

Name	In	Description								
		<ul style="list-style-type: none"> 1—HTTPS 								
AuthCertificatePassword	Body	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre>{ "SecretValue": "MySuperSecretPassword" }</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447 and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{ "Provider": "1", "Parameters":{ "Folder": "MyFolderName", "Object": "MyEJBAClientAuthPassword" } }</pre>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447 and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre> { "Provider": "1", "Parameters": { "SecretId": "MyEJBCAPasswordId" } } </pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 230: POST Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>

Name	Description
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description										
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924).</p>										
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>										
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										

Name	Description
	<p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery

Name	Description
	<ul style="list-style-type: none"> • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p>Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p>Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p>Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).</p>
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": ["Power Users", "Read Only"]</pre>

Name	Description												
	<p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 905 1411 1661"> <thead> <tr> <th data-bbox="477 905 607 968">Name</th> <th data-bbox="607 905 1411 968">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 968 607 1031">Off</td> <td data-bbox="607 968 1411 1031">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1031 607 1562">Interval</td> <td data-bbox="607 1031 1411 1562"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1415 1390 1549"> "Interval": { "Minutes": 60 } </pre> </td> </tr> <tr> <td data-bbox="477 1562 607 1661">Daily</td> <td data-bbox="607 1562 1411 1661">A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1415 1390 1549"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="628 1167 1390 1325"> <thead> <tr> <th data-bbox="628 1167 789 1230">Name</th> <th data-bbox="789 1167 1390 1230">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="628 1230 789 1325">Minutes</td> <td data-bbox="789 1230 1390 1325">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="628 1415 1390 1549"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Name	Description
	 <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>

IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 890 1414 1640"> <thead> <tr> <th data-bbox="477 890 607 947">Name</th> <th data-bbox="607 890 1414 947">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 947 607 1010">Off</td> <td data-bbox="607 947 1414 1010">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1010 607 1541">Interval</td> <td data-bbox="607 1010 1414 1541"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
CAType	An integer indicating the type of CA:																

Name	Description								
	<ul style="list-style-type: none"> • 0—DCOM • 1—HTTPS 								
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA. Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.		
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								

Name	Description						
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td> </tr> <tr> <td>ExpirationDate</td> <td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td> </tr> </tbody> </table>	Value	Description	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description						
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.						
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.						
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>						
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.						

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 231: PUT Certificate Authority Input Parameters

Name	In	Description
Id	Body	Required. An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #e6f2ff;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	Body	<p>Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same</p> </div>

Name	In	Description
		 <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be

Name	In	Description								
		denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). </div>								
Properties	Body	<p>Required. Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;">{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	Body	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1</td> <td>PFX Enrollment</td> </tr> <tr> <td style="text-align: center;">2</td> <td>CSR Enrollment</td> </tr> <tr> <td style="text-align: center;">3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description									
1	PFX Enrollment									
2	CSR Enrollment									
3	PFX and CSR Enrollment									
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="background-color: #2c3e50; color: white;">Value</th> <th style="background-color: #2c3e50; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Key Retention Disabled</td> </tr> </tbody> </table>	Value	Description	0	Key Retention Disabled				
Value	Description									
0	Key Retention Disabled									

Name	In	Description								
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Value	Description	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description									
1	Indefinite									
2	After Expiration									
3	From Issuance									
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.								
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> .								
		<p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>								
SubscriberTerms	Body	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .								
		<p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the</p>								

Name	In	Description
		 <i>Keyfactor Command Reference Guide</i> for more information.
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="553 520 1409 932" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div data-bbox="553 961 1409 1121" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command. </div>
ExplicitPassword	Body	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="553 1304 1409 1703" style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div>

Name	In	Description				
		 Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).				
AllowedRequesters	Body	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The <code>allowed requesters</code> option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	Body	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description					
Off	Turn off a previously configured schedule.					

Name	In	Description				
Interval		<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description					
Minutes	An integer indicating the number of minutes between each interval.					
Daily		<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
Weekly		<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Name	Description							
	time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).							
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").							

Name	In	Description										
		<pre data-bbox="553 268 1409 432">], "Time": "2022-05-27T17:30:00Z" } } </pre> <div data-bbox="553 457 1409 995"> <p> Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>										
IncrementalScan	Body	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="553 1115 1409 1178"> <thead> <tr> <th data-bbox="553 1115 675 1178">Name</th> <th data-bbox="675 1115 1409 1178">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 1178 675 1241">Off</td> <td data-bbox="675 1178 1409 1241">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="553 1241 675 1692">Interval</td> <td data-bbox="675 1241 1409 1692"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="695 1377 1390 1528"> <thead> <tr> <th data-bbox="695 1377 854 1440">Name</th> <th data-bbox="854 1377 1390 1440">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="695 1440 854 1528">Minutes</td> <td data-bbox="854 1440 1390 1528">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="699 1619 1390 1682"> "Interval": { </pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description							
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.							
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.							
AuthCertificate	Body	An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.						

Name	In	Description
		The syntax is the same as for <i>AuthCertificatePassword</i> .
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
LastScan	Body	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

Table 232: PUT Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.</p> </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #fff9e6;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>

Name	Description
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 328 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.

Name	Description										
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924).</p>										
Properties	<p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>										
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										

Name	Description
	<p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1924). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 308 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery

Name	Description
	<p> • Certificate request approval and denial</p> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Identities on page 572 in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	A string containing the password for the <i>ExplicitUser</i> .
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1924).</p>
AllowedRequesters	<p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="480 1583 1409 1738">"AllowedRequesters": ["Power Users", "Read Only"]</pre>

Name	Description												
	<p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA. This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1924).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td> </tr> </tbody> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").						

Name	Description
	 <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>

IncrementalScan	<p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table border="1" data-bbox="477 888 1412 1640"> <thead> <tr> <th data-bbox="477 888 609 947">Name</th> <th data-bbox="609 888 1412 947">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="477 947 609 1014">Off</td> <td data-bbox="609 947 1412 1014">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="477 1014 609 1545">Interval</td> <td data-bbox="609 1014 1412 1545"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description												
Off	Turn off a previously configured schedule.												
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
CAType	An integer indicating the type of CA:												

Name	Description								
	<ul style="list-style-type: none"> 0—DCOM 1—HTTPS 								
AuthCertificatePassword	<p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA. Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <table border="1" data-bbox="479 688 1411 1108"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table border="1" data-bbox="479 1360 1411 1682"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td> </tr> </tbody> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.		
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: "IssuedDN": "CN=SuperAdmin,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								

Name	Description						
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td> </tr> <tr> <td>ExpirationDate</td> <td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td> </tr> </tbody> </table>	Value	Description	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description						
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.						
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.						
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>						
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.						

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.6 POST Certificate Authority Test

The POST /CertificateAuthority/Test method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PkiManagement: *Read*

Table 233: POST Certificate Authority Test Input Parameters

Name	In	Description
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
ConfigurationTenant	Body	Required* . A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com). This parameter is required for Microsoft CAs.
AuthCertificatePassword	Body	Required* . An array indicating the password for the PKCS#12 client certificate to use to authenticate to the EJBCA CA. The password is provided in the following format: <pre>{ "SecretValue": "MySuperSecretPassword" }</pre> This parameter is required for EJBCA CAs.
AuthCertificate	Body	Required* . An array containing the base-64 encoded PKCS#12 client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format: <pre>{ "SecretValue": "MIACAQMmgAY ... CAwGQAAAA" }</pre> This parameter is required for EJBCA CAs.
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> 0—DCOM Use this option for Microsoft CAs and CA gateways. 1—HTTPS Use this option for EJBCA CAs. <p>The default is 0.</p>

Table 234: POST Certificate Authority Test Response Data

Name	Description
Success	A Boolean that indicates whether the CA could successfully be reached (True) or not (False).
Message	A string indicating a message about the validation test of the certificate authority.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.7.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Revoke*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 235: POST Certificate Authority PublishCRL Input Parameters

Name	In	Description
CertificateAuthorityHostName	Body	The host name of the machine hosting the CA. This field is optional, but is recommended.
CertificateAuthorityLogicalName	Body	Required. The logical name of the CA.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, list and set permissions on certificate collections.

Table 236: Certificate Collections Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the certificate collection with the specified ID.	GET Certificate Collections ID below
/name}	GET	Returns the certificate collection with the specified name.	GET Certificate Collections Name on page 1069
/	GET	Returns all certificate collections with details about the collection configuration.	GET Certificate Collections on page 1071
/	POST	Creates a new certificate collection.	POST Certificate Collections on page 1073
/	PUT	Updates an existing certificate collection.	PUT Certificate Collections on page 1079
/Copy	POST	Creates a new certificate collection based on an existing collection.	POST Certificate Collections Copy on page 1082
/id}/Permissions	POST	Grants the specified collection permissions for the specified role to the specified certificate collection.	POST Certificate Collections ID Permissions on page 1088

 **Note:** This endpoint will be removed in version 11.

3.2.8.1 GET Certificate Collections ID

The GET /CertificateCollections/{id} method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 237: GET CertificateCollections {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificates on page 953) to retrieve a list of all the certificate collections to determine the certificate collection ID.

Table 238: GET CertificateCollections {id} Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.2 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 239: GET CertificateCollections Name Input Parameters

Name	In	Description
name	Path	<p>Required. A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificates on page 953) to retrieve a list of all the certificate collections to determine the certificate collection name.</p> <p> Tip: When using the Keyfactor API Endpoint Utility, provide this name without quotation marks.</p>

Table 240: GET CertificateCollections ID Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.3 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 241: GET Certificate Collections Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page on page 31</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>Name</i>• <i>Query</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 242: GET CertificateCollections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Automated	An internally used Keyfactor Command field.										
Content	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.4 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

Certificates: *Read*

Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 243: POST Certificate Collections Input Parameters

Name	In	Description										
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .										
Query	Body	Required. A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See Certificate Search Page on page 31 in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .										
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table border="1" data-bbox="609 1243 1409 1549"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	In	Description
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <code>GET /CertificateCollections</code> method (see GET Certificate Collections on page 1071) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <code>Query</code> or <code>Description</code> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <code>Read</code> permissions for certificates. If the requesting user is granted <code>Read</code> permissions to the collection via collection-level security rather than global security, the <code>Query</code> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div data-bbox="609 703 1409 821" style="background-color: #fff9c4; padding: 10px;"> <p> Example: Gina wants to create a new collection using the <code>CopyFromId</code> option. She first uses <code>GET /CertificateCollections/{id}</code> to list the collection she plans to copy from and sees the following results:</p> </div> <pre data-bbox="690 846 1401 1199" style="background-color: #e0e0e0; padding: 10px;"> { "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <code>Read</code>, <code>Edit Metadata</code>, and <code>Download with Private Key</code> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the <i>Power Users</i> role do not have global certificate <code>Read</code> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <code>Read</code> permissions. Users with the <i>Power Users</i> role have <code>Modify</code> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the <i>Power Users</i> role and is not a full administrator.</p> <p>Gina uses <code>POST /CertificateCollections/Copy</code> (or <code>POST /CertificateCollections</code>—the behavior and output would be the same) to</p>

Name	In	Description
		<p data-bbox="618 281 667 331"></p> <p data-bbox="683 281 1390 342">create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre data-bbox="691 373 1398 674"> { "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p data-bbox="683 705 1081 730">In the response, Gina sees the following:</p> <pre data-bbox="691 762 1398 1171"> { "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p data-bbox="683 1203 1398 1570">Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view. Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p data-bbox="683 1587 1105 1612">In the response, Martha sees the following:</p> <pre data-bbox="691 1644 1398 1738"> { "Id": 16, </pre>

Name	In	Description
		 <pre data-bbox="691 306 1401 583">"Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, >ShowOnDashboard": false, Favorite": true }</pre> <p data-bbox="683 611 1360 640">Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 244: POST Certificate Collections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.5 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

Certificates: *Read*

Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 245: PUT CertificateCollections Input Parameters

Name	In	Description										
ID	Body	Required. The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the GET /CertificateCollections method (see GET Certificate Collections on page 1071) to locate the ID of the collection you wish to update.										
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Query	Body	Required. A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See Certificate Search Page on page 31 in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.										
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table border="1" data-bbox="609 1333 1409 1638"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	In	Description
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .

Table 246: PUT CertificateCollections Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.6 POST Certificate Collections Copy

The POST `/CertificateCollections/Copy` method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*
Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Permissions on page 583](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 247: POST Certificate Collections Copy Input Parameters

Name	In	Description										
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .										
Query	Body	Required. A string containing the search criteria for the collection. For example: <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> See Certificate Search Page on page 31 in the <i>Keyfactor Command Reference Guide</i> for querying guidelines. See also <i>CopyFromId</i> .										
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table border="1" data-bbox="609 1241 1411 1549"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description											
0	None											
1	Common Name											
2	Distinguished Name											
3	Principal Name											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	In	Description
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <code>GET /CertificateCollections</code> method (see GET Certificate Collections on page 1071) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <code>Query</code> or <code>Description</code> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <code>Read</code> permissions for certificates. If the requesting user is granted <code>Read</code> permissions to the collection via collection-level security rather than global security, the <code>Query</code> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div data-bbox="609 703 1409 821" style="background-color: #fff9c4; padding: 10px;"> <p> Example: Gina wants to create a new collection using the <code>CopyFromId</code> option. She first uses <code>GET /CertificateCollections/{id}</code> to list the collection she plans to copy from and sees the following results:</p> </div> <pre data-bbox="690 846 1401 1199" style="background-color: #e0e0e0; padding: 10px;"> { "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <code>Read</code>, <code>Edit Metadata</code>, and <code>Download with Private Key</code> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the <i>Power Users</i> role do not have global certificate <code>Read</code> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <code>Read</code> permissions. Users with the <i>Power Users</i> role have <code>Modify</code> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the <i>Power Users</i> role and is not a full administrator.</p> <p>Gina uses <code>POST /CertificateCollections/Copy</code> (or <code>POST /CertificateCollections</code>—the behavior and output would be the same) to</p>

Name	In	Description
		<p data-bbox="618 279 1390 342">  create a new certificate collection using the <i>CopyFromId</i> option with the following command: </p> <pre data-bbox="691 373 1398 674"> { "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p data-bbox="683 705 1081 730">In the response, Gina sees the following:</p> <pre data-bbox="691 762 1398 1171"> { "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p data-bbox="683 1203 1398 1570"> Notice that Gina has not achieved her desired goal. The new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view. Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection. </p> <p data-bbox="683 1587 1109 1612">In the response, Martha sees the following:</p> <pre data-bbox="691 1644 1398 1738"> { "Id": 16, </pre>

Name	In	Description
		 <pre data-bbox="691 306 1401 583">"Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, >ShowOnDashboard": false, Favorite": true }</pre> <p data-bbox="683 615 1360 642">Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 248: POST Certificate Collections Copy Response Data

Name	Description										
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.										
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.										
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.										
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.										
Query	A string containing the search criteria for the collection.										
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. "ignore renewed certificate results by") to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 38 in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name
Value	Description										
0	None										
1	Common Name										
2	Distinguished Name										
3	Principal Name										
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (<i>true</i>) or not (<i>false</i>).										
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(<i>true</i>) or not (<i>false</i>).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.8.7 POST Certificate Collections ID Permissions

The POST /CertificateCollections/{id}/Permissions method is used to set permissions on a certificate collection. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Security Settings: *Modify*

Warning: When using this method to update an existing certificate collection, all existing RoleId and Permission information must be submitted along with any updates. Any existing permissions that are not included with their full existing data (RoleId and Permission mappings) on an update using this method will be removed from the permissions for the certificate collection. There is not presently a GET method to retrieve the current state of the permissions for certificate collections.

