The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:																

Name	Description	
	Value	Description
	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	<p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>
	SampleSerialNumber	A string indicating the serial number of the CA.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.18.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 307: POST Monitoring Revocation Input Parameters

Name	In	Description								
Id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
EndpointType	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> <b>Important:</b> Because a "+" (plus sign) in a URL can represent either a space or a "+" Keyfactor Command has chosen to read "+" as a space. For CRL URLs that require a "+" (plus sign), rather than a space, replace plus signs in your CRL's URL with "%2B". Only replace the plus signs you don't wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	Body	<p><b>Required*</b>. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	<p><b>Required.</b> An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td><b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard</td></tr></table>	Value	Description	Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard				
Value	Description									
Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard									

Name	In	Description													
		<b>Value</b>	<b>Description</b>												
			(true) or not (false). The default is false.												
		WarningHours	<b>Required</b> *. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  WarningHours is <b>required</b> if Show is set to true and EndpointType is CRL.  WarningHours is not supported for EndpointType OCSP.  If the Days or Weeks value is selected in the Management Portal, it will be converted to hours when stored in the database.												
Schedule	Body	An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour:<pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>		Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description														
Off	Turn off a previously configured schedule.														
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.										
Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:														

Name	In	Description								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre></td></tr></table> <div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>	Name	Description		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description									
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
OCSPParameters	Body	<p><b>Required*</b>. for OCSF endpoints. For OCSF endpoints only, an array indicating the OCSF endpoint configuration. OCSF endpoint details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>CertificateContents</td><td>A string indicating the certificate contents.</td></tr><tr><td>CertificateAuthorityId</td><td>An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a>) to retrieve a list of all the CAs to determine the ID.</td></tr></table>	Value	Description	CertificateContents	A string indicating the certificate contents.	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a> ) to retrieve a list of all the CAs to determine the ID.		
Value	Description									
CertificateContents	A string indicating the certificate contents.									
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a> ) to retrieve a list of all the CAs to determine the ID.									

Table 308: POST Monitoring Revocation Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								
Schedule	An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:								

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:																

Name	Description	
	Value	Description
	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.18.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 309: PUT Monitoring Revocation {id}Input Parameters

Name	In	Description								
Id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	<b>Required.</b> A string indicating the name of the revocation monitoring location.								
EndpointType	Body	<b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> <b>Important:</b> Because a "+" (plus sign) in a URL can represent either a space or a "+" Keyfactor Command has chosen to read "+" as a space. For CRL URLs that require a "+" (plus sign), rather than a space, replace plus signs in your CRL's URL with "%2B". Only replace the plus signs you don't wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	Body	<p><b>Required*</b>. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	<p><b>Required.</b> An array indicating the configuration for display on the dashboard. Value	Description									
Show	<b>Required.</b> A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard									

Name	In	Description													
		<b>Value</b>	<b>Description</b>												
			(true) or not (false). The default is false.												
		WarningHours	<b>Required</b> *. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  WarningHours is <b>required</b> if Show is set to true and EndpointType is CRL.  WarningHours is not supported for EndpointType OCSP.  If the Days or Weeks value is selected in the Management Portal, it will be converted to hours when stored in the database.												
Schedule	Body	An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour:<pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>		Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description														
Off	Turn off a previously configured schedule.														
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> For example, every hour: <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.										
Name	Description														
Minutes	An integer indicating the number of minutes between each interval.														
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:														

Name	In	Description								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre></td></tr></table> <div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>	Name	Description		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description									
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {  "Time": "2022-02-25T23:30:00Z"}</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
OCSPParameters	Body	<p><b>Required*</b>. for OCSF endpoints. For OCSF endpoints only, an array indicating the OCSF endpoint configuration. OCSF endpoint details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>CertificateContents</td><td>A string indicating the certificate contents.</td></tr><tr><td>CertificateAuthorityId</td><td>An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a>) to retrieve a list of all the CAs to determine the ID.</td></tr></table>	Value	Description	CertificateContents	A string indicating the certificate contents.	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a> ) to retrieve a list of all the CAs to determine the ID.		
Value	Description									
CertificateContents	A string indicating the certificate contents.									
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a> ) to retrieve a list of all the CAs to determine the ID.									

Table 310: PUT Monitoring Revocation {id} Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you're monitoring LDAP locations but applications are using an HTTP location, you're not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority's CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is <b>required</b> if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>								
Schedule	An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:								

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
OCSPParameters	For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:																

Name	Description	
	Value	Description
	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>
	AuthorityName	A string indicating the distinguished name of the CA. For example: CN=CorpIssuingCA1, DC=keyexample, DC=com
	AuthorityNameId	A base 64 encoded SHA1 hash of the <i>AuthorityName</i> .
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.18.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 311: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	<b>Required*</b> . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve.  One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	<b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the CA in the database.  Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 291</a> ) to retrieve a list of all the CAs to determine the ID.  One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 312: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.18.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 313: POST Monitoring Revocation Test Input Parameters

Name	In	Description								
revocationMonitoringAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AlertId</td><td><b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.</td></tr><tr><td>EvaluationDate</td><td><b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</td></tr><tr><td>SendAlerts</td><td>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>{  "EvaluationDate": "2022-08-31T20:51:33.528Z"  "SendAlerts": true}</pre>	Name	Description	AlertId	<b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.	EvaluationDate	<b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .
Name	Description									
AlertId	<b>Required.</b> An integer indicating the reference ID of revocation monitoring alert to test.									
EvaluationDate	<b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.  You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.									
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .									

Table 314: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.18.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 315: POST Monitoring Revocation Test All Input Parameters

Name	In	Description						
revocationMonitoringAlertTestRequest	Body	<p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>EvaluationDate</td><td><p><b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.</p><p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p></td></tr></table> <p>For example:</p> <pre>{  "EvaluationDate": "2022-08-31T20:51:33.528Z"  "SendAlerts": true}</pre>	Name	Description	EvaluationDate	<p><b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>	SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>
Name	Description							
EvaluationDate	<p><b>Required.</b> A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>							
SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>							

Table 316: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.19 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 317: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	<a href="#">GET Orchestrator Jobs Job Status Data on the next page</a>
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Job History on page 699</a>
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	<a href="#">GET Orchestrator Jobs Scheduled Jobs on page 704</a>
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Custom on page 708</a>
/Reschedule	POST	Reschedules a failed orchestrator job.	<a href="#">POST Orchestrator Jobs Reschedule on page 712</a>

Endpoint	Method	Description	Link
/Unschedule	POST	Unschedules an active orchestrator job.	<a href="#">POST Orchestrator Jobs Unschedule on page 714</a>
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	<a href="#">POST Orchestrator Jobs Acknowledge on page 715</a>
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	<a href="#">POST Orchestrator Jobs Reschedule on page 712</a>

### 2.2.19.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

**Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

**Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:  
2021-08-05 10:47:23.1940  
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response status code does not indicate success: 413 (Request Entity Too Large).  
  
at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /\_src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172  
  
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri, Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\work\24\s\src\OrchestratorServices\HttpService.cs:line 38

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See *Fetch Logs* in the *Keyfactor Command Reference Guide* for more information.

Table 318: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	<b>Required.</b> The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see <a href="#">GET Orchestrator Jobs Job History below</a> ) to retrieve a list of jobs to determine the job's history ID.

Table 319: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.19.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 320: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 12</a> to find the ID)</li> <li>• <i>Agent</i> (ClientMachine)</li> <li>• <i>JobId</i></li> <li>• <i>Result</i> (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)</li> <li>• <i>Status</i> (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>Message</i></li> <li>• <i>OperationStart</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once) )</li> <li>• <i>TargetPath</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 321: GET Orchestrator Jobs Job History Response Data

Name	Description																
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.																
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.																
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.																
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time</td></tr> </table> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time
Name	Description																
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time												
Name	Description																
Time	The date and time to next run the job. The date and time																

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description		<p>should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.	ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Day	The number of the day, in the month, to run the job.																
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
JobType	A string indicating the job type (e.g. IISInventory).																
OperationStart	The time, in UTC, at which the orchestrator job started.																
OperationEnd	The time, in UTC, at which the orchestrator job finished.																
Message	A string providing the error message for the operation, if any.																
Result	<p>A string indicating the result of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>Unknown</li> </ul>																

Name	Description
	<ul style="list-style-type: none"> <li>• Success</li> <li>• Warning</li> <li>• Failure</li> </ul>
Status	<p>A string indicating the status of the orchestrator job. Possible values are:</p> <ul style="list-style-type: none"> <li>• Unknown</li> <li>• Waiting</li> <li>• In Process</li> <li>• Completed</li> <li>• Acknowledged</li> <li>• Completed Will Retry</li> </ul>
StorePath	<p>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
ClientMachine	<p>A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.19.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 322: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 12</a> to find the ID)</li> <li>• <i>Agent Machine</i> (ClientMachine)</li> <li>• <i>AgentPlatform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>AgentType</i> *Use -contains comparison (Capabilities in <a href="#">GET Agents on page 12</a>)</li> <li>• <i>Requested</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once) )</li> <li>• <i>TargetPath</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 323: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.19.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 699](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 698](#)) to retrieve the data.

Table 324: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description												
AgentId	Body	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>												
JobTypeName	Body	<p><b>Required.</b> A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 564</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>

Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"JobFields": {   "Favorite Type of Pet": "Rat",   "Mother's Birthday": "1952-05-21" }</pre> <div> <b>Note:</b> If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</div>								

Name	In	Description
		Use the <code>GET /JobTypes/Custom</code> method (see <a href="#">GET Custom Job Types on page 564</a> ) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.
		 <b>Tip:</b> The built-in Fetch Logs job does not have any optional job fields.

Table 325: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.
RequestTimestmap	The date, in UTC, when the custom job was submitted.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.19.5 POST Orchestrator Jobs Reschedule

The `POST /OrchestratorJobs/Reschedule` method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- **Certificate Store Inventory**  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 481](#)).
- **Custom Jobs scheduled to run Immediately or Exactly Once**  
A new custom job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 708](#)).
- **Fetch Logs**  
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 708](#)).
- **SSL Discovery and Monitoring**  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1145](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator**  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 329](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

AgentManagement: *Modify*

CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Tip:** Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 326: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p><b>Required</b>*. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the <a href="#">GET /OrchestratorJobs/JobHistory</a> method (see <a href="#">GET Orchestrator Jobs Job History on page 699</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>
Query	Body	<p><b>Required</b>*. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Job History Search Feature</i> section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.19.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 481](#)).
- SSH Synchronization  
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1026](#)).

- SSL Discovery and Monitoring  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1145](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 329](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

AgentManagement: *Modify*

CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 327: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p><b>Required</b>*. An array of GUIDs indicating the job IDs of the jobs that should be unscheduled.</p> <p>Use the <a href="#">GET /OrchestratorJobs/ScheduledJobs</a> method (see <a href="#">GET Orchestrator Jobs Scheduled Jobs on page 704</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>
Query	Body	<p><b>Required</b>*. A string containing a query to identify the jobs to unschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Orchestrator Scheduled Job Search Feature</a> section.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.19.7 POST Orchestrator Jobs Acknowledge

The POST /OrchestratorJobs/Acknowledge method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for

acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see [Application Settings: Agents Tab](#) in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 328: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<b>Required*</b> . An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.  Use the <i>GET /OrchestratorJobs/JobHistory</i> method (see <a href="#">GET Orchestrator Jobs Job History on page 699</a> ) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgement:  <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b> , but not both.
Query	Body	<b>Required*</b> . A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide Job History Search Feature</i> section.  Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b> , but not both.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.19.8 POST Orchestrator Jobs Custom Bulk

The POST */OrchestratorJobs/Custom/Bulk* method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 699](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 698](#)) to retrieve the data.

Table 329: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description												
Orches- tratorIds	Body	<p><b>Required.</b> A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 12</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>												
JobTypeName	Body	<p><b>Required.</b> A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 564</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Name	Description																					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																					

Name	In	Description
		<div>  <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <div> <pre>"JobFields": {   "Favorite Type of Pet": "Rat",   "Mother's Birthday": "1952-05-21" }</pre> </div> <div>  <b>Note:</b> If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value. </div> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 564</a>) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <div>  <b>Tip:</b> The built-in Fetch Logs job does not have any optional job fields. </div>

Table 330: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
OrchestratorJobPairs	<p>An array containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>JobId</td><td>A string indicating the Keyfactor Command reference GUID for the job.</td></tr> <tr> <td>OrchestratorId</td><td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td></tr> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobTypeName	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.						
RequestTimestmap	The date, in UTC, when the custom job was submitted.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.20 PAM Providers

Privileged Access Management (PAM) functionality in Keyfactor Web APIs allows for configuration of third party PAM providers to secure certificate stores. In the current release, both CyberArk and Delinea (formerly Thycotic) are supported. The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM Providers.

Table 331: PamProviders Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes a PAM provider.	<a href="#">DELETE PAM Providers ID on the next page</a>
/id	GET	Returns information for the specified PAM provider.	<a href="#">GET PAM Providers ID on the next page</a>
/Types	GET	Returns a list of all available PAM provider types.	<a href="#">GET PAM Providers Types on page 732</a>

Endpoint	Method	Description	Link
/Types	POST	Creates a new PAM provider type.	<a href="#">POST PAM Providers Types on page 735</a>
/	GET	Returns a list of all the configured PAM providers.	<a href="#">GET PAM Providers on page 738</a>
/	POST	Creates a new PAM provider.	<a href="#">POST PAM Providers on page 747</a>
/	PUT	Updates a PAM provider.	<a href="#">PUT PAM Providers on page 763</a>

### 2.2.20.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Modify*

Table 332: DELETE PamProviders {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 738</a> ) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.20.2 GET PAM Providers ID

The GET /PamProviders/{id} method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 333: GET PamProviders {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the PAM provider to retrieve.</p> <p>Use the <i>GET /PAM/Providers</i> method (see <a href="#">GET PAM Providers on page 738</a>) to retrieve a list of all the PAM providers to determine the provider's ID.</p>

Table 334: GET PamProviders {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> </table> </td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider-TypeParams	<p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
Value	Description																
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																
Name	A string indicating the name of the provider type.																
Provider-TypeParams	<p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.								
Value	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																
Name	A string indicating the internal name for the PAM provider type parameter.																
DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.																

Name	Description		
	Value	Description	
		Value	Description
		DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>• 1 = String</li> <li>• 2 = Secret</li> </ul>
		InstanceLevel	<p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).</p> <div>  <p><b>Example:</b> For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:</p> <ul style="list-style-type: none"> <li>• PrivateArk Safe: The name of the safe in CyberArk containing the certificate store password you wish to use.</li> <li>• Application ID: The name of the application created in CyberArk for use with Keyfactor Command.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> <pre>{   "Id": 1,   "Name": "Safe",   "DisplayName": "PrivateArk Safe",   "DataType": 1,   "InstanceLevel": false,</pre> </div>

Name	Description		
	Value	Description	
		Value	Description
			<div><pre>"ProviderType": null }, {   "Id": 4,   "Name": "AppId",   "DisplayName": "Application ID",   "DataType": 1,   "InstanceLevel": false,   "ProviderType": null }</pre></div> <p>When you configure a certificate store to use CyberArk as a credential provider, you enter the name of the folder in the CyberArk safe where the protected object is stored and you enter the name of the projected object in the CyberArk safe containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <div><pre>{   "Id": 2,   "Name": "Folder",   "DisplayName": "PrivateArk Folder Name",   "DataType": 1,   "InstanceLevel": true,   "ProviderType": null }, {   "Id": 3,   "Name": "Object",</pre></div>

Value	Description																		
Id	The Keyfactor Command reference GUID for the PAM provider type parameter.																		
Name	A string indicating the internal name for the PAM provider type parameter.																		
ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.																		
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>																		

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.20.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 335: GET PamProviders Types Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.
Name	A string containing the name of the PAM provider type.

Name	Description
ProviderTypeParams	An array containing parameters set for the PAM provider type.

Value	Description																		
Id	An integer indicating the ID of the type. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Private Ark Safe</td></tr> <tr> <td>2</td><td>PrivateArk Folder Name</td></tr> <tr> <td>3</td><td>PrivateArk Protected Password Name</td></tr> <tr> <td>4</td><td>Application ID</td></tr> <tr> <td>5</td><td>Secret Server Url</td></tr> <tr> <td>6</td><td>Rule Name</td></tr> <tr> <td>7</td><td>Thycotic Secret ID</td></tr> <tr> <td>8</td><td>Rule Key</td></tr> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key
Value	Description																		
1	Private Ark Safe																		
2	PrivateArk Folder Name																		
3	PrivateArk Protected Password Name																		
4	Application ID																		
5	Secret Server Url																		
6	Rule Name																		
7	Thycotic Secret ID																		
8	Rule Key																		

Name	A string indicating the internal name for the PAM provider type parameter.
------	--

DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
-------------	--

DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul>
----------	--

InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).
---------------	---

**Example:** For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:

- PrivateArk Safe: The name of the safe in

CyberArk containing the certificate store password you wish to use.

- Application ID: The name of the application created in CyberArk for use with Keyfactor Command.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.20.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Modify*  
SystemSettings: *Read*

Table 336: POST PamProviders Types Input Parameters

Name	Description										
Name	A string containing the name of the PAM provider type.										
Parameters	<p>An array containing parameters for the provider type. Parameter details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> <tr> <td>DataType</td><td> <p>An integer indicating the data type for the parameter. 	Value	Description
		 <pre>Protected Password Name",   "DataType": 1,   "InstanceLevel": true   "ProviderType": null }</pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in CyberArk where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.20.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 337: GET PamProviders Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Area</i></li> <li>• <i>Name</i></li> <li>• <i>ProviderType</i></li> <li>• <i>SecuredAreald</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 338: GET PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. ProviderType	An array containing details for the provider type. Provider type parameters include:																		

Name	Description		
	Value	Description	
		Value	Description
			Value
			Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>		

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.20.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

- CertificateStoreManagement: *Modify*
- PrivilegedAccessManagement: *Modify*
- SystemSettings: *Read*

Table 339: POST PamProviders Input Parameters

Name	In	Description																
Name	Body	<b>Required.</b> A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	Body	<div>An array containing details about the provider type for the provider. Provider type details include:<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr></tbody></table></div></td></tr></tbody></table></div>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type.	Provider-TypeParams	<div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr></tbody></table></div>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayNam-e	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
Value	Description																	
Id	A string indicating the Keyfactor Command reference GUID for the provider type.																	
Name	A string indicating the name of the provider type.																	
Provider-TypeParams	<div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr></tbody></table></div>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayNam-e	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.									
Value	Description																	
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.																	
Name	A string indicating the internal name for the PAM provider type parameter.																	
DisplayNam-e	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.

ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.																								
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>																								

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.20.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 CertificateStoreManagement: *Modify*  
 PrivilegedAccessManagement: *Modify*  
 SystemSettings: *Read*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 341: PUT PamProviders Input Parameters

Name	In	Description																
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	Body	<b>Required.</b> A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	Body	<div>An array containing details about the provider type for the provider.</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.</div><table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. Provider type parameters include:</td></tr></table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.	Name	A string indicating the internal name for the PAM provider type parameter.	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"><li>1 = String</li><li>2 = Secret</li></ul>	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.	ProviderType	An array containing details for the provider type. Provider type parameters include:
	Value	Description														
	Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.														
	Name	A string indicating the internal name for the PAM provider type parameter.														
	DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.														
	DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"><li>1 = String</li><li>2 = Secret</li></ul>														
	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.														
ProviderType	An array containing details for the provider type. Provider type parameters include:															

Name	Description		
	Value	Description	
		Value	Description
			Value
			Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		ProviderTypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting pass-</p>		

Name	Description
	words for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 343: Reports Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns the built-in report with the specified ID.	<a href="#">GET Reports ID on the next page</a>
/Custom/{id}	DELETE	Deletes the custom report with the specified ID.	<a href="#">DELETE Reports Custom ID on page 787</a>
/Custom/{id}	GET	Returns the custom report with the specified ID.	<a href="#">GET Reports Custom ID on page 788</a>
/Schedules/{id}	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	<a href="#">DELETE Reports Schedules ID on page 789</a>
/Schedules/{id}	GET	Returns the schedule for the built-in report with the specified schedule ID.	<a href="#">GET Reports Schedules ID on page 789</a>
/id}/Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	<a href="#">GET Reports ID Parameters on page 793</a>
/id}/Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	<a href="#">PUT Reports ID Parameters on page 794</a>
/	GET	Returns all built-in reports with filtering and output options.	<a href="#">GET Reports on page 796</a>
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	<a href="#">PUT Reports on page 799</a>
/Custom	GET	Returns all custom reports with filtering and	<a href="#">GET Reports Custom on</a>

Endpoint	Method	Description	Link
		output options.	<a href="#">page 802</a>
/Custom	POST	Creates a custom report.	<a href="#">POST Reports Custom on page 804</a>
/Custom	PUT	Updates the custom report with the specified ID.	<a href="#">PUT Reports Custom on page 806</a>
/ {id} /Schedules	GET	Returns the schedule for the built-in report with the specified report ID.	<a href="#">GET Reports ID Schedules on page 807</a>
/ {id} /Schedules	POST	Creates a schedule for the built-in report with the specified report ID.	<a href="#">POST Reports ID Schedules on page 811</a>
/ {id} /Schedules	PUT	Updates a schedule for the built-in report with the specified report ID.	<a href="#">PUT Reports ID Schedules on page 820</a>

### 2.2.21.1 GET Reports ID

The GET /Reports/{id} method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: Read

Table 344: GET Reports {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer containing the Keyfactor Command reference ID for the report that should be retrieved.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 345: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 364</a>). This corresponds to the Keyfactor </div>

Name	Description														
	 Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.														
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).														
ReportParameter	<p>An array containing the parameters for the report. . Report parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the report <b>parameter</b>.</td></tr> <tr> <td>ParameterName</td><td>A string containing the short reference name for the report parameter (e.g. EvalDate).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul> </td></tr> <tr> <td>DisplayName</td><td>A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).</td></tr> <tr> <td>Description</td><td>A string containing the description for the parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value for the parameter.</td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report <b>parameter</b> .	ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).	ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>	DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).	Description	A string containing the description for the parameter.	DefaultValue	A string containing the default value for the parameter.
Name	Description														
Id	The Keyfactor Command reference ID of the report <b>parameter</b> .														
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).														
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>														
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).														
Description	A string containing the description for the parameter.														
DefaultValue	A string containing the default value for the parameter.														

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </td></tr> <tr> <td>DisplayOrder</td><td>An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.</td></tr> <tr> <td>ParameterVisibility</td><td>A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i>. The alternative setting is <i>Hidden</i>.</td></tr> </table>	Name	Description		 <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.	DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.	ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .										
Name	Description																		
	 <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.																		
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.																		
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .																		
Schedules	<p>An array containing the configured schedules for running the report, if any. Schedules include the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the report <b>schedule</b>.</td></tr> <tr> <td>SendReport</td><td>A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).</td></tr> <tr> <td>SaveReport</td><td>A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).</td></tr> <tr> <td>SaveReportPath</td><td>A string containing the UNC path to which the report will be written, if configured.</td></tr> <tr> <td>ReportFormat</td><td> <p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul> </td></tr> <tr> <td>KeyfactorSchedule</td><td> <p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table> </td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report <b>schedule</b> .	SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).	SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).	SaveReportPath	A string containing the UNC path to which the report will be written, if configured.	ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>	KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	The Keyfactor Command reference ID of the report <b>schedule</b> .																		
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).																		
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).																		
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.																		
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>																		
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td> <p>The date and time to next run the job. Day	<p>The number of the day, in the month, to run the job.</p>																
EmailRecipients	<p>An array containing the email addresses of users configured as recipients of the scheduled report, if any.</p>																

Name	Description																								
RuntimeParameters	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</td><td></td></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr> <tr> <td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr> <tr> <td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr> <tr> <td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr> <tr> <td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr> <tr> <td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr> <tr> <td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> </table>	Name	Description	Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:		CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.
Name	Description																								
Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:																									
CertAuth	The certificate authority or authorities selected to report on.																								
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																								
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																								
Metadata	The custom metadata fields selected to include in the report.																								
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																								
OrchestratorPool	The orchestrator pool selected to report on.																								
PeriodCount	The number of days, weeks or months selected to report on.																								
PeriodSize	The selected reporting period (day, weeks or months).																								
Requesters	The certificate requesters selected to include in the report.																								
SSHKeyType	The SSH key type(s) selected to report on.																								

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.										
AcceptedScheduleFormats	An array containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.21.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 346: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link to be deleted.</p> <p>Use the <i>GET /Reports/Custom</i> method (see <a href="#">GET Reports Custom on page 802</a>) to retrieve a list of your custom report links to determine the report ID to use.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.21.3 GET Reports Custom ID

The GET /Reports/Custom/{id} method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 347: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link that should be retrieved.

Table 348: GET Reports Custom {id} Response Data

Name	Description
CustomURL	A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).   <b>Tip:</b> Custom reports are automatically opened in a new browser tab.
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 349: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a> ) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 780</a> ) to retrieve the details for that report to determine the schedule ID to use.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.5 GET Reports Schedules ID

The GET /Reports/Schedules/{id} method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 807](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 350: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a> ) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 780</a> ) to retrieve the details for that report to determine the schedule ID to use.

Table 351: GET Reports Schedules {id} Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report <b>schedule</b> .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										

Name	Description																										
	<div>  functionality—are valid for this endpoint. </div>																										
EmailRecipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																										
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr> <tr> <td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr> <tr> <td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr> <tr> <td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr> <tr> <td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr> <tr> <td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr> <tr> <td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 352: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the parameter is associated with.  Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a> ) to retrieve a list of your built-in reports to determine the report ID to use.

Table 353: GET Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report <b>parameter</b> .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	A string containing the type of the parameter. Possible values include: <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	A string containing the default value for the parameter. <div>  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 354: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the parameter is associated with. Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on the next page</a> ) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	<b>Required.</b> The Keyfactor Command reference ID of the report <b>parameter</b> . Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 780</a> ) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter. <div> <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.</div>

Table 355: PUT Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report <b>parameter</b> .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul>
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	<p>A string containing the default value for the parameter.</p> <div>  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 780](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: Read

Table 356: GET Reports Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Categories</i> (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability, SSHKeys)</li> <li>• <i>Custom</i></li> <li>• <i>Favorite</i> (true, false)</li> <li>• <i>InNavigator</i> (true, false)</li> <li>• <i>Scheduled</i> (Number of schedules)</li> </ul> <div>  <p><b>Tip:</b> This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category: Categories -contains "PKIOperations"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 357: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. </div>

Name	Description
	 Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 364</a> ). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 811](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 820](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 794](#)). This method returns HTTP 200 OK on a success with the details of the report.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 358: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p><b>Required.</b> The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <p><b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 364</a>). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 359: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> </div>

Name	Description
	 parameter (see <a href="#">POST Certificate Collections on page 364</a> ). This corresponds to the Keyfactor Command Management Portal "Ignore renewed certificate results by" option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: Read

Table 360: GET Reports Custom Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Categories</i> (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability, SSHKeys)</li> <li>• <i>Custom</i></li> <li>• <i>Favorite</i> (true, false)</li> <li>• <i>InNavigator</i> (true, false)</li> <li>• <i>Scheduled</i> (Number of schedules)</li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 361: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 362: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p><b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
DisplayName	Body	<b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 363: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.21.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 364: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).   <b>Tip:</b> Custom reports are automatically opened in a new browser tab.
Id	Body	<b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link. Use the <a href="#">GET /Reports/Custom</a> method (see <a href="#">GET Reports Custom on page 802</a> ) to retrieve a list of your custom report links to determine the report ID to use.
DisplayName	Body	<b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 365: PUT Reports Custom Response Data

Name	Description
CustomURL	A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://mywebserver.keyexample.com/mycustomreport/).   <b>Tip:</b> Custom reports are automatically opened in a new browser tab.
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.21.13 GET Reports ID Schedules

The GET /Reports/{id}/Schedules method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the GET /Reports/Schedules/{id} method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 789](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: Read

Table 366: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.  Use the GET /Reports method (see <a href="#">GET Reports on page 796</a> ) to retrieve a list of your built-in reports to determine the report ID to use.

Table 367: GET Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report <b>schedule</b> .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																										
CertAuth	The certificate authority or authorities selected to report on.																										
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																										
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
Metadata	The custom metadata fields selected to include in the report.																										
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																										
OrchestratorPool	The orchestrator pool selected to report on.																										
PeriodCount	The number of days, weeks or months selected to report on.																										
PeriodSize	The selected reporting period (day, weeks or months).																										
Requesters	The certificate requesters selected to include in the report.																										
SSHKeyType	The SSH key type(s) selected to report on.																										
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																										
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.2.21.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 368: POST Reports {id} Schedules Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>						
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .						
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .						
SaveReportPath	Body	<p><b>Required</b>*. A string containing the UNC path to which the report will be written, if configured.</p> <div> <b>Note:</b> The path for saved reports must be provided in UNC format (\\server-name\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</div> <ul style="list-style-type: none"><li>• Do not use a trailing "\" in the report path.</li><li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li><li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li></ul> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p>						
ReportFormat	Body	<p><b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"><li>• PDF</li><li>• Excel</li><li>• CSV</li></ul>						
KeyfactorSchedule	Body	<p><b>Required.</b> An array providing the schedule for the report. The schedule can be one of:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description																									
CertAuth	The certificate authority or authorities selected to report on.																									
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																									
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																									
Metadata	The custom metadata fields selected to include in the report.																									
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																									
OrchestratorPool	The orchestrator pool selected to report on.																									
PeriodCount	The number of days, weeks or months selected to report on.																									
PeriodSize	The selected reporting period (day, weeks or months).																									
Requesters	The certificate requesters selected to include in the report.																									
SSHKeyType	The SSH key type(s) selected to report on.																									
StartDate	The start date selected for the reporting period to report on.																									

Name	In	Description

Name	Description							
	This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).							
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.							

Table 369: POST Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report <b>schedule</b> .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.21.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 370: PUT Reports {id} Schedules Input Parameters

Name	In	Description				
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 796</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>				
Id	Body	<p><b>Required.</b> The Keyfactor Command reference ID of the report <b>schedule</b>.</p> <p>Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 780</a>) to retrieve the details for the desired report to determine the schedule ID to use.</p>				
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .				
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .				
SaveReportPath	Body	<p><b>Required*</b>. A string containing the UNC path to which the report will be written, if configured.</p> <div> <b>Note:</b> The path for saved reports must be provided in UNC format (\\server-name\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</div> <ul style="list-style-type: none"><li>• Do not use a trailing "\" in the report path.</li><li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li><li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li></ul> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p>				
ReportFormat	Body	<p><b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"><li>• PDF</li><li>• Excel</li><li>• CSV</li></ul>				
KeyfactorSchedule	Body	<p><b>Required.</b> An array providing the schedule for the report.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description					
Off	Turn off a previously configured schedule.

## 2.2.22 Security Identities

The Security Identities component of the Keyfactor API includes methods necessary to list, add, and delete security identities. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 372: Security Identities Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the security identity with the specified ID.	<a href="#">DELETE Security Identities ID below</a>
/id}	GET	Returns permission details for the security identity with the specified ID.	<a href="#">GET Security Identities ID on the next page</a>
/Lookup	GET	Validates that the identity with the specified name exists.	<a href="#">GET Security Identities Lookup on page 833</a>
/	GET	Returns all security identities with filtering and output options.	<a href="#">GET Security Identities on page 834</a>
/	POST	Adds a new security identity into Keyfactor Command.	<a href="#">POST Security Identities on page 853</a>

### 2.2.22.1 DELETE Security Identities ID

The DELETE `/Security/Identities/{id}` method is used to delete the security identity with the specified ID from Keyfactor Command. Use the `GET /Security/Identities` method (see [GET Security Identities on page 834](#)) to determine the ID of the security identity you wish to delete. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 373: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the security identity that should be deleted from Keyfactor Command.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.22.2 GET Security Identities ID

The GET /Security/Identities/{id} method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 374: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security identity to retrieve.  Use the GET /Security/Identities method (see <a href="#">GET Security Identities on page 834</a> ) to retrieve a list of all the security identities to determine the identity's ID.