Note: This method has been deprecated and will be removed from the Keyfactor API in release 11. It has been replaced by the endpoint: PUT /Security/Roles/{id}/Permissions/Collection.

Table 249: POST CertificateCollections {id} Permissions Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate collection to update. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1071) to retrieve a list of all the certificate collections to determine the certificate collection ID.
Roleid	Body	An integer identifying the Keyfactor Command security role that you wish to grant collection security permissions to. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1622) to retrieve a list of your defined security roles to determine the security role ID to use.
Permissions	Body	An array of the collection permissions that can be granted to the role. Possible values are: <ul style="list-style-type: none"> • Read • EditMetadata • Recover • Revoke • Delete <p>For example:</p> <pre>"Permissions": ["Read", "Recover", "Revoke"]</pre> <p>Permissions for certificates can be set at either the global or certificate collection level. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information about global vs collection permissions.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the *Keyfactor Command Reference Guide* and *Keyfactor Command Orchestrator Installation and Configuration Guide*, or contact your Keyfactor

representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 250: Certificate Stores Endpoints](#).

Table 250: Certificate Stores Endpoints

Endpoint	Method	Description	
/	DELETE	Deletes multiple certificate stores specified in the request body.	DELETE Certificate Stores on the next page
/	GET	Returns all certificate stores with paging and option to specify detail level.	GET Certificate Stores on page 1092
/	POST	Creates a new certificate store if valid parameters are supplied.	POST Certificate Stores on page 1100
/	PUT	Updates an existing certificate store.	PUT Certificate Stores on page 1120
/ {id}	DELETE	Deletes a certificate store by its GUID.	DELETE Certificate Stores ID on page 1140
/ {id}	GET	Returns certificate store details for the specified certificate store.	GET Certificate Stores ID on page 1140
/ {id} /Inventory	GET	Returns certificate inventory for the specified certificate store.	GET Certificate Stores ID Inventory on page 1153
/Server (*deprecated)	GET	Returns a list of certificate store servers.	GET Certificate Stores Server on page 1155
/Server (*deprecated)	POST	Creates a new certificate store server.	POST Certificate Stores Server on page 1157
/Server (*deprecated)	PUT	Updates an existing certificate store server.	PUT Certificate Stores Server on page 1162
/Password	PUT	Updates the password for a certificate store.	PUT Certificate Stores Password on page 1166
/DiscoveryJob	PUT	Creates a job to find certificate stores.	PUT Certificate Stores Discovery Job on page 1169
/AssignContainer	PUT	Assigns a certificate store to a container.	PUT Certificate Stores Assign Container on page 1174
/Approve	POST	Approves an array of pending certificate	POST Certificate Stores

Endpoint	Method	Description	
		stores.	Approve on page 1182
/Schedule	POST	Creates an inventory schedule for a certificate store.	POST Certificate Stores Schedule on page 1190
/Reenrollment	POST	Schedules a reenrollment of a certificate into a certificate store.	POST Certificate Stores Reenrollment on page 1193
/Certificates/Add	POST	Configures a management job to add a certificate to one or more stores with the provided schedule.	POST Certificate Stores Certificates Add on page 1196
/Certificates/Remove	POST	Configures a management job to remove a certificate from one or more stores with the provided schedule.	POST Certificate Stores Certificates Remove on page 1201

3.2.9.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 251: DELETE Certificate Stores Input Parameters

Name	In	Description
IDs	Body	<p>Required. An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <pre>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</pre> <p>Use the GET /CertificateStores method (see GET Certificate Stores on the next page) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon  at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 252: GET Certificate Stores Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature on page 356</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AddSupported</i> (True, False) • <i>AgentAvailable</i> (True, False) • <i>AgentId</i> • <i>Approved</i> (True, False) • <i>Category</i> (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) • <i>CertificateId</i> • <i>ClientMachine</i> • <i>Container</i> (ContainerName) • <i>ContainerId</i> • <i>HasInventoryScheduled</i> (True, False) • <i>PrivateKeyAllowed</i> (0-Forbidden, 1-Optional, 2-Required) • <i>RemoveSupported</i> (True, False) • <i>StorePath</i> <div style="border: 1px solid #ccc; background-color: #e6f2e6; padding: 10px; margin-top: 10px;"> <p> Tip: Use the following query to limit the results to only active certificate stores and not include discovery results: approved -eq true</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 253: GET Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see POST Certificate Stores Server</p>

Name	Description
	<p>on page 1157.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 506 1409 667">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 825 1409 987">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="477 1073 1409 1262">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="477 1413 1409 1661">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p>

Name	Description				
	<div data-bbox="483 279 532 331" style="float: left; margin-right: 10px;"></div> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <div data-bbox="483 632 532 684" style="float: left; margin-right: 10px;"></div> <p>Tip: Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. 				
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.				
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).				
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.				
InventorySchedule	<p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="472 1566 1411 1688"> <thead> <tr> <th data-bbox="472 1566 634 1625">Name</th> <th data-bbox="634 1566 1411 1625">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 1625 634 1688">Off</td> <td data-bbox="634 1625 1411 1688">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description				
Off	Turn off a previously configured schedule.				

Name	Description				
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>				
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description				
Minutes	An integer indicating the number of minutes between each interval.				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				

Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
ReenrollmentStatus	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	An array of key/value pairs for the unique parameters defined										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div> <p>This field is optional.</p> </td> </tr> <tr> <td>CustomAliasAllowed</td> <td> <p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required </td> </tr> </tbody> </table>	Name	Description		<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. You may have custom certificate store types that make use of this functionality.</p> </div> <p>This field is optional.</p>						
CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required 						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div style="border: 1px solid #ccc; padding: 5px;"> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p> </div>						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 254: POST Certificate Stores Input Parameters

Name	In	Description
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	Body	Required. The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreatelfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see POST Certificate Stores Server on page 1157 . When reading this field, the values are returned as simple key value pairs, with the values

Name	In	Description
		<p>being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="505 432 1411 596"> { "privateKeyPath": "/opt/app/mystore.key", "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="505 747 1411 911"> { "privateKeyPath": {"value": "/opt/app/mystore.key"}, "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="505 999 1411 1188"> { "ServerUsername": {"value": {"SecretValue": "User_Name"}}, "ServerPassword": {"value": {"SecretValue": "Password"}}, "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the user-name and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="505 1339 1411 1587"> { "ServerUsername": {"value": {"Provider": "1", "Parameters": {"SecretId": "User_Name"}}, "ServerPassword": {"value": {"Provider": "1", "Parameters": {"SecretId": "Password"}}, "ServerUseSsl": {"value": "true"} }</pre> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul data-bbox="610 1696 805 1759" style="list-style-type: none"> • ServerUsername • ServerPassword

Name	In	Description
		<div style="border: 1px solid #ccc; padding: 10px; margin-bottom: 10px;">  <ul style="list-style-type: none"> • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div style="border: 1px solid #ccc; padding: 10px;">  <p>Tip: Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. </div>
AgentId	Body	Required. A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	Body	The inventory schedule for this certificate store. The following schedule types are supported:

Name	In	Description																		
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required 							
SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .						
Password	Body	An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores Server on page 1157).						

Name	In	Description												
		<p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre> </td> </tr> <tr> <td>SecretType-Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the type of credentials. Name	Description													
Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre>													
SecretType-Guid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.													
InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.													
InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.													
Provider-Type Para-	An array containing the values for the PAM provider types specified by <code>ProviderTypeParams</code> . The provider type parameter values include:

Name	Description																									
	provider type parameter.																									
Provider-TypeParams	Unused field																									
ProviderId		An integer indicating the Keyfactor Command reference ID for the PAM provider.																								
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																								

Table 255: POST Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see POST Certificate Stores Server

Name	Description
	<p>on page 1157.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 506 1409 667">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 825 1409 987">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="477 1073 1409 1262">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="477 1413 1409 1661">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p>

Name	Description				
	<div data-bbox="483 279 532 331" style="float: left; margin-right: 10px;"></div> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <div data-bbox="483 632 532 684" style="float: left; margin-right: 10px;"></div> <p>Tip: Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. 				
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.				
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).				
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.				
InventorySchedule	<p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="472 1566 1412 1688"> <thead> <tr> <th data-bbox="472 1566 634 1625">Name</th> <th data-bbox="634 1566 1412 1625">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 1625 634 1688">Off</td> <td data-bbox="634 1625 1412 1688">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description				
Off	Turn off a previously configured schedule.				

Name	Description				
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>				
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <pre>"Interval": { "Minutes": 60 }</pre> </div>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description				
Minutes	An integer indicating the number of minutes between each interval.				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				

Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
ReenrollmentStatus	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	An array of key/value pairs for the unique parameters defined										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>for the certificate store type. Name	Description						
	<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div> <p>This field is optional.</p>						
CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required 						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div style="border: 1px solid #ccc; padding: 5px;"> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p> </div>						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 256: PUT Certificate Stores Input Parameters

Name	In	Description
Id	Body	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	Body	Required. The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreatelfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but

Name	In	Description
		<p>are retained for backwards compatibility. For more information, see POST Certificate Stores Server on page 1157.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="506 541 1409 701"> { "privateKeyPath": "/opt/app/mystore.key", "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="506 856 1409 1016"> { "privateKeyPath": {"value": "/opt/app/mystore.key"}, "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="506 1108 1409 1289"> { "ServerUsername": {"value": {"SecretValue": "User_Name"}}, "ServerPassword": {"value": {"SecretValue": "Password"}}, "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="506 1453 1409 1696"> { "ServerUsername": {"value": {"Provider": "1", "Parameters": {"SecretId": "User_Name"}}, "ServerPassword": {"value": {"Provider": "1", "Parameters": {"SecretId": "Password"}}, "ServerUseSsl": {"value": "true"} }</pre> <p> Note: There are three standard properties that are used for any built-in certificate</p>

Name	In	Description
		<div style="border: 1px solid #ccc; padding: 10px; margin-bottom: 10px;">  store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div style="border: 1px solid #ccc; padding: 10px;">  Tip: Built-in stores that make use of this field include: <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. </div>
AgentId	Body	Required. A string indicating the Keyfactor Command GUID of the orchestrator for this store.
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.
InventorySchedule	Body	The inventory schedule for this certificate store. The following schedule types are supported:

Name	In	Description																		
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre> </td> </tr> <tr> <td>Daily</td> <td> A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Daily": { "Time": "2022-02-25T23:30:00Z" } </pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Daily": { "Time": "2022-02-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																			
Off	Turn off a previously configured schedule.																			
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>																			
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Interval": { "Minutes": 60 } </pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.															
Name	Description																			
Minutes	An integer indicating the number of minutes between each interval.																			
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc; margin-top: 10px;"> "Daily": { "Time": "2022-02-25T23:30:00Z" } </pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).															
Name	Description																			
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																			

Name	In	Description										
ExactlyOnce		<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).											
ReenrollmentStatus	Body	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined
Name	Description

CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required 							
SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .						
Password	Body	An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores Server on page 1157).						

Name	In	Description												
		<p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre> </td> </tr> <tr> <td>SecretType-Guid</td> <td>A string indicating the Keyfactor Command reference GUID for the type of credentials. Provider-TypeParams	Unused field																									
ProviderId		An integer indicating the Keyfactor Command reference ID for the PAM provider.																								
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																								

Table 257: PUT Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see POST Certificate Stores Server

Name	Description
	<p>on page 1157.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 506 1409 667">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 825 1409 987">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="477 1073 1409 1262">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="477 1415 1409 1661">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p>

Name	Description				
	<div data-bbox="483 279 532 331" style="float: left; margin-right: 10px;"></div> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <div data-bbox="483 632 532 684" style="float: left; margin-right: 10px;"></div> <p>Tip: Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. 				
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.				
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).				
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.				
InventorySchedule	<p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="472 1566 1412 1688"> <thead> <tr> <th data-bbox="472 1566 634 1629">Name</th> <th data-bbox="634 1566 1412 1629">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 1629 634 1688">Off</td> <td data-bbox="634 1629 1412 1688">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description				
Off	Turn off a previously configured schedule.				

Name	Description				
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>				
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description				
Minutes	An integer indicating the number of minutes between each interval.				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				

Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
ReenrollmentStatus	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	An array of key/value pairs for the unique parameters defined										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>for the certificate store type. Password	<div style="border: 1px solid #ccc; padding: 5px;"> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p> </div>						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.5 DELETE Certificate Stores ID

The DELETE /CertificateStores/{id} method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 258: DELETE Certificate Stores Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store to delete. Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) to retrieve a list of all the certificate stores to determine the certificate store GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.6 GET Certificate Stores ID

The GET /CertificateStores/{id} method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 259: GET Certificate Stores {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command.

Table 260: GET Certificate Stores {id} Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreatelfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Name	Description						
	<div data-bbox="444 279 1406 464">  These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use. </div> <div data-bbox="444 495 1406 1115">  Tip: Built-in stores that make use of this field include: <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. </div>						
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.						
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).						
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.						
InventorySchedule	<p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="435 1440 1411 1654"> <thead> <tr> <th data-bbox="435 1440 602 1499">Name</th> <th data-bbox="602 1440 1411 1499">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="435 1499 602 1558">Off</td> <td data-bbox="602 1499 1411 1558">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="435 1558 602 1654">Immediate</td> <td data-bbox="602 1558 1411 1654">A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).
Name	Description						
Off	Turn off a previously configured schedule.						
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).						

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </td> </tr> </tbody> </table>	Name	Description		 Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i> .
Name	Description				
	 Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i> .				
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description				
Minutes	An integer indicating the number of minutes between each interval.				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				

Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
ReenrollmentStatus	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the

Name	Description																						
Id	A string indicating the Keyfactor Command reference GUID for the PAM provider type parameter.																						
Name	A string indicating the internal name for the PAM provider type parameter.																						
Provider-TypeParams	Unused field																						
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.																						
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																						

Name	Description
	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 261: GET Certificate Stores {id} Inventory Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 262: GET Certificate Stores {id} Inventory Response Data

Name	Description																				
Name	A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 131 in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Certificates	<p>An array of certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>NotBefore</td> <td>The date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>NotAfter</td> <td>The date, in UTC, on which the certificate expires.</td> </tr> <tr> <td>SigningAlgorithm</td> <td>A string indicating the algorithm used to sign the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the issuer.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>CertStoreInventoryItemId</td> <td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	The date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	Thumbprint	A string indicating the thumbprint of the certificate.	CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																				
IssuedDN	A string indicating the distinguished name of the certificate.																				
SerialNumber	A string indicating the serial number of the certificate.																				
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																				
NotAfter	The date, in UTC, on which the certificate expires.																				
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																				
IssuerDN	A string indicating the distinguished name of the issuer.																				
Thumbprint	A string indicating the thumbprint of the certificate.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.																				
Parameters	An array of entry parameters associated with the certificate in the certificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See POST Certificate Store Types on page 1239 for more information about entry parameters.																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.8 GET Certificate Stores Server

The GET /CertificateStores/Server method is used to retrieve all servers for certificate stores. Only select types of certificate stores have an associated server. These include F5, FTP, NetScaler, and any custom method you've defined to support this. This method returns HTTP 200 OK on a success with details for each server.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: This method has been deprecated and will be removed from the Keyfactor API in release 12. Certificate store server information is now found in the certificate store (see [GET Certificate Stores on page 1092](#)).

Table 263: GET Certificate Stores Server Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature on page 356</i> section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Id</i> • <i>Name</i> • <i>ServerType</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 264: GET Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
Username	<p>The username used to connect to the certificate store.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>														
Password	<p>The password used to connect to the certificate store.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	<p>An integer indicating the type of server. Possible values include (plus any custom values):</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>F5 Web Server & F5 SSL Profiles</td> </tr> <tr> <td>1</td> <td>NetScaler</td> </tr> <tr> <td>2</td> <td>FTP</td> </tr> <tr> <td>3</td> <td>F5 Web Server REST</td> </tr> <tr> <td>4</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>5</td> <td>F5 CA Bundles REST</td> </tr> </tbody> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles	1	NetScaler	2	FTP	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles														
1	NetScaler														
2	FTP														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.9 POST Certificate Stores Server

The POST /CertificateStores/Server method is used to create a new server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the newly created server record.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Creating new certificate store server records requires permissions at the global level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. Certificate store server information is now found in the certificate store (see [POST Certificate Stores on page 1100](#)). The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new API endpoint.

Tip: If a certificate store that requires a server is missing a server definition within the store record, the certificate store server created with this method will be used. If no credentials are supplied in the request and no certificate store server exists, an error is returned and the request fails.

Table 265: POST Certificate Stores Server Input Parameters

Name	In	Description								
Username	Body	<p>Required. The username used to connect to the certificate store. Username parameters include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> </td> </tr> <tr> <td>Provider</td> <td> <p>An integer that identifies the PAM provider used to store the username. Use the GET /PamProviders method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See PAM Provider Configuration in Keyfactor Command on page 647 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p> </td> </tr> <tr> <td>Parameters</td> <td> <p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the GET /PamProviders method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"Username": { "Provider": 2, "Parameters": { "SecretId": 4 } },</pre> <p>For CyberArk, this might be:</p> <pre>"Username": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Username" } },</pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	<p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p>	Provider	<p>An integer that identifies the PAM provider used to store the username. Use the GET /PamProviders method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. Name	The host name of the server.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.10 PUT Certificate Stores Server

The PUT /CertificateStores/Server method is used to update the server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the server record.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Updating certificate store server records requires permissions at the global level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new [PUT Certificate Stores on page 1120](#) API endpoint. Using this deprecated API endpoint could potentially, for instance, overwrite all cert stores on the server.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 267: PUT Certificate Stores Server Input Parameters

Name	In	Description								
Id	Body	The ID of the server.

UseSSL	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false). The default is <i>false</i> .						
Name	Body	Required. The host name of the server.						

Name	In	Description
Container	Body	An integer that identifies the certificate store container into which the certificate store should be placed for organizational and management purposes. This value must be specified if you are using PAM to store your username and/or password and your PAM provider has been configured to be linked to a specific certificate store container.

Table 268: PUT Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	An integer indicating the type of server. Possible values include (plus any custom values): <table border="1" data-bbox="402 779 1411 1209"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>F5 Web Server & F5 SSL Profiles</td> </tr> <tr> <td>1</td> <td>NetScaler</td> </tr> <tr> <td>2</td> <td>FTP</td> </tr> <tr> <td>3</td> <td>F5 Web Server REST</td> </tr> <tr> <td>4</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>5</td> <td>F5 CA Bundles REST</td> </tr> </tbody> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles	1	NetScaler	2	FTP	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles														
1	NetScaler														
2	FTP														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.11 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 269: PUT Certificate Stores Password Input Parameters

Name	Type	Description								
CertStoreID	Body	Required. A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see GET Certificate Stores on page 1092) to retrieve a list of all your certificate stores to determine the GUID of the store.								
NewPassword	Body	<p>Required. A array that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command's definition of it. Password settings include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you're storing your password using a PAM provider.</td> </tr> <tr> <td>Parameters</td> <td> <p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"NewPassword": { "Provider": 2, "Parameters": { "SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password"</pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you're storing your password using a PAM provider.	Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"NewPassword": { "Provider": 2, "Parameters": { "SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password"</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you're storing your password using a PAM provider.									
Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"NewPassword": { "Provider": 2, "Parameters": { "SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password"</pre>

		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>} },</td> </tr> </tbody> </table> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre>	Name	Description		} },
Name	Description					
	} },					

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.12 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.
- F5 bundle and SSL certificates discovered by the Keyfactor Windows Orchestrator on F5 devices using the F5 REST API (v14 and up).
- F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with a custom extension to support F5. For more information about the Keyfactor Universal Orchestrator and custom extensions, see [Universal Orchestrator on page 2350](#) in the [Installing Orchestrators on page 2347](#).
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 1182](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 270: PUT Certificate Stores Discovery Job Input Parameters

Name	In	Description
ClientMachine	Body	Required. A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.
Type	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) The default is 0 for a JKS discovery.
JobExecutionTimestamp	Body	The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Dirs	Body	<p>Required. A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas.</p> <p>Java</p> <p>For Java discovery, enter at a minimum either "/" for a Linux server or "c:\" for a Windows server.</p> <p>PEM</p> <p>For PEM discovery, enter at a minimum either "/" for a Linux server or "c:\" for a Windows server.</p> <p>F5</p> <p>For F5 discovery, enter "/".</p>
IgnoredDirs	Body	A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.
Extensions	Body	A string containing the file extensions for which to search. For example, search for files with the extension "jks" in order to exclude files with other extensions such as "txt". The dot should not be included when specifying extensions.

Name	In	Description
NamePatterns	Body	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. "myjks").
SymLinks	Body	A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows.
Compatibility	Body	A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.

Name	In	Description								
ServerUsername	Body	<p>Required*. The username used to connect to the certificate store server.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> </td> </tr> <tr> <td>Provider</td> <td> <p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See PAM Provider Configuration in Keyfactor Command on page 647 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p> </td> </tr> <tr> <td>Parameters</td> <td> <p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"ServerUsername": { "Provider": 2, "Parameters": { "SecretId": 4 } },</pre> <p>For CyberArk, this might be:</p> <pre>"ServerUsername": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Username" } },</pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	<p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p>	Provider	<p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See PAM Provider Configuration in Keyfactor Command on page 647 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p>	Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"ServerUsername": { "Provider": 2, "Parameters": { "SecretId": 4 } },</pre> <p>For CyberArk, this might be:</p> <pre>"ServerUsername": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Username" } },</pre>
Name	Description									
SecretValue	<p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p>									
Provider	<p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See PAM Provider Configuration in Keyfactor Command on page 647 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p>									
Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"ServerUsername": { "Provider": 2, "Parameters": { "SecretId": 4 } },</pre> <p>For CyberArk, this might be:</p> <pre>"ServerUsername": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Username" } },</pre>									

Name	In	Description								
		<div data-bbox="667 275 1409 363" style="border: 1px solid #ccc; padding: 5px; margin-bottom: 10px;">  Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div> <p>This field is required only for select certificate store types that require authentication at the server level. These include F5, FTP, NetScaler, and any custom method you've defined to support this.</p>								
ServerPassword	Body	<p>Required*. The password used to connect to the certificate store server. Password parameters include:</p> <table border="1" data-bbox="659 604 1409 1738"> <thead> <tr> <th data-bbox="659 604 855 661">Name</th> <th data-bbox="855 604 1409 661">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="659 661 855 793">SecretValue</td> <td data-bbox="855 661 1409 793">A string containing the password. Name	Description					
	<pre>"Object": "F5Password" } },</pre>					
ServerUseSsl	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.13 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 271: PUT Certificate Stores Assign Container Input Parameters

Name	In	Description
CertStoreContainerId	Body	Required* . An integer that identifies the container into which you want to place the certificate store or stores. One of the following is required : <ul style="list-style-type: none"><i>CertStoreContainerId</i><i>NewContainerName</i> and <i>NewContainerType</i>
KeystoreIds	Body	Required . An array of certificate store GUIDs for the stores you want to place into the container.
NewContainerName	Body	Required* . A string that sets the name of the container if you would like to create a new container while assigning store(s) to it. One of the following is required : <ul style="list-style-type: none"><i>CertStoreContainerId</i><i>NewContainerName</i> and <i>NewContainerType</i>
NewContainerType	Body	Required* . An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types. Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype=eq 7</i>) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i> . One of the following is required : <ul style="list-style-type: none"><i>CertStoreContainerId</i><i>NewContainerName</i> and <i>NewContainerType</i>

Table 272: PUT Certificate Stores Assign Container Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1204).
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see POST Certificate Stores Server

Name	Description
	<p>on page 1157.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 506 1409 667">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="477 825 1409 987">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="477 1073 1409 1262">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1447):</p> <pre data-bbox="477 1413 1409 1661">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p>

Name	Description				
	<div data-bbox="483 279 532 331" style="float: left; margin-right: 10px;"></div> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <div data-bbox="483 632 532 684" style="float: left; margin-right: 10px;"></div> <p>Tip: Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> • AWS stores use this field to store secured versions of the access key and secret. • F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version). • F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • IIS stores (all types) use this field to store the UseSSL flag and the port for WinRM communications. • Java keystores use this field to store type (ProviderType). • NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl). • PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined. 				
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.				
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).				
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.				
InventorySchedule	<p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="472 1566 1411 1688"> <thead> <tr> <th data-bbox="472 1566 634 1625">Name</th> <th data-bbox="634 1566 1411 1625">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="472 1625 634 1688">Off</td> <td data-bbox="634 1625 1411 1688">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description				
Off	Turn off a previously configured schedule.				

Name	Description				
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>				
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description				
Minutes	An integer indicating the number of minutes between each interval.				
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description				
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				

Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
ReenrollmentStatus	<p>An array that indicates whether the certificate store can use the re-enrollment function with accompanying data about the re-enrollment job. The following reenrollment fields are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Data</td> <td>A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).</td> </tr> <tr> <td>AgentId</td> <td>A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.</td> </tr> <tr> <td>Message</td> <td>A string indicating the reason the certificate store cannot re-enroll, if applicable.</td> </tr> <tr> <td>JobProperties</td> <td>An array of key/value pairs for the unique parameters defined</td> </tr> </tbody> </table>	Name	Description	Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).	AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.	Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.	JobProperties	An array of key/value pairs for the unique parameters defined
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	An array of key/value pairs for the unique parameters defined										

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> </div> <p>This field is optional.</p> </td> </tr> <tr> <td>CustomAliasAllowed</td> <td> <p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required </td> </tr> </tbody> </table>	Name	Description		<p>for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. CustomAliasAllowed	<p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> • 0—forbidden • 1—optional • 2—required 						
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).						
Password	<div style="border: 1px solid #ccc; padding: 5px;"> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p> </div>						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.14 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores Discovery Job on page 1169](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 273: POST Certificate Stores Approve Input Parameters

Name	In	Description
Id	Body	Required. The GUID of the pending certificate store. Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) with a query of "Approved -eq false" to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.
ContainerId	Body	An integer that identifies the container in which the certificate store should be placed on approval. Use the GET /CertificateStores/Containers method (see GET Certificate Store Containers on page 1204) to retrieve a list of your defined certificate store containers to determine the container ID to use.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
Properties	Body	Required* . Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information). When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values. For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be: <pre>"{ \"privateKeyPath\": \" /opt/app/mystore.key \", \"separatePrivateKey\": \"true\" }"</pre> However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be: <pre>"{ \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key \"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> This field is required for certificate store types that store additional properties in this parameter.
Password	Body	Required. An array indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores Server on page 1157). Certificate stores that require credentials support up to three possible credential options:

Name	In	Description												
		<ul style="list-style-type: none"> Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 635 in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 1431 for more information. <p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre> </div> </td> </tr> <tr> <td>SecretTypeGuid</td> <td>A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.</td> </tr> <tr> <td>InstanceId</td> <td>The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.</td> </tr> <tr> <td>InstanceGuid</td> <td>The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.</td> </tr> <tr> <td>Provider-TypeParameterValues</td> <td>An array containing the values for the provider types specified by ProviderTypeParams. PAM provider type parameter values include:</td> </tr> </tbody> </table>	Name	Description	Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre> </div>	SecretTypeGuid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.	InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.	InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.	Provider-TypeParameterValues	An array containing the values for the provider types specified by ProviderTypeParams. PAM provider type parameter values include:
Name	Description													
Value	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "Value": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "Value": "MyVerySecurePassword" }</pre> </div>													
SecretTypeGuid	A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by Keyfactor Command.													
InstanceId	The Keyfactor Command reference ID for the secret provider. If you are using a secret provider with an integer ID, this will be used. This value is automatically set by Keyfactor Command.													
InstanceGuid	The Keyfactor Command reference GUID for the secret provider. If you are using a secret provider with a GUID ID, this will be used. This value is automatically set by Keyfactor Command.													
Provider-TypeParameterValues	An array containing the values for the provider types specified by ProviderTypeParams. PAM provider type parameter values include:													

Name	In	Description																										
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>The Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Value</td> <td>The value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).</td> </tr> <tr> <td>Instance-Id</td> <td>The Keyfactor Command reference ID for the PAM provider. If you are attaching to something with an integer Id, this will be used.</td> </tr> <tr> <td>Instance-Guid</td> <td>The Keyfactor Command reference GUID for the PAM provider. 	indicating the internal name for the PAM provider type parameter.																					
Provider-TypeParams	Unused field																					
Provider		An integer indicating the Keyfactor Command reference ID for the PAM provider.																				
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.15 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Schedule*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 274: POST Certificate Stores Schedule Input Parameters

Name	In	Description																		
Storelds	Body	Required. An array of strings providing the certificate store GUIDs to schedule.																		
Schedule	Body	<p>Required. The inventory schedule for the certificate store(s). Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 3.2.9.16 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.

- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1408](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:

CertificateEnrollment: *EnrollCSR*

CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

In addition, the either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see [Authorization Methods Tab on page 318](#) in the *Keyfactor Command Reference Guide*) must have enrollment permissions configured on the CA and template.