Table 375: GET Security Identities {id} Response Data

Name	Description						
Identity	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						
SecuredAreaPermissions	<p>An object containing a series of arrays with information about the global permissions granted to the security identity. Global permission information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Permission</td><td>A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td></tr><tr><td>GrantedByRoles</td><td>An object containing a list of roles that grant that permission.</td></tr></table> <p>For example:</p> <pre>"SecuredAreaPermissions": [   {     "Permission": "AdminPortal:Read",     "GrantedByRoles": [       "Read Only",       "Staff"     ]   },   {     "Permission": "Reports:Read",     "GrantedByRoles": [       "Read Only"     ]   }, ]</pre> <p>For more information about global permissions, see the <a href="#">Security Roles and Identities</a> page in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
CollectionPermissions	<p>An object containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Permission</td><td>A string indicating the permission granted. In the case of</td></tr></table>	Name	Description	Permission	A string indicating the permission granted. In the case of		
Name	Description						
Permission	A string indicating the permission granted. In the case of						

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>collection permissions, this is the name of the certificate collection followed by the level of permission granted.</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre> "CollectionPermissions": [   {     "Permission": "Issued in the Last Week:Certificates_Read",     "GrantedByRoles": [       "Staff",       "Power Users"     ]   },   {     "Permission": "Web Server Certs:Certificates_EditMetadata",     "GrantedByRoles": [       "Power Users"     ]   }, ] </pre> <p>For more information about collection permissions, see the <a href="#">Certificate Permissions</a> page in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description		collection permissions, this is the name of the certificate collection followed by the level of permission granted.	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
	collection permissions, this is the name of the certificate collection followed by the level of permission granted.						
GrantedByRoles	An array containing a list of roles that grant that permission.						
ContainerPermissions	<p>An object containing information about the global permissions granted to the security identity. Container permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre> "ContainerPermissions": [   {     "Permission": "IIS Personal:CertificateStoreManagement_Read", </pre>	Name	Description	Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						

Name	Description
	<pre>       "GrantedByRoles": [         "Power Users",         "Staff"       ],     },     {       "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_ Schedule",       "GrantedByRoles": [         "Power Users"       ],     },   ], </pre> <p>For more information about container permissions, see the <a href="#">Container Permissions</a> page in the <i>Keyfactor Command Reference Guide</i>.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.22.3 GET Security Identities Lookup

The GET /Security/Identities/Lookup method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using *POST /Security/Identities* (see [POST Security Identities on page 853](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 376: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	<b>Required.</b> The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 377: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.22.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 378: GET Security Identities Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> .
queryString		<i>Not used.</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 379: GET Security Identities Response Data

Name	Description																											
Id	An integer containing the Keyfactor Command reference ID for the security identity.																											
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\\user or group name. For example: KEYEXAMPLE\\PKI Administrators																											
IdentityType	A string indicating the type of identity—User or Group.																											
Roles	<div>An array containing information about the security roles assigned to the security identity. Role information includes:</div> <table><tr><th>Name</th><th>In</th><th>Description</th></tr><tr><td>Id</td><td>Body</td><td><b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see <a href="#">GET Security Roles on page 913</a>) to retrieve a list of all the security roles to determine the role's ID.</td></tr><tr><td>Name</td><td>Body</td><td><b>Required.</b> A string containing the short reference name for the security role.</td></tr><tr><td>Description</td><td>Body</td><td><b>Required.</b> A string containing the description for the security role.</td></tr><tr><td>Enabled</td><td>Body</td><td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.  This is considered deprecated and may be removed in a future release.</td></tr><tr><td>Immutable</td><td>Body</td><td>A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.</td></tr><tr><td>Valid</td><td>Body</td><td>A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.</td></tr><tr><td>Private</td><td>Body</td><td>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.  This is considered deprecated and may be removed in a future release.</td></tr><tr><td>Identities</td><td>Body</td><td>An array containing information about the security identities assigned to the security role. Identity details include:</td></tr></table>	Name	In	Description	Id	Body	<b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see <a href="#">GET Security Roles on page 913</a> ) to retrieve a list of all the security roles to determine the role's ID.	Name	Body	<b>Required.</b> A string containing the short reference name for the security role.	Description	Body	<b>Required.</b> A string containing the description for the security role.	Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .  This is considered deprecated and may be removed in a future release.	Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.	Valid	Body	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.	Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .  This is considered deprecated and may be removed in a future release.	Identities	Body	An array containing information about the security identities assigned to the security role. Identity details include:
Name	In	Description																										
Id	Body	<b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see <a href="#">GET Security Roles on page 913</a> ) to retrieve a list of all the security roles to determine the role's ID.																										
Name	Body	<b>Required.</b> A string containing the short reference name for the security role.																										
Description	Body	<b>Required.</b> A string containing the description for the security role.																										
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .  This is considered deprecated and may be removed in a future release.																										
Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.																										
Valid	Body	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.																										
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .  This is considered deprecated and may be removed in a future release.																										
Identities	Body	An array containing information about the security identities assigned to the security role. Identity details include:																										

Name	Description

	(a.k.a. Alerts)			
	pending, issued, and denied workflow alerts, including the alert text, recipients, and event handlers. Users can also add new alerts, delete alerts, and configure the pending alert delivery schedule.			
	WorkflowManagement (a.k.a. Alerts)			
	Test			
	Users can test the pending alerts, including sending email to recipients. Users must also have Read permissions for <i>Workflow</i> .			
	WorkflowManagement (a.k.a. Certificate Requests)			
	Participate			
	Users can participate in the pending, issued and denied workflow process by approving or denying certificate requests from the Certificate Requests page or from the individual pages reached from links included in alerts in the Management Portal and with related API endpoints.			
	For example:			
	<pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>			
Valid	A Boolean indicating whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.			

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.22.5 POST Security Identities

The POST `/Security/Identities` method is used to create a new security identity in Keyfactor Command. Use the `GET /Security/Identities/Lookup` method (see [GET Security Identities Lookup on page 833](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

**Tip:** This method cannot be used to assign roles to an identity. Use the `PUT /Security/Roles` method (see [PUT Security Roles on page 932](#)) to assign roles to an identity.

Table 380: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	<b>Required.</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators

Table 381: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.23 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, container and collection-level.

Table 382: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/id/Permissions	GET	Returns all permissions associated with the security role that matches the id	<a href="#">GET Security Roles ID Permissions on the next page</a>
/id/Permissions/Global	GET	Returns all global permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions Global on page 857</a>
/id/Permissions/Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	<a href="#">POST Security Roles ID Permissions Global on page 858</a>
/id/Permissions/Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	<a href="#">PUT Security Roles ID Permissions Global on page 878</a>
/id/Permissions/Containers	GET	Returns all container permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions Containers on page 899</a>
/id/Permissions/Containers	POST	Adds container permissions to the security role that matches the ID.	<a href="#">POST Security Roles ID Permissions Containers on page 900</a>
/id/Permissions/Containers	PUT	Sets container permissions to the security role that matches the ID.	<a href="#">PUT Security Roles ID Permissions Containers on page 902</a>
/id/Permissions/Collections	GET	Returns all collection permissions associated with the security role that matches the ID.	<a href="#">GET Security Roles ID Permissions Collections on</a>

Endpoint	Method	Description	Link
			<a href="#">page 903</a>
/[id]/Permissions/Collections	POST	Adds collection permissions to the security role that matches the ID.	<a href="#">POST Security Roles ID Permissions Collections on page 904</a>
/[id]/Permissions/Collections	PUT	Sets collection permissions to the security role that matches the ID.	<a href="#">PUT Security Roles ID Permissions Collections on page 905</a>

### 2.2.23.1 GET Security Roles ID Permissions

The GET /Security/Roles/[id]/Permissions method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Read*

Table 383: GET Security Roles [id] Permissions Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 913</a>) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 384: GET Security Roles {id} Permissions Response Data

Name	Description								
	An object containing information about the permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Type</td><td>A string containing the area at which the permission is applied to (global, container, or collection).</td></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. "Certificates").</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td></tr></table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. "Certificates").								
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.23.2 GET Security Roles ID Permissions Global

The GET /Security/Roles/{id}/Permissions/Global method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 385: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve global permissions.  Use the GET /Security/Roles method (see <a href="#">GET Security Roles on page 913</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 386: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. "Certificates").</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td></tr></table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon  at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.23.3 POST Security Roles ID Permissions Global

The POST `/Security/Roles/{id}/Permissions/Global` method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

 **Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 388: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. "Certificates").</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td></tr></table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.2.23.4 PUT Security Roles ID Permissions Global

The PUT /Security/Roles/{id}/Permissions/Global method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

**Warning:** Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not

changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. "Certificates").</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. "Read").</td></tr> </table>	Name	Description	Area	A string containing the name of the permission (e.g. "Certificates").	Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").
Name	Description						
Area	A string containing the name of the permission (e.g. "Certificates").						
Permission	A string indicating the permission level granted in the area for this role (e.g. "Read").						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.2.23.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 391: GET Security Roles {id} Permissions Containers Input Parameters

### 2.2.23.6 POST Security Roles ID Permissions Containers

The *POST /Security/Roles/{id}/Permissions/Containers* method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 393: POST Security Roles {id} Permissions Containers Input Parameters

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.23.7 PUT Security Roles ID Permissions Containers

The PUT /Security/Roles/{id}/Permissions/Containers method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Warning:** Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 395: PUT Security Roles {id} Permissions Containers Input Parameters

### 2.2.23.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 397: GET Security Roles {id} Permissions Collections Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions. 2.2.23.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Warning:** Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 401: PUT Security Roles {id} Permissions Collections Input Parameters

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.24 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 403: Security Roles Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the security role with the specified ID.	<a href="#">DELETE Security Roles ID below</a>
/id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and security identities assigned the role.	<a href="#">GET Security Roles ID on the next page</a>
/id}/Identities	GET	Returns the security identities assigned to the security role with the specified ID.	<a href="#">GET Security Roles ID Identities on page 911</a>
/id}/Identities	PUT	Updates the security identities assigned to the security role with the specified ID.	<a href="#">PUT Security Roles ID Identities on page 912</a>
/	GET	Returns all security roles with filtering and output options.	<a href="#">GET Security Roles on page 913</a>
/	POST	Adds a new security role.	<a href="#">POST Security Roles on page 915</a>
/	PUT	Updates the security role with the specified ID.	<a href="#">PUT Security Roles on page 932</a>
/id}/Copy	POST	Adds a new security role by copying the existing security role with the specified ID.	<a href="#">POST Security Roles ID Copy on page 949</a>

### 2.2.24.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 913](#)) to determine the ID of the security role you wish to delete. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 404: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The ID of the security role that should be deleted from Keyfactor Command.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.24.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 405: GET Security Roles {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role to retrieve. Use the GET /Security/Roles method (see <a href="#">GET Security Roles on page 913</a> ) to retrieve a list of all the security roles to determine the role's ID.

Table 406: GET Security Roles {id} Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	<p>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr><tr><td>AccountName</td><td><p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p><pre>KEYEXAMPLE\PKI Administrators</pre></td></tr><tr><td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr><tr><td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr></table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read" ],</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.24.3 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 407: GET Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve security identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 913</a>) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 408: GET Security Roles {id} Identities Response Data

Name	Description						
	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>Name</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.24.4 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 409: PUT Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID of the security role for which to update identities. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on the next page</a> ) to retrieve a list of all the security roles to determine the role's ID.
identities	Body	An array in which you provide a <b>complete</b> list of the identities that are associated with an Security Role Id. Use the <i>GET /Security/Identities</i> method (see <a href="#">GET Security Identities on page 834</a> ) to retrieve a list of all the security identities to determine the identity ID(s).

Table 410: PUT Security Roles {id} Identities Response Data

Name	Description						
	An array containing information about the security identities assigned to the security role. Identity details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr><tr><td>Name</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators</td></tr></table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.24.5 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 411: GET Security Roles Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> .
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Security Role Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Name</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 412: GET Security Roles Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	<p>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr><tr><td>AccountName</td><td><p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p><div>KEYEXAMPLE\PKI Administrators</div></td></tr><tr><td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr><tr><td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr></table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div>KEYEXAMPLE\PKI Administrators</div>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <div>KEYEXAMPLE\PKI Administrators</div>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <div>"Permissions": [</div>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read" ],</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.24.6 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 413: POST Security Roles Input Parameters

Name	In	Description															
Name	Body	<b>Required.</b> A string containing the short reference name for the security role.															
Description	Body	<b>Required.</b> A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal (a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Read</td><td>Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Modify</td><td>Users can modify the agent auto-registration settings.</td></tr> <tr> <td>AgentManagement</td><td>Read</td><td>Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including filtering the orchestrator management grid</li> </ul> </td></tr> </table>	Name	Value	Description	AdminPortal (a.k.a. Management Portal)	Read	Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.	AgentAutoRegistration	Read	Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.	AgentAutoRegistration	Modify	Users can modify the agent auto-registration settings.	AgentManagement	Read	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including filtering the orchestrator management grid</li> </ul>
Name	Value	Description															
AdminPortal (a.k.a. Management Portal)	Read	Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.															
AgentAutoRegistration	Read	Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.															
AgentAutoRegistration	Modify	Users can modify the agent auto-registration settings.															
AgentManagement	Read	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including filtering the orchestrator management grid</li> </ul>															

Name	In	Description		
				<ul style="list-style-type: none"> <li>View orchestrator jobs, including status, schedules, failures and warnings</li> </ul>
		AgentManagement	Modify	<p>Users can access the Management Portal areas and API endpoints to:</p> <ul style="list-style-type: none"> <li>Manage orchestrators, including approving and disapproving them</li> <li>Unschedule and reschedule orchestrator jobs</li> </ul>
		API	Read	Users can call the Classic (CMS) API endpoints.
		ApplicationSettings	Read	Users can view the application settings.
		ApplicationSettings	Modify	Users can modify the application settings.
		Auditing	Read	Users can access the Audit Log page in the Management Portal, and will be able to make API requests to obtain data from the audit log (query, etc.). The System Settings drop-down menu will display the Audit Log option to users with the <i>Auditing</i> Read permission.
		CertificateCollections	Modify	Users can add or edit certi-

Name	In	Description		
				ficate collections. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		CertificateEnrollment	EnrollPFX	Users can use the PFX Enrollment page in the Management Portal and use the PFX enrollment related API endpoints.
		CertificateEnrollment	EnrollCSR	Users can use the CSR Enrollment page in the Management Portal and use the CSR enrollment related API endpoints.
		CertificateEnrollment	CsrGeneration	Users can use the CSR Generation page in the Management Portal and use the CSR generation related API endpoints.
		CertificateEnrollment	PendingCsr	Users can use manage pending CSRs.
		CertificateMetadataTypes	Read	Users can read custom metadata attribute definitions on the Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateMetadataTypes	Modify	Users can add, edit, and delete custom metadata attribute definitions on the Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateStoreManagement	Read	Users can view certificate

Name	In	Description		
		Name	Value	Description
				stores—including the stores and containers but not discovery records—and certificate store types. Users who also have Read permissions for <i>Certificates</i> can view inventory for a certificate store.  See <i>Container Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		CertificateStoreManagement	Modify	Users can manage certificate stores—including the stores, containers, and discovery process—and certificate store types. Note that this permission does not control additions of certificates to certificate stores.
		CertificateStoreManagement	Schedule	Users can add certificates to certificate stores, renew/re-issue certificates, and remove certificates from certificate stores.
Certificates	Read	Users can view certificates in certificate search and certificate collections in the Management Portal and with related API endpoints, including certificate history, and can download certificates. Users who also have Read permissions for <i>Certificate Store Management</i> or container permissions can add certificates to certificate stores.		

Name	In	Description		
				See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		Certificates	Import	Users can import certificates through Add Certificate in the Management Portal and with related API endpoints. Users who also have Read permissions for <i>Certificate Store Management</i> or container permissions can add certificates to certificate stores from Add Certificate.
		Certificates	Recover	Users can download the certificates with their private key.
		Certificates	Revoke	Users can revoke certificates through Certificate Search and Certificate Collections in the Management Portal and with related API endpoints.
		Certificates	Delete	Users can delete certificates and, if applicable, the private keys of the certificates from the Keyfactor Command database.
		Certificates	ImportPrivateKey	Users can save the private key for the certificate in the Keyfactor Command database.
		Certificates	EditMetadata	Users can modify certificate metadata for certificates accessed through Certificate Search and Certificate Collections in the Management

Name	In	Description		
				Portal and with related API endpoints.
		Dashboard	Read	Users can view the panels on their personalized dashboard and add and remove them.
		Dashboard	RiskHeader	Users can view the risk header at the top of the dashboard.
		EventHandlerRegistration	Read	Users can view the event handler registration settings.
		EventHandlerRegistration	Modify	Users can modify the event handler registration settings.
		MacAutoEnrollManagement	Read	Users can view the Mac Auto-Enroll Management settings.
		MacAutoEnrollManagement	Modify	Users can modify the Mac Auto-Enroll Management settings.
		Monitoring	Read	Users can view the expiration alerts in the Certificate Alerts in the Management Portal and with related API endpoints, including the alert schedule.
		Monitoring	Modify	Users can modify the expiration alerts, including the alert text, recipients and event handlers. Users can also add new alerts, delete alerts and configure the expiration alert delivery schedule.

Name	In	Description		
		Name	Value	Description
		Monitoring	Test	Users can test the expiration alerts, including sending email to recipients. Users must also have Read permissions for <i>Monitoring</i> .
		PkiManagement	Read	Users can view the Keyfactor Command PKI management settings within the following Management Portal areas and use related endpoints: <ul style="list-style-type: none"><li>Certificate Authorities</li><li>Certificate Templates</li><li>Revocation Monitoring</li></ul>
		PkiManagement	Modify	Users can modify the Keyfactor Command PKI management settings: <ul style="list-style-type: none"><li>Import, add, edit, and delete certificate authorities</li><li>Import certificate templates</li><li>Add, edit, delete, and test revocation monitoring endpoints</li><li>Configure revocation monitoring schedule</li><li>Configure revocation monitoring recipients</li></ul>
		PrivilegedAccessManagement	Read	Users can view PAM

Name	In	Description																	
		<table><tr><th>Name</th><th>Value</th><th>Description</th></tr><tr><td></td><td></td><td>providers.</td></tr><tr><td>PrivilegedAccessManagement</td><td>Modify</td><td>Users can add, edit, and delete PAM providers.</td></tr><tr><td>Reports</td><td>Read</td><td>Users can generate and view reports.</td></tr><tr><td>Reports</td><td>Modify</td><td>Users can modify the delivery schedule for reports in Report Manager in the Management Portal and add, edit, and delete custom reports.</td></tr></table>	Name	Value	Description			providers. For example: KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read" ],</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.24.7 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 415: PUT Security Roles Input Parameters

Name	In	Description															
Id	Body	<b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 913</a> ) to retrieve a list of all the security roles to determine the role's ID.															
Name	Body	<b>Required.</b> A string containing the short reference name for the security role.															
Description	Body	<b>Required.</b> A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal (a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Read</td><td>Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Modify</td><td>Users can modify the agent auto-registration settings.</td></tr> <tr> <td>AgentManagement</td><td>Read</td><td>Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including</li> </ul> </td></tr> </table>	Name	Value	Description	AdminPortal (a.k.a. Management Portal)	Read	Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.	AgentAutoRegistration	Read	Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.	AgentAutoRegistration	Modify	Users can modify the agent auto-registration settings.	AgentManagement	Read	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including</li> </ul>
Name	Value	Description															
AdminPortal (a.k.a. Management Portal)	Read	Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.															
AgentAutoRegistration	Read	Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.															
AgentAutoRegistration	Modify	Users can modify the agent auto-registration settings.															
AgentManagement	Read	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orchestrators, including</li> </ul>															

Name	In	Description		
				filtering the orchestrator management grid <ul style="list-style-type: none"> <li>• View orchestrator jobs, including status, schedules, failures and warnings</li> </ul>
		AgentManagement	Modify	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>• Manage orchestrators, including approving and disapproving them</li> <li>• Unschedule and reschedule orchestrator jobs</li> </ul>
		API	Read	Users can call the Classic (CMS) API endpoints.
		ApplicationSettings	Read	Users can view the application settings.
		ApplicationSettings	Modify	Users can modify the application settings.
		Auditing	Read	Users can access the Audit Log page in the Management Portal, and will be able to make API requests to obtain data from the audit log (query, etc.). The System Settings drop-down menu

Name	In	Description		
				will display the Audit Log option to users with the <i>Auditing</i> Read permission.
		CertificateCollections	Modify	Users can add or edit certificate collections. <i>See Certificate Permissions in the Keyfactor Command Reference Guide for more information.</i>
		CertificateEnrollment	EnrollPFX	Users can use the PFX Enrollment page in the Management Portal and use the PFX enrollment related API endpoints.
		CertificateEnrollment	EnrollCSR	Users can use the CSR Enrollment page in the Management Portal and use the CSR enrollment related API endpoints.
		CertificateEnrollment	CsrGeneration	Users can use the CSR Generation page in the Management Portal and use the CSR generation related API endpoints.
		CertificateEnrollment	PendingCsr	Users can use manage pending CSRs.
		CertificateMetadataTypes	Read	Users can read custom metadata attribute definitions on the Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateMetadataTypes	Modify	Users can add, edit, and delete custom metadata attribute definitions on the

Name	In	Description		
				Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateStoreManagement	Read	Users can view certificate stores—including the stores and containers but not discovery records—and certificate store types. Users who also have Read permissions for <i>Certificates</i> can view inventory for a certificate store.  See <i>Container Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		CertificateStoreManagement	Modify	Users can manage certificate stores—including the stores, containers, and discovery process—and certificate store types. Note that this permission does not control additions of certificates to certificate stores.
		CertificateStoreManagement	Schedule	Users can add certificates to certificate stores, renew/re-issue certificates, and remove certificates from certificate stores.
		Certificates	Read	Users can view certificates in certificate search and certificate collections in the Management Portal and with related API endpoints, including certificate history, and can download certificates. Users who also have

Name	In	Description		
		Name	Value	Description
		Certificates	EditMetadata	Users can modify certificate metadata for certificates accessed through Certificate Search and Certificate Collections in the Management Portal and with related API endpoints.
		Dashboard	Read	Users can view the panels on their personalized dashboard and add and remove them.
		Dashboard	RiskHeader	Users can view the risk header at the top of the dashboard.
		EventHandlerRegistration	Read	Users can view the event handler registration settings.
		EventHandlerRegistration	Modify	Users can modify the event handler registration settings.
		MacAutoEnrollManagement	Read	Users can view the Mac Auto-Enroll Management settings.
		MacAutoEnrollManagement	Modify	Users can modify the Mac Auto-Enroll Management settings.
		Monitoring	Read	Users can view the expiration alerts in the Certificate Alerts in the Management Portal and with related API endpoints, including the alert schedule.
Monitoring	Modify	Users can modify the expiration alerts, including the alert text, recipients and event handlers. Users can		

Name	In	Description		

Name	In	Description		
				<ul style="list-style-type: none"> <li>Configure revocation monitoring recipients</li> </ul>
		PrivilegedAccessManagement	Read	Users can view PAM providers.
		PrivilegedAccessManagement	Modify	Users can add, edit, and delete PAM providers.
		Reports	Read	Users can generate and view reports.
		Reports	Modify	<p>Users can modify the delivery schedule for reports in Report Manager in the Management Portal and add, edit, and delete custom reports.</p> <div>  <b>Note:</b> Report scheduling is limited by collection permissions. Users in roles that have <i>Reports: Read and Modify</i> permissions will also need to have <i>Read</i> collection permissions on individual collections to have the ability to add, edit and delete schedules associated with collections. The user will not have access to add, edit and delete schedules for any collections for which they do not </div>

Name	In	Description		
				 have collection <i>Read</i> permissions in addition to <i>Reports</i> permissions.
		SecuritySettings	Read	Users can view the settings for Security Roles and Security Identities. Users must also have the Read permission for <i>System Settings</i> .
		SecuritySettings	Modify	Users can modify the settings for Security Roles and Security Identities in the Management Portal and with related API endpoints.
		SSH	User	Users can generate their own SSH keys.
		SSH	ServerAdmin	Users can use all SSH functions, except creating server groups and assigning server group owners. Users have limited access to some functions based on server group ownership. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		SSH	EnterpriseAdmin	Users can use all SSH functions. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	In	Description		
				<ul style="list-style-type: none"> <li>• Event Handler Registration to view built-in or custom event handlers</li> <li>• API Applications allowed to use the APIs for certificate lifecycle management</li> <li>• SMTP Configuration for email delivery of reports and alerts</li> <li>• Installed components</li> <li>• Licensing</li> <li>• Alerts and Warnings about the health of the Keyfactor Command system</li> </ul>
		SystemSettings	Modify	<p>Users can modify the System Settings for:</p> <ul style="list-style-type: none"> <li>• Application Settings to configure many options for Keyfactor Command</li> <li>• Event Handler Registration to add or remove built-in or custom event handlers</li> <li>• Update SMTP</li> </ul>

Name	In	Description		
				<p>Configuration for email delivery of reports and alerts</p> <ul style="list-style-type: none"> <li>• Installed components, including removing servers from use</li> <li>• Licensing, including the option to replace the existing license file</li> </ul>
		WorkflowDefinitions	Read	Users can view the configured workflow definitions.
		WorkflowDefinitions	Modify	Users can modify both the built-in and any custom workflow definitions, including the name and description and the configuration for the steps. Users can also add new workflow definitions, delete workflow definitions, publish workflow definitions, and import and export workflow definitions.
		WorkflowInstances	Manage	Users can manage initiated workflow instances, including stopping, restarting, and deleting them.
		WorkflowInstances	ReadAssignedToMe	Users can view the workflow instances that have been

Name	In	Description		
				<p>initiated and are awaiting input from them.</p> <div>  <b>Tip:</b> There is not a security permission at this level that controls whether users can provide input (a signal) to a workflow instance. This is controlled using the security roles configured on the specific workflow definition. Any user who holds one of the roles configured in the workflow step that requires a signal may provide the necessary input. The user does not need to hold the <i>ReadAssignedToMe WorkflowInstances</i> permission in order to provide the input. </div>
		WorkflowInstances	ReadAll	Users can view all the workflow instances that have been initiated.
		WorkflowInstances	ReadMy	Users can view the workflow instances that have been initiated by them (e.g. because they enrolled for a certificate).
		WorkflowManagement	Read	Users can view the pending,

Name	In	Description		
		<b>Name</b>	<b>Value</b>	<b>Description</b>
		(a.k.a. Alerts)		issued, and denied workflow alerts.
		WorkflowManagement (a.k.a. Alerts)	Modify	Users can modify the pending, issued, and denied workflow alerts, including the alert text, recipients, and event handlers. Users can also add new alerts, delete alerts, and configure the pending alert delivery schedule.
		WorkflowManagement (a.k.a. Alerts)	Test	Users can test the pending alerts, including sending email to recipients. Users must also have Read permissions for <i>Workflow</i> .
		WorkflowManagement (a.k.a. Certificate Requests)	Participate	Users can participate in the pending, issued and denied workflow process by approving or denying certificate requests from the Certificate Requests page or from the individual pages reached from links included in alerts in the Management Portal and with related API endpoints.
		For example:		
		<pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre>		
Identities	Body	An array containing one or more identifiers for each security identity to associate with the role. Supported identifiers include:		

Name	In	Description						
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>AccountName</td><td><p><b>Required</b>*. A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\\user or group name. IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. For example:</p> <pre>"Permissions": [</pre>										

Name	Description
	<pre>"AdminPortal:Read", "Dashboard:Read" ],</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.24.8 POST Security Roles ID Copy

The POST /Security/Roles{id}/Copy method is used to copy an existing security role in Keyfactor Command to create a new security role. This method returns HTTP 200 OK on a success with the details of the new security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 417: POST Security Roles {id} Copy Input Parameters

Name	In	Description						
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID of the security role from which to copy role information.</p> <p>Use the <code>GET /Security/Roles</code> method (see <a href="#">GET Security Roles on page 913</a>) to retrieve a list of all the security roles to determine the role's ID.</p>						
role	Body	<p>An array containing information about the new security role to create. Role details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><b>Required.</b> A string containing the short reference name for the security role.</td></tr><tr><td>Description</td><td><b>Required.</b> A string containing the description for the security role.</td></tr></table>	Name	Description	Name	<b>Required.</b> A string containing the short reference name for the security role. ## 2.2.25 SSH

The SSH component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 419: SSH Endpoints

Endpoint	Method	Description	Link
/Keys/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	<a href="#">DELETE SSH Keys Unmanaged ID on page 955</a>
/Keys/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	<a href="#">GET SSH Keys Unmanaged ID on page 956</a>
/Keys/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	<a href="#">GET SSH Keys My Key on page 957</a>
/Keys/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	<a href="#">POST SSH Keys My Key on page 960</a>
/Keys/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	<a href="#">PUT SSH Keys My Key on page 964</a>
/Keys/Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">DELETE SSH Keys Unmanaged on page 965</a>
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">GET SSH Keys Unmanaged on page 966</a>

Endpoint	Method	Description	Link
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	<a href="#">DELETE SSH Logons ID on page 969</a>
/Logons/{id}	GET	Returns information about a Linux logons.	<a href="#">GET SSH Logons ID on page 970</a>
/Logons/	GET	Returns information about one or more Linux logons.	<a href="#">GET SSH Logons on page 972</a>
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory and publish policy</i> mode, publishes it out to a Linux server.	<a href="#">POST SSH Logons on page 973</a>
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	<a href="#">POST SSH Logons Access on page 976</a>
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	<a href="#">DELETE SSH Servers ID on page 978</a>
/Servers/{id}	GET	Returns the SSH server with the specified ID.	<a href="#">GET SSH Servers ID on page 978</a>
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	<a href="#">GET SSH Servers Access ID on page 983</a>
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	<a href="#">GET SSH Servers on page 985</a>
/Servers/	POST	Creates a new SSH server.	<a href="#">POST SSH Servers on page 989</a>
/Servers/	PUT	Updates an existing SSH server.	<a href="#">PUT SSH Servers on page 994</a>
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	<a href="#">DELETE SSH Servers Access on page 999</a>
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	<a href="#">POST SSH Servers Access on page 1001</a>

Endpoint	Method	Description	Link
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	<a href="#">DELETE SSH Server Groups ID on page 1004</a>
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	<a href="#">GET SSH Server Groups ID on page 1005</a>
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	<a href="#">GET SSH Server Groups Name on page 1009</a>
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	<a href="#">GET SSH Server Groups Access ID on page 1013</a>
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	<a href="#">GET SSH Server Groups on page 1014</a>
/ServerGroups/	POST	Creates a new SSH server group.	<a href="#">POST SSH Server Groups on page 1019</a>
/ServerGroups/	PUT	Updates an existing SSH server group.	<a href="#">PUT SSH Server Groups on page 1026</a>
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	<a href="#">DELETE SSH Server Groups Access on page 1033</a>
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	<a href="#">POST SSH Server Groups Access on page 1034</a>
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	<a href="#">DELETE SSH Service Accounts ID on page 1037</a>
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts ID on page 1039</a>
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key	<a href="#">GET SSH Service</a>

Endpoint	Method	Description	Link
		of an SSH service account with the specified ID.	<a href="#">Accounts Key ID on page 1045</a>
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	<a href="#">DELETE SSH Service Accounts on page 1049</a>
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	<a href="#">GET SSH Service Accounts on page 1051</a>
/ServiceAccounts/	POST	Creates a new SSH service account.	<a href="#">POST SSH Service Accounts on page 1058</a>
/ServiceAccounts/	PUT	Updates an existing SSH service account.	<a href="#">PUT SSH Service Accounts on page 1067</a>
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	<a href="#">POST SSH Service Accounts Rotate ID on page 1074</a>
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	<a href="#">DELETE SSH Users ID on page 1078</a>
/Users/{id}	GET	Returns the SSH user with the specified ID.	<a href="#">GET SSH Users ID on page 1078</a>
/Users/	GET	Returns a list of SSH users based on the specified filters.	<a href="#">GET SSH Users on page 1083</a>
/Users/	POST	Creates a new SSH user.	<a href="#">POST SSH Users on page 1092</a>
/Users/	PUT	Updates an existing SSH user.	<a href="#">PUT SSH Users on page 1093</a>
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	<a href="#">POST SSH Users Access on page 1095</a>

### 2.2.25.1 SSH Keys

The SSH Keys component of the Keyfactor Web APIs includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see *SSH Permissions* in the *Keyfactor Command Reference Guide*) to generate

an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 420: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	<a href="#">DELETE SSH Keys Unmanaged ID below</a>
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	<a href="#">GET SSH Keys Unmanaged ID on the next page</a>
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	<a href="#">GET SSH Keys My Key on page 957</a>
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	<a href="#">POST SSH Keys My Key on page 960</a>
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	<a href="#">PUT SSH Keys My Key on page 964</a>
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">DELETE SSH Keys Unmanaged on page 965</a>
Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	<a href="#">GET SSH Keys Unmanaged on page 966</a>

## DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 421: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 966</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged ID

The *GET /SSH/Keys/Unmanaged/{id}* method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 422: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 966</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 423: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 960](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 SSH: *User* OR  
 SSH: *ServerAdmin* OR  
 SSH: *EnterpriseAdmin*

Table 424: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	<p><b>Required</b><sup>*</sup>. A string that sets a password used to secure the private key of the SSH key pair for download. This field is <b>required</b> if <i>IncludePrivateKey</i> is set to <i>true</i>.</p> <div>  <p><b>Tip:</b> This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.</p> </div>

Table 425: GET SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 976](#), [POST SSH Server Groups Access on page 1034](#), and [POST SSH Servers Access on page 1001](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *User* OR

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

Table 426: POST SSH Keys My Key Input Parameters

Name	In	Description
KeyType	Body	<b>Required.</b> A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:
PrivateKeyFormat	Body	<b>Required.</b> A string indicating the format to use for the downloadable private key. Possible values are:
KeyLength	Body	<b>Required*</b> . An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and <b>required</b> if the <i>KeyType</i> is set to RSA.
Email	Body	<b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Password	Body	<b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download. <div> <b>Tip:</b> This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see <a href="#">GET SSH Keys My Key on page 957</a>) and encrypt it with a different password, if desired.</div>
Comment	Body	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment

Name	In	Description
		<p>field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div> <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</div>

Table 427: POST SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *User* OR  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 428: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH key.
Email	Body	<b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its life-time.
Comment	Body	<p>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div> <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</div>

Table 429: PUT SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST <code>/SSH/Keys/MyKey</code> method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## DELETE SSH Keys Unmanaged

The DELETE `/SSH/Keys/Unmanaged` method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 430: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4,27,89]</pre> <p>Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged below</a>) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged

The *GET /SSH/Keys/Unmanaged* method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 431: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Unmanaged Keys Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DiscoveredDate</i></li> <li>• <i>KeyComments</i></li> <li>• <i>KeyLength</i></li> <li>• <i>KeyType</i></li> <li>• <i>ServerId</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 432: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.25.2 SSH Logons

The SSH Logons component of the Keyfactor Web APIs includes methods necessary to view and manage the Linux user accounts associated with authorized\_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 433: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	<a href="#">DELETE SSH</a>

Endpoint	Method	Description	Link
			<a href="#">Logons ID on the next page</a>
/ {id}	GET	Returns information about a Linux logons.	<a href="#">GET SSH Logons ID on the next page</a>
/	GET	Returns information about one or more Linux logons.	<a href="#">GET SSH Logons on page 972</a>
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server.	<a href="#">POST SSH Logons on page 973</a>
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	<a href="#">POST SSH Logons Access on page 976</a>

## DELETE SSH Logons ID

The DELETE `/SSH/Logons/{id}` method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 434: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH logon to be deleted. Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a> ) to retrieve a list of all the SSH logons to determine the logon's ID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Logons ID

The GET /SSH/Logons/{id} method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 435: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a> ) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 436: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 437: GET SSH Logons Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Id</i> (Login ID)</li><li>• <i>LastLogon</i></li><li>• <i>Hostname</i> (Logon Server Name)</li><li>• <i>LogonUserUsername</i></li><li>• <i>ServerId</i></li><li>• <i>UnmanagedKeyId</i></li><li>• <i>Username</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 438: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 439: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	<b>Required.</b> A string indicating the user's logon name on the Linux server.
ServerId	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created.</p> <p>Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 985</a>) to retrieve a list of all the SSH servers to determine the server's ID.</p>
UserIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format:</p> <pre>[4, 7, 19]</pre> <p>See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.</p> <p>Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1083</a>) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.</p>

Table 440: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# POST SSH Logons Access

The POST /SSH/Logons/Access method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 441: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH logon. Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a> ) to retrieve a list of all the SSH logons to determine the logon's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: [ 4, 7, 19 ] Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1083</a> ) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.