Table 275: POST Certificates Stores Reenrollment Input Parameters

Name	In	Description
KeystoreId	Body	<p>Required. The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) to retrieve a list of your certificate stores to determine the GUID of the store.</p>
SubjectName	Body	<p>Required. A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>
AgentGuid	Body	<p>Required. The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>
Alias	Body	<p>Required. The alias of the certificate in the certificate store.</p>
JobProperties	Body	<p>An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the GET CertificateStoreTypes method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by GET CertificateStoreTypes like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.</p> </div>
CertificateAuthority	Body	<p>A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab on page 560 in the <i>Keyfactor Command Reference Guide</i>).</p>
CertificateTemplate	Body	<p>A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i></p>

Name	In	Description
		application setting will be used (see Application Settings: Agents Tab on page 560 in the <i>Keyfactor Command Reference Guide</i>).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.17 POST Certificate Stores Certificates Add

The POST `/CertificateStores/Certificates/Add` method is used to add a certificate to one or more certificate stores. The POST request must contain a certificate ID and an array of certificate store GUIDs that identify the stores to which the certificate should be added. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1408](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 Certificates: *Read*
 CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See [Certificate Permissions on page 583](#) and [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 276: POST Certificate Stores Certificates Add Input Parameters

Name	In	Description												
CertificateId	Body	Required. An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).												
CertificateStores	Body	<p>Required. An array of certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertificateStoreIds</td> <td>Required. A string containing the GUID for the certificate store to which the certificate should be added.</td> </tr> <tr> <td>Alias</td> <td>Required* . A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 64 in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.</td> </tr> <tr> <td>JobFields</td> <td>An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td> </tr> <tr> <td>Overwrite</td> <td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>. Use the GET /Certificates/Locations/{id} method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</td> </tr> <tr> <td>EntryPassword</td> <td>The password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password</td> </tr> </tbody> </table>	Name	Description	CertificateStoreIds	Required. A string containing the GUID for the certificate store to which the certificate should be added.	Alias	Required* . A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 64 in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.	JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.	Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i> . Use the GET /Certificates/Locations/{id} method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.	EntryPassword	The password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password
Name	Description													
CertificateStoreIds	Required. A string containing the GUID for the certificate store to which the certificate should be added.													
Alias	Required* . A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 64 in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.													
JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.													
Overwrite	A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i> . Use the GET /Certificates/Locations/{id} method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.													
EntryPassword	The password to set on the entry within the certificate store, if applicable. Only select certificate stores support entry passwords (e.g. Java keystores). Entry password													

Name	In	Description														
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>values include:</td> </tr> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.</td> </tr> <tr> <td>Parameters</td> <td> <p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"EntryPassword": { "Provider": 2, "Parameters": { "SecretId": 5 } }</pre> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description		values include:		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This is only relevant if there's a private key being added along with the certificate.	IncludePrivateKey	A Boolean that sets whether to include the private key of the certificate in the certificate store if private keys are optional for the given certificate store (true) or not (false). The default is <i>false</i> .					
Name	Description													
	<pre> }, For CyberArk, this might be: "EntryPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } }, </pre>													
PfxPassword	A string that sets the password to use when saving a certificate with its private key in the certificate store. This is only relevant if there's a private key being added along with the certificate.													
IncludePrivateKey	A Boolean that sets whether to include the private key of the certificate in the certificate store if private keys are optional for the given certificate store (true) or not (false). The default is <i>false</i> .													
Schedule	Body	Required. The inventory schedule for the add job. Possible schedule values include:												

Name	In	Description												
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>ExactlyOnce</td> <td> A dictionary that indicates a job scheduled to run at the time specified with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div> </td> </tr> </tbody> </table> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	ExactlyOnce	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>													
ExactlyOnce	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).													
CollectionId	Body	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.9.18 POST Certificate Stores Certificates Remove

The POST `/CertificateStores/Certificates/Remove` method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1408](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*
CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See [Certificate Permissions on page 583](#) and [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 277: POST Certificate Stores Certificates Remove Input Parameters

Name	In	Description								
CertificateStores	Body	<p>Required. An array of certificate store GUIDs and related information to identify the certificate to remove from the certificate store(s). Certificate store detail includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Alias</td> <td>Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the GET /Certificates/{id} method (see GET Certificates ID on page 938) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.</td> </tr> <tr> <td>CertificateStoreIds</td> <td>Required. A string containing the GUID for the certificate store from which the certificate should be removed.</td> </tr> <tr> <td>JobFields</td> <td>An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.</td> </tr> </tbody> </table> <p>For example, to remove from one IIS personal store and one NetScaler store:</p> <pre> "CertificateStores": [{ "Alias": "MyCertificate.pfx", "CertificateStoreId": "fde12aa7-6643-43db-88e8-5c91c5ce78b3" }, { "Alias": "C2107973A928859C21330E566B299CD4A0705AE8", "CertificateStoreId": "322e12ea-43b2-4aab-80ae-c4ad4569b4e7" }] </pre>	Name	Description	Alias	Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the GET /Certificates/{id} method (see GET Certificates ID on page 938) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.	CertificateStoreIds	Required. A string containing the GUID for the certificate store from which the certificate should be removed.	JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.
Name	Description									
Alias	Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the GET /Certificates/{id} method (see GET Certificates ID on page 938) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.									
CertificateStoreIds	Required. A string containing the GUID for the certificate store from which the certificate should be removed.									
JobFields	An array of key/value pairs that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.									
Schedule	Body	<p>Required. The inventory schedule for the removal job. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.				
Name	Description									
Off	Turn off a previously configured schedule.									

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>ExactlyOnce</td> <td> <p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p> </td> </tr> </tbody> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>
Name	Description											
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>											
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td> <p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> </td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>							
Name	Description											
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>											
CollectionId	Body	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.10 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 278: Certificate Store Containers Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of certificate store containers.	GET Certificate Store Containers below
/	POST	Adds a certificate store container.	POST Certificate Store Containers on page 1207
/id}	DELETE	Deletes a certificate store container.	DELETE Certificate Store Containers ID on page 1215
/id}	GET	Returns details for the specified certificate store container.	GET Certificate Store Containers ID on page 1216
/id}	PUT	Edits a certificate store container.	PUT Certificate Store Containers on page 1211

3.2.10.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 279: GET Certificate Store Containers Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Containers Search Feature on page 390</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CertStoreType</i> (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) • <i>HasSchedule</i> (True, False) • <i>Id</i> • <i>Name</i>(Short Name)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 280: GET Certificate Stores Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Over-writeSchedules	A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description
	 Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)
StoreCount	An integer indicating the number of stores of the type referenced by CertStoreType in the container.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.10.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 281: POST Certificate Stores Containers Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management</p>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description
	 only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.10.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 283: PUT Certificate Store Containers Input Parameters

Name	In	Description																
Id	Path	Required. An integer indicating the ID of the container.																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																	

Name	In	Description
		 Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) The default is 0 for a JKS keystore.

Table 284: PUT Certificate Store Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description
	 only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.10.4 DELETE Certificate Store Containers ID

The DELETE /CertificateStoreContainers/{id} method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 285: DELETE Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container to delete. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 1204) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.10.5 GET Certificate Store Containers ID

The GET /CertificateStoreContainers/{id} method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 286: GET Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 1204) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Table 287: GET Certificate Stores Containers {id} Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
Name	Description														
Id	A string indicating the GUID of the certificate store within Keyfactor Command.														
DisplayName	A string indicating the display name of the certificate store.														
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container.														
ClientMachine	The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.														
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.														
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.														

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertStoreType</td> <td>An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</td> </tr> <tr> <td>Approved</td> <td>A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.</td> </tr> <tr> <td>CreatelfMissing</td> <td>A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.</td> </tr> <tr> <td>Properties</td> <td> <p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> </td> </tr> </tbody> </table>	Name	Description	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)	Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.	CreatelfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.	Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p>
Name	Description										
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)										
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.										
CreatelfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.										
Properties	<p>Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1234 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;">"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p>

Password	An array indicating the source for and details of the credential																				

Name	Description	
	Name	Description
		information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 288: Certificate Store Type Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a certificate store type using StoreType number.	DELETE Certificate Store Types ID on the next page
/id}	GET	Returns certificate store type details for the specified certificate store type using StoreType number.	GET Certificate Store Types ID on the next page
/Name/{name}	GET	Returns certificate store type details for the specified certificate store type using ShortName.	GET CertificateStoreTypes Name Name on page 1227
/	DELETE	Delete multiple certificate store types using StoreType number.	DELETE Certificate Store Types on page 1233
/	GET	Returns all certificate store types with paging and options to the specified detail level.	GET Certificate Store Types on page 1234
/	POST	Creates a new certificate store type.	POST Certificate Store Types on page 1239
/	PUT	Updates a certificate store type using StoreType number.	PUT Certificate Store Types on page 1251

3.2.11.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Table 289: DELETE Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type to delete. Use the GET /CertificateStoreTypes method (see GET Certificate Store Types on page 1234) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.2 GET Certificate Store Types ID

The GET /CertificateStoreTypes/{id} method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Read*

Table 290: GET Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type. Use the GET /CertificateStoreTypes method (see GET Certificate Store Types on page 1234) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Table 291: GET Certificate Store Types {id} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> Add Create Discovery Enrollment Remove 								
Properties	An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="500 1268 1411 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> String Bool MultipleChoice Secret </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> String Bool MultipleChoice Secret
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.								
Type	A string containing the type of the property: <ul style="list-style-type: none"> String Bool MultipleChoice Secret 								

Name	Description								
	<table border="1" data-bbox="501 264 1412 783"> <thead> <tr> <th data-bbox="501 264 709 327">Name</th> <th data-bbox="709 264 1412 327">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="501 327 709 522">DependsOn</td> <td data-bbox="709 327 1412 522">A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td> </tr> <tr> <td data-bbox="501 522 709 688">DefaultValue</td> <td data-bbox="709 522 1412 688">A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td> </tr> <tr> <td data-bbox="501 688 709 783">Required</td> <td data-bbox="709 688 1412 783">A Boolean that indicates whether the parameter is required (true) or not (false).</td> </tr> </tbody> </table> <div data-bbox="505 814 1409 1209" style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Note: There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>	Name	Description	DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.	DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that indicates whether the parameter is required (true) or not (false).
Name	Description								
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.								
DefaultValue	A string containing the default value(s) of the parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a comma-separated list of multiple choice options for this parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .								
Required	A Boolean that indicates whether the parameter is required (true) or not (false).								
PasswordOptions	<p>Options for the password in the certificate store type. Password options include:</p> <table border="1" data-bbox="501 1289 1412 1730"> <thead> <tr> <th data-bbox="501 1289 735 1352">Name</th> <th data-bbox="735 1289 1412 1352">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="501 1352 735 1451">EntrySupported</td> <td data-bbox="735 1352 1412 1451">A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).</td> </tr> <tr> <td data-bbox="501 1451 735 1543">StoreRequired</td> <td data-bbox="735 1451 1412 1543">A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).</td> </tr> <tr> <td data-bbox="501 1543 735 1730">Style</td> <td data-bbox="735 1543 1412 1730"> A string containing the style of password: <ul style="list-style-type: none"> • <i>Default</i>: Keyfactor Command will randomly generate a password. • <i>Custom</i>: Allow a password to be entered and authen- </td> </tr> </tbody> </table>	Name	Description	EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).	StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).	Style	A string containing the style of password: <ul style="list-style-type: none"> • <i>Default</i>: Keyfactor Command will randomly generate a password. • <i>Custom</i>: Allow a password to be entered and authen-
Name	Description								
EntrySupported	A Boolean that indicates whether entry of a password for the certificate in the certificate store is allowed (true) or not (false).								
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).								
Style	A string containing the style of password: <ul style="list-style-type: none"> • <i>Default</i>: Keyfactor Command will randomly generate a password. • <i>Custom</i>: Allow a password to be entered and authen- 								

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p>icated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 Tip: What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.3 GET CertificateStoreTypes Name Name

The GET /CertificateStoreTypes/Name/{name} method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Read*

Table 292: GET Certificate Store Types Name {ShortName} Input Parameters

Name	In	Description
name	Path	Required. The short name of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 1234) to retrieve a list of all the certificate store types to determine the certificate store type short name.

Table 293: GET Certificate Store Types Name {ShortName} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="500 1268 1411 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret
Name	Description								
Name	A string containing the short name of the property.

This option is used to configure one custom parameter to display only if another custom parameter contains a value.																
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. The certificate store type IDs should be supplied in the request body as a JSON array of integers. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Modify*

Table 294: DELETE Certificate Store Types Input Parameters

Name	In	Description
ids	Body	Required. An array of Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name): [106,108,109] Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types below) to retrieve a list of all the certificate store types to determine the certificate store type IDs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.5 GET Certificate Store Types

The *GET /CertificateStoreTypes* method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Read*

Table 295: GET Certificate Store Types Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 296: GET Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Name	Description
	 Tip: What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Table 297: POST Certificate Store Types Input Parameters

Name	In	Description								
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.								
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.								
Capability	Body	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .								
SupportedOperations	Body	An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove The default for each value is <i>false</i> .								
Properties	Body	An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="630 1228 1409 1732"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. A string containing the short name of the property. If you choose to define a property, this field is required.</td> </tr> <tr> <td>DisplayName</td> <td>Required. A string containing the full display name of the property. If you choose to define a property, this field is required.</td> </tr> <tr> <td>Type</td> <td>Required. A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice </td> </tr> </tbody> </table>	Name	Description	Name	Required. A string containing the short name of the property. If you choose to define a property, this field is required .	DisplayName	Required. A string containing the full display name of the property. If you choose to define a property, this field is required .	Type	Required. A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice
Name	Description									
Name	Required. A string containing the short name of the property. If you choose to define a property, this field is required .

If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	 Tip: What's the difference between properties (custom fields) and entry parameters? <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.11.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 299: PUT Certificate Store Types Input Parameters

Name	In	Description						
StoreType	Body	Required. The Keyfactor Command reference ID for the certificate store type.						
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.						
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.						
Capability	Body	<p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Note: The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list.</p> </div>						
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .						
SupportedOperations	Body	<p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove <p>The default for each value is <i>false</i>.</p>						
Properties	Body	<p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table border="1" style="width: 100%; margin-top: 10px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeID</td> <td>Required. An integer identifying the certificate store type. This is the same ID referenced by the StoreType parameter, above. Name	In	Description
		<p>For example, to set a multiple choice entry parameter:</p> <pre data-bbox="634 327 1411 821"> "EntryParameter": [{ "StoreTypeId": 111, "Name": "ZooAnimal", "DisplayName": "Favorite Zoo Animal", "Type": "MultipleChoice", "RequiredWhen": { "HasPrivateKey": false, "OnAdd": true, "OnRemove": true, "OnReenrollment": true }, "DefaultValue": "Penguin", "Options": "Tiger,Bear,Giraffe,Lion,Wolf,Penguin,Zebra" }] </pre> <p>This value is unset by default.</p> <div data-bbox="634 905 1411 1713" style="background-color: #e6f2e6; padding: 10px;"> <p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </div>

Table 300: PUT Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="500 1268 1411 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret
Name	Description								
Name	A string containing the short name of the property.								
DisplayName	A string containing the full display name of the property.

	<p>icated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i>.</p>				
StorePathValue	An array containing the value(s) for the certificate store path.				
PrivateKeyAllowed	<p>A string containing the option for private key requirements for certificates stored in stores with this certificate store type:</p> <ul style="list-style-type: none"> • <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates). • <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store. • <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization). 				
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a user-name and password to connect to the remote server.				
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).				
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see Orchestrator Blueprints on page 471 in the <i>Keyfactor Command Reference Guide</i> .				
CustomAliasAllowed	<p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> • <i>Forbidden</i>: A custom alias is not required and cannot be supplied. • <i>Optional</i>: A custom alias is optional. • <i>Required</i>: A custom alias is required. <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>				
EntryParameters	An array of unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:				

Name	Description																
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the entry parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the entry parameter.</td> </tr> <tr> <td>Type</td> <td> A string containing the type of the entry parameter: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret </td> </tr> <tr> <td>RequiredWhen</td> <td> An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are: <ul style="list-style-type: none"> • HasPrivateKey: If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store. • OnAdd: If set to <i>true</i>, a value must be provided for this field when configuring an add certificate job. • OnRemove: If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job. • OnReenrollment: If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. </td> </tr> <tr> <td>DependsOn</td> <td>A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.</td> </tr> <tr> <td>DefaultValue</td> <td>A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td> </tr> <tr> <td>Options</td> <td>A string containing a comma-separated list of multiple choice options for this entry parameter.</td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the entry parameter.	DisplayName	A string containing the full display name of the entry parameter.	Type	A string containing the type of the entry parameter: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret 	RequiredWhen	An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.																

Name	Description
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.12 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 301: CSR Generation Endpoints

Endpoint	Method	Description	Link
/Pending/{id}	DELETE	Deletes a pending CSR by ID.	DELETE CSR Generation Pending ID below
/Pending/{id}	GET	Returns the details of a specific CSR request based on the ID number.	GET CSR Generation Pending ID below
/Pending	DELETE	Deletes multiple pending CSRs.	DELETE CSR Generation Pending on the next page
/Pending	GET	Returns a list of all pending CSRs.	GET CSR Generation Pending on page 1267
/Generate	POST	Generate and configure a CSR request.	POST CSR Generation Generate on page 1268

3.2.12.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *PendingCsr*

Table 302: DELETE CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate signing request for the CSR that should be deleted. Use the <i>GET /CSRGeneration/Pending</i> method (see GET CSR Generation Pending on page 1267) to retrieve a list of all the pending CSRs to determine the CSR IDs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.12.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the *GET /CSRGeneration/Pending* method (see [GET CSR Generation Pending on page 1267](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *PendingCsr*

Table 303: GET CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the CSR that should be retrieved.

Table 304: GET CSR Generation Pending {id} Response Data

Name	Description
CSRFilePath	The proposed file name for the CSR file. This is considered deprecated and may be removed in a future release.
CSR	The text of the CSR in PEM format.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.12.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. The IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *PendingCsr*

Table 305: DELETE CSR Generation Pending Input Parameters

Name	In	Description
ids	Body	Required. An array of Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name): [8,14,27] Use the <i>GET /CSRGeneration/Pending</i> method (see GET CSR Generation Pending on the next page) to retrieve a list of all the pending CSRs to determine the CSR IDs.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.12.4 GET CSR Generation Pending

The GET /CSRGeneration/Pending method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateEnrollment: *PendingCsr*

Table 306: GET CSR Generation Pending Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 307: GET CSR Generation Pending Response Data

Name	Description
Id	A unique integer for the CSR generated.
CSR	A string containing the text of the CSR in PEM format.
RequestTime	A string containing the date and time that the CSR was generated in UTC time.
Subject	An array containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.12.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 1318](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 978](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *CsrGeneration*

Note: This endpoint no longer includes the CSRFilePath return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 308: POST CSR Generation Generate Input Parameters

Name	In	Description																								
Subject	Body	<p>Required. A string containing the subject name for the certificate using X.500 format for the full distinguished name (DN). For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=L=Independence,ST=OH,C=US"</pre> <p>Supported subject name fields are:</p>

The desired common name of the certificate to be requested with the CSR.</p> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Organization	O	The desired organization of the certificate to be requested with the CSR.	OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.	Locality	L	The desired city of the certificate to be requested with the CSR.	State	ST	The desired state of the certificate to be requested with the CSR.	Country	C	The desired country (two characters) of the certificate to be requested with the CSR.	Email	E	The desired email address of the certificate to be requested with the CSR.
		Name	Abbreviation	Description																						
		CommonName	CN	<p>Required*. The desired common name of the certificate to be requested with the CSR.</p> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																						
		Organization	O	The desired organization of the certificate to be requested with the CSR.																						
		OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.																						
		Locality	L	The desired city of the certificate to be requested with the CSR.																						
		State	ST	The desired state of the certificate to be requested with the CSR.																						
Country	C	The desired country (two characters) of the certificate to be requested with the CSR.																								
Email	E	The desired email address of the certificate to be requested with the CSR.																								
KeyType	Body	<p>Required. A string indicating the desired key encryption of the certificate. Accepted key types are:</p> <ul style="list-style-type: none"> RSA 																								

Name	In	Description																				
		<ul style="list-style-type: none"> ECC 																				
KeyLength	Body	<p>Required. An integer indicating the desired key size of the certificate. Accepted key sizes are:</p> <ul style="list-style-type: none"> 256 384 521 2048 4096 8192 																				
Template	Body	<p>A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Tip: Although you can include a template in your CSR, template handling in CSRs is future functionality, and the template will not be parsed back out of the CSR. Instead, submit a template directly with your CSR enrollment (see POST Enrollment CSR on page 1318).</p> </div>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipalname</td> <td>MS_NTPrincipalName (a string)</td> </tr> <tr> <td>ms_ntdsreplication</td> <td>MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					

Name	In	Description
		<pre>"SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] }</pre>

Table 309: POST CSR Generation Generate Response Data

Name	Description
CSR	The text of the CSR in PEM format.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.13 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 310: Custom Job Types Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the custom job type for the specified ID.	DELETE Custom Job Types ID on the next page
/id}	GET	Returns details for the custom job type for the specified ID.	GET Custom Job Types ID on the next page
/	GET	Returns all the custom job types.	GET Custom Job Types on page 1273
/	POST	Creates a custom job type.	POST Custom Job Types on

Endpoint	Method	Description	Link
			page 1275
/	PUT	Updates an existing custom job type.	PUT Custom Job Types on page 1279

3.2.13.1 DELETE Custom Job Types ID

The DELETE `/JobTypes/Custom/{id}` method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Table 311: DELETE JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <code>GET /JobTypes/Custom</code> method (see GET Custom Job Types on the next page) to retrieve a list of all the custom job types to determine the job type GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.13.2 GET Custom Job Types ID

The GET `/JobTypes/Custom/{id}` method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Read*

Table 312: GET JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <code>GET /JobTypes/Custom</code> method (see GET Custom Job Types on the next page) to retrieve a list of all the custom job types to determine the job type GUID.

Table 313: GET JobTypes Custom {id} Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DefaultValue</td> <td> <p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p> </td> </tr> <tr> <td>Required</td> <td>A Boolean that sets whether the job type field is required (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer

4	Bool	Boolean																								
DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.13.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Read*

Table 314: GET JobTypes Custom Input Parameters

Name	In	Description
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 315: GET JobTypes Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DefaultValue</td> <td> <p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p> </td> </tr> <tr> <td>Required</td> <td>A Boolean that sets whether the job type field is required (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean

DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.13.4 POST Custom Job Types

The POST `/JobTypes/Custom` method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of custom job type details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Table 316: POST JobTypes Custom Input Parameters

Name	In	Description																									
JobTypeName	Body	Required. A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
JobTypeFields	Body	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>Required. A value that indicates the data type of the job type field.</p> <p>It may be entered as either an integer or the matching enum value. Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DefaultValue</td> <td> <p>Required*. DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.13.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 318: PUT JobTypes Custom Input Parameters

Name	In	Description																									
Id	Body	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	Body	Required. A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
JobTypeFields	Body	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. 		<pre>"JobTypeFields": [{ "Name": "Favorite Type of Pet", "Type": "String", "DefaultValue": "Cat", "Required": true }, { "Name": "Model Year of First Car", "Type": "Int" }, { "Name": "Mother's Birthday", "Type": "DateTime" }]</pre>

Table 319: PUT JobTypes Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DefaultValue</td> <td> <p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p> </td> </tr> <tr> <td>Required</td> <td>A Boolean that sets whether the job type field is required (true) or not (false).</td> </tr> </tbody> </table>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<p>A value that indicates the data type of the job type field.</p> <p>Possible values are:</p> <table border="1"> <thead> <tr> <th>Integer Value</th> <th>Enum Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> <td>String</td> </tr> <tr> <td>2</td> <td>Int</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>DateTime</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Bool</td> <td>Boolean</td> </tr> </tbody> </table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
DefaultValue	<p>A string containing the default value of the job type field.</p> <p>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</p>																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFxs).

Table 320: Enrollment Endpoints

Endpoint	Method	Description	Link
/Settings/{id}	GET	Returns the template settings to use during enrollment.	GET Enrollment Settings ID below
/CSR/Context/My	GET	Returns the templates available for CSR enrollment by the current user.	GET Enrollment CSR Content My on page 1291
/PFX/Context/My	GET	Returns the templates available for PFX enrollment by the current user.	GET Enrollment PFX Content My on page 1303
/AvailableRenewal/Id/{id}	GET	Returns the type of renewals available for the referenced certificate ID.	GET Enrollment Available Renewal ID on page 1315
/AvailableRenewal/Thumbprint/{thumbprint}	GET	Returns the type of renewals available for the referenced certificate thumbprint.	GET Enrollment Available Renewal Thumbprint on page 1316
/CSR	POST	Performs a CSR enrollment.	POST Enrollment CSR on page 1318
/PFX	POST	Performs a PFX enrollment.	POST Enrollment PFX on page 1324
/CSR/Parse	POST	Returns information found in a CSR in a human friendly form.	POST Enrollment CSR Parse on page 1337
/PFX/Deploy	POST	Adds a certificate into a certificate store following a PFX enrollment or certificate renewal.	POST Enrollment PFX Deploy on page 1339
/PFX/Replace	POST	Replaces a certificate in a certificate store following a PFX enrollment.	POST Enrollment PFX Replace on page 1344
/Renew	POST	Performs a certificate renewal.	POST Enrollment Renew on page 1347

3.2.14.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateEnrollment: *EnrollCSR* or CertificateEnrollment: *EnrollPFX* or CertificateEnrollment: *CsrGeneration*

Table 321: GET Enrollment Settings {id} Input Parameters

Name	Description
id	The enrollment template Id. Use the <i>GET /Templates</i> method (see GET Templates on page 1914) to retrieve a list of all the templates to determine the template ID.

Table 322: GET Enrollment Settings {id} Response Body

Name	Description												
TemplateRegexes	<p>An object containing the regular expressions resolved for the template. Regular expression details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SubjectPart</td> <td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td> </tr> <tr> <td>RegEx</td> <td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1913) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table border="1"> <thead> <tr> <th>Subject Part</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>CN (Common Name)</td> <td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td> </tr> <tr> <td>O (Organization)</td> <td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *EnrollCSR*

Table 323: GET Enrollment CSR Content My Response Body

Name	Description																						
Templates	<p>An array containing the templates available for enrollment by the user. The array contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td> </tr> <tr> <td>Name</td> <td>A string containing the common name (short name) of the template. 	 <i>Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *EnrollPFX*

Table 324: GET Enrollment PFX Content My Response Body

Name	Description																						
Templates	<p>An array containing the templates available for enrollment by the user. The array contains the following parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A integer indicating the Keyfactor Command reference ID of the certificate template.</td> </tr> <tr> <td>Name</td> <td>A string containing the common name (short name) of the template. 	 <i>Terms</i> application setting. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 325: GET Enrollment Available Renewal ID {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status.</p> <p>Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

Table 326: GET Enrollment Available Renewal ID {id} Response Body

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—renewal is not supported for this certificate.</td> </tr> <tr> <td>1</td> <td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td> </tr> <tr> <td>2</td> <td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> The certificate is located together with its private key in one or more managed certificate store(s). The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 329 in the <i>Keyfactor Command Reference Guide</i> for more information. </td> </tr> </tbody> </table> <p> Tip: If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> The certificate is located together with its private key in one or more managed certificate store(s). The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 329 in the <i>Keyfactor Command Reference Guide</i> for more information.
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> The certificate is located together with its private key in one or more managed certificate store(s). The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See Certificate Templates on page 329 in the <i>Keyfactor Command Reference Guide</i> for more information. 								
Message	A message providing more details about the available renewal type result (e.g. "One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.").								

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 327: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

Name	In	Description
thumbprint	Path	Required. The thumbprint of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Permissions on page 583 in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 328: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Body

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None—renewal is not supported for this certificate.</td> </tr> <tr> <td>1</td> <td>Seeded PFX is supported. Message	A message providing more details about the available renewal type result (e.g. "One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.").								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *EnrollCSR*

Tip: Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 205](#)).

Table 329: POST Enrollment CSR Input Parameters

Name	In	Description
CSR	Body	Required. The base-64 encoded CSR that will be passed in for enrollment.
PrivateKey	Body	A string containing the base-64 encoded private key that corresponds to the CSR to be saved with the enrollment. This is done to support private key retention in Keyfactor Command for requests made through CSR enrollment. The key should be provided in unencrypted PKCS#8 format. The private key option is only supported for enrollments done using templates configured in Keyfactor Command for private key retention.
Timestamp	Body	Required. The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Template	Body	Required* . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required unless the enrollment is being done against a standalone CA.
CertificateAuthority	Body	Required* . A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i> . For example: <pre>corpca01.keyexample.com\\CorplssuingCA1 OR CorplssuingCA1</pre> If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i> . This field is optional unless the enrollment is being done against a standalone CA, in which case it is required .
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example: <pre>"Metadata": {</pre>

Name	In	Description																				
		<pre data-bbox="711 268 1409 762"> "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. KeyfactorRequestid	An integer indicating the Keyfactor Command reference ID of the request.										

Value	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>RequestDisposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>DispositionMessage</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>EnrollmentContext</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description	RequestDisposition	A string indicating the state of the request (e.g. ISSUED).	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description								
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).								
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).								
EnrollmentContext	An internally used Keyfactor Command field.								
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.		
Name	Description								
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.								
Value	The value of the metadata.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 1335](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 1339](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 1344](#)).

Tip: Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 205](#)).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 711](#).

Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

Note: The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 331: POST Enrollment PFX v2 Input Parameters

Name	In	Description										
Stores	Body	<p>An object containing a comma delimited set of arrays indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td> <p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1092) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> </td> </tr> <tr> <td>Alias</td> <td> <p>A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 131 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p> </td> </tr> <tr> <td>Properties</td> <td> <p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> </td> </tr> </tbody> </table>	Name	Description	StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1092) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 131 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. You may have custom certificate store types that make use of this functionality.</p>
Name	Description							
	<p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre>							
	<p> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>							
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is <i>12</i>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>						
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i>.</p>						
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIn-</i></p>						

Name	In	Description
		<p><i>toExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIn-toExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorplssuingCA1 OR Corpls-suingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "william.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre> <p>See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Timestamp	Body	<p>The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>

Name	In	Description																				
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is required unless the enrollment is being done against a standalone CA.</p>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipalname</td> <td>MS_NTPrincipalName (a string)</td> </tr> <tr> <td>ms_ntdsreplication</td> <td>MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> { "SANs": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } } </pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
InstallIn- toExistingCertificateStores	Body	<p>A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i>.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIn-</i></p>																				

Name	In	Description
		<p><i>toExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIn-toExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre data-bbox="721 562 1411 632">"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-CertificateFormat	Header	<p>Required. The desired output format for the certificate. Available options are PFX, Zip, and Store. If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>

Table 332: POST Enrollment PFX v2 Response Data

Value	Description																
SuccessfulStores	An object containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.																
CertificateInformation	Information about the certificate that was requested. Certificate information includes: <table border="1" data-bbox="509 464 1411 1705"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>KeyfactorID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>PKCS12Blob</td> <td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p> </td> </tr> <tr> <td>Password</td> <td>An internally used Keyfactor Command field.</td> </tr> <tr> <td>WorkflowInstanceid</td> <td> <p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow</p> </td> </tr> </tbody> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>	Password	An internally used Keyfactor Command field.	WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow</p>
Value	Description																
SerialNumber	A string indicating the serial number of the certificate.																
IssuerDN	A string indicating the issuer DN of the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.																
PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>																
Password	An internally used Keyfactor Command field.																
WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow</p>																

Value	Description														
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>  instance record—one using a GUID and one using a more human readable integer. </td> </tr> <tr> <td>WorkflowReferenceId</td> <td> An integer containing the Keyfactor Command reference ID of the workflow instance.  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID of the request.</td> </tr> <tr> <td>RequestDisposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>DispositionMessage</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>EnrollmentContext</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description		 instance record—one using a GUID and one using a more human readable integer.	WorkflowReferenceId	An integer containing the Keyfactor Command reference ID of the workflow instance.  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.	RequestDisposition	A string indicating the state of the request (e.g. ISSUED).	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description														
	 instance record—one using a GUID and one using a more human readable integer.														
WorkflowReferenceId	An integer containing the Keyfactor Command reference ID of the workflow instance.  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.														
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.														
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).														
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).														
EnrollmentContext	An internally used Keyfactor Command field.														
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.								
Name	Description														
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.														
Value	The value of the metadata.														

Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 333: POST Enrollment PFX v1 Input Parameters

Name	In	Description
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is <i>12</i>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
PopulateMissingValuesFromAD	Body	<p>A Boolean that sets whether to populate the information in the subject from Active Directory (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p>
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=we- ebsrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See Application Settings: Enrollment Tab on page 555 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (<i>true</i>) or not (<i>false</i>). The default is <i>true</i>.</p>
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorplssuingCA1 OR CorplssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p>

Name	In	Description
		This field is optional unless the enrollment is being done against a standalone CA, in which case it is required .
Timestamp	Body	The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Template	Body	Required* . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required unless the enrollment is being done against a standalone CA.
Metadata	Body	An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example: <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre> </div> <p>See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
SANs	Body	An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:

Name	In	Description																				
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> <tr> <td>directory</td> <td>Directory Name</td> </tr> <tr> <td>uri</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>ip4</td> <td>IP v4 Address</td> </tr> <tr> <td>ip6</td> <td>IP v6 Address</td> </tr> <tr> <td>registeredid</td> <td>Registered ID (an OID)</td> </tr> <tr> <td>ms_ntprincipalname</td> <td>MS_NTPrincipalName (a string)</td> </tr> <tr> <td>ms_ntdsreplication</td> <td>MS_NTDSReplication (a GUID)</td> </tr> </tbody> </table> <p>For example:</p> <pre> { "SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } } </pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre> "AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" } </pre> <p>See Certificate Template Operations on page 330 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
x-CertificateFormat	Header	<p>Required. The desired output format for the certificate. Available options are PFX, Zip, and Store. If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>																				

Table 334: POST Enrollment PFX v1 Response Data

Value	Description																
CertificateInformation	<p>Information about the certificate that was requested. Certificate information includes:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the issuer DN of the certificate.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>KeyfactorID</td> <td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td> </tr> <tr> <td>PKCS12Blob</td> <td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p> </td> </tr> <tr> <td>Password</td> <td>An internally used Keyfactor Command field.</td> </tr> <tr> <td>WorkflowInstanceid</td> <td> <p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </td> </tr> </tbody> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>	Password	An internally used Keyfactor Command field.	WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>
Value	Description																
SerialNumber	A string indicating the serial number of the certificate.																
IssuerDN	A string indicating the issuer DN of the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.																
PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. The <i>Store</i> option is designed to be used when pushing a newly obtained PFX certificate to a certificate store (see POST Enrollment PFX Deploy on page 1339).</p>																
Password	An internally used Keyfactor Command field.																
WorkflowInstanceid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceid</i> and the <i>WorkflowReferenceid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>																

Value	Description												
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>WorkflowReferenceId</td> <td>An integer containing the Keyfactor Command reference ID of the workflow instance. <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </div> </td> </tr> <tr> <td>KeyfactorRequestId</td> <td>An integer indicating the Keyfactor Command reference ID of the request.</td> </tr> <tr> <td>RequestDisposition</td> <td>A string indicating the state of the request (e.g. ISSUED).</td> </tr> <tr> <td>DispositionMessage</td> <td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td> </tr> <tr> <td>EnrollmentContext</td> <td>An internally used Keyfactor Command field.</td> </tr> </tbody> </table>	Value	Description	WorkflowReferenceId	An integer containing the Keyfactor Command reference ID of the workflow instance. <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </div>	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.	RequestDisposition	A string indicating the state of the request (e.g. ISSUED). Value	Description												
WorkflowReferenceId	An integer containing the Keyfactor Command reference ID of the workflow instance. <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </div>												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.												
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).												
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).												
EnrollmentContext	An internally used Keyfactor Command field.												
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>MetadataFieldName</td> <td>A string containing the name of the metadata field in Keyfactor Command.</td> </tr> <tr> <td>Value</td> <td>The value of the metadata.</td> </tr> </tbody> </table> <p>See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.						
Name	Description												
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.												
Value	The value of the metadata.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

Table 335: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	Required. Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 336: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	<p>An array containing key/value pairs representing all the elements in the CSR. Possible values include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Key Length</td> <td>An integer indicating the desired key size of the certificate.</td> </tr> <tr> <td>Key Type</td> <td>A string indicating the desired key encryption of the certificate.</td> </tr> <tr> <td>CN</td> <td>The common name of the certificate.</td> </tr> <tr> <td>O</td> <td>The organization of the certificate.</td> </tr> <tr> <td>OU</td> <td>The organizational unit of the certificate.</td> </tr> <tr> <td>L</td> <td>The city of the certificate.</td> </tr> <tr> <td>ST</td> <td>The state of the certificate.</td> </tr> <tr> <td>C</td> <td>The country (two characters) of the certificate.</td> </tr> <tr> <td>E</td> <td>The email address of the certificate.</td> </tr> <tr> <td>DNS Name</td> <td>A SAN value containing a DNS name.</td> </tr> <tr> <td>IP Address</td> <td>A SAN value containing an IP v4 or IP v6 address.</td> </tr> <tr> <td>RFC822 Name</td> <td>A SAN value containing an email message.</td> </tr> <tr> <td>URL</td> <td>A SAN value containing a uniform resource identifier.</td> </tr> <tr> <td>Directory Name</td> <td>A SAN value containing a directory name.</td> </tr> <tr> <td>Registered ID</td> <td>A SAN value containing a registered ID.</td> </tr> <tr> <td>Other name:Principal Name</td> <td>A SAN value containing a user principal name (UPN) value.</td> </tr> <tr> <td>Other name:DS Object Guid</td> <td>A SAN value containing the MS_NTDSReplication value.</td> </tr> </tbody> </table> <p> Note: Some of these fields cannot be added to a CSR generated within Keyfactor Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.</p>	Name	Description	Key Length	An integer indicating the desired key size of the certificate.	Key Type	A string indicating the desired key encryption of the certificate.	CN	The common name of the certificate.	O	The organization of the certificate.	OU	The organizational unit of the certificate.	L	The city of the certificate.	ST	The state of the certificate.	C	The country (two characters) of the certificate.	E	The email address of the certificate.	DNS Name	A SAN value containing a DNS name.	IP Address	A SAN value containing an IP v4 or IP v6 address.	RFC822 Name	A SAN value containing an email message.	URL	A SAN value containing a uniform resource identifier.	Directory Name	A SAN value containing a directory name.	Registered ID	A SAN value containing a registered ID.	Other name:Principal Name	A SAN value containing a user principal name (UPN) value.	Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.
Name	Description																																				
Key Length	An integer indicating the desired key size of the certificate.																																				
Key Type	A string indicating the desired key encryption of the certificate.																																				
CN	The common name of the certificate.																																				
O	The organization of the certificate.																																				
OU	The organizational unit of the certificate.																																				
L	The city of the certificate.																																				
ST	The state of the certificate.																																				
C	The country (two characters) of the certificate.																																				
E	The email address of the certificate.																																				
DNS Name	A SAN value containing a DNS name.																																				
IP Address	A SAN value containing an IP v4 or IP v6 address.																																				
RFC822 Name	A SAN value containing an email message.																																				
URL	A SAN value containing a uniform resource identifier.																																				
Directory Name	A SAN value containing a directory name.																																				
Registered ID	A SAN value containing a registered ID.																																				
Other name:Principal Name	A SAN value containing a user principal name (UPN) value.																																				
Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 1324](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateStoreManagement: *Schedule*
CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Tip: The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 337: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p>Required*. An array indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreId</td> <td> <p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> </td> </tr> <tr> <td>Alias</td> <td> <p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 131 in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </td> </tr> <tr> <td>Overwrite</td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the GET /Certificates/Locations/{id} method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p> </td> </tr> <tr> <td>Properties</td> <td> <p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the GET CertificateStoreTypes method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by GET CertificateStoreTypes like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> </td> </tr> </tbody> </table>	Name	Description	StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1092) with a query of "Approved -eq true" to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 131 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Overwrite	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the GET /Certificates/Locations/{id} method (see GET Certificates Locations ID on page 930) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	<p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. Name	Description							
	<p>The setting is referenced using the following format:</p> <pre>"Properties": {"NetscalerVserver": "MyVirtualServerName"}</pre>							
	<p>Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>							
Password	Body	Required *. A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.						
CertificateId	Body	Required *. The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> .						
		 Note: For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is required . The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.						
RequestId	Body	Required *. The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> . See the note under <i>CertificateId</i> regarding when this field is required and when it is not.						
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.						
StoreIds	Body	An array of the certificate store GUIDs for the stores to which the certificate should be added.						

Name	Type	Description																														
		The StoreIds parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but no longer required.																														
StoreTypes	Body	<p>An array of store types used with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. The StoreTypes parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but is no longer required.</p> <p>Store type parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeId</td> <td> <p>The type of certificate store the certificate is being deployed to. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr><td>0</td><td>Java Keystore</td></tr> <tr><td>2</td><td>PEM File</td></tr> <tr><td>3</td><td>F5 SSL Profiles</td></tr> <tr><td>4</td><td>IIS Roots</td></tr> <tr><td>5</td><td>NetScaler</td></tr> <tr><td>6</td><td>IIS Personal</td></tr> <tr><td>7</td><td>F5 Web Server</td></tr> <tr><td>8</td><td>IIS Revoked</td></tr> <tr><td>9</td><td>F5 Web Server REST</td></tr> <tr><td>10</td><td>F5 SSL Profiles REST</td></tr> <tr><td>11</td><td>F5 CA Bundles REST</td></tr> <tr><td>100</td><td>Amazon Web Services</td></tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	StoreTypeId	<p>The type of certificate store the certificate is being deployed to. 		Name	Description
			 makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.

Table 338: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <p> Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <code>GET /Certificates/{id}</code> method with <code>includeLocations=true</code> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.</p>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 1324](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 CertificateStoreManagement: *Schedule*
 CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: You could achieve the same end using the `POST /Enrollment/PFX/Deploy` method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the `POST /Enrollment/PFX/Replace` method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the `POST /Enrollment/PFX/Deploy` method (see [POST Enrollment PFX Deploy on page 1339](#)).

Tip: The `POST /Enrollment/PFX/Replace` method must be used within 5 minutes of acquiring a certificate with the `POST /Enrollment/PFX` or `POST /Enrollment/Renew` method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 339: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	Required. The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 340: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.14.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Certificates: *Read*
CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 1339](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 1344](#)).

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 205](#)).

Table 341: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	Required* . The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Thumbprint	Body	Required* . The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Timestamp	Body	Required . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
CertificateAuthority	Body	Required* . A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>host-name\logical name</i> format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code> This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 1315 or GET Enrollment Available Renewal Thumbprint on page 1316).
Template	Body	Required* . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 1315 or GET Enrollment Available Renewal Thumbprint on page 1316).

Table 342: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.15 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 343: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	GET License below

3.2.15.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters. For more information regarding licensing, see [Licensing on page 652](#) in the *Keyfactor Command Reference Guide*.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SystemSettings: Read

Table 344: GET License Response Data

Name	Description												
KeyfactorVersion	A string indicating the Keyfactor Command version number in the format: <div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">majorversion.incrementalversion.patchnumber</div>												
LicenseData	<p>An object containing your Keyfactor customer information. License data details are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>LicenseId</td> <td>A string indicating the internal reference GUID of your Keyfactor license.</td> </tr> <tr> <td>Customer</td> <td>An object containing identifying information about your organization. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing your company name as per your Keyfactor account.</td> </tr> <tr> <td>Id</td> <td>An integer containing your Keyfactor account number.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	LicenseId	A string indicating the internal reference GUID of your Keyfactor license.	Customer	An object containing identifying information about your organization. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing your company name as per your Keyfactor account.</td> </tr> <tr> <td>Id</td> <td>An integer containing your Keyfactor account number.</td> </tr> </tbody> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.
Name	Description												
LicenseId	A string indicating the internal reference GUID of your Keyfactor license.												
Customer	An object containing identifying information about your organization. <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 5px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing your company name as per your Keyfactor account.</td> </tr> <tr> <td>Id</td> <td>An integer containing your Keyfactor account number.</td> </tr> </tbody> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.						
Name	Description												
Name	A string containing your company name as per your Keyfactor account.												
Id	An integer containing your Keyfactor account number.												
IssuedDate	A string indicating the valid issue date of the license, in UTC.												
ExpirationDate	A string indicating the valid expiration date of the license, in UTC.												
LicensedProducts	<p>An array containing details of the products and features included in the license. License product and feature details are:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ProductId</td> <td>A string indicating the Keyfactor Command product GUID for the product(s) included in the license.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".</td> </tr> <tr> <td>MajorRev</td> <td>A string indicating the valid major release version of the license.</td> </tr> <tr> <td>MinorRev</td> <td>A string indicating the valid incremental release version of the license.</td> </tr> </tbody> </table>	Name	Description	ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.	DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".	MajorRev	A string indicating the valid major release version of the license.	MinorRev	A string indicating the valid incremental release version of the license.		
Name	Description												
ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.												
DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is "Certificate Management System".												
MajorRev	A string indicating the valid major release version of the license.												
MinorRev	A string indicating the valid incremental release version of the license.												