Table 442: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	<p>An array of key/value pairs providing information about the users mapped to the logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.25.3 SSH Servers

The SSH Servers component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 443: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server with the specified ID.	<a href="#">DELETE SSH Servers ID on the next page</a>
/id}	GET	Returns the SSH server with the specified ID.	<a href="#">GET SSH Servers ID on the next page</a>
/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	<a href="#">GET SSH Servers Access ID on page 983</a>
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	<a href="#">GET SSH Servers on page 985</a>

Endpoint	Method	Description	Link
/	POST	Creates a new SSH server.	<a href="#">POST SSH Servers on page 989</a>
/	PUT	Updates an existing SSH server.	<a href="#">PUT SSH Servers on page 994</a>
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	<a href="#">DELETE SSH Servers Access on page 999</a>
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	<a href="#">POST SSH Servers Access on page 1001</a>

## DELETE SSH Servers ID

The DELETE /SSH/Servers/{id} method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 444: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH server to be deleted. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 985</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Servers ID

The GET /SSH/Servers/{id} method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 445: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH server to be retrieved. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 985</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

Table 446: GET SSH Servers {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<div>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><div>For example, every hour:</div><pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <div>For example, every hour:</div> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>										
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Servers Access ID

The GET `/SSH/Servers/Access/{id}` method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 447: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on the next page</a> ) to retrieve a list of all the SSH servers to determine the server's ID.

Table 448: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<div>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td><div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div></td></tr></table></div>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 449: GET SSH Servers Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Agent</i> (Agent ID)</li><li>• <i>Hostname</i></li><li>• <i>Orchestrator</i> (ClientMachine)</li><li>• <i>ServerGroup</i> (Server Group Id)</li><li>• <i>ServerGroupName</i></li><li>• <i>ServerGroupOwner</i> (Username)</li><li>• <i>EnforcePublishPolicy</i> (UnderManagement) (true, false)</li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Host-name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 450: GET SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<div>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><div>For example, every hour:</div><pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre> <div>  <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <p>For example:</p> <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>										
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1019](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 12](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 SSH: *ServerAdmin* OR  
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 451: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	<b>Required.</b> A string indicating the hostname of the SSH server.
ServerGroupId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
UnderManagement	Body	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 452: POST SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>										
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 453: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>
Port	Body	The port that is configured for SSH on the SSH server. The default is 22.

Table 454: PUT SSH Servers Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.																
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.																
Hostname	A string indicating the hostname of the SSH server.																
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.																
SyncSchedule	<div>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <div>  <b>Tip:</b> If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode. </div>										
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p>										

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a

mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 455: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<b>Required.</b> An array containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\\jsmith"     ]   } ]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.							

Table 456: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Servers Access

The POST /SSH/Servers/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 SSH: *ServerAdmin* OR  
 SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 457: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	<b>Required.</b> An array containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\\jsmith"     ]   } ]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.							

Table 458: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.25.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor Web APIs includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 459: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server group with the specified ID.	<a href="#">DELETE SSH Server Groups ID on the</a>

Endpoint	Method	Description	Link
			<a href="#">next page</a>
/ {id}	GET	Returns the SSH server group with the specified ID.	<a href="#">GET SSH Server Groups ID on the next page</a>
/ {name}	GET	Returns the SSH server group with the specified name.	<a href="#">GET SSH Server Groups Name on page 1009</a>
/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	<a href="#">GET SSH Server Groups Access ID on page 1013</a>
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	<a href="#">GET SSH Server Groups on page 1014</a>
/	POST	Creates a new SSH server group.	<a href="#">POST SSH Server Groups on page 1019</a>
/	PUT	Updates an existing SSH server group.	<a href="#">PUT SSH Server Groups on page 1026</a>
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	<a href="#">DELETE SSH Server Groups Access on page 1033</a>
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	<a href="#">POST SSH Server Groups Access on page 1034</a>

## DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: EnterpriseAdmin

Table 460: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted.</p> <p>Use the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1014</a>) to retrieve a list of all the SSH server groups to determine the server group's GUID.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Server Groups ID

The *GET /SSH/ServerGroups/{id}* method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 461: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved.</p> <p>Use the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1014</a>) to retrieve a list of all the SSH server groups to determine the server group's GUID.</p>

Table 462: GET SSH Server Groups {id} Response Data

Name	Description												
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.												
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.												
GroupName	A string indicating the name of the SSH server group.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").								
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p>								

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										
ServerCount	An integer indicating the number of SSH servers that belong to the server group.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

For example, on the first of every month at 5:30 pm: <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>			<div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>			For example: <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>			Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).	ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.
Name	Description																												
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr><tr><td>Day</td><td>The number of the day, in the month, to run the job.</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.																						
Name	Description																												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																												
Day	The number of the day, in the month, to run the job.																												
For example, on the first of every month at 5:30 pm: <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>																													
<div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>																													
For example: <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>																													
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).																											
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.																											

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 465: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on the next page</a> ) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 466: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to

specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 467: GET SSH Server Groups Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Server Group Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>GroupId</i></li><li>• <i>GroupName</i></li><li>• <i>Owner</i> (Owner ID)</li><li>• <i>OwnerName</i> (Username)</li><li>• <i>EnforcePublishPolicy</i> (Under Management) (true, false)</li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 468: GET SSH Server Groups Response Data

Name	Description												
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.												
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\username format) who holds the owner role on the SSH server group.												
GroupName	A string indicating the name of the SSH server group.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										
ServerCount	An integer indicating the number of SSH servers that belong to the server group.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *EnterpriseAdmin*

Table 469: POST SSH Server Groups Input Parameters

Name	In	Description																
OwnerName	Body	<p><b>Required.</b> A string indicating the Active Directory user who owns the server group (in DOMAIN\\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> <b>Tip:</b> Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>																
GroupName	Body	<p><b>Required.</b> A string indicating the name of the SSH server group.</p>																
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": {   "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time</td></tr></table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										
ServerCount	An integer indicating the number of SSH servers that belong to the server group.										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 471: PUT SSH Server Groups Input Parameters

Name	In	Description												
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
OwnerName	Body	<p><b>Required.</b> A string indicating the Active Directory user who owns the server group (in DOMAIN\\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> <b>Tip:</b> Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>												
GroupName	Body	<b>Required.</b> A string indicating the name of the SSH server group.												
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": {  "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Day	The number of the day, in the month, to run the job.																						
Name	Description																												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																												
Day	The number of the day, in the month, to run the job.																												
For example, on the first of every month at 5:30 pm: <pre>"Monthly": {   "Day": 1   "Time": "2022-02-27T17:30:00Z" }</pre>																													
<div> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div>																													
For example: <pre>"SyncSchedule": {   "Weekly": {     "Days": [       "Monday",       "Wednesday",       "Friday"     ],     "Time": "2022-11-20T14:00:00Z"   } }</pre>																													
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).																											
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.																											

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 473: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<div>An array containing information for the Linux logon(s) to update. The following information should be included:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td></tr></table> <div>For example:</div> <div><pre>"LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\\jsmith"     ]   } ]</pre></div>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 474: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 475: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	<b>Required.</b> The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<b>Required.</b> An array containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [   {     "LogonName": "johns",     "Users": [       "KEYEXAMPLE\\jsmith"     ]   } ]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 476: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> <b>Tip:</b> Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> <b>Tip:</b> Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.25.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 477: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH service account with the specified ID.	<a href="#">DELETE SSH Service Accounts ID below</a>
/id}	GET	Returns the SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts ID on page 1039</a>
/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	<a href="#">GET SSH Service Accounts Key ID on page 1045</a>
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	<a href="#">DELETE SSH Service Accounts on page 1049</a>
/	GET	Returns a list of SSH service accounts based on the specified filters.	<a href="#">GET SSH Service Accounts on page 1051</a>
/	POST	Creates a new SSH service account.	<a href="#">POST SSH Service Accounts on page 1058</a>
/	PUT	Updates an existing SSH service account.	<a href="#">PUT SSH Service Accounts on page 1067</a>
/Rotate/{id}	POST	Generates a new key pair for an existing service account.	<a href="#">POST SSH Service Accounts Rotate ID on page 1074</a>

## DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/{id} method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 478: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see <a href="#">GET SSH Service Accounts on page 1051</a>) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div>  <b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <i>GET /SSH/ServiceAccounts</i>:         <pre> {   "Id": 2,   "ClientHostname": "appsrvr80.keyexample.com",   "ServerGroup": {     "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546",     "GroupName": "Server Group Two",     "UnderManagement": false   },   "User": {     "Id": 7,     "Key": {       "Id": 36,       "Fingerprint":         "kwuo2k3Ej7wFVMLhI3g+rxT2qXwGp7qcvzdBjVTDHNg=",       "PublicKey": "ssh-rsa         AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for         display]",       "KeyType": "RSA",       "KeyLength": 2048,       "CreationDate": "2020-11-17T17:53:55.68",       "Email": "pkiadmins@keyexample.com",       "Comments": [         "Access App Two"       ],       "LogonCount": 3     },     "Username": "svc_access2@appsrvr80.keyexample.com"   } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> <li>• ID 2: The service account's ID. Use this one for delete requests.</li> <li>• ID 7: The service account user's ID.</li> <li>• ID 36: The ID of the service account user's key.</li> </ul> </div>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1045](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 479: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved. Use the <i>GET /SSH/ServiceAccounts</i> method (see <a href="#">GET SSH Service Accounts on page 1051</a> ) to retrieve a list of all the SSH service accounts to determine the service account's ID.

Table 480: GET SSH Service Accounts {id} Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description		
	Name	Description	
		Name	Description
			generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
		KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
		CreationDate	The date, in UTC, on which the SSH key pair was created.
		StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
		Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
		LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).		

Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts Key ID

The GET /SSH/ServiceAccounts/Key/{id} method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 481: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1051</a>) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  <p><b>Tip:</b> Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre>{   "Id": 2,   "ClientHostname": "appsrvr80.keyexample.com",   "ServerGroup": {     "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546",     "GroupName": "Server Group Two",     "UnderManagement": false   },   "User": {     "Id": 7,     "Key": {       "Id": 36,       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=",       "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]",       "KeyType": "RSA",       "KeyLength": 2048,       "CreationDate": "2020-11-17T17:53:55.68",       "Email": "pkiadmins@keyexample.com",       "Comments": [         "Access App Two"       ],       "LogonCount": 3     },     "Username": "svc_ access2@appsrvr80.keyexample.com"   } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> <li>• ID 2: The service account's ID.</li> <li>• ID 7: The service account user's ID.</li> </ul> </div>

Name	In	Description
		 <ul style="list-style-type: none"> <li>ID 36: The ID of the service account user's key. Use this one to request the key.</li> </ul>
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Phrase header must be supplied.

Table 482: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 483: DELETE SSH Service Accounts Input Parameters

Name	In	Description
ids	Body	<p><b>Required.</b> An array of Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre>[4,12,17]</pre> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on the next page</a>) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <div>  <p><b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre>{   "Id": 2,   "ClientHostname": "appsrvr80.keyexample.com",   "ServerGroup": {     "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546",     "GroupName": "Server Group Two",     "UnderManagement": false   },   "User": {     "Id": 7,     "Key": {       "Id": 36,       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx2qXwGp7qcvzdBjVTDHNg=",       "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]",       "KeyType": "RSA",       "KeyLength": 2048,       "CreationDate": "2020-11-17T17:53:55.68",       "Email": "pkiadmins@keyexample.com",       "Comments": [         "Access App Two"       ],       "LogonCount": 3     },     "Username": "svc_access2@appsrvr80.keyexample.com"   } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> <li>• ID 2: The service account's ID. Use this one for delete requests.</li> <li>• ID 7: The service account user's ID.</li> <li>• ID 36: The ID of the service account user's key.</li> </ul> </div>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1045](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 484: GET SSH Service Accounts Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Service Account Key Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CreationDate</i></li> <li>• <i>Id</i></li> <li>• <i>Comments</i> (Key comments)</li> <li>• <i>KeyLength</i></li> <li>• <i>KeyType</i></li> <li>• <i>ServerGroup</i> (Server Group ID)</li> <li>• <i>ServerGroupName</i></li> <li>• <i>Username</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 485: GET SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the SSH service account's key.																
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																
PublicKey	A string indicating the public key of the key pair for the SSH service account.																
KeyType	A string indicating the cryptographic algorithm used to																

Name	Description		
		Name	Description
		Name	Description
			generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
		KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
		CreationDate	The date, in UTC, on which the SSH key pair was created.
		StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
		Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
		LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).		

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1019](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 12](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 486: POST SSH Service Accounts Input Parameters

Name	In	Description																												
KeyGenerationRequest	Body	<b>Required.</b> An array that set the information to include in the SSH key pair request. Key generation request details include:																												
		<table><tr><th>Name</th><th>Description</th></tr><tr><td rowspan="5">KeyType</td><td><b>Required.</b> A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</td></tr><tr><td><table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table></td></tr><tr><td colspan="2">The <i>KeyType</i> may be specified using either the numeric value or text value.</td></tr><tr><td rowspan="3">PrivateKeyFormat</td><td><b>Required.</b> A string indicating the format to use for the downloadable private key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Password	<b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.	Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Email	<b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.									
Password	<b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.									
Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.									
User	Body	<p><b>Required.</b> An array containing information about the service account user. User details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Username</td><td><b>Required.</b> A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i>, is used to build the full user name (e.g. myapp@appsrvr75).</td></tr><tr><td>LogonIds</td><td>An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.</td></tr></table>	Name	Description	Username	<b>Required.</b> A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i> , is used to build the full user name (e.g. myapp@appsrvr75).	LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.		
Name	Description									
Username	<b>Required.</b> A string indicating the short name of the SSH service account user (e.g. myapp). This, together with the <i>ClientHostname</i> , is used to build the full user name (e.g. myapp@appsrvr75).									
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.									
ClientHostname	Body	<p><b>Required.</b> A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to use the host-name of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast).</p>								

Name	In	Description
ServerGroupId	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 487: POST SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.																		

Name	Description

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the SSH service account's key.																
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																
PublicKey	A string indicating the public key of the key pair for the SSH service account.																
KeyType	A string indicating the cryptographic algorithm used to																

Name	Description		
	Name	Description	
		Name	Description
			generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
		KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
		CreationDate	The date, in UTC, on which the SSH key pair was created.
		StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
		Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
		LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).		

Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 488: PUT SSH Service Accounts Input Parameters

Name	In	Description								
KeyUpdateRequest	Body	<b>Required.</b> An array that sets the information to include in the SSH service account key update request. Key update request information includes:								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td><b>Required.</b> The Keyfactor Command reference ID for the service account's key.</td></tr><tr><td>Email</td><td><b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</td></tr><tr><td>Comment</td><td>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</td></tr></table>	Name	Description	Id	<b>Required.</b> The Keyfactor Command reference ID for the service account's key.	Email	<b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.
		Name	Description							
		Id	<b>Required.</b> The Keyfactor Command reference ID for the service account's key.							
Email	<b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.									
Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<b>Required.</b> The Keyfactor Command reference ID for the service account. Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1051</a> ) to retrieve a list of all the SSH service accounts to determine the service account's ID.								

Table 489: PUT SSH Service Accounts Response Data

Name	Description																		
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.																		
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).																		
ServerGroup	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td> <p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.																		
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.																		
GroupName	A string indicating the name of the SSH server group.																		
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.														
Name	Description																		
Off	Turn off a previously configured schedule.

		Name	Description
			generate the SSH key. Possible values are: <ul style="list-style-type: none"><li>• RSA</li><li>• ECDSA</li><li>• Ed25519</li></ul>
	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	
	CreationDate	The date, in UTC, on which the SSH key pair was created.	
	StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	
	Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.	
	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.	
	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.	
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).		

Name	Description
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Service Accounts Rotate ID

The POST /SSH/ServiceAccounts/Rotate/{id} method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 490: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see <a href="#">GET SSH Service Accounts on page 1051</a>) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  <p><b>Tip:</b> Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre>{   "Id": 2,   "ClientHostname": "appsrvr80.keyexample.com",   "ServerGroup": {     "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546",     "GroupName": "Server Group Two",     "UnderManagement": false   },   "User": {     "Id": 7,     "Key": {       "Id": 36,       "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=",       "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]",       "KeyType": "RSA",       "KeyLength": 2048,       "CreationDate": "2020-11-17T17:53:55.68",       "Email": "pkiadmins@keyexample.com",       "Comments": [         "Access App Two"       ],       "LogonCount": 3     },     "Username": "svc_ access2@appsrvr80.keyexample.com"   } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> <li>ID 2: The service account's ID. Use this one to rotate the key.</li> <li>ID 7: The service account user's ID.</li> </ul> </div>

Name	In	Description								
		<div><ul style="list-style-type: none"><li>ID 36: The ID of the service account user's key.</li></ul></div>								
KeyType	Body	<div><p><b>Required.</b> A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table></div>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<div><p><b>Required.</b> A string indicating the format to use for the downloadable private key. Possible values are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>OpenSSH</td></tr><tr><td>2</td><td>PKCS8</td></tr></table></div>	Value	Description	1	OpenSSH	2	PKCS8		
Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<div><p><b>Required</b><sup>*</sup>. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and <b>required</b> if the <i>KeyType</i> is set to RSA.</p></div>								
Email	Body	<div><p><b>Required.</b> A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p></div>								
Password	Body	<div><p><b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.</p></div>								
Comment	Body	<div><p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p></div>								

Table 491: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.25.6 SSH Users

The SSH Users component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 492: SSH Users Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH user with the specified ID.	<a href="#">DELETE SSH Users ID below</a>
/id}	GET	Returns the SSH user with the specified ID.	<a href="#">GET SSH Users ID below</a>
/	GET	Returns a list of SSH users based on the specified filters.	<a href="#">GET SSH Users on page 1083</a>
/	POST	Creates a new SSH user.	<a href="#">POST SSH Users on page 1092</a>
/	PUT	Updates an existing SSH user.	<a href="#">PUT SSH Users on page 1093</a>
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	<a href="#">POST SSH Users Access on page 1095</a>

## DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin*

Table 493: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1083</a> ) to retrieve a list of all the SSH users to determine the user's ID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET /SSH/Keys/MyKey method

(see [GET SSH Keys My Key on page 957](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1045](#)) for a service account.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 6](#).

## Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 494: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the GET /SSH/Users method (see <a href="#">GET SSH Users on page 1083</a> ) to retrieve a list of all the SSH users to determine the user's ID.

Table 495: GET SSH Users {id} v2 Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																				
Key	<p>An array containing information about the key for the user. Key details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td></tr> <tr> <td>Fingerprint</td><td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td></tr> <tr> <td>PublicKey</td><td>A string indicating the public key of the key pair for the SSH user.</td></tr> <tr> <td>KeyType</td><td>           A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	The date, in UTC, on which the SSH key pair was created.	StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																				
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																				
PublicKey	A string indicating the public key of the key pair for the SSH user.																				
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>																				
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																				
CreationDate	The date, in UTC, on which the SSH key pair was created.																				
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																				
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>																				

Name	Description	
	Name	Description
		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.
	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).	
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.	

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Users

The GET */SSH/Users* method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET */SSH/Keys/MyKey* method (see [GET SSH Keys My Key on page 957](#)) for user accounts and the GET */SSH/ServiceAccounts/Key/{id}* method (see [GET SSH Service Accounts Key ID on page 1045](#)) for service accounts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 6](#).

## Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 498: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 985</a>) or the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1014</a>) to determine ownership of a server or server group.</p> <div>  <p><b>Example:</b> Example Scenario One</p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B but not on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div>  <p><b>Example:</b> Example Scenario Two</p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B and a logon on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> </div>

Name	In	Description
		 Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.  The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Email</i></li> <li>• <i>Fingerprint</i></li> <li>• <i>IsServiceAccount</i></li> <li>• <i>KeyLength</i></li> <li>• <i>KeyType</i></li> <li>• <i>LogonCount</i></li> <li>• <i>LogonServerGroupId</i></li> <li>• <i>LogonServerId</i></li> <li>• <i>ServiceAccountId</i></li> <li>• <i>StaleDate</i></li> <li>• <i>Username</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 499: GET SSH Users v2 Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td></tr> <tr> <td>LogonCount</td><td>An integer indicating the number of Linux logons associated with the SSH key pair.</td></tr> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.		
Name	Description								
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.								
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.								
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).								
Access	<p>An array containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>KeyCount</td><td>An integer indicating the number of SSH keys associated with the Linux logon.</td></tr> <tr> <td>Access</td><td>An array containing information about the users mapped to the Linux logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An array containing information about the users mapped to the Linux logon.
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.								
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.								
Access	An array containing information about the users mapped to the Linux logon.								
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).								

## Version 1

Version 1 of the GET */SSH/Users* method includes the same capabilities as version 2, but offers more limited information on returned logons for the user.

Table 500: GET SSH Users v1 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see <a href="#">GET SSH Servers on page 985</a>) or the <i>GET /SSH/ServerGroups</i> method (see <a href="#">GET SSH Server Groups on page 1014</a>) to determine ownership of a server or server group.</p> <div>  <p><b>Example:</b> Example Scenario One</p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B but not on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div>  <p><b>Example:</b> Example Scenario Two</p> <ul style="list-style-type: none"> <li>• Server A is owned by Gina and server B is owned by John.</li> <li>• Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>.</li> <li>• Dave has a logon on server B and a logon on server A.</li> </ul> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> </div>

Name	In	Description
		 Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.  The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 501: GET SSH Users v1 Response Data

Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																				
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																				
PublicKey	A string indicating the public key of the key pair for the SSH user.																				
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>																				
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																				
CreationDate	The date, in UTC, on which the SSH key pair was created.																				
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																				
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>																				

Name	Description	
	Name	Description
		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.
	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).	
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.	

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Users

The POST */SSH/Users* method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory* and *publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 502: POST SSH Users Input Parameters

Name	In	Description
Username	Body	<p><b>Required.</b> A string indicating the full username of the <i>user</i> or <i>service account</i>.</p> <p>For a <i>user</i> account, the username is given in DOMAIN\\username format (e.g. KEYEXAMPLE\\jsmith). For a <i>service account</i>, the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheese-toast). The full service account name is given in the form username@clienthostname (e.g. svc_myapp@appsvr75).</p>
LogonIds	Body	<p>An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a>) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p>

Table 503: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be published out to a Linux server—for servers in *inventory* and *publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 504: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	<p><b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1083</a>) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[ 12, 27, 39 ]</pre> <p>Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a>) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div>  <p><b>Important:</b> Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see <a href="#">GET SSH Users on page 1083</a>) before updating and provide both existing and new logon IDs.</p> </div>

Table 505: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# POST SSH Users Access

The POST /SSH/Users/Access method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 506: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SSH user. Use the <i>GET /SSH/Users</i> method (see <a href="#">GET SSH Users on page 1083</a> ) to retrieve a list of all the SSH users to determine the user's ID.
LogonIds	Body	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: [ 12, 27, 39] Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 972</a> ) to retrieve a list of all the SSH logons to determine the logon's ID(s). <div> <b>Important:</b> Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see <a href="#">GET SSH Users on page 1083</a>) before updating and provide both existing and new logon IDs.</div>

Table 507: POST SSH Users Access Response Data

Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																				
Key	<p>An array containing information about the key for the user. Key details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td></tr> <tr> <td>Fingerprint</td><td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td></tr> <tr> <td>PublicKey</td><td>A string indicating the public key of the key pair for the SSH user.</td></tr> <tr> <td>KeyType</td><td>           A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:           <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul> </td></tr> <tr> <td>KeyLength</td><td>An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.</td></tr> <tr> <td>CreationDate</td><td>The date, in UTC, on which the SSH key pair was created.</td></tr> <tr> <td>StaleDate</td><td>The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Email</td><td>A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td></tr> <tr> <td>Comments</td><td>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i></td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	The date, in UTC, on which the SSH key pair was created.	StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																				
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																				
PublicKey	A string indicating the public key of the key pair for the SSH user.																				
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>																				
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																				
CreationDate	The date, in UTC, on which the SSH key pair was created.																				
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																				
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST</i>																				

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td><i>/SSH/ServiceAccounts</i> method will contain only one string in the array.</td></tr> <tr> <td>LogonCount</td><td>An integer indicating the number of Linux logons associated with the SSH key pair.</td></tr> </table>	Name	Description		<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.				
Name	Description										
	<i>/SSH/ServiceAccounts</i> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
Access	<p>An array containing information about the Linux logons mapped to the user. Linux logon mapping details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>Username</td><td>A string indicating the user's logon name on the Linux server.</td></tr> <tr> <td>KeyCount</td><td>An integer indicating the number of SSH keys associated with the Linux logon.</td></tr> <tr> <td>Access</td><td>An array containing information about the users mapped to the Linux logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.	Username	A string indicating the user's logon name on the Linux server.	KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.	Access	An array containing information about the users mapped to the Linux logon.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.										
Username	A string indicating the user's logon name on the Linux server.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.										
Access	An array containing information about the users mapped to the Linux logon.										
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.26 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 508: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	<a href="#">GET SMTP on the next page</a>

Endpoint	Method	Description	Link
/	PUT	Updates settings for the SMTP configuration profile.	<a href="#">PUT SMTP on page 1100</a>
/Test	POST	Sends a test email message to confirm SMTP configuration.	<a href="#">POST SMTP Test on page 1102</a>

### 2.2.26.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Read*

Table 509: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future release.</p>						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.26.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 510: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	<b>Required.</b> A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	<b>Required.</b> An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<div>An integer indicating the type of authentication used to connect to the mail server. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Anonymous</td></tr><tr><td>2</td><td>Explicit Credentials</td></tr></table></div>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<b>Required*</b> . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2.  No data is output in this field on a GET.						
RelayUsername	Body	<b>Required*</b> . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2.  For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	<b>Required.</b> A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	<b>Required.</b> A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Table 511: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.26.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Modify*

Table 512: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	<b>Required.</b> A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	<b>Required.</b> An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<div>An integer indicating the type of authentication used to connect to the mail server. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Anonymous</td></tr><tr><td>2</td><td>Explicit Credentials</td></tr></table></div>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<b>Required*</b> . A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2.  No data is output in this field on a GET.						
RelayUsername	Body	<b>Required*</b> . A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is <b>required</b> if <i>RelayAuthenticationType</i> is set to 2.  For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.						
SenderAccount	Body	<b>Required.</b> A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	Body	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). This is considered deprecated and may be removed in a future release.						
SenderName	Body	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						

Name	In	Description
TestRecipient	Body	<b>Required.</b> A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 513: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the "from" in the user's mail client (e.g. "Keyfactor Command"). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
TestRecipient	A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 514: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	<a href="#">GET SSL Parts ID on the next page</a>
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	<a href="#">GET SSL Endpoints ID on page 1111</a>
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	<a href="#">DELETE SSL NetworkRanges ID on page 1112</a>
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	<a href="#">GET SSL NetworkRanges ID on page 1113</a>
/Networks/{identifier}	GET	Returns information about the specified SSL network.	<a href="#">GET SSL Networks Identifier on page 1114</a>
/	GET	Returns the results of an SSL scan based on query information.	<a href="#">GET SSL on page 1122</a>
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	<a href="#">GET SSL Networks on page 1124</a>
/Networks	POST	Creates a new SSL network.	<a href="#">POST SSL Networks on page 1133</a>
/Networks	PUT	Updates an existing SSL network.	<a href="#">PUT SSL Networks on page 1145</a>
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	<a href="#">GET SSL Endpoints ID History on page 1157</a>
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	<a href="#">GET SSL Networks ID Parts on page 1163</a>
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	<a href="#">POST SSL NetworkRanges on page 1164</a>

Endpoint	Method	Description	Link
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	<a href="#">PUT SSL NetworkRanges on page 1165</a>
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	<a href="#">PUT SSL Endpoints Review Status on page 1166</a>
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	<a href="#">PUT SSL Endpoints Monitor Status on page 1167</a>
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	<a href="#">PUT SSL Endpoints Review All on page 1167</a>
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	<a href="#">PUT SSL Endpoints Monitor All on page 1168</a>
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	<a href="#">POST SSL Networks ID Scan on page 1168</a>
/NetworkRanges/Validate	POST	Validates all SSL networks given.	<a href="#">POST SSL NetworkRanges Validate on page 1169</a>
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	<a href="#">DELETE SSL Networks ID on page 1170</a>

### 2.2.27.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 1163](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 515: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved.</p> <p>Use the <code>GET /SSL/Networks/{id}/Parts</code> method (see <a href="#">GET SSL Networks ID Parts on page 1163</a>) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.</p>

Table 516: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	The Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	The Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	The Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	<p>An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning.</p> <p>The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in <i>Application Settings: Agents Tab</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.								
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 517: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1122</a> ) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 518: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
NetworkId	The Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	The Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	The IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.27.3 DELETE SSL NetworkRanges ID

The DELETE /SSL/NetworkRanges/{id} method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

**Tip:** To delete some but not all of the network ranges for a network, use the *PUT /SSL/Networks* method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 1145](#)).

Table 519: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.4 GET SSL NetworkRanges ID

The GET /SSL/NetworkRanges/{id} method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 520: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 521: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>IP Address</td></tr> <tr> <td>2</td><td>Host Name</td></tr> <tr> <td>3</td><td>Network Notation</td></tr> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

# 2.2.27.5 GET SSL Networks Identifier

The GET /SSL/Networks/{identifier} method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 522: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 523: GET SSL Networks {id} Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description										
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": {   "Time": "2022-02-27T11:45:00Z" }</pre> <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).						
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned
Value	Description										
0	Unknown										
1	Not Scheduled										
2	Running										
3	Previously Scanned										

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	4	Scheduled	5	Disabled	6	In Quiet Hours								
Value	Description																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).																

Name	Description
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 524: GET SSL Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Using the Discovery Results Search Feature</a> section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentPoolName</i></li> <li>• <i>CertificateCN</i></li> <li>• <i>CertificateFound</i> (True, False)</li> <li>• <i>Status</i> ( 6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4- Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown)</li> <li>• <i>IpAddress</i></li> <li>• <i>IsMonitored</i> (True, False)</li> <li>• <i>IssuerDN</i></li> <li>• <i>NetworkName</i></li> <li>• <i>Port</i></li> <li>• <i>ReverseDNS</i></li> <li>• <i>Reviewed</i> (True, False)</li> <li>• <i>SelfSigned</i> (True, False)</li> <li>• <i>SNIName</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 525: GET SSL Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 526: GET SSL Networks Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i></li> <li>• <i>Pool</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 527: GET SSL Networks Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.										
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned
Value	Description										
0	Unknown										
1	Not Scheduled										
2	Running										
3	Previously Scanned										

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	4	Scheduled	5	Disabled	6	In Quiet Hours								
Value	Description																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).																

Name	Description
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.8 POST SSL Networks

The POST /SSL/Networks method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 528: POST SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	<b>Required.</b> A string indicating the name for the SSL network.										
AgentPoolName	Body	<b>Required.</b> A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	<b>Required.</b> A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	In	Description
		This field is for reference and is not configurable.
SslAlertRecipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Body	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Body	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre> "QuietHours": [   {     "StartDay": "Monday",     "StartTime": "2022-11-21T14:00:08Z",     "EndDay": "Tuesday",     "EndTime": "2022-11-22T14:00:08Z"   },   {     "StartDay": "Saturday",     "StartTime": "2022-11-26T04:00:08Z",     "EndDay": "Sunday", </pre>

Name	In	Description
		<pre>      "EndTime": "2022-11-27T16:00:08Z"     }   ]</pre>

Table 529: POST SSL Networks Response Data

Name	Description								
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.								
Name	A string indicating the name for the SSL network.								
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.								
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.								
Description	A string indicating the description of the SSL network.								
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.								
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.								
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running
Value	Description								
0	Unknown								
1	Not Scheduled								
2	Running								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours						
Value	Description

MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network																

Name	Description
	activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.9 PUT SSL Networks

The PUT /SSL/Networks method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 530: PUT SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	<b>Required.</b> A string indicating the name for the SSL network.										
AgentPoolName	Body	<b>Required.</b> A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	<b>Required.</b> A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": {   "Minutes": 60 }</pre></td></tr></table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.