Name	Description	
LicensedFeatures	Description	
	An array containing the Keyfactor Command features included in the license.	
	Name	Description
	FeatureID	A string indicating the ID code of feature.
	DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.
	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).
Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> • How many of the elements you are licensed for. • For those features which have no licensing limits, <i>null</i>. <p>Unlimited is indicated by 999999999.</p>	
ExpirationDate	This field is unused and will always return <i>null</i> .	
 Tip: Currently there is only one licensed product offered, which is Keyfactor Command.		

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.16 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 345: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	GET MacEnrollment below
/	PUT	Updates the Mac auto-enrollment configuration.	PUT MacEnrollment on the next page

3.2.16.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
SystemSettings: Read

Table 346: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.16.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: SystemSettings: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 347: PUT MacEnrollment Response Data

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 348: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See Certificate Metadata on page 607 in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 349: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes an existing metadata field.	DELETE MetadataFields ID on the next page
/id	GET	Returns detailed information for the specified metadata field.	GET MetadataFields ID on page 1357
/name	GET	Returns detailed information for the specified metadata field.	GET MetadataFields Name on page 1360

Endpoint	Method	Description	Link
/ {id} /InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	GET MetadataFields ID InUse on page 1363
/	DELETE	Deletes multiple metadata fields specified in the request body.	DELETE MetadataFields on page 1364
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	GET MetadataFields on page 1364
/	POST	Creates a new metadata field using values supplied in the request body.	POST MetadataFields on page 1368
/	PUT	Updates an existing metadata field using values supplied in the request body.	PUT MetadataFields on page 1374

3.2.17.1 DELETE MetadataFields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

Table 350: DELETE MetadataFields {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field to be deleted. Use the GET /MetadataFields method (see GET MetadataFields on page 1364) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the GET /MetadataFields/{id}/InUse method (see GET MetadataFields ID InUse on page 1363) to determine whether a metadata field is in use.

Tip: For code examples, see the [Keyfactor API Endpoint Utility](#). To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.2 GET MetadataFields ID

The GET /MetadataFields/{id} method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 351: GET MetadataFields {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields on page 1364) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 352: GET MetadataFields {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>																
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If a template specific option is set for a given metadata field, that takes precedence </div>																

Name	Description								
	 over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>								
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of</p>								

Name	Description
	<p>email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, <i>Email</i> or <i>multiple choice</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.3 GET MetadataFields Name

The GET /MetadataFields/{name} method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateMetadataTypes: *Read*

Table 353: GET MetadataFields {name} Input Parameters

Name	In	Description
name	Path	Required. A string that indicates the name of the metadata field. This value is not case sensitive.

Table 354: GET MetadataFields {name} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email

The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.4 GET MetadataFields ID InUse

The GET /MetadataFields/{id}/InUse method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 355: GET MetadataFields {id} In Use Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the metadata field.</p> <p>Use the <i>GET /MetadataFields</i> method (see GET MetadataFields on the next page) to retrieve a list of all the metadata fields to determine the metadata field's ID.</p>

Table 356: GET MetadataFields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.5 DELETE MetadataFields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. The metadata fields IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateMetadataTypes: *Modify*

Table 357: DELETE MetadataFields Input Parameters

Name	In	Description
ids	Body	Required. An array of Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields below) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET MetadataFields ID InUse on the previous page) to determine whether a metadata field is in use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.6 GET MetadataFields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 358: GET MetadataFields Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search on page 537</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>Name</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 359: GET MetadataFields Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	A string indicating the description for the metadata field.																
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																
1	String																
2	Integer																
3	Date																
4	Boolean																
5	Multiple Choice																
6	Big Text																
7	Email																
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>																
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If a template specific option is set for a given metadata field, that takes precedence </div>																

Name	Description								
	 over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p> <p> Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).</p>								
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of</p>								

Name	Description
	<p>email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, <i>Email</i> or <i>multiple choice</i>.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881). </div>
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon  at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.17.7 POST MetadataFields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature: CertificateMetadataTypes: *Modify*

Table 360: POST MetadataFields Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.																
Description	Body	Required. A string indicating the description for the metadata field.																
DataType	Body	<p>Required. An integer indicating the data type of the metadata field. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>String</td> </tr> <tr> <td>2</td> <td>Integer</td> </tr> <tr> <td>3</td> <td>Date</td> </tr> <tr> <td>4</td> <td>Boolean</td> </tr> <tr> <td>5</td> <td>Multiple Choice</td> </tr> <tr> <td>6</td> <td>Big Text</td> </tr> <tr> <td>7</td> <td>Email</td> </tr> </tbody> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text	7	Email
Value	Description																	
1	String																	
2	Integer																	
3	Date																	
4	Boolean																	
5	Multiple Choice																	
6	Big Text																	
7	Email																	
Hint	Body	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>																
Validation	Body	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																

Name	In	Description								
		 Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Optional Users have the option to either enter a value or not enter a value in the field.</td> </tr> <tr> <td>1</td> <td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td> </tr> <tr> <td>2</td> <td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td> </tr> </tbody> </table> <p>The default is <i>optional</i>.</p>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description									
0	Optional Users have the option to either enter a value or not enter a value in the field.									
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.									
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.									
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).								
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is required for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p>								

Name	In	Description
		 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, <i>Email</i> or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1881).
AllowAPI	Body	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	Body	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	Body	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

Table 361: POST MetadataFields Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.

3.2.17.8 PUT MetadataFields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

 **Tip:** The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

 **Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 362: PUT MetadataFields Input Parameters

Name	In	Description																
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.																
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.

This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18 Monitoring Revocation

The Monitoring Revocation component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 364: Monitoring Revocation Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the revocation monitoring location with the specified ID.	DELETE Monitoring Revocation ID on the next page
/id}	GET	Returns details for the revocation monitoring location with the specified ID.	GET Monitoring Revocation ID on page 1382
/	PUT	Edits the revocation monitoring location with the specified ID.	PUT Monitoring Revocation on page 1395

Endpoint	Method	Description	Link
/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	GET Monitoring Revocation on page 1385
/	POST	Creates a new revocation monitoring location.	POST Monitoring Revocation on page 1389
/ResolveOSCP	POST	Resolves the given OSCP certificate authority.	POST Monitoring Resolve OSCP on page 1401
/Test	POST	Tests the revocation monitoring alert with the specified ID.	POST Monitoring Revocation Test on page 1402
/TestAll	POST	Tests the revocation monitoring alerts.	POST Monitoring Revocation Test All on page 1404

3.2.18.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Modify*

Table 365: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 1385) to retrieve a list of all the revocation monitoring locations to determine the ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.2 GET Monitoring Revocation ID

The GET /Monitoring/Revocation/{id} method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: Read

Table 366: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 1385) to retrieve a list of all the revocation monitoring locations to determine the ID.

Table 367: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								
Schedule	An array containing the inventory schedule set for the revocation monitoring location. Supported								

Name	Description																
	<p>schedules are:</p> <table border="1" data-bbox="423 321 1411 380"> <thead> <tr> <th data-bbox="423 321 565 380">Name</th> <th data-bbox="565 321 1411 380">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="423 380 565 443">Off</td> <td data-bbox="565 380 1411 443">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="423 443 565 974">Interval</td> <td data-bbox="565 443 1411 974"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="581 579 1391 737"> <thead> <tr> <th data-bbox="581 579 743 638">Name</th> <th data-bbox="743 579 1391 638">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 638 743 737">Minutes</td> <td data-bbox="743 638 1391 737">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="586 827 1386 961">"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td data-bbox="423 974 565 1505">Daily</td> <td data-bbox="565 974 1411 1505"> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="581 1079 1391 1138"> <thead> <tr> <th data-bbox="581 1079 743 1138">Name</th> <th data-bbox="743 1079 1391 1138">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 1138 743 1268">Time</td> <td data-bbox="743 1138 1391 1268">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="586 1358 1386 1493">"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p data-bbox="423 1541 1411 1671">  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </p>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="581 579 1391 737"> <thead> <tr> <th data-bbox="581 579 743 638">Name</th> <th data-bbox="743 579 1391 638">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 638 743 737">Minutes</td> <td data-bbox="743 638 1391 737">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="586 827 1386 961">"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="581 1079 1391 1138"> <thead> <tr> <th data-bbox="581 1079 743 1138">Name</th> <th data-bbox="743 1079 1391 1138">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 1138 743 1268">Time</td> <td data-bbox="743 1138 1391 1268">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="581 579 1391 737"> <thead> <tr> <th data-bbox="581 579 743 638">Name</th> <th data-bbox="743 579 1391 638">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 638 743 737">Minutes</td> <td data-bbox="743 638 1391 737">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="586 827 1386 961">"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="581 1079 1391 1138"> <thead> <tr> <th data-bbox="581 1079 743 1138">Name</th> <th data-bbox="743 1079 1391 1138">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 1138 743 1268">Time</td> <td data-bbox="743 1138 1391 1268">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre data-bbox="586 1358 1386 1493">"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:																

Name	Description	
	Value	Description
	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the GET /CertificateAuthority method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID. This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 368: GET Monitoring Revocation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DashboardWarningValue</i> (WarningHours value) • <i>DisplayName</i> (Name) • <i>EndpointType</i> (1-CRL, 2-OCSP) • <i>SendWarning</i> (emailreminder) (true, false) • <i>ShowOnDashboard</i> (true, false) • <i>Url</i> • <i>WarningDays</i> <div style="background-color: #e6f2e6; padding: 10px; margin-top: 10px;"> <p> Tip: To return all revocation monitoring locations of type CRL, use the following query: EndpointType -eq 1 To return locations of type OCSP, use this query: EndpointType -eq 2</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 369: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								
Schedule	An array containing the inventory schedule set for the revocation monitoring location. Supported								

Name	Description																
	<p>schedules are:</p> <table border="1" data-bbox="423 321 1411 380"> <thead> <tr> <th data-bbox="423 321 565 380">Name</th> <th data-bbox="565 321 1411 380">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="423 380 565 443">Off</td> <td data-bbox="565 380 1411 443">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="423 443 565 974">Interval</td> <td data-bbox="565 443 1411 974"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).	SampleSerialNumber	A string indicating the serial number of the CA.
Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com												
AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .												
AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).												
SampleSerialNumber	A string indicating the serial number of the CA.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Modify*

Table 370: POST Monitoring Revocation Input Parameters

Name	In	Description								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	<p>Required. An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningHours</td> <td> <p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	<p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description									
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.									
WarningHours	<p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>									

Name	In	Description																
Schedule	Body	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.

Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description												
Off	Turn off a previously configured schedule.												
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:												

Name	Description	
	Value	Description
	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID. This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Modify*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 372: PUT Monitoring Revocation {id}Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	<p>Required. An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td> </tr> <tr> <td>WarningHours</td> <td> <p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i></p> </td> </tr> </tbody> </table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	<p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i></p>		
Value	Description									
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.									
WarningHours	<p>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i></p>									

Name	In	Description

	<p>is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																	
Schedule	Body	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																	

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>		
Name	Description							
	<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>							
OCSPParameters	Body	<p>Required*. for OCSP endpoints. For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertificateContents</td> <td>A string indicating the certificate contents.</td> </tr> <tr> <td>CertificateAuthorityId</td> <td>An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID.</td> </tr> </tbody> </table>	Value	Description	CertificateContents	A string indicating the certificate contents.	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID.
Value	Description							
CertificateContents	A string indicating the certificate contents.							
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID.							

Table 373: PUT Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EnableReminder</td> <td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td> </tr> <tr> <td>WarningDays</td> <td>An integer indicating the number of days before expiration to send the warning email.</td> </tr> <tr> <td>Recipients</td> <td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td> </tr> </tbody> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Show</td> <td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td> </tr> <tr> <td>WarningHours</td> <td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td> </tr> </tbody> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								
Schedule	An array containing the inventory schedule set for the revocation monitoring location. Supported								

Name	Description												
	<p>schedules are:</p> <table border="1" data-bbox="423 321 1411 380"> <thead> <tr> <th data-bbox="423 321 565 380">Name</th> <th data-bbox="565 321 1411 380">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="423 380 565 443">Off</td> <td data-bbox="565 380 1411 443">Turn off a previously configured schedule.</td> </tr> </tbody> </table> <p data-bbox="423 443 565 974">Interval</p> <p data-bbox="565 443 1411 575">A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="581 579 1390 737"> <thead> <tr> <th data-bbox="581 579 743 638">Name</th> <th data-bbox="743 579 1390 638">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 638 743 737">Minutes</td> <td data-bbox="743 638 1390 737">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p data-bbox="565 737 1411 821">For example, every hour:</p> <pre data-bbox="581 825 1390 961"> "Interval": { "Minutes": 60 } </pre> <p data-bbox="423 974 565 1505">Daily</p> <p data-bbox="565 974 1411 1058">A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="581 1077 1390 1136"> <thead> <tr> <th data-bbox="581 1077 743 1136">Name</th> <th data-bbox="743 1077 1390 1136">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="581 1136 743 1268">Time</td> <td data-bbox="743 1136 1390 1268">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="565 1268 1411 1352">For example, daily at 11:30 pm:</p> <pre data-bbox="581 1356 1390 1493"> "Daily": { "Time": "2022-02-25T23:30:00Z" } </pre> <p data-bbox="423 1505 1411 1688">  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </p>	Name	Description	Off	Turn off a previously configured schedule.	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description												
Off	Turn off a previously configured schedule.												
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:												

Name	Description	
	Value	Description
	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the GET /CertificateAuthority method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID. This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
WorkflowManagement: *Modify*

Table 374: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	Required* . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	Required* . An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 1000) to retrieve a list of all the CAs to determine the ID. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 375: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

Tip: Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 WorkflowManagement: *Read*
 WorkflowManagement: *Test*

Table 376: POST Monitoring Revocation Test Input Parameters

Name	In	Description								
revocationMonitoringAlertTestRequest	Body	<p>Required. An array containing information for the alert test. Alert test detail values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AlertId</td> <td>Required. An integer indicating the reference ID of revocation monitoring alert to test.</td> </tr> <tr> <td>EvaluationDate</td> <td>Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</td> </tr> <tr> <td>SendAlerts</td> <td>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example:</p> <pre>{ "EvaluationDate": "2022-08-31T20:51:33.528Z" "SendAlerts": true }</pre>	Name	Description	AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.	EvaluationDate	Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .
Name	Description									
AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.									
EvaluationDate	Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.									
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .									