3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
DiscoverLastScanned	Body	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																
MonitorLastScanned	Body	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																

Name	In	Description
		This field is for reference and is not configurable.
SslAlertRecipients	Body	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Body	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Body	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Body	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	Body	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Body	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Body	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Body	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre> "QuietHours": [   {     "StartDay": "Monday",     "StartTime": "2022-11-21T14:00:08Z",     "EndDay": "Tuesday",     "EndTime": "2022-11-22T14:00:08Z"   },   {     "StartDay": "Saturday",     "StartTime": "2022-11-26T04:00:08Z",     "EndDay": "Sunday", </pre>

Name	In	Description
		<pre>      "EndTime": "2022-11-27T16:00:08Z"     }   ]</pre>

Table 531: PUT SSL Networks Response Data

Name	Description								
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.								
Name	A string indicating the name for the SSL network.								
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.								
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.								
Description	A string indicating the description of the SSL network.								
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.								
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.								
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.

5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  <b>Note:</b> To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>																
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).																
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network																

Name	Description
	activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.10 GET SSL Endpoints ID History

The GET /SSL/Endpoints/{id}/History method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the specified endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 532: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	<p><b>Required.</b> The Keyfactor Command reference GUID for the SSL endpoint for which to return history information.</p> <p>Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1122</a>) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.</p>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 533: GET SSL Endpoints {id} History Response Data

Name	Description																																
HistoryId	The Keyfactor Command reference GUID for the history entry.																																
EndpointId	The Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	The Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	The date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>TimeOutConnecting</td></tr> <tr> <td>2</td><td>ExceptionConnecting</td></tr> <tr> <td>3</td><td>TimeoutDownloading</td></tr> <tr> <td>4</td><td>ExceptionDownloading</td></tr> <tr> <td>5</td><td>NotSsl</td></tr> <tr> <td>6</td><td>CertificateFound</td></tr> <tr> <td>7</td><td>ExceptionInSql</td></tr> <tr> <td>8</td><td>InvalidOrUnreachableHost</td></tr> <tr> <td>9</td><td>ConnectionRefused</td></tr> <tr> <td>10</td><td>BadSslHandshake</td></tr> <tr> <td>11</td><td>ClientAuthenticationFailed</td></tr> <tr> <td>12</td><td>NoCertificate</td></tr> <tr> <td>13</td><td>SslRefused</td></tr> <tr> <td>14</td><td>NotProbed</td></tr> </table>	Value	Description	0	Unknown	1	TimeOutConnecting	2	ExceptionConnecting	3	TimeoutDownloading	4	ExceptionDownloading	5	NotSsl	6	CertificateFound	7	ExceptionInSql	8	InvalidOrUnreachableHost	9	ConnectionRefused	10	BadSslHandshake	11	ClientAuthenticationFailed	12	NoCertificate	13	SslRefused	14	NotProbed
Value	Description																																
0	Unknown																																
1	TimeOutConnecting																																
2	ExceptionConnecting																																
3	TimeoutDownloading																																
4	ExceptionDownloading																																
5	NotSsl																																
6	CertificateFound																																
7	ExceptionInSql																																
8	InvalidOrUnreachableHost																																
9	ConnectionRefused																																
10	BadSslHandshake																																
11	ClientAuthenticationFailed																																
12	NoCertificate																																
13	SslRefused																																
14	NotProbed																																
JobType	An integer containing the type of scan job from which the history entry was created. The possible values are:																																

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Discovery</td></tr> <tr> <td>2</td><td>Monitoring</td></tr> <tr> <td>3</td><td>Compliance</td></tr> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance						
Value	Description																
0	Unknown																
1	Discovery																
2	Monitoring																
3	Compliance																
ProbeType	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>SSLv2</td></tr> <tr> <td>3</td><td>TLS</td></tr> </table>	Value	Description	2	SSLv2	3	TLS										
Value	Description																
2	SSLv2																
3	TLS																
ReverseDNS	A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.																
HistoryCertificates	<p>An array of certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>The date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>The date, in UTC, on which the certificate expires.</td></tr> <tr> <td>SigningAlgorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	The date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																
IssuedDN	A string indicating the distinguished name of the certificate.																
SerialNumber	A string indicating the serial number of the certificate.																
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.																
NotAfter	The date, in UTC, on which the certificate expires.																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																

Name	Description	
	Name	Description
	IssuerDN	A string indicating the distinguished name of the issuer.
	IssuedCN	A string indicating the common name of the certificate.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). The results from this method are of the currently in progress job or the latest completed job.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 534: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 535: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 536: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	<b>Required.</b> An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": [ "192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443" ]</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.27.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 SslManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 537: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	<b>Required.</b> The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	<b>Required.</b> An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": [ "192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443" ]</pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 538: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the GET /SSL method (see <a href="#">GET SSL on page 1122</a> ) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	<b>Required.</b> A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 539: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the endpoint to be updated.  Use the <i>GET /SSL</i> method (see <a href="#">GET SSL on page 1122</a> ) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	<b>Required.</b> A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 540: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Using the Discovery Results Search Feature</a> section.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 541: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Using the Discovery Results Search Feature</a> section.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.18 POST SSL Networks ID Scan

The POST /SSL/Networks/{id}/Scan method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 542: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.19 POST SSL Networks ID Reset

The POST */SSL/Networks/{id}/Reset* method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 543: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.20 POST SSL NetworkRanges Validate

The POST */SSL/NetworkRanges/Validate* method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network

range before using POST /SSL/NetworkRanges or PUT /SSL/NetworkRanges to configure it for an SSL network.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 544: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
networkRangesToVerify	Body	<b>Required.</b> An array of network ranges to validate. For example: [ "10.5.4.0/24:443", "192.168.12.0/16:443,22", "keyexample.com:443" ]

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.27.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Modify*

Table 545: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted. Use the <i>GET /SSL/Networks</i> method (see <a href="#">GET SSL Networks on page 1124</a> ) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.28 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 546: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	<a href="#">GET Status Endpoints below</a>

### 2.2.28.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. There are no input parameters for this method. This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
None

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 547: Templates Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns information about the specified template.	<a href="#">GET Templates ID on the next page</a>
/Settings	GET	Returns the global template policy settings.	<a href="#">GET Templates Settings on page 1185</a>
/Settings	PUT	Sets global values for template policy.	<a href="#">PUT Templates Settings on page 1191</a>
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	<a href="#">GET Templates Subject Parts on page 1204</a>
/	GET	Returns a list of templates.	<a href="#">GET Templates on page 1205</a>
/	PUT	Updates selected settings for the specified template.	<a href="#">PUT Templates on page 1215</a>

Endpoint	Method	Description	Link
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	<a href="#">POST Templates/Import on page 1242</a>

### 2.2.29.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 548: GET Templates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see <a href="#">GET Templates on page 1205</a> ) to retrieve a list of all the templates to determine the template ID.

Table 549: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name>_<certificate profile name>. This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name> (<certificate profile name>). This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>           An integer indicating the parameter type. The options are:           <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description														
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.														
Options	For multiple choice values, an array of strings containing the value choices.														
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.								
Value	Description														
1	String: A free-form data entry field.														
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.														
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> <li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li> <li>• The <i>default value</i> for the metadata field.</li> <li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li> <li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li> </ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.						
Name	Description														
Id	The Keyfactor Command reference ID of the template-specific metadata setting.														
DefaultValue	A string containing the default value defined for the metadata field for the specific template.														
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.														

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td></tr> <tr> <td>Enrollment</td><td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td> <p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p> </td></tr> <tr> <td>1</td><td> <p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p> </td></tr> <tr> <td>2</td><td> <p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p> </td></tr> </table> </td></tr> <tr> <td>Message</td><td> <p>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</p> </td></tr> <tr> <td>Options</td><td> <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple</i></p> </td></tr> </table>	Name	Description	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td> <p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p> </td></tr> <tr> <td>1</td><td> <p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p> </td></tr> <tr> <td>2</td><td> <p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p> </td></tr> </table>	Value	Description	0	<p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p>	1	<p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>	2	<p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>	Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</p>	Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple</i></p>
Name	Description																		
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																		
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td> <p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p> </td></tr> <tr> <td>1</td><td> <p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p> </td></tr> <tr> <td>2</td><td> <p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p> </td></tr> </table>	Value	Description	0	<p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p>	1	<p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>	2	<p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>										
Value	Description																		
0	<p>Optional</p> <p>Users have the option to either enter a value or not enter a value in the field.</p>																		
1	<p>Required</p> <p>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</p>																		
2	<p>Hidden</p> <p>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</p>																		
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</p>																		
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple</i></p>																		

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>choice.</td></tr> </table>	Name	Description		choice.														
Name	Description																		
	choice.																		
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment &amp; PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> <tr> <td>5</td><td>CSR Generation &amp; PFX Enrollment</td></tr> <tr> <td>6</td><td>CSR Generation &amp; CSR Enrollment</td></tr> <tr> <td>7</td><td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	<p>An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1185</a>. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Templateld</td><td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> </table>	Name	Description	Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Name	Description																		
Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		

Name	Description

Value	Description								
Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.								
RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>								
ECCValidCurves	An object containing a list of strings defining the valid elliptic curve								

Name	Description	
	Value	Description
		<p>algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>
	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.
	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.
	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.
	AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).
	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
UseAllowedRequesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the</p>	

Name	Description												
	Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.												
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.												
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div> <b>Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</div>  <p><i>Figure 2: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>												
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr></table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
Value	Function	Description											
0	None	No key usage parameters.											
1	Encipherment Only	The key can be used for encryption only.											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).											

Name	Description																								
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
4	Key Certificate Signing	The key can be used to sign certificates.																							
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in Active Directory.</td></tr><tr><td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr><tr><td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"><li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li><li>1.3.132.0.34 = P-384/secp384r1</li><li>1.3.132.0.35 = P-521/secp521r1</li></ul>																								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings.

**Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1215](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

There are no input parameters for this method.

Table 550: GET Templates Settings Response Data

Value	Description												
TemplateRegexes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr><tr><td>Regex</td><td><p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p><p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p><p>The following are some regular expression examples:</p><table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>CN (Common Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre><p>The default value for the Common Name regular expression is:</p><pre>.+</pre><p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p></td></tr><tr><td>O (Organization)</td><td><p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p><pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre><p>The period in the final company name (Key Example,</p></td></tr></table></td></tr></table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	Regex	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>CN (Common Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre><p>The default value for the Common Name regular expression is:</p><pre>.+</pre><p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p></td></tr><tr><td>O (Organization)</td><td><p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p><pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre><p>The period in the final company name (Key Example,</p></td></tr></table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example,</p>
Name	Description												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Regex	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>CN (Common Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre><p>The default value for the Common Name regular expression is:</p><pre>.+</pre><p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p></td></tr><tr><td>O (Organization)</td><td><p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p><pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre><p>The period in the final company name (Key Example,</p></td></tr></table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example,</p>						
Subject Part	Example												
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>

Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).
Value	Description						
SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).						
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).						

Value	Description												
	 ment defaults at both the system-wide and template level (see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> ) but does not apply to enrollment requests done through the Keyfactor API.												
TemplatePolicy	<p>An array containing the system-wide template policy settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Template policy details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RSASValidKeySizes</td><td> <p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul> </td></tr> <tr> <td>ECCValidCurves</td><td> <p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p> </td></tr> <tr> <td>AllowKeyReuse</td><td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.</td></tr> <tr> <td>AllowWildcards</td><td>A Boolean that indicates whether wildcards are allowed (true) or not (false).</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</td></tr> </table>	Value	Description	RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>	ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.
Value	Description												
RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>												
ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>												
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.

Value	Description						
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).						
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.29.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

**Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1215](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

**Note:** Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 551: PUT Templates Settings Input Parameters

Value	Description												
TemplateRegexes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>Regex</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example,</p> </td></tr> </table> </td></tr> </table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). Value	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Error</td><td>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</td></tr> </table> <p>For example:</p> <pre> "TemplateRegexes": [   {     "SubjectPart": "O",     "Regex": "^(?:Key Example Company Key Example\\, Inc\\.\\.)\$",     "Error": "Organization must be Key Example, Inc or Key Example Company."   } ] </pre>	Name	Description	Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.		
Name	Description						
Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.						
TemplateDefaults	<p>An object containing the system-wide template default settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Template default details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</td></tr> <tr> <td>Value</td><td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td></tr> </table> <p>For example:</p> <pre> "TemplateDefaults": [   {     "SubjectPart": "L",     "Value": "Denver"   },   {     "SubjectPart": "ST",     "Value": "Colorado"   } ] </pre> <p> <b>Note:</b> See also the <i>Subject Format</i> application setting, which takes precedence over enroll-</p>	Value	Description	SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).
Value	Description						
SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).						
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).						

Value	Description												
	 ment defaults at both the system-wide and template level (see <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> ) but does not apply to enrollment requests done through the Keyfactor API.												
TemplatePolicy	<p>An array containing the system-wide template policy settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Template policy details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RSASValidKeySizes</td><td> <p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul> </td></tr> <tr> <td>ECCValidCurves</td><td> <p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p> </td></tr> <tr> <td>AllowKeyReuse</td><td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.</td></tr> <tr> <td>AllowWildcards</td><td>A Boolean that indicates whether wildcards are allowed (true) or not (false).</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</td></tr> </table>	Value	Description	RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>	ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.
Value	Description												
RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>												
ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>												
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.												

Value	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>AllowEd448</td><td>A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).</td></tr> <tr> <td>AllowEd25519</td><td>A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).</td></tr> </table> <p>For example:</p> <pre> "TemplatePolicy": {   "RSAValidKeySizes": [     2048,     4096   ],   "ECCValidCurves": [     "1.2.840.10045.3.1.7",     "1.3.132.0.34",     "1.3.132.0.35"   ],   "AllowKeyReuse": false,   "AllowWildcards": true,   "RFCEnforcement": true,   "AllowEd448": false,   "AllowEd25519": false } </pre>	Value	Description	AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
Value	Description						
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).						
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 553: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 554: GET Templates Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Template Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AllowedEnrollmentType</i> (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None)</li> <li>• <i>DisplayName</i></li> <li>• <i>FriendlyName</i></li> <li>• <i>ForestRoot</i> (deprecated)</li> <li>• <i>ConfigurationTenant</i></li> <li>• <i>HasPrivateKeyRetention</i> (True, False)</li> <li>• <i>IsDefaultTemplate</i> (True, False)</li> <li>• <i>KeyType</i> (Unknown, RSA, DSA, ECC, DH)</li> <li>• <i>ShortName</i></li> </ul> <div>  <p><b>Tip:</b> To filter out all the built-in Active Directory templates and display only your custom templates, use the following query:  <code>IsDefaultTemplate -eq "false"</code>  To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query:  <code>AllowedEnrollmentType -eq "3"</code>  A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment.</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 555: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name>_<certificate profile name>. This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <end entity profile name> (<certificate profile name>). This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

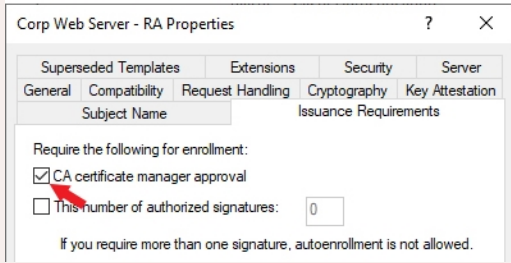

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>           An integer indicating the parameter type. The options are:           <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.				
Name	Description																		
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																		
Options	For multiple choice values, an array of strings containing the value choices.																		
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.												
Value	Description																		
1	String: A free-form data entry field.																		
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																		
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment &amp; PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> <tr> <td>5</td><td>CSR Generation &amp; PFX Enrollment</td></tr> <tr> <td>6</td><td>CSR Generation &amp; CSR Enrollment</td></tr> <tr> <td>7</td><td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																		
0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide																		

Name	Description														
	<p>regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1185</a>. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>TemplateId</td><td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>RegEx</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> </td></tr> </table> </td></tr> </table>	Name	Description	TemplateId	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> </td></tr> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p>
Name	Description														
TemplateId	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.														
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).														
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <a href="#">GET /Templates/SubjectParts</a> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p> </td></tr> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p>								
Subject Part	Example														
CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly ".keyexample.com":</p> <pre>^[a-zA-Z0-9' _\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>														
O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of "Key Example Inc", "Key Example" or "Key Example Inc.":</p>

Error	A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.										
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.										
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.										
RequiresApproval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).										

Name	Description																											
	<div><div> <b>Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</div><div></div><div>Figure 3: Microsoft Issuance Requirements on a Template for Manager Approval</div></div>																											
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr></table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.
Value	Function	Description																										
0	None	No key usage parameters.																										
1	Encipherment Only	The key can be used for encryption only.																										
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																										
4	Key Certificate Signing	The key can be used to sign certificates.																										
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																										
16	Data Encipherment	The key can be used for data encryption.																										
32	Key Encipherment	The key can be used for key encryption.																										
64	Nonrepudiation	The key can be used for authentication.																										

Name	Description		
	Value	Function	Description
	128	Digital Signature	The key can be used as a digital signature.
	32768	Decipherment Only	The key can be used for decryption only.
	For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i> . A value of 224 would add <i>nonrepudiation</i> to those.		
ExtendedKeyUsages	An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:		
	Name	Description	
	Id	An integer indicating the ID of the extended key usage in Active Directory.	
	Oid	A string containing the object ID of the extended key usage.	
	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).	

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 556: PUT Templates Input Parameters

Name	In	Description										
Id	Body	<b>Required.</b> An integer indicating the ID of the template in Keyfactor Command.										
KeySize	Body	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.										
KeyType	Body	A string indicating the key type of the template as defined by the CA. The field is not configurable.										
FriendlyName	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	Body	<div><p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>None</td><td>The private key will not be retained.</td></tr><tr><td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr><tr><td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr><tr><td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr></table></div>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.											
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.											
KeyRetentionDays	Body	An integer indicating the number of days a certificate’s private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	Body	An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:										

Name	In	Description																
		<ul style="list-style-type: none"><li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li><li>Providing additional information to the CA with the CSR.</li></ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div> <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</div> <p>The enrollment fields object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr><tr><td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr><tr><td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr><tr><td>DataType</td><td>An integer indicating the parameter type. The options are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table></td></tr></table> <p>For example:</p> <pre>"EnrollmentFields": [   {     "Id": 3,     "Name": "MyCustomField",     "Options": ["Green", "Red", "Yellow", "Blue"],     "DataType": 2   } ]</pre>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																	
Id	An integer indicating the ID of the custom enrollment field.																	
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																	
Options	For multiple choice values, an array of strings containing the value choices.																	
DataType	An integer indicating the parameter type. The options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.											
Value	Description																	
1	String: A free-form data entry field.																	
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																	

Name	In	Description										
		<div>]</div>										
MetadataFields	Body	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"><li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li><li>• The <i>default value</i> for the metadata field.</li><li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li><li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li></ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr><tr><td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr><tr><td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr><tr><td>Validation</td><td><p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p><div><pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre></div><p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p></td></tr></table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <div><pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre></div> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p>
Name	Description											
Id	The Keyfactor Command reference ID of the template-specific metadata setting.											
DefaultValue	A string containing the default value defined for the metadata field for the specific template.											
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.											
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <div><pre>^[a-zA-Z0-9' _\.\-]*@ (keyexample\.org keyexample\.com)\$</pre></div> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either "@keyexample.org" or "keyexample.com".</p>											

Name	In	Description									
		<b>Name</b>	<b>Description</b>								
			This field is only supported for metadata fields with data type <i>string</i> .								
		Enrollment	An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr><tr><td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr></table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
		Value	Description								
		0	Optional Users have the option to either enter a value or not enter a value in the field.								
		1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
		2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression ( <i>Validation</i> field).										
Options	An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields. This field is only supported for metadata fields with data type <i>multiple choice</i> .										
For example:											
<pre>"MetadataFields": [   {     "Id": 4,     "DefaultValue": "reggie.wallace@keyexample.com",</pre>											

Name	In	Description																		
		<pre>      "MetadataId": 4,       "Validation": "^[a-zA-Z0-9' _\\.\\-]*@(keyexample\\.or- g keyexample\\.com)\$",       "Enrollment": 1,       "Message": "Your email address must be of the form user- @keyexample.com or fname.lname@keyexample.com."     },     {       "Id": 13,       "DefaultValue": "E-Business",       "MetadataId": 5,       "Validation": "",       "Enrollment": 0,       "Message": "",       "Options": "Accounting,E-Busi- ness,Executive,HR,IT,Marketing,R&amp;D,Sales"     }   ]</pre>																		
AllowedEnrollmentTypes	Body	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>CSR Enrollment &amp; PFX Enrollment</td></tr><tr><td>4</td><td>CSR Generation</td></tr><tr><td>5</td><td>CSR Generation &amp; PFX Enrollment</td></tr><tr><td>6</td><td>CSR Generation &amp; CSR Enrollment</td></tr><tr><td>7</td><td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td></tr></table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation
Value	Description																			
0	None																			
1	PFX Enrollment																			
2	CSR Enrollment																			
3	CSR Enrollment & PFX Enrollment																			
4	CSR Generation																			
5	CSR Generation & PFX Enrollment																			
6	CSR Generation & CSR Enrollment

Your custom message follows this.</p>	<p>For example:</p> <pre>"TemplateRegexes": [   {     "TemplateId": 57,     "SubjectPart": "0",     "Regex": "^(?:Key Example Company Key Example\, Inc\\.\\.)\$",     "Error": "Organization must be Key Example, Inc or Key Example Company."   } ]</pre>		TemplateDefaults	Body	An object containing individual template-level template default settings. Template
		Name	Description																
			<table><tr><th>Subject Part</th><th>Example</th></tr><tr><td>MAIL (Subject Alternative Name: Email)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre></td></tr><tr><td>UPN (Subject Alternative Name: User Principal Name)</td><td><p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p><pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre></td></tr></table>	Subject Part	Example	MAIL (Subject Alternative Name: Email)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre>	UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre>										
		Subject Part	Example																
		MAIL (Subject Alternative Name: Email)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre>																
UPN (Subject Alternative Name: User Principal Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the "@" made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly "@keyexample.com":</p> <pre>^[a-zA-Z0-9' _ \. \- ]*@keyexample\.com\$</pre>																		
Error	<p>A string specifying the error message displayed to the user when the subject part referenced in the CSR or entered for a PFX enrollment does not match the given regular expression. Note that the error message already includes a leading string with the subject part (e.g. "Common Name:" or "Invalid CN provided:" depending on the interface used). Your custom message follows this.</p>																		
<p>For example:</p> <pre>"TemplateRegexes": [   {     "TemplateId": 57,     "SubjectPart": "0",     "Regex": "^(?:Key Example Company Key Example\, Inc\\.\\.)\$",     "Error": "Organization must be Key Example, Inc or Key Example Company."   } ]</pre>																			
TemplateDefaults	Body	An object containing individual template-level template default settings. Template																	

Name	In	Description						
		<p>defaults defined on a template apply to enrollments made with that template only. Template-level defaults, if defined, take precedence over system-wide template defaults. For more information about system-wide template defaults, see <a href="#">GET Templates Settings on page 1185</a>. The template default object contains the following parameters:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SubjectPart</td><td>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).  Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1204</a>) to retrieve a list of all the supported subject parts.</td></tr><tr><td>Value</td><td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td></tr></table> <p>For example:</p> <pre>"TemplateDefaults": [   {     "SubjectPart": "L",     "Value": "Denver"   },   {     "SubjectPart": "ST",     "Value": "Colorado"   } ]</pre>	Value	Description	SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).  Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1204</a> ) to retrieve a list of all the supported subject parts.	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).
Value	Description							
SubjectPart	A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).  Use the <i>GET /Templates/SubjectParts</i> method (see <a href="#">GET Templates Subject Parts on page 1204</a> ) to retrieve a list of all the supported subject parts.							
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).							
TemplatePolicy	Body	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see <a href="#">GET Templates Settings on page 1185</a>. The template policy object contains the following parameters:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Tempalteld</td><td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td></tr><tr><td>RSASValidKeySizes</td><td>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</td></tr></table>	Value	Description	Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.	RSASValidKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:
Value	Description							
Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.							
RSASValidKeySizes	An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:							

Name	In	Description					
		<table><tr><th>Value</th><th>Description</th></tr><tr><td></td><td><ul style="list-style-type: none"><li>2048</li><li>4096</li></ul></td></tr></table>	Value	Description		<ul style="list-style-type: none"><li>2048</li><li>4096</li></ul>	
		Value	Description				
			<ul style="list-style-type: none"><li>2048</li><li>4096</li></ul>				
		ECCValidCurves	<p>An object containing a list of strings defining the valid elliptic curve algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"><li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li><li>1.3.132.0.34 = P-384/secp384r1</li><li>1.3.132.0.35 = P-521/secp521r1</li></ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>				
		AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.				
		AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.				
		RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.				
		AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).				
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).						
For example:							

Name	In	Description
		<pre> "TemplatePolicy": {   "TemplateId": 17,   "RSAValidKeySizes": [     2048,     4096   ],   "ECCValidCurves": [     "1.2.840.10045.3.1.7",     "1.3.132.0.34",     "1.3.132.0.35"   ],   "AllowKeyReuse": false,   "AllowWildcards": true,   "RFCEnforcement": true,   "AllowEd448": false,   "AllowEd25519": false } </pre>
UseAllowedRequesters	Body	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	Body	<p>An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p> <p>For example:</p> <pre> "AllowedRequesters": [   "Administrator",   "Power Users",   "Revokers" ] </pre>
RequiresApproval	Body	<p>A Boolean indicating whether the template has been configured with the Microsoft CA <i>certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div>  <b>Important:</b> Any templates that are configured on the Microsoft CA Issuance </div>

Name	In	Description																																	
		<div><div></div><div>Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</div></div> <div></div> <div>Figure 4: Microsoft Issuance Requirements on a Template for Manager Approval</div>																																	
KeyUsage	Body	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																	
0	None	No key usage parameters.																																	
1	Encipherment Only	The key can be used for encryption only.																																	
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																	
4	Key Certificate Signing	The key can be used to sign certificates.																																	
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																	
16	Data Encipherment	The key can be used for data encryption.																																	
32	Key Encipherment	The key can be used for key encryption.																																	
64	Nonrepudiation	The key can be used for authentication.																																	
128	Digital Signature	The key can be used as a digital signature.																																	
32768	Decipherment Only	The key can be used for decryption only.																																	

Name	In	Description
		For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i> . A value of 224 would add <i>nonrepudiation</i> to those.
Curve	Body	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>

Table 557: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt;_&lt;certificate profile name&gt;</i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i>&lt;end entity profile name&gt; (&lt;certificate profile name&gt;)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  <b>Note:</b> The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued ( <i>KeyRetentionDays</i> ), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.						
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										

Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>           An integer indicating the parameter type. The options are:           <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description														
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.														
Options	For multiple choice values, an array of strings containing the value choices.														
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.								
Value	Description														
1	String: A free-form data entry field.														
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.														
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> <li>• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.</li> <li>• The <i>default value</i> for the metadata field.</li> <li>• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.</li> <li>• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns.</li> </ul> <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.						
Name	Description														
Id	The Keyfactor Command reference ID of the template-specific metadata setting.														
DefaultValue	A string containing the default value defined for the metadata field for the specific template.														
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.														

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment &amp; PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> <tr> <td>5</td><td>CSR Generation &amp; PFX Enrollment</td></tr> <tr> <td>6</td><td>CSR Generation &amp; CSR Enrollment</td></tr> <tr> <td>7</td><td>CSR Enrollment, PFX Enrollment &amp; CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation

TemplateRegexes	<p>An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see <a href="#">GET Templates Settings on page 1185</a>. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Templateld</td><td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> </table>	Name	Description	Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Name	Description																		
Templateld	The Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		

Name	Description

Value	Description								
Tempalteld	The Keyfactor Command reference ID of the certificate template the policy is associated with.								
RSASValidKeySizes	<p>An object containing a comma-delimited list of integers defining the valid RSA key sizes supported for all templates used for enrollment. The supported values are:</p> <ul style="list-style-type: none"> <li>• 2048</li> <li>• 4096</li> </ul>								
ECCValidCurves	An object containing a list of strings defining the valid elliptic curve								

Name	Description	
	Value	Description
		<p>algorithms for ECC templates. These may be specified using the well-known OIDs for ECC algorithms or by friendly name. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul> <p>When specifying by friendly name, do not include a slash (use "P-256", not "P-256/prime256v1/secp256r1").</p>
	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.
	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.
	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.
	AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).
	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the	

Name	Description												
	Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.												
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.												
RequiresApproval	<div><p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p><div><div></div><div><b>Important:</b> Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</div></div><div></div><p><i>Figure 5: Microsoft Issuance Requirements on a Template for Manager Approval</i></p></div>												
KeyUsage	<div><p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p><table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr></table></div>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).
Value	Function	Description											
0	None	No key usage parameters.											
1	Encipherment Only	The key can be used for encryption only.											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).											

Name	Description																								
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																							
4	Key Certificate Signing	The key can be used to sign certificates.																							
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																							
16	Data Encipherment	The key can be used for data encryption.																							
32	Key Encipherment	The key can be used for key encryption.																							
64	Nonrepudiation	The key can be used for authentication.																							
128	Digital Signature	The key can be used as a digital signature.																							
32768	Decipherment Only	The key can be used for decryption only.																							
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in Active Directory.</td></tr><tr><td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr><tr><td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																
Name	Description																								
Id	An integer indicating the ID of the extended key usage in Active Directory.																								
Oid	A string containing the object ID of the extended key usage.																								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).																								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"><li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li><li>1.3.132.0.34 = P-384/secp384r1</li><li>1.3.132.0.35 = P-521/secp521r1</li></ul>																								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.29.7 POST Templates/Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

Table 558: POST Templates/Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.30 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions](#) in the *Keyfactor Command Reference Guide*) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

Table 559: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	<a href="#">GET Workflow Certificates ID on the next page</a>
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	<a href="#">GET Workflow Certificates Denied on page 1245</a>

Endpoint	Method	Description	Link
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	<a href="#">GET Workflow Certificates Pending on page 1248</a>
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	<a href="#">GET Workflow Certificates External Validation on page 1251</a>
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	<a href="#">POST Workflow Certificates Approve on page 1256</a>
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	<a href="#">POST Workflow Certificates Deny on page 1254</a>

### 2.2.30.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 560: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	<b>Required.</b> An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see <a href="#">GET Workflow Certificates Pending on page 1248</a> ) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 561: GET Workflow Certificates {id} Input Parameters

Name	Description								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An object containing a comma delimited list of strings listing the subject alternative name elements of the certificate request.								
CertStores	<p>An object containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>EntryName</td><td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the machine on which the certificate store is located.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td></tr> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> <li>1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>1.3.132.0.34 = P-384/secp384r1</li> <li>1.3.132.0.35 = P-521/secp521r1</li> </ul>								
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div>  <b>Note:</b> The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command.         </div>								
CARestId	An integer indicating the row index of the certificate request in the certificate authority.								
CommonName	A string indicating the common name of the requested certificate.								

Name	Description
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. The possible values are: <ul style="list-style-type: none"> <li>Unknown (0)</li> <li>Active (1)</li> <li>Revoked (2)</li> <li>Denied (3)</li> <li>Failed (4)</li> <li>Pending (5)</li> <li>Certificate Authority (6)</li> <li>Parent Certificate Authority (7)</li> <li>External Validation (8)</li> </ul>
StateString	A string indicating the request state of the certificate (e.g. Pending).
Metadata	An array containing the metadata fields populated for the certificate request.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.30.2 GET Workflow Certificates Denied

The GET /Workflow/Certificates/Denied method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer

to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see Workflow Definitions in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 562: GET Workflow Certificates Denied Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CAHostname</i></li> <li>• <i>CALogical</i></li> <li>• <i>CommonName</i></li> <li>• <i>Requester</i></li> <li>• <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 3.</li> <li>• <i>SubmissionDate</i></li> <li>• <i>Template</i></li> </ul> <div>  <p><b>Tip:</b> For example, for recent denied requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 563: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: corpca01.keyexample.com\CorpIssuingCA1
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.   <b>Note:</b> This method returns only requests with state 3 (denied).
StateString	A string indicating the request state of the certificate (e.g. Pending).   <b>Note:</b> This method returns only requests with a Denied state.
Metadata	An array containing the metadata fields populated for the certificate request.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.30.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 564: GET Workflow Certificates Pending Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CAHostname</i></li> <li>• <i>CALogical</i></li> <li>• <i>CommonName</i></li> <li>• <i>Requester</i></li> <li>• <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 5.</li> <li>• <i>SubmissionDate</i></li> <li>• <i>Template</i></li> </ul> <div>  <p><b>Tip:</b> For example, for recent pending requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 565: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.   <b>Note:</b> This method returns only requests with state 5 (pending).
StateString	A string indicating the request state of the certificate (e.g. Pending).   <b>Note:</b> This method returns only requests with a Pending state.
Metadata	An array containing the metadata fields populated for the certificate request.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.30.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of

information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 566: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CAHostname</i></li> <li>• <i>CALogical</i></li> <li>• <i>CommonName</i></li> <li>• <i>Requester</i></li> <li>• <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8.</li> <li>• <i>SubmissionDate</i></li> <li>• <i>Template</i></li> </ul> <div>  <b>Tip:</b> For example, for recent external validation requests from requester key_service:  SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service" </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 567: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: corpca01.keyexample.com\\CorpIssuingCA1
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.   <b>Note:</b> This method returns only requests with state 8 (external validation).
StateString	A string indicating the request state of the certificate (e.g. Pending).   <b>Note:</b> This method returns only requests with an External Validation state.
Metadata	An array containing the metadata fields populated for the certificate request.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.30.5 POST Workflow Certificates Deny

The POST /Workflow/Certificates/Deny method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Participate*

Table 568: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	<b>Required.</b> An array of Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: [23,45,12] Use the <i>GET /Workflow/Certificates/Pending</i> method (see <a href="#">GET Workflow Certificates Pending on page 1248</a> ) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 569: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of the successful denial response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARequestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denies will have alternate comments (see below).</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARequestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denies will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARequestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be "Successful". Denies that fail or are denies will have alternate comments (see below).												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.30.6 POST Workflow Certificates Approve

The POST /Workflow/Certificates/Approve method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

**Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1258](#) and [Workflow Instances on page 1353](#)).

**Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see Workflow Definitions in the *Keyfactor Command Reference Guide*).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Participate*

Table 570: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	<p><b>Required.</b> An array of Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name):</p> <pre>[23,45,12]</pre> <p>Use the <i>GET /Workflow/Certificates/Pending</i> method (see <a href="#">GET Workflow Certificates Pending on page 1248</a>) to retrieve a list of all the certificate requests to determine the certificate request's IDs.</p>

Table 571: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of the successful approval response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARquestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A reason or description about why the request denials succeeded, failed or were denied.</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow's type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven't created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used.

For more information about workflows, see *Workflow Definitions* in the *Keyfactor Command Reference Guide*.

Table 572: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	<a href="#">GET Workflow Definitions Steps Extension Name on the next page</a>
/definitionId	DELETE	Deletes the workflow definition with the specified GUID.	<a href="#">DELETE Workflow Definitions Definition ID on page 1262</a>
/definitionId	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	<a href="#">GET Workflow Definitions Definition ID on page 1262</a>
/definitionId	PUT	Updates the name and description of the workflow definition with the specified GUID.	<a href="#">PUT Workflow Definitions Definition ID on page 1279</a>
/	GET	Returns a list of workflow definitions, without steps.	<a href="#">GET Workflow Definitions on page 1296</a>
/	POST	Creates a new workflow definition, without steps.	<a href="#">POST Workflow Definitions on page 1298</a>
/Steps	GET	Returns information about the structure of the workflow definitions.	<a href="#">GET Workflow Definitions Steps on page 1315</a>
/Types	GET	Returns a list of the defined workflow definition types.	<a href="#">GET Workflow Definitions Types on page 1317</a>
/definitionId/Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	<a href="#">PUT Workflow Definitions Definition ID Steps on page 1318</a>
/definitionId/Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	<a href="#">POST Workflow Definitions Definition ID Publish on page 1337</a>

### 2.2.31.1 GET Workflow Definitions Steps Extension Name

The GET /Workflow/Definitions/Steps/{extensionName} method is used to retrieve the workflow definition step structure for the step with the specified extensionName. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: Read

Table 573: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	<p><b>Required.</b> A string indicating the <i>extensionName</i> of the workflow definition step to retrieve.</p> <p>Use the GET /Workflow/Definitions/Steps method (see <a href="#">GET Workflow Definitions Steps on page 1315</a>) to retrieve a list of all the workflow definition steps to determine the extensionName.</p>

Table 574: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> <li>• <b>Email</b>—Send an email message. This is a separate email message from those typically sent as part of a <i>RequireApproval</i> step.</li> <li>• <b>EnrollStep</b>—Enroll for a certificate through Keyfactor Command.</li> <li>• <b>NOOPStep</b>—An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.</li> <li>• <b>PowerShell</b>—Run a PowerShell script. The script contents are embedded within the step. It does not call out to an external file.</li> <li>• <b>RequireApproval</b>—Require approval for a workflow step before the step can be completed. This step includes logic to gather the correct number of approvals from the users with the correct security roles and to send an email message indicating whether the step was approved or denied. This step does not include logic to send an email initiating the approval process. Use an <i>Email</i> type for this.</li> </ul> <div>  <b>Important:</b> Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>.         </div> <ul style="list-style-type: none"> <li>• <b>RestRequest</b>—Run a REST request. The REST request contents are embedded within the step. It does not call out to an external file.</li> <li>• <b>RevokeStep</b>—Revoke a certificate through Keyfactor Command.</li> </ul>
Outputs	An object containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Modify*

**Note:** The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 575: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to delete.  Use the <i>GET /Workflow/Definitions</i> method (see <a href="#">GET Workflow Definitions on page 1296</a> ) to retrieve a list of all the workflow definitions to determine the GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.3 GET Workflow Definitions Definition ID

The GET /Workflow/Definitions/{definitionid} method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Read*

Table 576: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see <a href="#">GET Workflow Definitions on page 1296</a>) to retrieve a list of all the workflow definitions to determine the GUID.</p>
definitionVersion	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see <a href="#">Security Roles on page 907</a> ) in the workflow definition should be removed from the response (true) or not (false). A value of <i>true</i> allows for the workflow definition to be exported without role-specific data. The default is <i>false</i> .

Table 577: GET Workflow Definitions {definitionsid} Response Data

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayNa-me	A string indicating the display name defined for the workflow definition.										
Descrip-tion	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDis-playName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPub-lished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
Work-flowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>Exten-sionName</td><td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	Exten-sionName	A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs

Value	Description																				
ScriptParameters	An array of key/value pair strings defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .																				
ScriptContent	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.																				
	 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved— <code>\$(cmnt)</code> —and append additional data to it using PowerShell.																				
	<p>Possible <b>RequireApproval</b> parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>MinimumApprovals</td><td>In integer indicating the minimum number of users who must approve the request to allow the request to complete.</td></tr> </table>	Value	Description	MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																
Value	Description																				
MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																				

Name	Description		
	Name	Description	
		Value	Description
	DenialEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is denied.	
	DenialEmailMessage	<p>A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.</p>	
	DenialEmailRecipients	<p>An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>	
	ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.	
	ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.	

Name	Description		
	Name	Description	
		Value	Description
			See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.
	ApprovalEmailRecipients		<p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
	<p> <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select \$(requester) in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable \$(requester).</p>		
	Possible <b>RestRequest</b> parameters include:		
		Value	Description
		Headers	An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each

Name	Description		
	Name	Description	
		Value	Description
			<p>endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
	DataBucketProperty		<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
	Verb		<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"> <li>DELETE</li> <li>GET</li> </ul>

Name	Description								
	Name	Description							
		Value	Description						
			<ul style="list-style-type: none"><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>						
	UseBasicAuth	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p> <p>If <i>UseBasicAuth</i> is <i>False</i>, Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>							
	BasicUsername	<p>An array indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store credential information are:</p> <ul style="list-style-type: none"><li>• Store the credential information in the Keyfactor secrets table.</li></ul> <p>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</p> <ul style="list-style-type: none"><li>• Load the credential information from a PAM provider. See <i>PAM Providers</i> and <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the username defined for basic authentication (in DOMAIN\username format).</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. 		Value	Description
			provider.
	Provider	<p>A string indicating the ID of the PAM provider.</p> <p>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 738</a>) to retrieve a list of all the PAM providers to determine the ID.</p> <p>For example, the username stored as a Keyfactor secret will look like:</p> <pre>{   "SecretValue": "KEYEXAMPLE\svc_MyServiceName" }</pre> <p>The username stored as a CyberArk PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{   "Provider": "1",   "Parameters":{     "Folder": "MyFolderName",     "Object": "MyWorkflowUsername"   } }</pre> <p>The username stored as a Delinea PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p>	

Name	Description		
	Name	Description	
		Value	Description
			<pre>{   "Provider": "1",   "Parameters":{     "SecretId":"MyUsernameId"   } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	BasicPassword		<p>An array indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	URL		<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div>  <p><b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> </div>

Name	Description		
	Name	Description	
		Value	Description
			 When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.
	ContentType	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"> <li>application/json</li> </ul>	
	RequestContent	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request): <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre>	
		 <b>Note:</b> This example assumes you have a metadata field called RevocationComment.	
		 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\${cmnt}—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \${id}.	
	Signals	An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see <i>ExtensionName</i> ). Possible <b>RequireApproval</b> values are:	

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".
Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".				
Value	Description										
RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.										
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".										
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).				
Value	Description										
Id	A string indicating the Keyfactor Command reference ID of the condition.										
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).										
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.						
Value	Description										
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.										

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
Published-Version	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.4 PUT Workflow Definitions Definition ID

The PUT /Workflow/Definitions/{definitionid} method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Modify*

**Note:** Only one workflow definition can be created for each combination of **Workflow Type** and **Key (Template)**. In other words, you cannot have two enrollment or revocation workflow definitions for the same template, though you can have one enrollment workflow definition and one revocation workflow definition for a given template.

**Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 578: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	Body	<b>Required.</b> A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 579: PUT Workflow Definitions {definitionid} Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. 	 message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select <code>\$(requester)</code> in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable <code>\$(requester)</code> .																				
Possible <b>PowerShell</b> parameters include:																					
Value	Description																				
ScriptParameters	An array of key/value pair strings defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .																				
ScriptContent	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.																				
 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved— <code>\$(cmnt)</code> —and append additional data to it using PowerShell.																					
Possible <b>RequireApproval</b> parameters include:																					
Value	Description																				
MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																				

Name	Description		
	Name	Description	
		Value	Description
	DenialEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is denied.	
	DenialEmailMessage	<p>A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.</p>	
	DenialEmailRecipients	<p>An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>	
	ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.	
	ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.	

Name	Description		
	Name	Description	
		Value	Description
			See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.
	ApprovalEmailRecipients		<p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
	<p> <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select \$(requester) in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable \$(requester).</p>		
	Possible <b>RestRequest</b> parameters include:		
		Value	Description
		Headers	An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each

Name	Description		
	Name	Description	
		Value	Description
			<p>endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
	DataBucketProperty		<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
	Verb		<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"> <li>DELETE</li> <li>GET</li> </ul>

Name	Description								
	Name	Description							
		Value	Description						
			<ul style="list-style-type: none"><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>						
	UseBasicAuth		<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p> <p>If <i>UseBasicAuth</i> is <i>False</i>, Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>						
	BasicUsername		<p>An array indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store credential information are:</p> <ul style="list-style-type: none"><li>• Store the credential information in the Keyfactor secrets table.</li></ul> <p>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</p> <ul style="list-style-type: none"><li>• Load the credential information from a PAM provider. See <i>PAM Providers</i> and <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the username defined for basic authentication (in DOMAIN\username format).</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM</td></tr></table>	Value	Description	SecretValue	A string containing the username defined for basic authentication (in DOMAIN\username format).	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM

To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".				
Value	Description										
RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.										
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".										
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).				
Value	Description										
Id	A string indicating the Keyfactor Command reference ID of the condition.										
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).										
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.						
Value	Description										
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.										

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
Published-Version	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 1262](#)) to return details including the workflow steps.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Read*

Table 580: GET Workflow Definitions Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DisplayName</i></li> <li>• <i>Id</i></li> <li>• <i>IsPublished</i> (true or false)</li> <li>• <i>WorkflowType</i> (Enrollment or Revocation)</li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 581: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul>
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 1318](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Modify*

**Note:** Only one workflow definition can be created for each combination of **Workflow Type** and **Key (Template)**. In other words, you cannot have two enrollment or revocation workflow definitions for the same template, though you can have one enrollment workflow definition and one revocation workflow definition for a given template.

Table 582: POST Workflow Definitions Input Parameters

Name	In	Description
DisplayName	Body	<b>Required.</b> A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p><b>Required.</b> A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1205</a>) to retrieve a list or your certificate templates to determine the template ID.</p> <p>This field cannot be modified on an edit.</p>
KeyDisplayName	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template.
WorkflowType	Body	<p><b>Required.</b> A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul> <p>This field cannot be modified on an edit.</p>

Table 583: POST Workflow Definitions Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.														
Value	Description																				
ScriptParameters	An array of key/value pair strings defining any parameters to be used in the PowerShell script. The key is the name of a custom parameter defined by you and the value is the initial value that should be set for that parameter before the PowerShell is executed, if any. Tokens are supported in the <i>value</i> .																				
ScriptContent	A string containing the PowerShell commands to execute. This should be the actual contents of the PowerShell script (the PowerShell commands and supporting components), not a path and filename to an external file.																				
	 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved— <code>\$(cmnt)</code> —and append additional data to it using PowerShell.																				
	<p>Possible <b>RequireApproval</b> parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>MinimumApprovals</td><td>In integer indicating the minimum number of users who must approve the request to allow the request to complete.</td></tr> </table>	Value	Description	MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																
Value	Description																				
MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																				

Name	Description		
	Name	Description	
		Value	Description
	DenialEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is denied.	
	DenialEmailMessage	<p>A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.</p>	
	DenialEmailRecipients	<p>An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>	
	ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.	
	ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.	

Name	Description		
	Name	Description	
		Value	Description
			See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.
	ApprovalEmailRecipients		<p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
	<p> <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select \$(requester) in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable \$(requester).</p>		
	Possible <b>RestRequest</b> parameters include:		
		Value	Description
		Headers	An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each

Name	Description		
	Name	Description	
		Value	Description
			<p>endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
	DataBucketProperty		<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
	Verb		<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"> <li>DELETE</li> <li>GET</li> </ul>

Name	Description								
	Name	Description							
		Value	Description						
			<ul style="list-style-type: none"><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>						
	UseBasicAuth		<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p> <p>If <i>UseBasicAuth</i> is <i>False</i>, Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>						
	BasicUsername		<p>An array indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store credential information are:</p> <ul style="list-style-type: none"><li>• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the credential information from a PAM provider. See <i>PAM Providers</i> and <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the username defined for basic authentication (in DOMAIN\username format).</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM</td></tr></table>	Value	Description	SecretValue	A string containing the username defined for basic authentication (in DOMAIN\username format).	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM
	Value	Description							
SecretValue	A string containing the username defined for basic authentication (in DOMAIN\username format).								
Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM								

Name	Description		
	Name	Description	
		Value	Description
		Value	Description
			provider.
	Provider	<p>A string indicating the ID of the PAM provider.</p> <p>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 738</a>) to retrieve a list of all the PAM providers to determine the ID.</p> <p>For example, the username stored as a Keyfactor secret will look like:</p> <pre>{  "SecretValue": "KEYEXAMPLE\svc_MyServiceName"}</pre> <p>The username stored as a CyberArk PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{  "Provider": "1",  "Parameters":{    "Folder": "MyFolderName",    "Object": "MyWorkflowUsername"  }}</pre> <p>The username stored as a Delinea PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p>	

Name	Description		
	Name	Description	
		Value	Description
			<pre>{   "Provider": "1",   "Parameters":{     "SecretId":"MyUsernameId"   } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	BasicPass-word		<p>An array indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	URL		<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div>  <p><b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> </div>

Name	Description	
	Name	Description
	Value	Description
		 When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.
	ContentType	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"> <li>application/json</li> </ul>
	RequestContent	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request): <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre> <div>  <b>Note:</b> This example assumes you have a metadata field called RevocationComment.         </div>
		 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\${cmnt}—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \${id}.
	Signals	An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see <i>ExtensionName</i> ). Possible <b>RequireApproval</b> values are:

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".
Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".				
Value	Description										
RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.										
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".										
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).				
Value	Description										
Id	A string indicating the Keyfactor Command reference ID of the condition.										
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).										
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.						
Value	Description										
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.										

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
Published-Version	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Read*

Table 584: GET Workflow Definitions Steps Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i> . The query fields supported for this endpoint are <i>DisplayName</i> , <i>ExtensionName</i> , and <i>SupportedWorkflowTypes</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 585: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> <li>• <b>Email</b>—Send an email message. This is a separate email message from those typically sent as part of a <i>RequireApproval</i> step.</li> <li>• <b>EnrollStep</b>—Enroll for a certificate through Keyfactor Command.</li> <li>• <b>NOOPStep</b>—An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow.</li> <li>• <b>PowerShell</b>—Run a PowerShell script. The script contents are embedded within the step. It does not call out to an external file.</li> <li>• <b>RequireApproval</b>—Require approval for a workflow step before the step can be completed. This step includes logic to gather the correct number of approvals from the users with the correct security roles and to send an email message indicating whether the step was approved or denied. This step does not include logic to send an email initiating the approval process. Use an <i>Email</i> type for this.</li> </ul> <div>  <b>Important:</b> Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <ul style="list-style-type: none"> <li>• <b>RestRequest</b>—Run a REST request. The REST request contents are embedded within the step. It does not call out to an external file.</li> <li>• <b>RevokeStep</b>—Revoke a certificate through Keyfactor Command.</li> </ul>
SupportedWorkflowTypes	<p>An array containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul>
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Read*

Table 586: GET Workflow Definitions Types Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i> . The query field supported for this endpoint is <i>Name</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>WorkflowType</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 587: GET Workflow Definitions Types Response Data

Name	Description												
WorkflowType	A string indicating the display name of the workflow type.												
KeyType	A string indicating the key type for the workflow. The built-in enrollment and revocation workflows use <i>Templates</i> as the key type.												
ContextParameters	An object containing the tokens that the workflow type provider has the ability to replace. These will vary depending on the workflow type.												
BuiltInSteps	<p>An object containing the information about the built-in step(s) for the workflow type (e.g. the enrollment step of the enrollment type). Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>ExtensionName</td><td>           A string indicating the extension name for the step. The built-in extensions are:           <ul style="list-style-type: none"> <li>• EnrollStep</li> <li>• RevokeStep</li> </ul> </td></tr> <tr> <td>Outputs</td><td>An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.</td></tr> <tr> <td>ConfigurationParametersDefinition</td><td>An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.</td></tr> <tr> <td>SignalsDefinition</td><td>An array containing the signals defined for the workflow definition step. These will vary depending on the step.</td></tr> </table>	Name	Description	DisplayName	A string indicating the display name for the step.	ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> <li>• EnrollStep</li> <li>• RevokeStep</li> </ul>	Outputs	An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.	ConfigurationParametersDefinition	An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.	SignalsDefinition	An array containing the signals defined for the workflow definition step. These will vary depending on the step.
Name	Description												
DisplayName	A string indicating the display name for the step.												
ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> <li>• EnrollStep</li> <li>• RevokeStep</li> </ul>												
Outputs	An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete.												
ConfigurationParametersDefinition	An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.

## 2.2.31.9 PUT Workflow Definitions Definition ID Steps

The PUT /Workflow/Definitions/{definitionid}/Steps method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Modify*

**Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

**Warning:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 588: PUT Workflow Definitions {definitionid} Steps Input Parameters

Name	In	Description
definitionId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to update.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see <a href="#">GET Workflow Definitions on page 1296</a>) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Name	In	Description

</		

Table 589: PUT Workflow Definitions {definitionid} Steps Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. Name	Description						
	<ul style="list-style-type: none"> <li> <b>SubjectFormatter</b>  On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step. <div>  <b>Important:</b> The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>. </div> </li> <li> <b>EnrollStep</b>  Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. </li> <li> <b>NOOPStep</b>  An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. </li> <li> <b>RevokeStep</b>  Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step. <div>  <b>Tip:</b> For steps that send email messages, the SMTP settings and sender information come from the standard Keyfactor Command SMTP configuration (see <a href="#">SMTP on page 1097</a>) and are not configured individually in the workflow steps. </div> </li> </ul>						
Enabled	A Boolean indicating whether the step is enabled to run (true) or not (false).

		Value	Description
	DenialEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is denied.	
	DenialEmailMessage	<p>A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.</p>	
	DenialEmailRecipients	<p>An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>	
	ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.	
	ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.	

Name	Description		
	Name	Description	
		Value	Description
			See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.
	ApprovalEmailRecipients		<p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
	<p> <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select \$(requester) in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable \$(requester).</p>		
	Possible <b>RestRequest</b> parameters include:		
		Value	Description
		Headers	An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each

Name	Description		
	Name	Description	
		Value	Description
			<p>endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
	DataBucketProperty		<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
	Verb		<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"> <li>DELETE</li> <li>GET</li> </ul>

Name	Description								
	Name	Description

	Name	Description	
		Value	Description
		Value	Description
			provider.
	Provider	<p>A string indicating the ID of the PAM provider.</p> <p>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 738</a>) to retrieve a list of all the PAM providers to determine the ID.</p> <p>For example, the username stored as a Keyfactor secret will look like:</p> <pre>{  "SecretValue": "KEYEXAMPLE\svc_MyServiceName"}</pre> <p>The username stored as a CyberArk PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{  "Provider": "1",  "Parameters":{    "Folder": "MyFolderName",    "Object": "MyWorkflowUsername"  }}</pre> <p>The username stored as a Delinea PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p>	

Name	Description	
	Name	Description
	Value	Description
		<pre>{   "Provider": "1",   "Parameters":{     "SecretId":"MyUsernameId"   } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	BasicPass-word	<p>An array indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div>  <p><b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> </div>

Name	Description		
	Name	Description	
		Value	Description
			 When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.
	ContentType	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"> <li>application/json</li> </ul>	
	RequestContent	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request): <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre>  <b>Note:</b> This example assumes you have a metadata field called RevocationComment.	
		 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\${cmnt}—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \${id}.	
	Signals	An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see <i>ExtensionName</i> ). Possible <b>RequireApproval</b> values are:	

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".				
Value	Description										
RoleId	An array of integers indicating the security roles whose members are allowed to approve the request.										
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".										
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).				
Value	Description										
Id	A string indicating the Keyfactor Command reference ID of the condition.										
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).										
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.						
Value	Description										
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.										

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
Published-Version	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.31.10 POST Workflow Definitions Definition ID Publish

The POST `/Workflow/Definitions/{definitionid}/Publish` method is used to mark the most recent version of the workflow definition with the specified GUID as the published, active, version. When a definition is published, all new or restarted workflow instances (see [Workflow Instances on page 1353](#)) will be able to use the updated version of the workflow. This method returns HTTP 200 OK on a success with details about the workflow definition.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowDefinitions: *Modify*

Table 590: POST Workflow Definitions {definitionid} Publish Input Parameters

Name	In	Description
definitionId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow definition to publish.</p> <p>Use the <code>GET /Workflow/Definitions</code> method (see <a href="#">GET Workflow Definitions on page 1296</a>) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Table 591: POST Workflow Definitions {definitionid} Publish Response Body

Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Description	A string indicating the description for the workflow definition.										
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template.										
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template.										
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .										
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	A string indicating the type of step. The currently supported types are: <ul style="list-style-type: none"> <li><b>Email</b></li> </ul> Send an email message. Value	Description																				
MinimumApprovals	In integer indicating the minimum number of users who must approve the request to allow the request to complete.																				

Name	Description		
	Name	Description	
		Value	Description
		DenialEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is denied.
		DenialEmailMessage	<p>A string indicating the email message that will be delivered if the request is denied. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.</p>
		DenialEmailRecipients	<p>An array of strings containing the recipients for the denial email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
		ApprovalEmailSubject	A string indicating the subject line for the email message that will be delivered if the request is approved.
		ApprovalEmailMessage	A string indicating the email message that will be delivered if the request is approved. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML.

Name	Description		
	Name	Description	
		Value	Description
			See <i>Table: Tokens for Workflow Definitions</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available tokens.
	ApprovalEmailRecipients		<p>An array of strings containing the recipients for the approval email. Each email message can have multiple recipients. You can use specific email addresses and/or use tokens to replace an email address variable with actual email addresses at processing time. Available email tokens include:</p> <ul style="list-style-type: none"> <li>\$(requester:mail) The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to \$(metadata:AppOwnerEmailAddress).</li> </ul>
	<p> <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the subject line, message and email recipient fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can select \$(requester) in the workflow definition for an enrollment request and the email message will contain the specific certificate requester name instead of the variable \$(requester).</p>		
	Possible <b>RestRequest</b> parameters include:		
		Value	Description
		Headers	An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see <a href="#">Table 1: Common Request Headers</a> and the specific documentation for each

Name	Description		
	Name	Description	
		Value	Description
			<p>endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": {   "x-keyfactor-requested-with": [     "APIClient"   ],   "x-keyfactor-api-version": [     "2"   ] }</pre> <p> <b>Tip:</b> For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>
	DataBucketProperty		<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> <b>Tip:</b> The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following:</p> <pre>\$(MyResponse.[0].ClientMachine)</pre>
	Verb		<p>A string indicating the HTTP verb for the type of request to perform. Supported values are:</p> <ul style="list-style-type: none"> <li>DELETE</li> <li>GET</li> </ul>

Name	Description								
	Name	Description							
		Value	Description						
			<ul style="list-style-type: none"><li>• HEAD</li><li>• OPTIONS</li><li>• POST</li><li>• PUT</li><li>• TRACE</li></ul>						
	UseBasicAuth	<p>A Boolean indicating whether Basic authentication should be used for the request (True) or not (False).</p> <p>If <i>UseBasicAuth</i> is <i>False</i>, Windows authentication in the context of the Keyfactor Command application pool user will be used (see <i>Create Active Directory Service Accounts for Keyfactor Command</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p>							
	BasicUsername	<p>An array indicating the username information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>.</p> <p>Supported methods to store credential information are:</p> <ul style="list-style-type: none"><li>• Store the credential information in the Keyfactor secrets table.</li></ul> <p>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</p> <ul style="list-style-type: none"><li>• Load the credential information from a PAM provider. See <i>PAM Providers</i> and <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li></ul> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the username defined for basic authentication (in DOMAIN\username format).</td></tr><tr><td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM</td></tr></table>		Value	Description	SecretValue	A string containing the username defined for basic authentication (in DOMAIN\username format).	Parameters	An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM

Name	Description		
	Name	Description	
		Value	Description
		Value	Description
			provider.
	Provider	<p>A string indicating the ID of the PAM provider.</p> <p>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 738</a>) to retrieve a list of all the PAM providers to determine the ID.</p> <p>For example, the username stored as a Keyfactor secret will look like:</p> <pre>{  "SecretValue": "KEYEXAMPLE\svc_MyServiceName"}</pre> <p>The username stored as a CyberArk PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre>{  "Provider": "1",  "Parameters":{    "Folder": "MyFolderName",    "Object": "MyWorkflowUsername"  }}</pre> <p>The username stored as a Delinea PAM secret will look like (where the Provider value—<b>1</b> in this example—is the <b>Id value</b> from <a href="#">GET PAM Providers on page 738</a> and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p>	

Name	Description		
	Name	Description	
		Value	Description
			<pre>{   "Provider": "1",   "Parameters":{     "SecretId":"MyUsernameId"   } }</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	BasicPassword		<p>An array indicating the password information to use for authentication if <i>UseBasicAuth</i> is <i>True</i>. The syntax is the same as for <i>BasicUsername</i>.</p> <p>Due to its sensitive nature, this value is not returned in responses.</p>
	URL		<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div>  <p><b>Note:</b> To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> </div>

Name	Description		
	Name	Description	
		Value	Description
			 When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.
	ContentType	A string indicating the content type for the request. Supported values are: <ul style="list-style-type: none"> <li>application/json</li> </ul>	
	RequestContent	A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request): <pre>{   "Id": "\${certid}",   "Metadata":{     "RevocationComment": "\${cmnt}"   } }</pre>	
		 <b>Note:</b> This example assumes you have a metadata field called RevocationComment.	
		 <b>Tip:</b> Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\${cmnt}—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the \${id}.	
	Signals	An array of objects containing data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step (see <i>ExtensionName</i> ). Possible <b>RequireApproval</b> values are:	

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleIds</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleIds</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".
Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleIds</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".</td></tr> </table> <div>  <b>Important:</b> If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".				
Value	Description										
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.										
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is "ApprovalStatus".										
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).				
Value	Description										
Id	A string indicating the Keyfactor Command reference ID of the condition.										
Value	A string indicating the value of the condition. This should be one of "true", "false", or a token that will be set to either "true" or "false" in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).										
Outputs	<p>An array indicating the next step in the workflow. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.						
Value	Description										
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.										

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.32 Workflow Instances

The Workflow Instances component of the Keyfactor API includes methods necessary to programmatically retrieve, restart, delete and submit data into workflow instances.

Table 592: Workflow Instances Endpoints

Endpoint	Method	Description	Link
/instanceId	DELETE	Delete the workflow instance with the specified GUID.	<a href="#">DELETE Workflow Instances Instance Id on the next page</a>
/instanceId	GET	Retrieve the workflow instance with the specified GUID.	<a href="#">GET Workflow Instances Instance ID on the next page</a>
/	GET	Retrieve a list of the workflow instances.	<a href="#">GET Workflow Instances on page 1375</a>
/My	GET	Retrieve the workflow instances created by the user making the API request.	<a href="#">GET Workflow Instances My on page 1378</a>
/AssignedToMe	GET	Retrieve the workflow instances assigned to the user making the API request.	<a href="#">GET Workflow Instances AssignedToMe on page 1381</a>
/instanceId/Stop	POST	Rejects a workflow instance, preventing it from continuing.	<a href="#">POST Workflow Instances Instance Id Stop on page 1385</a>
/instanceId/Signals	POST	Input data to the workflow instance with the specified GUID.	<a href="#">POST Workflow Instances Instance ID Signals on page 1385</a>
/instanceId/Restart	POST	Restart the specified workflow instance after a failure.	<a href="#">POST Workflow Instances Instance Id Restart on page 1388</a>

### 2.2.32.1 DELETE Workflow Instances Instance Id

The DELETE /Workflow/Instances/{instanceId} method is used to delete the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *Manage*

Table 593: DELETE Workflow Instances {instanceId} Input Parameters

Name	In	Description
instanceId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to delete.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1375</a> ) to retrieve a list of all the workflow instances to determine the GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.32.2 GET Workflow Instances Instance ID

The GET /Workflow/Instances/{instanceId} method is used to retrieve the initiated workflow with the specified instance GUID. Both in progress and completed workflows will be returned. This method returns HTTP 200 OK on a success with details about the workflow instance.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *ReadAll* OR  
WorkflowInstances: *ReadAssignedToMe* OR  
WorkflowInstances: *ReadMy*

Users with *ReadMy* or *ReadAssignedToMe* will only be able to retrieve the workflow instances created by them (*ReadMy*) or assigned to them (*ReadAssignedToMe*) unless they also have *ReadAll*.

Table 594: GET Workflow Instances {instanceId} Input Parameters

Name	In	Description
instanceId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to retrieve.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1375</a> ) to retrieve a list of all the workflow instances to determine the GUID. Note that the <b>integer</b> workflow IDs (returned with <i>GET /Workflow/Instances/{instanceId}</i> ) cannot be used with the API, only the GUID from <i>GET /Workflow/Instances</i> is valid.

Table 595: GET Workflow Instances {instanceId} Response Data

Name	Description						
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.						
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul>						
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.						
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. The private key was successfully retained.</li> <li>• Post-process Failed: [Message indicating reason for failure generally from the CA]</li> <li>• Pre-process failed: [Message indicating details of the failure]</li> <li>• Revoked</li> <li>• Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure]</li> <li>• Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure]</li> <li>• Step [custom step name] failed: [Message indicating details of the failure]</li> <li>• Taken Under Submission. The certificate template requires manager approval, and is marked as pending.</li> <li>• Workflow rejected by user with Id #.</li> </ul>						
Signals	<p>An object containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. Possible <b>RequireApproval</b> values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i>.</td></tr> <tr> <td>StepSignalId</td><td>A string indicating the Keyfactor Command reference GUID of the signal in</td></tr> </table>	Value	Description	SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .	StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in
Value	Description						
SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .						
StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in						

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>the step.</td></tr> <tr> <td>SignalReceived</td><td> <p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p> </td></tr> </table>	Value	Description		the step.	SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>				
Value	Description										
	the step.										
SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>										
Definition	<p>An array containing the workflow definition. Workflow definition data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name defined for the workflow definition.</td></tr> <tr> <td>Version</td><td>An integer indicating the version number of the workflow definition.</td></tr> <tr> <td>WorkflowType</td><td> <p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.	DisplayName	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition.	WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul>
Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Version	An integer indicating the version number of the workflow definition.										
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> <li>• Enrollment</li> <li>• Revocation</li> </ul>										
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.										
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.										
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (DOMAIN\username) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=apps-srvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>										
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.										

Name	Description			
StartDate	A string indicating the date and time when the instance was initiated.			
InitialData	An array containing the data included in the workflow instance when the workflow was initiated. Initial workflow instance data includes:			
	Name	Operation Type	Description	
	CertificateAuthority	Enrollment and Revocation	A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>hostname\logical name</i> format.	
	CertificateId	Revocation	An integer indicating the Keyfactor Command reference ID for the certificate.	
	SerialNumberString	Revocation	A string indicating the serial number of the certificate being revoked.	
	Thumbprint	Revocation	A string indicating the thumbprint of the certificate being revoked.	
	RevokeCode	Revocation	An integer containing the specific reason that the certificate is being revoked. Available values are:	
			Value	Description
-1			Remove from Hold	
0			Unspecified	
1			Key Compromised	
2			CA Compromised	
3	Affiliation Changed			
4	Superseded			
5	Cessation of Operation			

Name	Description								
	Name	Operation Type	Description						
			<table><tr><th>Value</th><th>Description</th></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td></tr></table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	6	Certificate Hold	7	Remove from CRL. 	6	Certificate Hold							
	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold							
	EffectiveDate	Revocation	A string containing the date and time when the certificate will be revoked.						
	Comment	Revocation	A string containing a freeform reason or comment on why the certificate is being revoked.						
	Delegate	Revocation	A Boolean indicating whether delegation is enabled for the certificate authority that issued the certificate (true) or not (false).						
	OperationStart	Revocation	A string indicating the time at which the revocation workflow was initiated.						
	Template	Enrollment	A string indicating the certificate template short name used for the enrollment request.						
	IncludeChain	Enrollment	A Boolean indicating whether to include the certificate chain in the enrollment response (true) or not (false).						
	SANs	Enrollment	An array of key/value pairs indicating the subject alternative names (SANs) for the certificate requested in the enrollment. Possible values for the key are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr></table>	Value	Description	rfc822	RFC 822 Name		
	Value	Description							
	rfc822	RFC 822 Name

RequesterName	A string containing the requester name on the certificate request as returned by the CA.											
SerialNumber	Enrollment	A string indicating the serial number of the certificate.										
IssuerDn	Enrollment	A string indicating the distinguished name of the issuer.										
Thumbprint	Enrollment	A string indicating the thumbprint of the certificate.										