Table 377: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An object containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.18.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

Tip: Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 WorkflowManagement: Read
 WorkflowManagement: Test

Table 378: POST Monitoring Revocation Test All Input Parameters

Name	In	Description						
revocationMonitoringAlertTestRequest	Body	<p>Required. An array containing information for the alert test. Alert test detail values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>EvaluationDate</td> <td> <p>Required. A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p> </td> </tr> <tr> <td>SendAlerts</td> <td> <p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p> </td> </tr> </tbody> </table> <p>For example:</p> <pre>{ "EvaluationDate": "2022-08-31T20:51:33.528Z" "SendAlerts": true }</pre>	Name	Description	EvaluationDate	<p>Required. A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>	SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>
Name	Description							
EvaluationDate	<p>Required. A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>							
SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>							

Table 379: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td> </tr> <tr> <td>Message</td> <td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td> </tr> <tr> <td>Recipients</td> <td>An object containing the recipient(s) for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 380: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	GET Orchestrator Jobs Job Status Data on the next page
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	GET Orchestrator Jobs Job History on page 1408
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	GET Orchestrator Jobs Scheduled Jobs on page 1413
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	POST Orchestrator Jobs Custom on page 1417
/Reschedule	POST	Reschedules a failed orchestrator job.	POST Orchestrator Jobs Reschedule on page 1421

Endpoint	Method	Description	Link
/Unschedule	POST	Unschedules an active orchestrator job.	POST Orchestrator Jobs Unschedule on page 1423
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	POST Orchestrator Jobs Acknowledge on page 1424
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	POST Orchestrator Jobs Reschedule on page 1421

3.2.19.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Read*

Tip: This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

Tip: If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:
2021-08-05 10:47:23.1940
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response status code does not indicate success: 413 (Request Entity Too Large).

at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172

at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri, Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\work\24\s\src\OrchestratorServices\HttpService.cs:line 38

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See [Fetch Logs on page 460](#) in the *Keyfactor Command Reference Guide* for more information.

Table 381: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	Required. The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History below) to retrieve a list of jobs to determine the job's history ID.

Table 382: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Read*

Table 383: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature on page 468</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentId</i> (The GUID of the orchestrator. Run GET Agents on page 717 to find the ID) • <i>Agent</i> (ClientMachine) • <i>JobId</i> • <i>Result</i> (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown) • <i>Status</i> (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry) • <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • <i>Message</i> • <i>OperationStart</i> (DateTime) • <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_(Monthly), O_(Once)) • <i>TargetPath</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 384: GET Orchestrator Jobs Job History Response Data

Name	Description																
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.																
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.																
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.																
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time
Name	Description																
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time												
Name	Description																
Time	The date and time to next run the job. The date and time

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>								

Name	Description						
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> <tr> <td>Day</td> <td>The number of the day, in the month, to run the job.</td> </tr> </tbody> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Day	The number of the day, in the month, to run the job.						
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).		
Name	Description						
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
JobType	A string indicating the job type (e.g. IISInventory).						
OperationStart	The time, in UTC, at which the orchestrator job started.						
OperationEnd	The time, in UTC, at which the orchestrator job finished.						
Message	A string providing the error message for the operation, if any.						
Result	<p>A string indicating the result of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> Unknown 						

Name	Description
	<ul style="list-style-type: none"> • Success • Warning • Failure
Status	<p>A string indicating the status of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> • Unknown • Waiting • In Process • Completed • Acknowledged • Completed Will Retry
StorePath	<p>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ClientMachine	<p>A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Read*

Table 385: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature on page 468</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentId</i> (The GUID of the orchestrator. Run GET Agents on page 717 to find the ID) • <i>Agent Machine</i> (ClientMachine) • <i>AgentPlatform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator) • <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • <i>AgentType</i> *Use -contains comparison (Capabilities in GET Agents on page 717) • <i>Requested</i> (DateTime) • <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly),M_(Monthly), O_(Once)) • <i>TargetPath</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 386: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See Adding or Modifying a Certificate Store on page 359 in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.4 POST Orchestrator Jobs Custom

The POST `/OrchestratorJobs/Custom` method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Tip: Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the `GET /OrchestratorJobs/JobHistory` method (see [GET Orchestrator Jobs Job History on page 1408](#)) to determine the `JobHistoryId` of the completed job and then use the `GET /OrchestratorJobs/JobStatus/Data` method (see [GET Orchestrator Jobs Job Status Data on page 1407](#)) to retrieve the data.

Table 387: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description												
AgentId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 717) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 717) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>												
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1273) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div> </td> </tr> <tr> <td>Weekly</td> <td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </div>

Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre>"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> <p> Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p>								

Name	In	Description
		Use the <code>GET /JobTypes/Custom</code> method (see GET Custom Job Types on page 1273) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.

 **Tip:** The built-in Fetch Logs job does not have any optional job fields.

Table 388: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.
RequestTimestmap	The date, in UTC, when the custom job was submitted.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.5 POST Orchestrator Jobs Reschedule

The `POST /OrchestratorJobs/Reschedule` method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- **Certificate Store Inventory**
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 1190](#)).
- **Custom Jobs scheduled to run Immediately or Exactly Once**
A new custom job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 1417](#)).
- **Fetch Logs**
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 1417](#)).
- **SSL Discovery and Monitoring**
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1854](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator**
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 1038](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Tip: Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 389: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 1408) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Job History Search Feature on page 468</i> section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for uncheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 1190](#)).
- SSH Synchronization
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1735](#)).

- SSL Discovery and Monitoring
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1854](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 1038](#)).

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 586](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 390: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p>Required*. An array of GUIDs indicating the job IDs of the jobs that should be unscheduled.</p> <p>Use the GET /OrchestratorJobs/ScheduledJobs method (see GET Orchestrator Jobs Scheduled Jobs on page 1413) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to unschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Orchestrator Scheduled Job Search Feature on page 464 section.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.7 POST Orchestrator Jobs Acknowledge

The POST /OrchestratorJobs/Acknowledge method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for

acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see [Application Settings: Agents Tab on page 560](#) in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Table 391: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the <i>GET /OrchestratorJobs/JobHistory</i> method (see GET Orchestrator Jobs Job History on page 1408) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgement:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Job History Search Feature on page 468</i> section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.19.8 POST Orchestrator Jobs Custom Bulk

The *POST /OrchestratorJobs/Custom/Bulk* method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
AgentManagement: *Modify*

Tip: Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 1408](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 1407](#)) to retrieve the data.

Table 392: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description												
OrchestratorIds	Body	<p>Required. A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 717) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 717) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>												
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1273) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>													
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.									
Name	Description													
Minutes	An integer indicating the number of minutes between each interval.													

Name	In	Description						
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"Interval": { "Minutes": 60 }</pre>		
Name	Description							
	<pre>"Interval": { "Minutes": 60 }</pre>							
	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. Name	Description							
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).							

Name	In	Description
		<p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre data-bbox="496 617 1409 779"> "JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" } </pre> <p> Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST <code>/OrchestratorJobs/Custom</code> request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the <code>GET /JobTypes/Custom</code> method (see GET Custom Job Types on page 1273) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> Tip: The built-in Fetch Logs job does not have any optional job fields.</p>

Table 393: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
OrchestratorJobPairs	<p>An array containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>JobId</td> <td>A string indicating the Keyfactor Command reference GUID for the job.</td> </tr> <tr> <td>OrchestratorId</td> <td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td> </tr> </tbody> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobTypeName	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.						
RequestTimestmap	The date, in UTC, when the custom job was submitted.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20 PAM Providers

Privileged Access Management (PAM) functionality in Keyfactor Web APIs allows for configuration of third party PAM providers to secure certificate stores. In the current release, both CyberArk and Delinea (formerly Thycotic) are supported. The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM Providers.

Table 394: PamProviders Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes a PAM provider.	DELETE PAM Providers ID on the next page
/id	GET	Returns information for the specified PAM provider.	GET PAM Providers ID on the next page
/Types	GET	Returns a list of all available PAM provider types.	GET PAM Providers Types on page 1441

Endpoint	Method	Description	Link
/Types	POST	Creates a new PAM provider type.	POST PAM Providers Types on page 1444
/	GET	Returns a list of all the configured PAM providers.	GET PAM Providers on page 1447
/	POST	Creates a new PAM provider.	POST PAM Providers on page 1456
/	PUT	Updates a PAM provider.	PUT PAM Providers on page 1472

3.2.20.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PrivilegedAccessManagement: *Modify*

Table 395: DELETE PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20.2 GET PAM Providers ID

The GET /PamProviders/{id} method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PrivilegedAccessManagement: *Read*
SystemSettings: *Read*

Table 396: GET PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see GET PAM Providers on page 1447) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 397: GET PamProviders {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider-TypeParams	<p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																
Name	A string indicating the name of the provider type.																
Provider-TypeParams	<p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.								
Value	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																
Name	A string indicating the internal name for the PAM provider type parameter.																
DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.

		Value	Description
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.

Provider-TypeParamValues	An array containing the values for the provider types specified by ProviderTypeParams. Provider type parameter values include:		
	Value	Description	
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	
	Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	
	InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.	
	InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.	
	Provider	An array containing information about the provider.

		Value	Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>		

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 PrivilegedAccessManagement: *Read*
 SystemSettings: *Read*

Table 398: GET PamProviders Types Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.
Name	A string containing the name of the PAM provider type.

Name	Description
ProviderTypeParams	An array containing parameters set for the PAM provider type.

Value	Description																		
Id	An integer indicating the ID of the type. Possible values are: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Private Ark Safe</td> </tr> <tr> <td>2</td> <td>PrivateArk Folder Name</td> </tr> <tr> <td>3</td> <td>PrivateArk Protected Password Name</td> </tr> <tr> <td>4</td> <td>Application ID</td> </tr> <tr> <td>5</td> <td>Secret Server Url</td> </tr> <tr> <td>6</td> <td>Rule Name</td> </tr> <tr> <td>7</td> <td>Thycotic Secret ID</td> </tr> <tr> <td>8</td> <td>Rule Key</td> </tr> </tbody> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key
Value	Description																		
1	Private Ark Safe																		
2	PrivateArk Folder Name																		
3	PrivateArk Protected Password Name																		
4	Application ID																		
5	Secret Server Url																		
6	Rule Name																		
7	Thycotic Secret ID																		
8	Rule Key																		

Name	A string indicating the internal name for the PAM provider type parameter.
------	--

DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
-------------	--

DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> 1 = String 2 = Secret
----------	--

InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).
---------------	---

 **Example:** For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:

- PrivateArk Safe: The name of the safe in CyberArk containing the certificate store password you wish to use.
- Application ID: The name of the application created in CyberArk for use with Keyfactor Command.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
PrivilegedAccessManagement: *Modify*
SystemSettings: *Read*

Table 399: POST PamProviders Types Input Parameters

Name	Description										
Name	A string containing the name of the PAM provider type.										
Parameters	<p>An array containing parameters for the provider type. Parameter details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the data type for the parameter. 3.2.20.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 PrivilegedAccessManagement: *Read*
 SystemSettings: *Read*

Table 400: GET PamProviders Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i>: Certificate Search Page on page 31. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Area</i> • <i>Name</i> • <i>ProviderType</i> • <i>SecuredAreald</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 401: GET PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. 		Value	Description
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.

Provider-TypeParamValues	An array containing the values for the provider types specified by ProviderTypeParams. Provider type parameter values include:		
	Value	Description	
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	
	Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	
	InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.	
	InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.	
	Provider	An array containing information about the provider.	

Name	Description	
Provider- TypeParams	Value	Description
		An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:
	Value	Description
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.
	Name	A string indicating the internal name for the PAM provider type parameter.
	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
	DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> • 1 = String • 2 = Secret
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.	
ProviderType	An array containing details for the provider type. Provider type parameters include:	

Name	Description										
	Value	Description									
		Value	Description								
			<table border="1"> <thead> <tr> <th data-bbox="906 247 1179 327">Value</th> <th data-bbox="1179 247 1430 327">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="906 327 1179 747">Id</td> <td data-bbox="1179 327 1430 747">The Keyfactor Command reference GUID for the PAM provider type parameter.</td> </tr> <tr> <td data-bbox="906 747 1179 978">Name</td> <td data-bbox="1179 747 1430 978">A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td data-bbox="906 978 1179 1444">ProviderTypeParams</td> <td data-bbox="1179 978 1430 1444">An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.</td> </tr> </tbody> </table>	Value	Description	Id	The Keyfactor Command reference GUID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
Value	Description										
Id	The Keyfactor Command reference GUID for the PAM provider type parameter.										
Name	A string indicating the internal name for the PAM provider type parameter.										
ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.										
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>										

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 CertificateStoreManagement: *Modify*
 PrivilegedAccessManagement: *Modify*
 SystemSettings: *Read*

Table 402: POST PamProviders Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	Body	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Value	Description									
Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.									
SecureAreald	Body	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>								

Table 403: POST PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.																		
ProviderType	An array containing details for the provider type. Provider type parameters include:																		

Name	Description		
	Value	Description	
		Value	Description
		Value	Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>		

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔗) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.20.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
 CertificateStoreManagement: *Modify*
 PrivilegedAccessManagement: *Modify*
 SystemSettings: *Read*

Warning: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 404: PUT PamProviders Input Parameters

Name	In	Description																
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	Body	Required. A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	Body	<p>An array containing details about the provider type for the provider.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td> </tr> <tr> <td>Name</td> <td>A string indicating the internal name for the PAM provider type parameter.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name for the PAM provider type parameter. Value	Description																						
	provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.																						
SecureAreald	Body	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>																					

Table 405: PUT PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider type.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the provider type.</td> </tr> <tr> <td>Provider-TypeParams</td> <td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. 	Value	Description	
		Value	Description
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.

Provider-TypeParamValues	An array containing the values for the provider types specified by ProviderTypeParams. Provider type parameter values include:		
	Value	Description	
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	
	Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	
	InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.	
	InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.	
	Provider	An array containing information about the provider.

ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
Value	Description										
Id	The Keyfactor Command reference GUID for the PAM provider type parameter.										
Name	A string indicating the internal name for the PAM provider type parameter.										
ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.										
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>										

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

3.2.21 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 406: Reports Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns the built-in report with the specified ID.	GET Reports ID on the next page
/Custom/id	DELETE	Deletes the custom report with the specified ID.	DELETE Reports Custom ID on page 1496
/Custom/id	GET	Returns the custom report with the specified ID.	GET Reports Custom ID on page 1497
/Schedules/id	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	DELETE Reports Schedules ID on page 1498
/Schedules/id	GET	Returns the schedule for the built-in report with the specified schedule ID.	GET Reports Schedules ID on page 1498
/id/Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	GET Reports ID Parameters on page 1502
/id/Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	PUT Reports ID Parameters on page 1503
/	GET	Returns all built-in reports with filtering and output options.	GET Reports on page 1505
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	PUT Reports on page 1508
/Custom	GET	Returns all custom reports with filtering and	GET Reports Custom on

Endpoint	Method	Description	Link
		output options.	page 1511
/Custom	POST	Creates a custom report.	POST Reports Custom on page 1513
/Custom	PUT	Updates the custom report with the specified ID.	PUT Reports Custom on page 1515
/id/Schedules	GET	Returns the schedule for the built-in report with the specified report ID.	GET Reports ID Schedules on page 1516
/id/Schedules	POST	Creates a schedule for the built-in report with the specified report ID.	POST Reports ID Schedules on page 1520
/id/Schedules	PUT	Updates a schedule for the built-in report with the specified report ID.	PUT Reports ID Schedules on page 1529

3.2.21.1 GET Reports ID

The GET /Reports/{id} method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

Tip: The following permissions (see [Security Overview on page 569](#)) are required to use this feature:
Reports: Read

Table 407: GET Reports {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report that should be retrieved. Use the <i>GET /Reports</i> method (see GET Reports on page 1505) to retrieve a list of your built-in reports to determine the report ID to use.

Table 408: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;">  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 1073). This corresponds to the Keyfactor </div>