Name	Description		
	Name	Operation Type	Description
	KeyfactorId	Enrollment	An integer indicating the Keyfactor Command reference ID for the certificate.
	KeyStatus	Enrollment	An integer indicating the status of the private key retention for the certificate within Keyfactor Command. Possible values are: <ul style="list-style-type: none"> <li>• 0—Unknown</li> <li>• 1—Saved</li> <li>• 2—Expected</li> <li>• 3—NoRetention</li> <li>• 4—Failure</li> <li>• 5—Temporary</li> </ul>
	PrivateKeyConverter	Enrollment	An internally used Keyfactor Command field.
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.		

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.2.32.3 GET Workflow Instances

The GET /Workflow/Instances method is used to retrieve the list of workflows that have been initiated. Both in progress and completed workflows are included. This method returns HTTP 200 OK on a success with details about the workflow instances.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *ReadAll*

Table 596: GET Workflow Instances Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Instances Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DefinitionId</i> (workflow definition ID)</li> <li>• <i>Id</i> (workflow instance GUID)</li> <li>• <i>InitiatingUserName</i> (DOMAIN\\username)</li> <li>• <i>LastModified</i></li> <li>• <i>ReferenceId</i> (workflow instance integer ID)</li> <li>• <i>StartDate</i></li> <li>• <i>Status</i></li> <li>• <i>Title</i></li> <li>• <i>WorkflowType</i></li> </ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 597: GET Workflow Instances Response Data

Name	Description						
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.						
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul>						
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.						
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. The private key was successfully retained.</li> <li>• Post-process Failed: <i>[Message indicating reason for failure generally from the CA]</i></li> <li>• Pre-process failed: <i>[Message indicating details of the failure]</i></li> <li>• Revoked</li> <li>• Step 'Keyfactor-Enroll' failed: <i>[Message indicating details of the failure]</i></li> <li>• Step 'Keyfactor-Revoke' failed: <i>[Message indicating details of the failure]</i></li> <li>• Step [custom step name] failed: <i>[Message indicating details of the failure]</i></li> <li>• Taken Under Submission. The certificate template requires manager approval, and is marked as pending.</li> <li>• Workflow rejected by user with Id #.</li> </ul>						
Definition	<p>An array containing the workflow definition. Workflow definition data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name defined for the workflow definition.</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.	DisplayName	A string indicating the display name defined for the workflow definition.
Name	Description						
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.						
DisplayName	A string indicating the display name defined for the workflow definition.						

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Version</td><td>An integer indicating the version number of the workflow definition.</td></tr> <tr> <td>WorkflowType</td><td> A string indicating the type of workflow definition. WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>
Name	Description						
Version	An integer indicating the version number of the workflow definition.						
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>						
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.						
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.						
Title	A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (DOMAIN\username) followed by an indication of the type of action and a specific message about the action. For example: "KEYEXAMPLE\jsmith is enrolling for a certificate with CN=apps-srvr14.keyexample.com." Or "KEYEXAMPLE\jsmith is revoking certificate with CN=apps-srvr12.keyexample.com."						
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.						
StartDate	A string indicating the date and time when the instance was initiated.						
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.						

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.32.4 GET Workflow Instances My

The GET /Workflow/Instances/My method is used to retrieve the list of initiated workflows created by the user making the API request—as a result of enrolling for a certificate, for example, or revoking a certificate. This method returns HTTP 200 OK on a success with details about the workflow instances.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *ReadAll* OR  
WorkflowInstances: *ReadMy*

Table 598: GET Workflow Instances My Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Instances Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DefinitionId</i> (workflow definition ID)</li><li>• <i>Id</i> (workflow instance GUID)</li><li>• <i>InitiatingUserName</i> (DOMAIN\\username)</li><li>• <i>LastModified</i></li><li>• <i>ReferenceId</i> (workflow instance integer ID)</li><li>• <i>StartDate</i></li><li>• <i>Status</i></li><li>• <i>Title</i></li><li>• <i>WorkflowType</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 599: GET Workflow Instances My Response Data

Name	Description						
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.						
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul>						
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.						
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. ## 2.2.32.5 GET Workflow Instances AssignedToMe

The GET /Workflow/Instances/AssignedToMe method is used to retrieve the list of initiated workflows awaiting input from the user making the API request. This method returns HTTP 200 OK on a success with details about the workflow instances.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *ReadAll* OR  
WorkflowInstances: *ReadAssignedToMe*

Table 600: GET Workflow Instances AssignedToMe Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Instances Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DefinitionId</i> (workflow definition ID)</li><li>• <i>Id</i> (workflow instance GUID)</li><li>• <i>InitiatingUserName</i> (DOMAIN\\username)</li><li>• <i>LastModified</i></li><li>• <i>ReferenceId</i> (workflow instance integer ID)</li><li>• <i>StartDate</i></li><li>• <i>Status</i></li><li>• <i>Title</i></li><li>• <i>WorkflowType</i></li></ul>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 601: GET Workflow Instances AssignedToMe Response Data

Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.				
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> <li>• CanceledForRestart</li> <li>• Complete</li> <li>• Failed</li> <li>• Rejected</li> <li>• Running</li> <li>• Suspended</li> </ul> <p>Only instances with a Status of <i>Suspended</i> are returned using this method.</p>				
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.				
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> <li>• Access is denied</li> <li>• Awaiting # more approval(s) from approval roles.</li> <li>• Either the credentials are invalid, or the CA on [CA hostname] is not running</li> <li>• Issued</li> <li>• Issued. The private key was successfully retained.</li> <li>• Post-process Failed: [Message indicating reason for failure generally from the CA]</li> <li>• Pre-process failed: [Message indicating details of the failure]</li> <li>• Revoked</li> <li>• Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure]</li> <li>• Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure]</li> <li>• Step [custom step name] failed: [Message indicating details of the failure]</li> <li>• Taken Under Submission. The certificate template requires manager approval, and is marked as pending.</li> <li>• Workflow rejected by user with Id #.</li> </ul> <p>Only instances with a StatusMessage of <i>Awaiting # more approval(s) from approval roles.</i> are returned using this method.</p>				
Definition	<p>An array containing the workflow definition. Workflow definition data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.				

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>A string indicating the display name defined for the workflow definition.</td></tr> <tr> <td>Version</td><td>An integer indicating the version number of the workflow definition.</td></tr> <tr> <td>WorkflowType</td><td> A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul> </td></tr> </table>	Name	Description	DisplayName	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition.	WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>
Name	Description								
DisplayName	A string indicating the display name defined for the workflow definition.								
Version	An integer indicating the version number of the workflow definition.								
WorkflowType	A string indicating the type of workflow definition. The currently supported types are: <ul style="list-style-type: none"> <li>Enrollment</li> <li>Revocation</li> </ul>								
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.								
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.								
Title	A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (DOMAIN\username) followed by an indication of the type of action and a specific message about the action. For example: <div>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=apps-srvr14.keyexample.com."</div> Or <div>"KEYEXAMPLE\jsmith is revoking certificate with CN=apps-srvr12.keyexample.com."</div>								
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.								
StartDate	A string indicating the date and time when the instance was initiated.								
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.								

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.32.6 POST Workflow Instances Instance Id Stop

The POST /Workflow/Instances/{instanceId}/Stop method is used to stop the workflow instance with the specified GUID, preventing it from continuing. This endpoint returns 204 with no content upon success.

**Note:** Only workflow instances with a Status of *Suspended* can be stopped.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *Manage*

Table 602: POST Workflow Instances {instanceId} Stop Input Parameters

Name	In	Description
instanceId	Path	<b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to stop.  Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1375</a> ) to retrieve a list of all the workflow instances to determine the GUID.

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.2.32.7 POST Workflow Instances Instance ID Signals

The POST /Workflow/Instances/{instanceId}/Signals method is used to input signals to the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

**Note:** If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

**Note:** A locking conflict may occur if two (or more) users attempt to provide input to a workflow instance (e.g. approve a request) at exactly the same time. If this happens, input from only one of the users will be reflected in the Management Portal, and the workflow instance will not be moved along to the next step if it should have been with input from the two users. The other input is still accepted, however, and there is a scheduled task that runs daily and attempts to continue all suspended workflows that may be eligible to continue but have not done so due to locking conflicts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
The user executing the request must hold at least one security role ID configured in the workflow definition step for which signal data is being input.

Table 603: POST Workflow Instances {instanceid} Signals Input Parameters

Name	In	Description												
instanceId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to which to input a signal.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1375</a>) to retrieve a list of all the workflow instances to determine the GUID.</p>												
signal	Body	<p><b>Required.</b> An array containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. <b>RequireApproval</b> signal values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SignalKey</td><td><p><b>Required.</b> A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p><div>RequireApproval1.ApprovalStatus</div><p>Use the GET <i>/Workflow/Definitions/{definitionid}</i> method (see <a href="#">GET Workflow Definitions Definition ID on page 1262</a>) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see <a href="#">GET Workflow Instances on page 1375</a>, <a href="#">GET Workflow Instances AssignedToMe on page 1381</a>, or <a href="#">GET Workflow Instances My on page 1378</a>) to return the <i>CurrentStepUniqueName</i>.</p></td></tr><tr><td>Data</td><td><p><b>Required.</b> An array containing key/value pairs providing the input information for the signal. The key(s) will vary depending on the signal. <b>RequireApproval</b> signal data values are:</p><table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td><p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p></td></tr><tr><td>Comment</td><td><p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p></td></tr></table></td></tr></table> <p>For example, to approve a Require Approval step called <i>RequireApproval1</i> with a comment:</p> <div>{</div>	Value	Description	SignalKey	<p><b>Required.</b> A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <div>RequireApproval1.ApprovalStatus</div> <p>Use the GET <i>/Workflow/Definitions/{definitionid}</i> method (see <a href="#">GET Workflow Definitions Definition ID on page 1262</a>) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see <a href="#">GET Workflow Instances on page 1375</a>, <a href="#">GET Workflow Instances AssignedToMe on page 1381</a>, or <a href="#">GET Workflow Instances My on page 1378</a>) to return the <i>CurrentStepUniqueName</i>.</p>	Data	<p><b>Required.</b> An array containing key/value pairs providing the input information for the signal. The key(s) will vary depending on the signal. <b>RequireApproval</b> signal data values are:</p> <table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td><p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p></td></tr><tr><td>Comment</td><td><p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p></td></tr></table>	Key	Value	Approved	<p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p>	Comment	<p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p>
Value	Description													
SignalKey	<p><b>Required.</b> A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <div>RequireApproval1.ApprovalStatus</div> <p>Use the GET <i>/Workflow/Definitions/{definitionid}</i> method (see <a href="#">GET Workflow Definitions Definition ID on page 1262</a>) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see <a href="#">GET Workflow Instances on page 1375</a>, <a href="#">GET Workflow Instances AssignedToMe on page 1381</a>, or <a href="#">GET Workflow Instances My on page 1378</a>) to return the <i>CurrentStepUniqueName</i>.</p>													
Data	<p><b>Required.</b> An array containing key/value pairs providing the input information for the signal. The key(s) will vary depending on the signal. <b>RequireApproval</b> signal data values are:</p> <table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td><p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p></td></tr><tr><td>Comment</td><td><p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p></td></tr></table>	Key	Value	Approved	<p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p>	Comment	<p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p>							
Key	Value													
Approved	<p><b>Required.</b> A Boolean indicating whether the request is approved (true) or denied (false).</p>													
Comment	<p>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</p>													

Name	In	Description
		<pre> "SignalKey": "RequireApproval1.ApprovalStatus", "Data": {   "Approved": "True",   "Comment": "Here is my comment." } </pre>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.2.32.8 POST Workflow Instances Instance Id Restart

The POST /Workflow/Instances/{instanceId}/Restart method is used to restart the workflow instance with the specified GUID. This can be used either after it has reached a failed state and the failure has been corrected (e.g. a CA was not responding when an enrollment was attempted or a PowerShell script failed to run to completion) or midstream while it's still active but in a suspended state waiting for signals to introduce a new version of the workflow definition. The workflow instance will restart from the beginning. This endpoint returns 204 with no content upon success.

**Note:** Only workflow instances with a Status of *Failed* or *Suspended* can be restarted.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowInstances: *Manage*  
WorkflowDefinitions: *Read*

Table 604: POST Workflow Instances {instanceId} Restart Input Parameters

Name	In	Description
instanceId	Path	<p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the workflow instance to restart.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see <a href="#">GET Workflow Instances on page 1375</a>) to retrieve a list of all the workflow instances to determine the GUID.</p> <div>  <b>Note:</b> When you restart an instance, it will be issued a new instance ID. </div>
version	Body	<p>An integer indicating the version number of the workflow definition. If no version is specified, the workflow will be restarted using the most recently published version.</p>

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.3 Classic API

The Keyfactor Classic API, also known as the CMS API, is the Web API that has been provided with Keyfactor Command for several product generations. The Classic API may be needed in your environment if you're upgrading and have written API applications using the Classic API. If you're new to building an API application to work with Keyfactor Command, Keyfactor strongly recommends that you use the newer Keyfactor API (see [Keyfactor API on page 7](#)).

### 2.3.1 Security Role Overview

In order to use the Classic API, certain security role permissions must be granted to the identity used by the client to authenticate to the API. Specifically, the user must have the *API Read* permission to make any requests. Beyond this, different API endpoints have different requirements (see [Classic API Security Role Requirements below](#)).

Where the table indicates that *Certificate Store Management* permissions are required, this can either be global permissions to all certificate stores or permissions granted to the specific certificate store using certificate store container security. Likewise, where *Certificates* permissions are required, this can either be global certificate permissions on all certificates or permissions granted to a specific certificate or set of certificates using certificate collection security. See the *Keyfactor Command Reference Guide* for more information about container and collection security.

Table 605: Classic API Security Role Requirements

Endpoint	Security Role Permissions
ApiApp/1/GetApiApps	System Settings: Read
ApiApp/1/AddApiApp	System Settings: Modify
ApiApp/1/EditApiApp	System Settings: Modify
ApiApp/1/DeleteApiApp	System Settings: Modify
CertEnroll/1/Pkcs10	None
CertEnroll/1/Pkcs12	None
CertEnroll/1/Templates	None
CertEnroll/1/Token	None
CertEnroll/2/Pkcs10	None

Endpoint	Security Role Permissions
CertEnroll/2/Pkcs12	None
CertEnroll/2/Templates	None
CertEnroll/2/Token	None
CertEnroll/3/Pkcs10	None
CertEnroll/3/Pkcs12	None
CertEnroll/3/Renew	Certificate Store Management: Read and Schedule
CertEnroll/3/Templates	None
Certificates/1/Metafield	Certificates: Modify and Certificate Metadata Types: Read
Certificates/2/Import	Certificates: Import
Certificates/3/Contents	Certificates: Read
Certificates/3/Count	Certificates: Read
Certificates/3/PublishCRL	PKI Management: Modify
Certificates/3/Recover	Certificates: Recover
Certificates/3/Revoke	Certificates: Revoke
Certificates/3/Search	Certificates: Read
Certstore/1/AddCert	Certificate Store Management: Read and Schedule, and Certificates: Read
Certstore/1/AddCertStore	Certificate Store Management: Modify
Certstore/1/AddCertStoreServer	Certificate Store Management: Modify
Certstore/1/AddPFX	Certificate Store Management: Read and Schedule
Certstore/1/CreateJKS	Certificate Store Management: Modify
Certstore/1/EditCertStore	Certificate Store Management: Modify
Certstore/1/EditCertStoreServer	Certificate Store Management: Modify
Certstore/1/Inventory	Certificate Store Management: Read
Certstore/1/Keystores	Certificate Store Management: Read

Endpoint	Security Role Permissions
Certstore/1/Remove	Certificate Store Management: Schedule and Certificates: Read
Certstore/1/ScheduleInventory	Certificate Store Management: Modify
Metadata/2/Compare	Certificates: Read and Certificate Metadata Types: Read
Metadata/2/Get	Certificates: Read and Certificate Metadata Types: Read
Metadata/2/Set	Certificates: Modify and Certificate Metadata Types: Read
Metadata/3/Get	Certificates: Read and Certificate Metadata Types: Read
Metadata/3/GetDefinition	Certificate Metadata Types: Read
Metadata/3/Set	Certificates: Modify and Certificate Metadata Types: Read
Security/1/GetIdentities	Security Settings: Read
Security/1/AddIdentity	Security Settings: Modify
Security/1/DeleteIdentity	Security Settings: Modify
Security/1/GetRoles	Security Settings: Read
Security/1/AddRole	Security Settings: Modify
Security/1/EditRole	Security Settings: Modify
Security/1/DeleteRole	Security Settings: Modify
SSL/1/AddEndpoint	SSL Management: Modify
SSL/1/AddEndpointGroup	SSL Management: Modify
SSL/1/Agents	SSL Management: Read
SSL/1/EndpointGroups	SSL Management: Read
Workflow/1/ApproveRequest	Workflow: Read and Participate
Workflow/1/DenyRequest	Workflow: Read and Participate

Endpoint	Security Role Permissions
Workflow/1/PendingList	Workflow: Read and Participate
Status	None
vSCEP	Configured through the Keyfactor Command Configuration Wizard or through the Application Settings page in the Keyfactor Command Management Portal.

## 2.3.2 ApiApp

The ApiApp component of the Keyfactor Web APIs includes all methods necessary to programmatically add, edit, get and delete API Applications. The complete set of endpoints is shown in [2.3.2 ApiApp](#).

Table 606: ApiApp Endpoints

Endpoint	Method	Description
/1/GetApiApps	GET	Returns a list of the API applications
/1/AddApiApp	POST	Add an API application to Keyfactor Command
/1/EditApiApp	POST	Edit an API application in Keyfactor Command
/1/DeleteApiApp	POST	Deletes and API application from Keyfactor Command

### 2.3.2.1 ApiAPP GetApiApps

The GET GetApiApps endpoint returns a list of all API Applications defined in Keyfactor Command with the Id, Name, Key, Secret, CAId, CAConfiguration, TemplateId, TemplateName, TemplateForest and whether the Application is Enabled or not. No parameters or extra headers are required for this method.

#### Example Request

GET http://<host>/CMSApi/ApiApp/1/GetApiApps

#### Example Response

Status Code: 200

```
[
  {
    "Id": "<Id>",
    "Name": "<name>",
    "Key": "<hexadecimal key>",
```

```

    "Secret": "<hexadecimal secret>",
    "Enabled": "True",
    "CAId": "<CA Id>",
    "CAConfiguration": "<CA Host Name>\\<CA Logical Name>",
    "TemplateId": "<Template Id>",
    "TemplateName": "<Template Common Name>",
    "TemplateForest": "<Template Forest>"
  }
]

```

### 2.3.2.2 ApiApp AddApiApp

The POST AddApiApp endpoint adds an API Application to Keyfactor Command. It returns the Id of the newly added Application. Table 8 - AddApiApp Parameters shows the parameters that are used for the creation of API Applications through the Keyfactor Web APIs.

Table 607: AddApiApp Parameters

Parameter Name	Parameter Description
Name	The name of the API Application. This parameter is required.
Key	The Key used for the API Application. This parameter is required.
Secret	The Secret used for the API Application. This parameter is required.
Enabled	The Enabled parameter tells whether the API Application is enabled or not. This parameter is optional.
CA	The CA parameter sets the CA for the API Application. The format used for this parameter is HostName\\LogicalName. This parameter is optional.
Template	The Template parameter sets the template that is used with the API Application. This should be the template short name. This parameter is optional.

### Example Request

POST http://<host>/CMSApi/ApiApp/1/AddApiApp HTTP/1.1

```

{
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": true,
  "CA": "<CA Host Name>\\<CA Logical Name>",

```

```
    "Template": "<Template Common Name>"
  }
```

## Example Response

Status Code: 200

```
{
  "Id": <Id>
}
```

### 2.3.2.3 ApiApp EditApiApp

The POST EditApiApp endpoint allows certain aspects of an API Application definition to be updated. The only aspect of the API Application that cannot be updated is the Id. The response has the same elements as the GetApiApps call except for a single Api Application. Table 9 – EditApiApp Request Parameters holds the Parameters for the request.

Table 608: AddApiApp Parameters

Parameter Name	Parameter Description
Id	The Id of the API Application that is to be updated. This parameter is required.
Name	The name that the API Application will be updated to. This parameter is optional.
Key	The Key that the API Application will be updated to. This parameter is optional.
Secret	The Secret that the API Application will be updated to. This parameter is optional.
Enabled	The Enabled state the API Application will be updated to. This parameter is optional.
CAId	The Id of the Certification Authority the API Application will be updated to. This is an alternative to CaConfiguration. This parameter is optional.
CaConfiguration	The CA Configuration the API Application will be updated to. The format for the Configuration is Host.Name\\Logical-Name. This is an alternative to CAId. This parameter is optional.
TemplateId	The Id of the Template that the API Application will be updated to. This is an alternative to TemplateName. This parameter is optional.
TemplateName	The Name of the Template the API Application will be updated to. The name of the template should be the short name. This is an alternative to Template Id. This parameter is optional.

## Example Request

POST http://<host>/CMSApi/ApiApp/1/EditApiApp

```
{
  "Id": <Id>,
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": true,
  "CAId": <CA Id>,
  "TemplateName": "<Template Common Name>"
}
```

## Example Response

Status Code: 200

```
{
  "Id": "<Id>",
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": "True",
  "CAId": "<CA Id>",
  "CAConfiguration": "<CA Host Name>\\<CA Logical Name>",
  "TemplateId": "<Template Id>",
  "TemplateName": "<Template Common Name>",
  "TemplateForest": " <Template Forest>"
}
```

### 2.3.2.4 ApiApp DeleteApiApp

The POST DeleteApiApp endpoint removes an API Application from Keyfactor Command. The POST request must contain a JSON string containing the Identity Id. This method returns a 200 a message stating the API App was deleted successfully.

## Example Request

POST http://<host>/CMSApi/ApiApp/1/DeleteApiApp HTTP/1.1

```
{
  "Id": <Id>
}
```

## Example Response

Status Code: 200

```
{
  "Message": "The Api Application was deleted"
}
```

### 2.3.3 CertEnroll

The CertEnroll component of the Keyfactor Web APIs includes all methods necessary to programmatically request and obtain a certificate. Keyfactor Command supports enrollment through Microsoft Active Directory Certificate Services Certificate Authorities, both in the local Active Directory forest and, by using Keyfactor Gateways, in remote domains and a variety of public CA vendors. Contact your Keyfactor representative for more information about Keyfactor Gateways, including the most recent list of supported Certificate Authorities.) The CertEnroll component allows enrollment through all CAs configured in your Keyfactor Command environment. The API supports two variations of enrollment. The more secure variant allows the client application to generate the certificate's public/private keypair on the device issuing the request, so that the private key is never transmitted or stored anywhere else. This model is useful in scenarios where the key doesn't need to be archived or exported. The second model lets the server generate the keys, returning the resulting cert and keypair as a PFX/PKCS12 blob. This method is suitable when the key does need to be exported or archived, or when the client is not capable of generating a keypair itself.

There are three versions of the CertEnroll API, each with separate methods for the two enrollment variations, and up to three auxiliary methods to help formulate a successful enrollment request or perform related operations. The complete set of endpoints is given here in [Table 609: CertEnroll Endpoints](#).

Table 609: CertEnroll Endpoints

Endpoint	Method	Description
/1/Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility
/1/Templates	GET	Return a list of certificate templates available to this API application
/1/Token	GET	Retrieve a temporary authentication token to be used with an enrollment request
/1/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/1/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes
/2/Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility
/2/Templates	GET	Return a list of certificate templates available to this API application

Endpoint	Method	Description
/2/Token	GET	Retrieve a temporary authentication token to be used with an enrollment request
/2/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/2/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes
/3/Templates	GET	Return a list of certificate templates available to this API application
/3/Renew	POST	Obtain a new certificate based on content from an existing certificate in Keyfactor Command
/3/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/3/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes

For historic reasons, slight differences in the template format necessitated differentiating the methods into a "version 1" and "version 2", with the same set of methods. Then, to allow simplification of the built-in security mechanisms, version 3 of these methods was introduced. In most cases, applications should use the CertEnrollv3 methods if taking advantage of this security mechanism (as described below) and CertEnrollv2 if not.

This Keyfactor Command API component supports an optional application authentication feature to restrict the API to selected third-party software clients. It uses a public application key and a private application secret. The application key identifies the API client application to the server and is sent as part of the HTTP headers for all enrollment endpoints. The application secret is used to compute an HMAC-SHA1 signature that is sent in an HTTP header for certain endpoints. The combination of the application key and the computed signature allows Keyfactor Command to verify the origin and the authenticity of the enrollment request. Although Basic authentication credentials are required in order to connect to the API, this allows a single user to configure different applications for different templates and have the restrictions enforced. The secret allows secure authentication and prevents attackers from attempting to replay successful enrollment requests. The calculation of this HMAC signature differs between v2 and v3 of the API. The different computations are covered in [Table 610: CertEnroll Security Headers](#).

Another difference between v1, v2 and v3 is that v3 will import the certificate immediately and sync the row from the CA database after the certificate has been issued, whereas v1 and v2 require a manual import of the certificate after it has been issued.

Each application should have its own unique application key and secret pair embedded in the application, as well as in secure storage on the server. These keys can be registered in the API Applications section of the System Settings menu on the Keyfactor Command Management Portal. Giving each application its own key and secret pair provides these advantages:

- An application can be restricted to request specific certificate templates and from specific CAs.
- One application key can be disabled while leaving other application keys enabled. This allows insecure or compromised versions of an application to be disabled without affecting up-to-date users.

Table 610: CertEnroll Security Headers

Header Name	Header Value
X-CSS-CMS-AppKey	<p>This header contains the application key assigned to this particular application. This header is a base-64-encoded string created from the key's byte sequence, and not the ASCII/UTF-8 hexadecimal representation of that byte sequence. For example, if the key is entered in the API Applications section as "0303030303030303FF", this represents the bit pattern "0000001100000011000000110000001100000011000000110000001111111111", with base-64 encoding "AwMDAwMDAwMD/w==". In Python, this conversion can be accomplished with the following code:</p> <pre>import base64 hexKey = "0303030303030303FF" binKey = hexKey.decode("hex") b64Key = base64.b64encode(binKey)</pre>
X-CSS-CMS-Token	<p>This header field contains the temporary token that was previously obtained from the GET Token method. Like the application key, this header is a base-64-encoded string created from the binary form of the token, and not the ASCII/UTF-8 hexadecimal representation actually returned by the response to the GET Token. This is required for the v1 and v2 endpoints only.</p>
X-CSS-CMS-Signature	<p>This header field contains an HMAC-SHA-1 message signature computed from the request. Producing this signature proves that the client has access to the application secret value that is also present in the server's configuration, that the message has been transmitted without modification, and that transmission is recent. This is required for all enrollment endpoints, although this requirement can be disabled through the application settings in the management console. The computation of this signature differs between versions; all versions are a base-64 encoding of a SHA-1 hash, but the content to be hashed varies. In general, v1 and v2 GET methods hash the URL and Token; v1 and v2 POST methods hash the URL, Token, and request body; v3 GET methods do not require a signature; and v3 POST methods hash the request body only. The computation of HMAC signatures is significantly easier for v3 methods. Sample Python code is included in <a href="#">Table 611: CertEnroll HMAC computations in Python</a> for each computation type.</p>

Table 611: CertEnroll HMAC computations in Python

Endpoints	Signature
GET Templates (v1 and v2)	<pre>token = json.loads(GET_Token_ResponseBody)["SessionTokenValue"] URLPath = "/CMSApi/CertEnroll/2/Templates" requestDataString = URLPath + token; appSecretBytes = appSecretString.decode("hex") signature = hmac.new(appSecretBytes, requestDataString, hashlib.sha1).hexdigest(); headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</pre>
POST	<pre>token = json.loads(GET_Token_ResponseBody)["SessionTokenValue"]</pre>

Endpoints	Signature
/1/Pkcs10, /1/Pkcs12, /2/Pkcs10, /2/Pkcs12	<p>URLPath = "/CMSApi/CertEnroll/2/Pkcs12"</p> <p>body= '{"Flags":0,"TemplateName":"User","Pkcs12Password":"lily1234","SubjectNameAttributes":null}'</p> <div>  <b>Note:</b> For these methods, the body must be formatted exactly as above, as far as parameter order, capitalization, and whitespace. This is one reason v3 signatures are easier to use. </div> <p>requestDataString = URLPath + token + body</p> <p>appSecretBytes = appSecretString.decode("hex")</p> <p>signature = hmac.new(appSecretBytes, requestDataString, hashlib.sha1).hexdigest();</p> <p>headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</p>
POST /3/Pkcs10 and /3/Pkcs12	<p>data= '{"Flags":0,"TemplateName":"User","Pkcs12Password":"lily1234","SubjectNameAttributes":null}'</p> <p>body = '{"Timestamp" : "' + datetime.datetime.utcnow().isoformat() + "', "Request" : ' + data + '}'</p> <div>  <b>Note:</b> For these methods, the request can be formatted in any equivalent json format without regard to capitalization, whitespace, or order of elements. This is one reason v3 signatures are easier to use. </div> <p>appSecretBytes = appSecretString.decode("hex")</p> <p>signature = hmac.new(appSecretBytes, body, hashlib.sha1).hexdigest();</p> <p>headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</p>

### 2.3.3.1 CertEnroll Token

The GET Token request returns a session token that is used in subsequent calls to v1 or v2 enrollment endpoints to authenticate the software client to the server. By default, the token has an expiration time of 10 minutes (configurable in the Keyfactor Command Management Portal Application Settings). Using a token after it is expired will result in an error.

#### Example Request

GET http://<host>/CMSApi/CertEnroll/1/Token HTTP/1.1

#### Example Response

```
{
  "SessionTokenValue": "F715F307DBE0DD5A9894260DBF0643C042173698"
}
```

### 2.3.3.2 CertEnroll Templates

The Templates methods return the list of templates configured and enabled for use by the application (identified by the X-CSS-CMS-AppKey HTTP header). The set of fields returned for a template differs from version 1 to version 2, but versions 2 and 3 return the same content. No parameters are required for these requests—only the app key in the header, formatted as described in [Table 610: CertEnroll Security Headers](#)—but the response formats are given in [Table 612: GET /2/Templates and /3/Templates Response Body](#).

**Important:** As of release 9.0 of the Classic API, version 1 of CertEnroll/1/Templates has been removed from the product and is no longer supported.

Table 612: GET /2/Templates and /3/Templates Response Body

Parameter Name	Parameter Value
DisplayName	Long/Friendly name of the template.
CommonName	Short name of the template.
Oid	Object Identifier for this template.
KeySize	String representation of Key Size in bits, or Unknown.

#### Example Request

GET http://<host>/CMSApi/CertEnroll/3/Templates HTTP/1.1

X-CSS-CMS-AppKey: AAAAAAAAAAAAAA==

X-CSS-CMS-Token: A0sTeMd9PT6XPw2BdqWb9PkerQk= [Version 2 only]

#### Example Response

Version 2 and 3

```
[
  {
    "DisplayName": "UserServer",
    "CommonName": "UserServer",
    "Oid": "1.3.6.1.4.1.311.21.8.2290866.14924250.4277929.6978074.6651290.247.14988018.16169587",
    "KeySize": "2048"
  }
]
```

### 2.3.3.3 CertEnroll Pkcs10

The PKCS10 method provides enrollment with on-device key generation. The basic workflow with on-device key generation is:

1. Client application retrieves list of available certificate templates using the Keyfactor Command API.
2. Client generates a public/private key pair based on the key size requirements from the selected template.
3. Client creates a PKCS10 Certificate Signing Request (CSR) using the keypair and template attributes.
4. Client sends the PKCS10 request and selected template name to the API which submits the request to the enterprise CA and returns the certificates received from the CA to the software client.

If successful, the response from the CA will be a PKCS#7 message containing the issued certificate and (optionally) the certificate chain. Once the response is received, a software client can construct a PKCS12 package with the previously generated key pair and the issued certificates, import the keys and certificates into an application-specific store, such as [Apple's KeyChain Services](#) or a Java Keystore, or perform any other processing required. The flow (for versions 1 and 2) is shown in [Figure 6: Pkcs#10-Based Enrollment Request](#). The version 3 flow is identical except that a token is not required for enrollment, so the initial exchange with the *token* endpoint is not needed. The difference in version 3 is explained in [Table 610: CertEnroll Security Headers](#).

Figure 6: Pkcs#10-Based Enrollment Request

The PKCS10-based method is the most secure way to enroll for certificates with Keyfactor Command. The PKCS10 method utilizes on-device key generation instead of the server-based key generation used for the PKCS12 method. The PKCS10 method also requires the use of a certificate template that populates the subject and/or subject alternate name from Active Directory. This reliance on certificate templates allows Keyfactor Command to utilize the security mechanisms built into the Microsoft CA Services.

To use this method, the following configuration should be present on the Keyfactor Command server and in its domain:

- IIS application pool configured with a non-administrator domain member account
- API Application with valid key, secret, template, and CA
- Certificate template configured to:
  - Populate subject and/or subject alternate name (SAN) fields from AD as needed. While the PKCS#10 request may contain data for these fields, the selected certificate template may replace those values with information from Active Directory.

- Not allow private key exportation
- Grant enroll permission to all users who may enroll for a certificate

The request parameters that should be sent for version 1 and 2 of the enrollment are listed in [Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body](#) and for version 3 in [Table 614: POST /3/Pkcs10 Request Body](#), while the response format (for all versions) is given in [Table 615: POST /\\*/Pkcs10 Response Body](#):

Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body

Parameter Name	Parameter Value
Flags	Bit flags that determine the enrollment behavior. At this time, the only available bit flag is: <ul style="list-style-type: none"> <li>• 0x01 = Include certificate only (default is to return certificate + trust chain)</li> </ul>
TemplateName	Name of the certificate template to use for enrollment. This name must match one of the template names configured for this application key in the API Applications page.
Pkcs10Request	Contains a base-64-encoded PKCS#10 request generated on the device. The key sizes used to generate the PKCS#10 request must match the key size specified in the certificate template.
MetadataList	A list of key value pairs for each metadata item that is to be set on the issued certificate in Keyfactor Command. This parameter is optional.

In version 3 of the API, the fields used by versions 1 and 2 are wrapped in an outer envelope and sent along with a timestamp. By including this timestamp in the request body and using this as part of the HMAC signature computation, the need for a current API access token is eliminated without reducing security. The request structure for version 3 of this endpoint is shown in [Table 614: POST /3/Pkcs10 Request Body](#):

Table 614: POST /3/Pkcs10 Request Body

Parameter Name	Parameter Value
Timestamp	ISO 8601 Timestamp in UTC timezone, e.g. "2018-11-22T20:41:08.440Z"
Request	JSON object in the same format as a version 1/2 Pkcs10 enrollment request (see <a href="#">Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body</a> ).

Table 615: POST /\*/Pkcs10 Response Body

Parameter Name	Parameter Value
SerialNumber	String containing the hexadecimal serial number of the issued certificate.
IssuerDN	Distinguished Name of the certificate's issuer.

Parameter Name	Parameter Value
Thumbprint	Thumbprint of the issued certificate.
CMSID	Identifier for this certificate in Keyfactor Command. Can be used to identify the cert in future API requests.
CMSRequestId	Identifier for the certificate request in Keyfactor Command. Can be used if certificate is pending issuance.
Certificates	<p>If the CERT_ONLY flag (0x01) is set in the request, then the response is a base-64 encoding of the DER-encoded cert.</p> <p>If the CERT_ONLY flag is not set, the response is a base-64 encoding of a PKCS7 containing the cert and its chain.</p>
RequestDisposition	Value returned by the CA in response to this certificate request
DispositionMessage	Message accompanying the disposition value returned by the CA

## Example Request

Versions 1 and 2

POST http://<host>/CMSApi/CertEnroll/1/Pkcs10 HTTP/1.1

```
{
  "Flags":0,
  "TemplateName": "User",
  "Pkcs10Request":"-----BEGIN CERTIFICATE REQUEST-----
    <base64-encoded-certificate-request>
    -----END CERTIFICATE REQUEST-----\n"
}
```

## Example Request

Version 3

```
{
  "Timestamp" : "2017-12-18T19:56:12.365Z",
  "Request": {
    "Flags":0,
    "TemplateName": "User",
    "Pkcs10Request":"-----BEGIN CERTIFICATE REQUEST-----
    <base64-encoded-certificate-request>
    -----END CERTIFICATE REQUEST-----",
  }
}
```

```

        "MetadataList": {"<metadata type name>": "<metadata value>", "<metadata type name>": "<metadata
value">}}
    }
}

```

## Example Response

```

{
  "SerialNumber": "2684C97728678A944A67C03E7192785B",
  "IssuerDN": "CN=CorpCA1, DC=keyexample, DC=com",
  "Thumbprint": "FDB3A0F4ADCF9C39A2BB639898EE1670DFDBF5BB",
  "CMSID": 5,
  "CMSRequestId": 3,
  "Certificates": <PEM-encoded certificates>
  "RequestDisposition": "Issued",
  "DispositionMessage": ""
}

```

### 2.3.3.4 CertEnroll Pkcs12

The PKCS12-based POST enrolls for a certificate with a server-generated private key. It generates a PKCS#12 file that is protected by the password specified in the request and returns a base-64-encoded PKCS#12 response if successful.

The basic workflow with server-based key generation is:

1. Third-party software client retrieves a list of available certificate templates using the Keyfactor Command API.
2. Third-party software client sends the selected template name and a password to the API. The Keyfactor Command component will:
  - a. Generate the RSA key pair.
  - b. Submit the request to the CA configured for the API application and retrieve the issued certificate.
  - c. Create a PKCS12 blob with the private key, the issued certificate, and the certificate trust chain using the supplied password.
  - d. Return the PKCS12 blob to the API client.

Figure 7: Pkcs#12-Based Enrollment Request

As with the Pkcs10 methods, versions 1 and 2 use the flow shown in [Figure 7: Pkcs#12-Based Enrollment Request](#), while version 3 does not require a token and uses a timestamp instead. For these methods, keys are generated on the server and returned to the client in the form of a P12 (PFX) file. This requires that the certificate's private key is transmitted over the network and temporarily stored on the server, which can present a security risk. For this reason, Keyfactor recommends that clients which are capable of generating their own keypair and submitting a CSR use the Pkcs10 enrollment. When clients do not have the capability or the processing power to do this, the Pkcs12 offers an alternate method. Certificate templates are used on the Microsoft CA; however, the private key must be marked as exportable in the template.

To use this method, the following configuration needs to be present on the Keyfactor Command server:

- Certificate template configured to:
  - Allow the requestor (Keyfactor Command) to supply the subject and subject alternate name details
  - Allow the private key to be exported
  - Grant enroll permission to the Keyfactor Command application pool user—no other user needs enroll permissions for this template and for best security, none should be granted to other users
- IIS application pool user configured to be a non-administrative domain member account
- The *Load User Profile* option configured to **true** under the advanced settings for the application pool

The format of a Pkcs12 request is given in [Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body](#) and [Table 617: POST /3/Pkcs12 Request Body](#), while the response format is given in [Table 618: POST /\\*/Pkcs12 Response Body](#).

Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body

Parameter Name	Parameter Value																						
Flags	Bit flags that determine the enrollment behavior. At this time, there are no available bit flags so this value should be set to "0" (zero).																						
TemplateName	Name of the certificate template used for enrollment. This name must match- one of the allowed template names.																						
Pkcs12Password	PKCS12 password. Must be 8 or more characters.																						
SubjectNameAttributes	<p>Token values that are substituted into the API subject format string. When needed values are not provided, Keyfactor Command will attempt to use the corresponding field from the requester's AD account. If no attributes are needed in the request, you must still include this attribute and set the value to null. Also, note that, although the terms are similar, SubjectNameAttributes are NOT the same as Subject Alternative Names, which are supplied separately in the SubjectAltNameElements field.</p> <p>Values can be supplied either as an array of key/value pairs or as a dictionary in the form {"Field1" : "Value1", "Field2" : "Value2"}.</p>																						
SubjectAltNameElements	<p>Contains an array of key/value pairs that represent the elements for Keyfactor Command to use when generating the certificate's subject alternative name. This parameter is optional. The key will be the numeric subject alternative name flag (in string form), associated with the value. The valid subject alternative name flags are as follows:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>UPN</td></tr> <tr> <td>2</td><td>RFC822</td></tr> <tr> <td>3</td><td>DNS</td></tr> <tr> <td>4</td><td>IP Address</td></tr> <tr> <td>5</td><td>URI</td></tr> <tr> <td>6</td><td>Email</td></tr> <tr> <td>7</td><td>GUID</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>9</td><td>Directory name</td></tr> </table>	Value	Definition	0	None	1	UPN	2	RFC822	3	DNS	4	IP Address	5	URI	6	Email	7	GUID	8	Registered Id	9	Directory name
Value	Definition																						
0	None																						
1	UPN																						
2	RFC822																						
3	DNS																						
4	IP Address																						
5	URI																						
6	Email																						
7	GUID																						
8	Registered Id																						
9	Directory name																						
MetadataList	A list of key value pairs for each metadata item that is to be set on the issued certificate in Keyfactor Command. This parameter is optional.																						

Table 617: POST /3/Pkcs12 Request Body

Parameter Name	Parameter Value
Timestamp	ISO 8601 Timestamp, e.g. "2018-11-22T20:41:08.440000"
Request	JSON object in the same format as a version 1/2 Pkcs10 enrollment request (see <a href="#">Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body</a> ).

Table 618: POST /\*/Pkcs12 Response Body

Parameter Name	Parameter Value
SerialNumber	String containing the hexadecimal serial number of the issued certificate.
IssuerDN	Distinguished Name of the certificate's issuer.
Thumbprint	Thumbprint of the issued certificate.
CMSID	Identifier for this certificate in Keyfactor Command. Can be used to identify the cert in future API requests.
CMSRequestId	Identifier for the certificate request in Keyfactor Command. Can be used if certificate is pending issuance.
Pkcs12Blob	Base-64-encoded representation of the Pkcs#12 certificate that was issued, if any.
RequestDisposition	Value returned by the CA in response to this certificate request.
DispositionMessage	Message accompanying the disposition value returned by the CA.

This method allows additional attributes to be included in the certificate's subject name. A common use for this is the inclusion of a device class identifier, such as "iPhone 4S". On the Keyfactor Command server there is a configuration property to define the format of the subject name. An example is:

```
"CN={cn},OU=Device Model {deviceType}"
```

For each of the tokens given in {brackets}, Keyfactor Command will replace the value with the corresponding value in the SubjectNameAttributes field of the request, if present. If no value is provided, it will attempt to look up the value in the requester's AD account. In this example, Keyfactor Command might replace the string "{deviceType}" with attribute value "deviceType" supplied in the SubjectNameAttributes key-value-pair structure inside of the JSON request from the API client, and (if "cn" is not specified in the request) the "{cn}" string would be replaced with the value of the "cn" property from the user's Active Directory properties. If a matching token cannot be found either in the request or in AD, no value is substituted.

## Example Request

Versions 1 and 2

POST http://<host>/CMSApi/CertEnroll/2/Pkcs12 HTTP/1.1

```
{
  "Flags":0,
  "Pkcs12Password": "12341234",
  "TemplateName": "User",
  "SubjectNameAttributes": {"deviceid":"iPad"}}
}
```

## Example Request

Version 3

POST http://<host>/CMSApi/CertEnroll/3/Pkcs12 HTTP/1.1

```
{
  "Timestamp" : "2017-12-18T19:56:12.365Z",
  "Request": {
    "Flags":0,
    "Pkcs12Password": "12341234",
    "TemplateName": "User",
    "SubjectNameAttributes": [{"key":"deviceid","value":"iPad"}],
    "MetadataList":{"<metadata type name>":"<value>","<metadata type name>":"<value>"}
  }
}
```

## Example Response

Status Code: 200

```
{
  "SerialNumber": "690003CC096AC71023934747AA00000003CC09",
  "IssuerDN": "CN=jdk-CA1, DC=jdk, DC=com",
  "Thumbprint": "04259811B3BC522093532FBA5F4C1FA3C0969A87",
  "CMSID": 8,
  "CMSRequestId": 6,
  "Pkcs12Blob": <base64-encoded PKCS#12>,
  "RequestDisposition": "Issued",
}
```

```
"DispositionMessage": ""  
}
```

### 2.3.3.5 CertEnroll Renew

Certificate renewal in Keyfactor Command allows a certificate to be issued based on data from an existing certificate. Some configurations, such as the issuing CA and template, can be made to differ between the original certificate and the renewed one. At renewal time, the new certificate can also be automatically delivered to different certificate stores managed by Keyfactor Command Agents, replacing the old certificates. This provides an easy mechanism to quickly replace expiring or compromised certificates, migrate deployed certificates from one PKI to another, or replace certificates with similar certificates using more secure cryptographic algorithms. The Renew Web API method, along with the web console and expiration alert handlers, allows access to this renewal functionality. The structure of a renew request is given [Table 619: POST /3/Renew Request Body](#), and the response in [Table 620: POST /3/Renew Response Body](#).

Table 619: POST /3/Renew Request Body

Parameter Name	Parameter Value
Lookup	Description of the certificate to be renewed. See <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .
CertStores	Array of GUIDs listing the certificate stores where the new certificate should be delivered. This must be a subset of the CertStores containing the original certificate.
Template	Certificate template to be used for the new certificate request.
CAConfiguration	Certificate authority for the new certificate, in the form "hostname\\logical name" (double-backslash required for JSON formatting).
Metadata	Optional dictionary of metadata fields and values to be associated with the newly issued certificate.
CustomPassword	Password to protect the private key of the new certificate. This field is optional and Keyfactor Command will use a randomly assigned password if this is not set.

Table 620: POST /3/Renew Response Body

Parameter Name	Parameter Value
Thumbprint	Thumbprint of the issued certificate.
CMSRequestId	Identifier for the certificate request in Keyfactor Command, if certificate is pending issuance.
RequestDisposition	Value returned by the CA in response to this certificate request.

Parameter Name	Parameter Value
DispositionMessage	Message accompanying the disposition value returned by the CA.
RenewedCertStores	List of certstores that had a certificate addition job scheduled successfully. The certstores will be listed in the format "<Store machine ><Store path>".

## Example Request

POST http://<host>/CMSApi/CertEnroll/3/Renew HTTP/1.1

```
{
  "Lookup": {"Type" : "CMSID", "CMSID" : 7},
  "CertStores": ["&lt;Guid&gt;"],
  "Template": "UserServer",
  "CAConfiguration" : "CA1.jdk.com\\jdk-CA1",
  "Metadata":{"Email-Contact":"a.b@example.com"}
}
```

## Example Response

```
{
  "RenewedCertStores": ["192.168.41.171-/home/pi/cherry/cherrystore"],
  "Thumbprint": "46CCE7023bce5c434f4206b74473fd614df56218",
  "CMSRequestId": 0,
  "RequestDisposition": "Issued",
  "DispositionMessage": "The certificate renewal has been completed successfully. Agent jobs to install the new certificate have been created."
}
```

## 2.3.4 Certificates

The Certificates component of the Web API supports certificate lifecycle and management tasks apart from enrollment. The complete set of methods in this component is given in [Table 621: Certificates Endpoints](#).

Table 621: Certificates Endpoints

Endpoint	Method	Description
/3/Contents	POST	Return the certificate contents in PEM format
/3/Count	POST	Return the number of certificates in the Keyfactor Command database matching a given search query

Endpoint	Method	Description
/1/Metafield	POST	Associate a metadata value with a certificate in the Keyfactor Command database.
/2/Import	POST	Add an existing certificate into the Keyfactor Command database.
/3/Revoke	POST	Revoke a given certificate.
/3/Recover	POST	Recover a given certificate
/3/PublishCRL	POST	Request a CA to publish a new CRL
/3/Search	POST	Return the full set of certificates in the Keyfactor Command database matching a given search query

### 2.3.4.1 Certificates Metafield

The metafield POST method is used to import individual certificate metadata field values into Keyfactor Command. This method offers limited functionality and security measures compared to the Metadata v2 and v3 methods described in the Metadata section (see [Metadata on page 1442](#)), but is included for backward-compatibility. A JSON string must be submitted with the POST request containing the data shown in [Table 622: POST /1/Metafield Request Body](#). This method returns HTTP 200 OK with message body "true" on success or an appropriate 4xx status with an accompanying error message in the body on failure.

Table 622: POST /1/Metafield Request Body

Parameter Name	Parameter Value
CertificateId	The Keyfactor Command database row identifier associated with the existing certificate. Many times this will be the certificate id returned by the import API call.
MetadataFieldTypeName	The string name of the metadata field type for which the value is provided.
Value	The metadata field value to be associated with the provided certificate identifier.

### Example Request

POST http://<host>/CMSApi/Certificates/1/Metafield HTTP/1.1

```
{
  "CertificateId": 1,
  "MetadataFieldTypeName": "Email-Contact",
```

```
}
  "Value": "support@example.com"
}
```

### 2.3.4.2 Certificates Import

The certificate import POST method is used to import a certificate (.cer) file into Keyfactor Command while also allowing the simultaneous definition of metadata values for the imported certificate. The POST request must contain a JSON string containing the certificate and any metadata items that should be associated with the certificate but does not require the content-disposition or multi-part form found in version 1. This method returns HTTP 200 OK with message body "true" on success or an appropriate 4xx status with an accompanying error message in the body on failure.

**Important:** Support for version 1 of the Classic API certificate import method (Certificates/1/Import) will end in an upcoming release of the product. All applications should be migrated to a newer Import endpoint.

Table 623: POST /2/Import Request Body

Parameter Name	Parameter Value						
X509Base64	String containing the certificate blob. This may include the "-----BEGIN CERTIFICATE-----" and "-----END CERTIFICATE-----" references or these may be left out.						
MetadataList	<div>A comma-delimited list of metadata fields, each containing two parts:</div> <table><tr><th>Name</th><th>Description</th></tr><tr><td>MetadataFieldTypeName</td><td>The metadata field name—e.g. Email-Address</td></tr><tr><td>Value</td><td>The metadata value—e.g. bob.smith@example.com</td></tr></table> <div>The metadataList parameter is not required, but if you choose to include it, you must include both the name and the value for each metadata value to be imported.</div>	Name	Description	MetadataFieldTypeName	The metadata field name—e.g. Email-Address	Value	The metadata value—e.g. bob.smith@example.com
Name	Description						
MetadataFieldTypeName	The metadata field name—e.g. Email-Address						
Value	The metadata value—e.g. bob.smith@example.com						
CertState	<div>Used to manually set the state of the imported certificate. The following values are accepted:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Active</td></tr></table>	Value	Description	0	Unknown	1	Active
Value	Description						
0	Unknown						
1	Active						

Parameter Name	Parameter Value	
	Value	Description
	2	Revoked
	3	Denied
	4	Failed
	5	Pending
	6	Certificate Authority
	7	Parent Certificate Authority

## Example Request

POST http://<host>/CMSApi/Certificates/2/Import HTTP/1.1

```
{
  "x509Base64": "-----BEGIN CERTIFICATE-----
  <base64-encoded-certificate-contents>
  -----END CERTIFICATE-----",
  "MetadataList":[
    {
      "MetadataFieldType": "Email-Contact",
      "Value": "john.doe@example.com"
    }
  ]
}
```

### 2.3.4.3 Certificates Contents

The Contents method retrieves the contents of a specified certificate. The request requires only enough information to identify a certificate in Keyfactor Command, and the body of a successful response will consist solely of the PEM-encoded representation of that certificate. Unlike most methods, for successful requests the response content type will be "text/plain".

Table 624: POST /3/Contents Request Body

Parameter Name	Parameter Value
Lookup	Description of the certificate to be retrieved. See <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .

## Example Request

POST http://<host>/CMSApi/Certificates/3/Contents HTTP/1.1

```
{
  "Lookup": {"type": "CMSID", "CMSID": <cms-certificate-id>}
}
```

## Example Response

```
<base64-encoded-certificate-contents>
```

### 2.3.4.4 Certificates PublishCRL

The PublishCRL method will cause Keyfactor Command to make a request to the provided Certificate Authority to publish a new CRL to the locations configured by the CA. This method requires only a single parameter and returns no response body on a successful request. On an unsuccessful request, an appropriate HTTP status code along with a string in the response body describing the error is returned.

Table 625: POST /3/PublishCRL Request Body

Parameter Name	Parameter Value
CertificateAuthority	Certificate authority for the new CRL, in the form "hostname\\logical name" (double-backslash required for JSON formatting).

## Example Request

POST http://<host>/CMSApi/Certificates/3/PublishCRL HTTP/1.1

```
{
  "CertificateAuthority" : "CA1.corp.com\\Issuing-CA1"
}
```

### 2.3.4.5 Certificates Recover

The Recover method allows a user to recover an archived private key for an issued certificate. For recovery to succeed, the CA that issued the certificate must have been configured to archive the private key, and the Key Recovery Agent certificate must be imported into the personal certificate store of the Keyfactor Command API IIS Application Pool's user account on the Keyfactor Command API server. If successful, the method will return the certificate and recovered private key as a base64-encoded PFX file. On error, an appropriate HTTP status code and message will be returned. See *Configuring Key Recovery for Keyfactor Command* in the *Keyfactor Command Reference Guide* for information about configuring key recovery.

Table 626: POST /3/Recover Request Body

Parameter Name	Parameter Value				
Lookup	Description of the certificate to be renewed. See <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .				
Details	Information to complete the recovery operation. This contains just a single field: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>Password</td><td>Password for the archived private key.</td></tr> </table>	Parameter Name	Parameter Value	Password	Password for the archived private key.
Parameter Name	Parameter Value				
Password	Password for the archived private key.				

## Example Request

POST http://<host>/CMSApi/Certificates/3/Recover HTTP/1.1

```
{
  "Lookup" : {"Type" : "CMSID", "CMSID" : 248852},
  "Details": {"Password": "MyPassword1234"}
}
```

## Example Response

```
{
  "pfx" : "<PEM-encoded pfx>"
}
```

### 2.3.4.6 Certificates Revoke

The Revoke method will attempt to revoke a certificate stored in Keyfactor Command. The certificate to be revoked can be identified using the *lookup* request body parameter (see [Table 4: Classic API Certificate Lookup Structure](#)). In addition, the message may contain string parameters describing the revocation. Caution is advised when programmatically revoking certificates as the operation generally cannot be undone. The method returns a 200 OK response if successful or an appropriate HTTP code and error message if unsuccessful.

Table 627: POST /3/Revoke Request Body

Parameter Name	Parameter Value
Lookup	Criteria to specify the certificate to be revoked. See <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .
Details	Details used to define the revocation operation. See <a href="#">Table 628: Certificate Revocation Details</a> .

Table 628: Certificate Revocation Details

Parameter Name	Parameter Value																
Reason	<p>Integer code for certificate revocation reason, as per IETF RFC 5280 ReasonFlags. This field is optional and will default to "0" (zero - unspecified). Allowed values are listed below:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> </table>	Value	Definition	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold
Value	Definition																
0	Unspecified																
1	Key Compromised																
2	CA Compromised																
3	Affiliation Changed																
4	Superseded																
5	Cessation of Operation																
6	Certificate Hold																
Comment	Explanation of revocation reason. Optional and will default to the empty string "".																
EffectiveDate	Date on which the revocation will take effect. Optional and will default to the current time if not specified.																
noCRL	If provided and set to "true", Keyfactor Command will not attempt to have the CA publish a new CRL. Optional and treated as "false" by default.																

## Example Request

POST http://<host>/CMSApi/Certificates/3/Revoke HTTP/1.1

```
{
  "Lookup": {"Type": "CMSID", "CMSID": 45},
  "Details": {"Reason":4, "EffectiveDate" : "2017-12-29", "Comment": "Reissued 12-27"}
}
```

### 2.3.4.7 Certificates Search and Count

The Search method will return the set of certificates known to Keyfactor Command that satisfy certain criteria. The criteria that can be searched on and the syntax by which queries are formed is the same as in the Advanced Certificate Search within the Keyfactor Command Management Portal. This is largely consistent with PowerShell comparison notation, but Keyfactor does not publish a complete specification of this query language. Instead,

developers are encouraged to examine the query strings formed in the Keyfactor Command Management Portal and model their API queries based on this. The response will contain a JSON body with an array whose entries each represent a single matching certificate. The Count method expects the same parameters as the Search query but simply returns a count of the records that would be returned if the same parameters were provided to the Search endpoint. For Count, the sorting parameters will have no effect.

Table 629: POST /3/Search and /3/Count Request Body

Parameter Name	Parameter Value
IncludeRevoked	Boolean denoting if revoked certificates should be included in the search results.
IncludeExpired	Boolean denoting if expired certificates should be included in the search results.
Query	Search query criteria, as defined above.
SortField	Name of the result field by which the results should be sorted. The field must be one returned within the results. This parameter is optional and the Keyfactor Command certificate id will be used if not provided. The available fields are the same as in <a href="#">Table 630: POST /3/Search Response Body</a> .
SortAscending	Boolean value denoting if the SortField should be sorted in ascending order. This parameter is optional and ascending will be used if not provided.
SkipCount	Number of records that should be skipped in the results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Numeric value of the limit of records to be returned. This field is optional and 5000 will be used if not provided.

Table 630: POST /3/Search Response Body

Parameter Name	Parameter Value
Id	Certificate ID assigned by Keyfactor Command, which can be used for service chaining to other many other Web API requests by providing this value as a <i>CMSID</i> in the <i>Lookup</i> section of the request. See <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .
IssuedCN	Issued Common Name
IssuedDN	Issued Distinguished Name
NotBefore	Beginning date for certificate validity
NotAfter	Ending (expiration) date for certificate validity
IssuerDN	Issuer Distinguished Name

Parameter Name	Parameter Value																		
PrincipalName	Subject Principal Name																		
RequesterName	Requester Name																		
TemplateName	Certificate Template Name																		
CertState	<p>Certificate State. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>CertificateAuthority</td></tr> <tr> <td>7</td><td>ParentCertificateAuthority</td></tr> </table>	Value	Definition	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	CertificateAuthority	7	ParentCertificateAuthority
Value	Definition																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	CertificateAuthority																		
7	ParentCertificateAuthority																		
KeySize	Bit-length of the public/private keys.																		
KeyType	<p>Cryptographic algorithm used for the public/private key. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>	Value	Definition	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Definition																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
SerialNumber	The hexadecimal serial number of the certificate.																		
Thumbprint	The hexadecimal thumbprint of the certificate.																		

## Example Request

POST http://<host>/CMSApi/Certificates/3/Search HTTP/1.1

```
{
  "includeRevoked": true,
  "includeExpired": true,
  "query": "(ExpirationDate -eq \"2018-05-10\")"
}
```

## Example Response

```
[{
  "Id":<certificate-id>,
  "IssuedCN": "<cn>",
  "IssuedDN": "<dn>",
  "NotBefore": "2017-05-10T18:59:57",
  "NotAfter": "2018-05-10T18:59:57",
  "IssuerDN": "<issuer-dn>",
  "PrincipalName": null,
  "RequesterName": null,
  "TemplateName": null,
  "CertState": 0,
  "KeySize": 4096,
  "KeyType": 1
}]
```

## 2.3.5 Certstore

The Certstore Web API (formerly known as the Jks API) provides a set of methods to support management of certificate locations. Keyfactor Command currently supports management of certificates in the following remote locations:

- Java Keystore
- PEM file
- F5 BigIP Web Server
- F5 BigIP SSL Profiles
- Windows Machine Personal, Revoked, and Trusted Roots stores
- Citrix NetScaler virtual servers

Keyfactor Command can, through different Keyfactor Command Agents and Orchestrators, inventory, install, and remove certificates for each of these store types. For certain store types, additional actions are supported as well. The certstore API provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the [Reference Guide](#) and [Installing Orchestrators](#) guide, or contact your Keyfactor representative. This API component currently has only one version, but for

backward-compatibility, it can be accessed through the component name "Certstore" (e.g. /CMSApi/Certstore/1/AddCert) or the legacy name "Jks" (e.g. /CMSApi/Jks/1/AddCert). The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed below in [Table 631: Certstore Endpoints](#).

Table 631: Certstore Endpoints

Endpoint	Method	Description
AddCert	POST	Add given certificate (without private key) to a given certificate store (as well as Keyfactor Command)
AddCertStore	POST	Define a new certstore in Keyfactor Command
AddCertStoreServer	POST	Define a new remote server (e.g. F5, NetScaler) in Keyfactor Command to be managed by a Keyfactor Command agent
AddPFX	POST	Add a PFX file (with private key) to a given certificate store (as well as Keyfactor Command)
AddCertStoreType	POST	Add a Certificate Store Type to be used by a certificate store
CreateJKS	POST	Create a Java Keystore on the file system on target machine
EditCertStore	POST	Update a definition of an existing certificate store in Keyfactor Command
EditCertStoreServer	POST	Update a definition of an existing remote server managed by a Keyfactor Command agent
GetCertStoreTypes	GET	List all certificate store types
Inventory	POST	Retrieve the inventory of a given certificate store
Keystores	GET	Get a list of certificate stores defined in Keyfactor Command
Remove	POST	Remove a certificate from a certificate store
ScheduleInventory	POST	Schedule a certificate store inventory job schedule
ScheduleJob	POST	Schedule a certificate store management job
Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility

### 2.3.5.1 CertStore AddCert

The POST AddCert method will schedule the addition of the provided certificate to the specified alias/name within the provided certificate stores. The request and response objects will contain the fields shown in [Table 632: POST /AddCert Request Body](#) and [Table 633: POST /AddCert Response Body](#).

Table 632: POST /AddCert Request Body

Parameter Name	Parameter Value
Keystores	Array of the certificate stores to which the provided entry should be added, with the same format as the response to GET /Keystores (see <a href="#">Table 647: GET /Keystores Response Body</a> ).
Alias	Name of the entry to which the certificate should be added. This parameter can also take a list of Certificate Store Type and Alias entries. If just a name is given, the certificate will have the same alias in all certificate stores it is added to. If a list is given, the certificate will have the same alias for each given store with the same certificate store type.
Overwrite	Boolean denoting if the entry should be overwritten, if one exists. An error will be returned if this is set to false, and an entry with the same alias/name exists.
Contents	PEM of the certificate to be added. This field is optional if a CertificateId is provided.
CertificateId	Database identifier within Keyfactor Command of the certificate to be added. This field is optional if the Contents are provided.

Table 633: POST /AddCert Response Body

Parameter Name	Parameter Value												
Result	Numerical code indicating the result of the operation, as described in <a href="#">Table 637: POST /AddCertificateStoreServer Response Body</a> .												
Message	Description of the result of the operation, e.g. "The operation completed successfully".												
InvalidKeystores	<p>Array of certstores provided in the request for which the operation could not be completed. Entries will be formatted as follows:</p> <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>KeystoreId</td><td>Guid of the certstore</td></tr> <tr> <td>ClientMachine</td><td>Machine hosting the certstore</td></tr> <tr> <td>StorePath</td><td>File path to the store on its machine</td></tr> <tr> <td>Alias</td><td>Alias for certificate to be added</td></tr> <tr> <td>Reason</td><td>Numerical code for the failure. Will take one of the following values:</td></tr> </table>	Parameter Name	Parameter Value	KeystoreId	Guid of the certstore	ClientMachine	Machine hosting the certstore	StorePath	File path to the store on its machine	Alias	Alias for certificate to be added	Reason	Numerical code for the failure. Will take one of the following values:
Parameter Name	Parameter Value												
KeystoreId	Guid of the certstore												
ClientMachine	Machine hosting the certstore												
StorePath	File path to the store on its machine												
Alias	Alias for certificate to be added												
Reason	Numerical code for the failure. Will take one of the following values:												

Parameter Name	Parameter Value		
	Parameter Name	Parameter Value	
		Value	Error Message
		0	The certificate store was not found.
		1	A job to add this certificate to this alias already exists.
		2	No agent is available to perform this job.
	Explanation	A description of the failure encountered.	

## Example Request

Multiple Alias entries

POST http://<host>/CMSApi/CertStore/1/AddCert HTTP/1.1

```
{
  "Keystores":
  [
    {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
    {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
  ],
  "Alias": {"<store type Id>":"<alias>","<store type Id>":"alias"},
  "Overwrite": true,
  "CertificateId": "<certificate-id>",
  "Contents": "-----BEGIN CERTIFICATE-----
<base64-encoded-certificate-contents>
-----END CERTIFICATE-----"
}
```

## Example Request

String Alias

POST http://<host>/CMSApi/CertStore/1/AddCert HTTP/1.1

```
{
  "Keystores":
```

```
[
  {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
  {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
],
"Alias": "<alias>",
"Overwrite":true,
"CertificateId":"<certificate-id>",
"Contents": "-----BEGIN CERTIFICATE-----
<base64-encoded-certificate-contents>
-----END CERTIFICATE-----"
}
```

## Example Response

```
{
  "Result": 1,
  "Message" : "The operation completed successfully.",
  "InvalidKeystores": []
}
```

### 2.3.5.2 CertStore AddCertStore

The AddCertStore method allows a client to define a new certificate store within Keyfactor Command. The structure is as follows:

Table 634: POST /AddCertStore Request Body

Parameter Name	Parameter Value										
StoreType	Type of certificate store to be defined. This field is required and allowed values are: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Java Keystore</td></tr> <tr> <td>2</td><td>PEM file</td></tr> <tr> <td>3</td><td>F5 SSL Profiles</td></tr> <tr> <td>4</td><td>IIS Trusted Root Certificates</td></tr> </table>	Parameter Name	Parameter Value	0	Java Keystore	2	PEM file	3	F5 SSL Profiles	4	IIS Trusted Root Certificates
Parameter Name	Parameter Value										
0	Java Keystore										
2	PEM file										
3	F5 SSL Profiles										
4	IIS Trusted Root Certificates										

Parameter Name	Parameter Value														
	<table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>5</td><td>NetScaler</td></tr> <tr> <td>6</td><td>IIS Personal Certificates</td></tr> <tr> <td>7</td><td>F5 Web Server</td></tr> <tr> <td>8</td><td>IIS Revoked Certificates</td></tr> <tr> <td>100</td><td>Amazon Web Services</td></tr> <tr> <td>101</td><td>File Transfer Protocol</td></tr> </table>	Parameter Name	Parameter Value	5	NetScaler	6	IIS Personal Certificates	7	F5 Web Server	8	IIS Revoked Certificates	100	Amazon Web Services	101	File Transfer Protocol
Parameter Name	Parameter Value														
5	NetScaler														
6	IIS Personal Certificates														
7	F5 Web Server														
8	IIS Revoked Certificates														
100	Amazon Web Services														
101	File Transfer Protocol														
ClientMachine	Machine where the certificate store resides (or will reside). Required.														
StorePath	Path on the client machine where the store should be defined. Required for Java Keystore, PEM file, F5 SSL Profiles, and NetScaler (categories 0, 2, 3, and 5).														
AgentId	Identifier of agent that will service the request. Either AgentId or AgentName must be provided for F5 (categories 3 and 7), IIS (categories 4, 6, and 8), and NetScaler stores (category 5).														
AgentName	Machine name of agent that will service the request. Either AgentId or AgentName must be provided for F5 (categories 3 and 7), IIS (categories 4, 6, and 8), and NetScaler stores (category 5).														
Container	Certificate store container that should contain the certificate store. This is optional and no certstore container will be assigned if it is not provided. See the <i>Keyfactor Command Reference Guide</i> for information on certificate store containers.														
Password	Password used to access the store. Required for Java Keystore and optional for PEM file.														
PrivateKeyPath	Path on the client machine where the private key should be stored. Supported only for PEM files, and is optional in that case. If no path is provided for a PEM file, the private key will be stored in the same PEM file as the certificate.														

Table 635: POST /AddCertStore Response Body

Parameter Name	Parameter Value
Message	Description of the result of the operation, e.g. "The operation completed successfully".
Result	Numerical code for the outcome of the operation, as given in <a href="#">Table 637: POST /AddCertStoreServer Response Body</a> .
Id	GUID of the created store, if successful.

## Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStore HTTP/1.1

```
{
  "ClientMachine": "192.168.41.171",
  "StorePath": "/opt/cms-java-agent/config/trust.jks",
  "StoreType": 0,
  "Password": "changeit"
}
```

## Example Response

```
{
  "Result": 1,
  "Message": "The operation completed successfully.",
  "Id": "b195c1f9-1957-4bdb-a15d-f45159482611"
}
```

### 2.3.5.3 CertStore AddCertStoreServer

Some certificate stores are managed by agents accessing the store through a third-party Web API. This currently includes F5 BigIP devices and Citrix NetScaler devices. These stores require the definition of a certstore server before the store itself can be defined in Keyfactor Command. Each server can be configured with a location and user credentials to access the client machine via the appropriate third-party API. This Keyfactor Command Web API method allows such configuration. The structure shown in [Table 636: POST /AddCertStoreServer Request Body](#) should be used for requests.

Table 636: POST /AddCertStoreServer Request Body

Parameter Name	Parameter Value						
Name	Hostname of the machine the agent will connect to.						
ServerType	Platform for this server, defining what certstore types are supported. Allowed values are: <table><tr><th>Parameter Name</th><th>Parameter Value</th></tr><tr><td>0</td><td>F5</td></tr><tr><td>1</td><td>NetScaler</td></tr></table>	Parameter Name	Parameter Value	0	F5	1	NetScaler
Parameter Name	Parameter Value						
0	F5						
1	NetScaler						
UseSSL	Boolean denoting whether the agent should connect to the client API using https or http.						

Parameter Name	Parameter Value
Username	Username to provide to the client API.
Password	Password corresponding to the login for the given Username to access the client API.

Table 637: POST /AddCertStoreServer Response Body

Parameter Name	Parameter Value	
Result	Status code for the operation. Will take one of the following values:	
	Value	Description
	1	Success
	2	Failure
	3	Warning
Message	Description of the operation outcome, e.g. "The operation completed successfully".	

## Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStoreServer HTTP/1.1

```
{
  "Name": "192.168.23.100",
  "UseSSL" : true,
  "Username": "nsroot",
  "Password": "nsroot",
  "ServerType": 1
}
```

## Example Response

```
{
  "Result": 1,
  "Message": "The operation completed successfully."
}
```

### 2.3.5.4 CertStore AddCertStoreType

The POST /AddCertStoreType method will create a certificate store type that will be used for a custom certificate store that extends the Keyfactor Command Agent's Any Agent functionality. The parameters that can be used for this endpoint are shown in [Table 638: POST /AddCertStoreType Request Body](#), while the response format can be found in [Table 639: POST /AddCertStoreType Response Body](#).

Table 638: POST /AddCertStoreType Request Body

Parameter Name	Parameter Value								
Name	The name the certificate store type will have in Keyfactor Command. This parameter is <b>required</b> .								
ShortName	The short name of the certificate store type. This parameter is <b>required</b> .								
AddSupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be added to. This parameter is <b>required</b> .								
CreateSupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be created if missing. This parameter is <b>required</b> .								
DiscoverySupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be discovered in a discovery scan. This parameter is <b>required</b> .								
RemoveSupported	A Boolean that sets if the certificate store of this certificate store type allows certificates to be removed from it. This parameter is <b>required</b> .								
EnrollmentSupported	A Boolean that sets if the certificate store of this certificate store type supports reenrollment. This parameter is <b>required</b> .								
EntryPasswordSupported	A Boolean that sets if the certificate store of this certificate store type supports an entry password. This parameter is <b>required</b> .								
PrivateKeyAllowed	<div>A parameter that sets requirements on the private key of a certificate being entered into the certificate store. This parameter is <b>required</b>. Valid values are:<table><tr><th>Value</th><th>Name</th></tr><tr><td>0</td><td>Forbidden</td></tr><tr><td>1</td><td>Optional</td></tr><tr><td>2</td><td>Required</td></tr></table></div>	Value	Name	0	Forbidden	1	Optional	2	Required
Value	Name								
0	Forbidden								
1	Optional								
2	Required								
LocalStore	A Boolean that sets if the certificate store of this certificate store type requires a certificate store server. This parameter is <b>required</b> .								
StorePasswordRequired	A Boolean that sets if the certificate store of this type requires a password. This para-								

Parameter Name	Parameter Value												
	meter is <b>required</b> .												
StorePathType	<p>The type used for the certificate store path.</p> <table> <tr> <th>Option</th><th>Description</th></tr> <tr> <td>Empty</td><td>Path will be a free form field.</td></tr> <tr> <td>String</td><td>Path will only be the specified string.</td></tr> <tr> <td>Comma Separated String</td><td>Path will need to be chosen from the list given.</td></tr> </table>	Option	Description	Empty	Path will be a free form field.	String	Path will only be the specified string.	Comma Separated String	Path will need to be chosen from the list given.				
Option	Description												
Empty	Path will be a free form field.												
String	Path will only be the specified string.												
Comma Separated String	Path will need to be chosen from the list given.												
CustomAliasAllowed	A Boolean that sets whether the certificate store of this type allows a custom alias. This parameter is optional.												
Powershell	A Boolean that sets whether the certificate store of this type uses PowerShell. This parameter is optional.												
ServerRegistration	A Boolean that sets whether Keyfactor Command needs to prompt for credentials for each client machine that has that certificate store type. This parameter is optional.												
JobProperties	A comma separated string defining properties that are required when performing management jobs on a certificate store of this type. This parameter is optional.												
Properties	<p>A dictionary of any extra properties a certificate store of this type would need. This parameter is optional. If this property is provided, a type is required. Parameters of a property are:</p> <table> <tr> <th>Field</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>The name of the property. This parameter is optional.</td></tr> <tr> <td>Type</td><td>The type of the property. This parameter is <b>required</b>. Valid values are: String, Bool, MC, and Secret</td></tr> <tr> <td>Required</td><td>A Boolean that sets whether the property is required in the certificate store.</td></tr> <tr> <td>Depends</td><td>If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.</td></tr> <tr> <td>Value</td><td>A default Value of the property.</td></tr> </table>	Field	Description	DisplayName	The name of the property. This parameter is optional.	Type	The type of the property. This parameter is <b>required</b> . Valid values are: String, Bool, MC, and Secret	Required	A Boolean that sets whether the property is required in the certificate store.	Depends	If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.	Value	A default Value of the property.
Field	Description												
DisplayName	The name of the property. This parameter is optional.												
Type	The type of the property. This parameter is <b>required</b> . Valid values are: String, Bool, MC, and Secret												
Required	A Boolean that sets whether the property is required in the certificate store.												
Depends	If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.												
Value	A default Value of the property.												

Table 639: POST /AddCertStoreType Response Body

Parameter Name	Parameter Value																								
Message	Description of the operation outcome, e.g. "The operation completed successfully".																								
Result	<p>Status code for the operation. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Success</td></tr> <tr> <td>2</td><td>Failure</td></tr> <tr> <td>3</td><td>Warning</td></tr> </table>	Value	Description	1	Success	2	Failure	3	Warning																
Value	Description																								
1	Success																								
2	Failure																								
3	Warning																								
Data	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Name</td><td>The name of the type.</td></tr> <tr> <td>ShortName</td><td>The ShortName of the type.</td></tr> <tr> <td>StoreType</td><td>The Id of the store</td></tr> <tr> <td>LocalStore</td><td>A Boolean if the certificate store is on the local server of the agent.</td></tr> <tr> <td>ServerRegistration</td><td>Tells whether server registration is needed by Keyfactor Command.</td></tr> <tr> <td>ImportType</td><td>A value to indicate the source of a certificate record in the Keyfactor Command audit logs.</td></tr> <tr> <td>InventoryJobType</td><td>The GUID of the inventory job type that is used to register with the Any Agent.</td></tr> <tr> <td>ManagementJobType</td><td>The GUID of the management job type that is used to register with the Any Agent.</td></tr> <tr> <td>AddSupported</td><td>A Boolean stating whether an add job will be supported by the certificate store.</td></tr> <tr> <td>RemoveSupported</td><td>A Boolean stating whether a remove job will be supported by the certificate store.</td></tr> <tr> <td>CreateSupported</td><td>A Boolean stating whether a create job will be supported by the certificate store.</td></tr> </table>	Value	Description	Name	The name of the type.	ShortName	The ShortName of the type.	StoreType	The Id of the store	LocalStore	A Boolean if the certificate store is on the local server of the agent.	ServerRegistration	Tells whether server registration is needed by Keyfactor Command.	ImportType	A value to indicate the source of a certificate record in the Keyfactor Command audit logs.	InventoryJobType	The GUID of the inventory job type that is used to register with the Any Agent.	ManagementJobType	The GUID of the management job type that is used to register with the Any Agent.	AddSupported	A Boolean stating whether an add job will be supported by the certificate store.	RemoveSupported	A Boolean stating whether a remove job will be supported by the certificate store.	CreateSupported	A Boolean stating whether a create job will be supported by the certificate store.
Value	Description																								
Name	The name of the type.																								
ShortName	The ShortName of the type.																								
StoreType	The Id of the store																								
LocalStore	A Boolean if the certificate store is on the local server of the agent.																								
ServerRegistration	Tells whether server registration is needed by Keyfactor Command.																								
ImportType	A value to indicate the source of a certificate record in the Keyfactor Command audit logs.																								
InventoryJobType	The GUID of the inventory job type that is used to register with the Any Agent.																								
ManagementJobType	The GUID of the management job type that is used to register with the Any Agent.																								
AddSupported	A Boolean stating whether an add job will be supported by the certificate store.																								
RemoveSupported	A Boolean stating whether a remove job will be supported by the certificate store.																								
CreateSupported	A Boolean stating whether a create job will be supported by the certificate store.																								

Parameter Name	Parameter Value									
	Value	Description								
	DiscoverySupported	A Boolean stating whether a discovery job will be supported by the certificate store.								
	EnrollmentSupported	A Boolean stating whether an enrollment job will be supported by the certificate store.								
	InventoryEndpoint	The endpoint that will be hit by the agent.								
	Properties	A list of properties that reflect those given in the request.								
	EntryPasswordSupported	A Boolean stating whether an entry password will be supported by the certificate store.								
	StorePasswordRequired	A Boolean stating whether a store password will be required by the certificate store.								
	PrivatekeyAllowed	<div>An integer notifying the state of the private keys in the certificate store.<table><tr><th>Value</th><th>Name</th></tr><tr><td>0</td><td>Forbidden</td></tr><tr><td>1</td><td>Optional</td></tr><tr><td>2</td><td>Required</td></tr></table></div>	Value	Name	0	Forbidden	1	Optional	2	Required
	Value	Name								
	0	Forbidden								
1	Optional									
2	Required									
StorePathType	The value of the store path. If value is an empty string, the field is free form.									
CustomAliasAllowed	A Boolean stating whether a custom alias will be supported by the certificate store.									
JobProperties	The properties that will be required when performing a management job on the certificate store with this type.									

## Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStoreType HTTP/1.1

```

{
  "Name": "<Type Name>",
  "ShortName": "<Type Short Name>",
  "AddSupported": true,
  "CreateSupported": false,
  "DiscoverySupported": true,
  "RemoveSupported": true,
  "EnrollmentSupported": true,
  "EntryPasswordSupported": true,
  "PrivateKeyAllowed": <integer 0-2>,
  "LocalStore": true,
  "StorePasswordRequired": true,
  "Powershell": false,
  "CustomAliasAllowed": false,
  "JobProperties": "<List of Job Properties>",
  "ServerRegistration": false,
  "Properties": {
    "<Property Name>": {
      "type": "<Property Type>",
      "DisplayName": "<Display Name>"
    },
    "<Property Name>": {
      "type": "<Type>",
      "displayName": "<Display Name>"
      "value": "<Value>"
    }
  },
  "StorePathType": <Path Type>
}

```

## Example Response

Status Code: 200

```

{
  "Message": "The operation completed successfully.",
  "Result": 1,
  "Data": {
    "Name": "<Name>",
    "ShortName": "<Short Name>",
    "StoreType": <Store Type Id>,
    "LocalStore": true,
    "ServerRegistration": null,
    "ImportType": <Import Type>,

```

```

    "InventoryJobType": "<Inventory Job Type Guid>",
    "ManagementJobType": "<Management Job Type Guid>",
    "AddSupported": false,
    "RemoveSupported": true,
    "CreateSupported": false,
    "DiscoveryJobType": "<Discovery Job Type Guid>",
    "EnrollmentJobType": "<Enrollment Job Type Guid>",
    "InventoryEndpoint": "<Inventory Endpoint>",
    "Properties": {
        "<Property Name>": {
            "Type": "<Type>",
            "DisplayName": "<Display Name>",
            "Required": false,
            "Depends": null,
            "Value": <Value>
        },
        "<Property Name>": {
            "Type": "<Type>",
            "DisplayName": "<Display Name> ",
            "Required": false,
            "Depends": null,
            "Value": "<Value>"
        }
    },
    "EntryPasswordSupported": true,
    "StorePasswordRequired": true,
    "PrivateKeyAllowed": <Integer 0-2>,
    "StorePathType": <Store Path Type>,
    "CustomAliasAllowed": false,
    "JobProperties": "<Job Properties>"
}

```

### 2.3.5.5 CertStore AddPFX

The POST AddPfx method will schedule the addition of the provided PFX(s) to the specified alias/name within the provided certificate store(s). The request should contain the fields shown in [Table 640: POST /AddPfx Request Body](#), while the response format will be the same as for AddCert (see [Table 633: POST /AddCert Response Body](#)).

Table 640: POST /AddPfx Request Body

Parameter Name	Parameter Value
Keystores	Array of certificate stores to which the provided entry should be added, with the same format as the response to GET /Keystores (see <a href="#">Table 647: GET /Keystores Response Body</a> ).

Parameter Name	Parameter Value
Alias	Name of the entry to which the certificate should be added.
Overwrite	Boolean denoting if the entry should be overwritten, if one exists. An error will be returned if this is set to false but an entry with the same alias/name exists.
Contents	PEM of the PFX to be added. Do not include the ...BEGIN... AND ...END... lines.
PfxPassword	Password of the PFX.
HasEntryPassword	Boolean denoting if the password required for the entry is different than that of the certificate store itself.
EntryPassword	Password for the certificate store entry. Required if the HasEntryPassword is set to true.

## Example Request

POST http://<host>/CMSApi/CertStore/1/AddPfx HTTP/1.1

```
{
  "Keystores":
  [{
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  },
  {
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }],
  "Alias": "<alias>",
  "Overwrite": "true",
  "HasEntryPassword": "true",
  "EntryPassword": "<entry-password>",
  "PfxPassword": "<pfx-password>",
  "Contents": "<base64-encoded PFX>"
}
```

### 2.3.5.6 CertStore CreateJKS

In most cases, certificate stores will already exist on the client machine prior to configuration within Keyfactor Command. For example, the IIS Personal Store exists on each windows machine independently of Keyfactor Command installation. In other cases, such as PEM files, the file can be created when a certificate is added. However, with a Java Keystore, creating the store on the file system and adding certificates to it are different

operations. The CreateJKS method supports scheduling creation of a Java Keystore as a Keyfactor Command Agent job. The structure of this request is given in [Table 641: POST /CreateJKS Request Body](#) while the response is the same as for AddCertStore (see [Table 635: POST /AddCertStore Response Body](#)).

Table 641: POST /CreateJKS Request Body

Parameter Name	Parameter Value
ClientMachine	Machine on which the certificate store will reside.
StorePath	Path and filename of the certificate store to be created.
Password	Password to use for the new store.

### Example Request

POST http://<host>/CMSApi/CertStore/1/CreateJKS HTTP/1.1

```
{
  "ClientMachine" : "192.168.41.171",
  "StorePath" : "/opt/cms-java-agent/config/trust.jks",
  "Password" : "changeit"
}
```

### 2.3.5.7 CertStore EditCertStore

The EditCertStore method allows certain aspects of a cert store definition to be updated. Some aspects, such as the store type and client machine, cannot be updated. The format of the request given in [Table 642: POST /EditCertStore Request Body](#), while the response will be as it is for [Table 637: POST /AddCertStoreServer Response Body](#).

Table 642: POST /EditCertStore Request Body

Parameter Name	Parameter Value
Id	Guid – Unique identifier of the certificate store. This field is the most specific, and does not require either the ClientMachine or StorePath fields to be provided.
ClientMachine	Machine on which the store resides. This field is required if the Id field is not provided.
StorePath	Path and filename of the certificate store. This field is required if the Id field is not provided.
NewStorePath	New path on the machine filesystem where the certstore resides.
NewContainer	Reassign the certstore container in Keyfactor Command where this store is configured.
NewPassword	Change the password used by the agent to access the store.

Parameter Name	Parameter Value
NewPrivateKeyPath	Change the path of a private key stored separately from a PEM file certificate
NewAgentId	Change the agent managing a remote certstore by providing its GUID. Cannot be used with NewAgentName.
NewAgentName	Change the agent managing a remote certstore by providing the name it reports to Keyfactor Command. Cannot be used with NewAgentId.

## Example Request

POST http://<host>/CMSApi/CertStore/1/EditCertStore HTTP/1.1

```
{
  "ClientMachine": "192.168.23.100",
  "StorePath" : "/nsconfig/ssl",
  "NewStorePath" : "/nsconfig/ssl/vserver1",
  "NewContainer": "NetScaler"
}
```

### 2.3.5.8 CertStore EditCertStoreServer

A cert store server is a machine that hosts a store that is remotely managed by a Keyfactor Command Agent, such as a NetScaler or F5 device. The CertStoreServer configuration contains the data that allows the agent to connect to the host via the host platform's API. This method allows configuration of an existing CertStoreServer to be updated. The request format is shown in [Table 643: POST /EditCertStoreServer Request Body](#), while the response format is the same as for AddCertStoreServer (see [Table 637: POST /AddCertStoreServer Response Body](#)).

Table 643: POST /EditCertStoreServer Request Body

Parameter Name	Parameter Value
Name	Hostname of the machine the agent will connect to. Required if Id is not provided.
Id	Identifier of the certstore server to update. Required if Name is not provided.
UseSSL	Boolean denoting whether the agent should connect to the client API using https or http.
NewUsername	Username to provide to the client API. Required if NewPassword is provided.
NewPassword	Password corresponding to the login for the given Username to access the client API. Required if NewUsername is provided.

## Example Request

POST http://<host>/CMSApi/CertStore/1/EditCertStoreServer HTTP/1.1

```
{
  "Name": "192.168.23.100",
  "UseSSL" : true,
  "newUsername" : "myNetScalerAdmin",
  "newPassword": "S1deways-Grasshopper4979"
}
```

### 2.3.5.9 CertStore GetCertStoreTypes

The GET CertStoreTypes method returns a list of all certificate store types. The format for each element in the list can be found in [Table 644: GET /GetCertStoreTypes Response Body](#).

Table 644: GET /GetCertStoreTypes Response Body

Parameter Name	Parameter Value
Name	The name of the type.
ShortName	The short name of the type.
StoreType	The Id of the type.
LocalServer	A Boolean stating if the certificate store server is the same machine as the agent.
ServerRegistration	A Boolean stating whether Keyfactor Command needs to prompt for credentials for each client machine that has this certificate store type.
InventoryJobType	The GUID of the Inventory Job.
ManagementJobType	The GUID of the management job.
DiscoveryJobType	The GUID of the discovery job.
EnrollmentJobType	The GUID of the enrollment job.
InventoryEndpoint	The server endpoint to which the agent publishes its inventory results.
Properties	The added properties of the certificate store that uses this type.
EntryPasswordSupported	A Boolean stating if an entry password is supported by the certificate store that uses this type.
StorePasswordRequired	A Boolean stating if a store password is required by the certificate store that uses this type.

Parameter Name	Parameter Value
PrivateKeyAllowed	A Boolean stating if a private key is allowed by the certificate store that uses this type.
StorePathType	The value for the store path. Can be null, a string or a comma-separated string for free form, the specified path or a list of paths to choose from respectively.

### 2.3.5.10 CertStore Inventory

The POST Inventory method returns a list of the entries within the provided certificate store. The request body is formatted the same as the response to GET /Keystores (see [Table 647: GET /Keystores Response Body](#)).

Table 645: POST /Inventory Response Body

Parameter Name	Parameter Value
Alias	Alias/name of the certificate store entry.
PrivateKeyEntry	Boolean value denoting if the entry has an associated private key.
Certificates	Array of the certificates contained within the certificate store (see <a href="#">Table 646: POST /Inventory Response Certificates Fields</a> ).

Table 646: POST /Inventory Response Certificates Fields

Parameter Name	Parameter Value
ChainLevel	Position of the certificate within the chain. This is only applicable for private key entries.
CertificateId	Database identifier of the certificate within Keyfactor Command.
Thumbprint	Thumbprint of the certificate.

### Example Request

POST http://<host>/CMSApi/CertStore/1/Inventory HTTP/1.1

```
{
  "Id": "<certificate-store-id>",
  "ClientMachine": "<client-machine>",
  "StorePath": "<store-path>"
}
```

### Example Response

```
[
  {
    "Alias": "<alias1>",
    "PrivateKeyEntry": false,
    "Certificates": [{"ChainLevel": 0, "CertificateId": <id>, "Thumbprint": "<thumbprint>"}]
  },
  {
    "Alias": "<alias2>",
    "PrivateKeyEntry": true,
    "Certificates":
    [
      {"ChainLevel": 0, "CertificateId": <id>, "Thumbprint": "<thumbprint>"},
      {"ChainLevel": 1, "CertificateId": <id>, "Thumbprint": "<thumbprint>"},
      {"ChainLevel": 2, "CertificateId": <id>, "Thumbprint": "<thumbprint>"}
    ]
  }
]
```

### 2.3.5.11 CertStore Keystores

The GET Keystores method returns a list of the certificate stores within Keyfactor Command. This method requires no parameters. An array of the certificate stores is returned. The information shown in [Table 647: GET /Keystores Response Body](#) is returned for each certificate store in the array.

Table 647: GET /Keystores Response Body

Parameter Name	Parameter Value
Id	The Keyfactor Command request database identifier of the certificate store.
ClientMachine	Host name of the machine on which the certificate store resides.
StorePath	Path or other identifier of the certificate store (e.g. "IIS Personal" for IIS Personal stores).

#### Example Request

GET http://<host>/CMSApi/Certstore/1/Keystores

#### Example Response

```
[
  {
    "Id": "<certificate-store-id>",
    "ClientMachine": "<client-machine>",
```

```

    "StorePath": "<store-path>"
  },
  {
    "Id": "<certificate-store-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }
]

```

### 2.3.5.12 CertStore Remove

The POST Remove method will schedule the removal of the provided entry associated with the specified alias/-name within the provided certificate store(s). The request should contain the fields shown in [Table 648: POST /Remove Request Body](#), while the response will be formatted as it is for AddCert and AddPfx (see [Table 633: POST /AddCert Response Body](#)).

Table 648: POST /Remove Request Body

Parameter Name	Parameter Value
Keystores	Array of the certificate stores from which the provided entry should be removed, formatted as with the GET /Keystores response (see <a href="#">Table 647: GET /Keystores Response Body</a> ).
Alias	Name of the entry from which the certificate should be removed.
Thumbprint	Thumbprint of the certificate to be removed. This field is optional if the CertificateId is provided.
CertificateId	Database identifier within Keyfactor Command of the certificate to be removed. This field is optional if the Thumbprint is provided.

### Example Request

POST http://<host>/CMSApi/CertStore/1/Remove HTTP/1.1

```

{
  "Keystores":
  [{
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  },
  {
    "Id": "<keystore-id>",

```

```

    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }},
  "Alias": "<alias>",
  "CertificateId": "<certificate-id>",
  "Thumbprint": "<thumbprint>"
}

```

### 2.3.5.13 CertStore ScheduleInventory

Keyfactor Command Agents typically monitor the contents of cert stores they manage on a pre-configured interval, either once per day or every n minutes. The ScheduleInventory endpoint allows this interval configuration to be updated or switched on and off. Requests are formatted as follows, while the response is formatted as for AddCertStoreServer (see [Table 637: POST /AddCertStoreServer Response Body](#)):

Table 649: POST /ScheduleInventory Request Body

Parameter Name	Parameter Value								
Id	Guid – Unique identifier of the certificate store. This field is the most specific, and does not require either the ClientMachine or StorePath fields to be provided.								
ClientMachine	Machine on which the certificate store resides. This field is optional if the Id field is provided. It is required if used in conjunction with the ClientMachine field.								
StorePath	Path and filename of the certificate store. This field is optional if the Id field is provided. It is required if used in conjunction with the ClientMachine field.								
ScheduleType	Value indicating whether inventory should be off, on an interval, or daily. Possible values are: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Off</td></tr> <tr> <td>1</td><td>Interval</td></tr> <tr> <td>2</td><td>Daily</td></tr> </table>	Parameter Name	Parameter Value	0	Off	1	Interval	2	Daily
Parameter Name	Parameter Value								
0	Off								
1	Interval								
2	Daily								
ScheduleTime	Time of day (hour and minute) that the inventory should run. Used for ScheduleType "Daily".								
ScheduleInterval	Integer number of minutes that should elapse between inventories. Used for ScheduleType "Interval".								
Overwrite	Boolean indicating whether a previous schedule configuration, if it exists, should be overwritten with the provided schedule configuration.								

### Example Request

POST http://<host>/CMSApi/CertStore/1/ScheduleInventory HTTP/1.1

```
{
  "ID": "832f87c7-0af7-4043-9840-3022faeeae45",
  "ClientMachine": "192.168.41.171",
  "StorePath": "/home/pi/cherry/cherrystore",
  "ScheduleType": 2,
  "ScheduleTime": "23:00",
  "Overwrite": true
}
```

## Example Response

Status Code: 200

```
{
  "Message": "The operation completed successfully.",
  "Result": 1
}
```

## 2.3.6 Metadata

Metadata in Keyfactor Command allows dynamic information about a certificate, or other data associated with a certificate that isn't included in the cert itself, to be associated with the certificate within Keyfactor Command. A metadata field can be defined within Keyfactor Command of a given type with a variety of other attributes, such as default values and security constraints. Currently, the supported metadata types are:

- String  
Alphanumeric text field limited to 400 characters.
- Integer  
Supports whole numbers only.
- Date
- Multiple Choice
- Big Text  
Big Text fields are limited to 4000 characters. String fields support additional indexing, and so may be preferable to Big Text fields for large databases where possible.
- Boolean  
True/False

Every certificate in Keyfactor Command can be assigned a value for each metadata field defined. The Metadata Web API component supports assignment, retrieval, and comparison of metadata values associated with a certificate, as well as retrieval of metadata field definitions. The supported methods are listed in [Table 650: Metadata Endpoints](#).

NOTE: Since the Certificates/1/Metafield endpoint (see [Certificates Metafield on page 1412](#)) is considered "Version 1" of this API component, version numbering here starts at 2.

Table 650: Metadata Endpoints

Endpoint	Method	Description
/2/Compare	POST	Compare the stored value for a metadata field associated with a given certificate against the value given in the request, and return a Boolean indicating whether the values match.
/2/Get	POST	Return the value for a metadata field associated with a given certificate.
/2/Set	POST	Assign a value for a metadata field to a given certificate.
/3/Get	POST	Return the value for a metadata field associated with a given certificate.
/3/GetDefinition	POST	Return the definition for the metadata field with given name.
/3/Set	POST	Assign a value for a metadata field to a given certificate.

### 2.3.6.1 Metadata V2

The *Metadata/2/...* calls all have a common request format and set of response codes. The request body is always a JSON-formatted string containing a set of fields used to identify the certificate the operation is to be performed on and a list of key-value pairs defining the metadata fields of interest. In the case of the Set method, the values to which each field should be set must also be provided.

Table 651: POST Metadata/2/\* Request Body

Parameter Name	Parameter Value
Key	The key value can either be "Thumbprint" or "Serial" to identify the certificate. If you choose serial, you must include both the SerialNumber and the IssuerDN fields.
SerialNumber	The serial number of the certificate. Required only if Key is set to "Serial".
IssuerDN	The issuer of the certificate. Required only if Key is set to "Serial".
Thumbprint	The thumbprint of the certificate. Required only if Key is set to "Thumbprint".
metadatalist	Metadata field/value entries in one of the following forms: <ul style="list-style-type: none"><li>• [{"MetadataFieldType": "&lt;field1-name&gt;", "Value": "&lt;field1-value&gt;"}, {...}, {...}]</li><li>• {"&lt;field1-name&gt;": "&lt;field1-value&gt;", "&lt;field2-name&gt;": "&lt;field2-value&gt;"}</li></ul>

## Metadata V2 Set

The Metadata V2 Set POST method is used to set metadata value on a certificate in Keyfactor Command. The POST request body must consist of a JSON string containing the parameters used to set a certificate's metadata. If the request is successful, a 200 OK will be returned with "true" in the message body. If it is not, an appropriate 4xx HTTP status code is returned, and the body will contain a JSON object with a message about the error.

### Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/2/Set

```
{
  "Key": "Thumbprint",
  "Thumbprint": "<thumbprint>",
  "metadatalist" : [{"EmailAddress": "bob.smith@example.com"}]
}
```

### Example Request

Using serial

POST http://<host>/CMSApi/Metadata/2/Set HTTP/1.1

```
{
  "Key": "Serial",
  "SerialNumber": "<serial-number>",
  "SerialIssuer": "<issuing-ca>",
  "metadatalist": [{"EmailAddress": "bob.smith@example.com"}]
}
```

### Example Response

(Unsuccessful)

```
{
  "Message": "The following metadata errors were found: 'myInvalidField' was not a valid MetadataFieldTypeName."
}
```

## Metadata V2 Get

The Metadata V2 Get POST method is used to get metadata value on a certificate in Keyfactor Command. Despite the "Get" in the Keyfactor Command method name, the HTTP method must be POST and not GET. As with metadata/2/set (see [Metadata V2 Set on the previous page](#)), the POST request body must consist of a JSON string containing the parameters used to get a certificate's metadata. The "value" attribute for each entry in the metadata list is not used, but must be present and can be set to null or an empty string.

### Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/2/Get HTTP/1.1

```
{
  "Key": "Thumbprint",
  "Thumbprint": "<thumbprint>",
  "metadatalist": [{"MetadataFieldName": "EmailAddress", "Value": ""}]
}
```

### Example Response

```
{
  "EmailAddress" : "bob.smith@example.com"
}
```

## Metadata V2 Compare

The Metadata V2 Compare method takes a collection of metadata and returns a true/false response depending on whether the values for the fields provided match the values stored in Keyfactor Command. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method a metadata attribute can be used along with the certificate itself as a second authentication factor to third-party applications.

### Example Request

POST http://<host>/CMSApi/Metadata/2/Compare HTTP/1.1

```
{
  "Key": "Thumbprint",
  "Thumbprint": <Thumbprint>
  "metadatalist": [{"MetadataFieldName": "EmailAddress",
```

```
}
  "Value": "example@example.com"
}
```

### 2.3.6.2 Metadata V3

Version 3 of the metadata API allows more flexibility in certificate lookup and security measures than version 2, while allowing more to be done in a single API call and with a more concise JSON representation. Requests to metadata v3 API methods include 3 parts as shown in [Table 652: Metadata V3 Request Body](#).

Table 652: Metadata V3 Request Body

Parameter Name	Parameter Value
Lookup	Given in <a href="#">Table 4: Classic API Certificate Lookup Structure</a> .
Security	Given in <a href="#">Table 653: Metadata V3 Security Bitflags</a>
Metadata	Dictionary of key-value pairs, where the key represents the metadata field and (for the set method) the value represents the value to be associated to the certificate referenced in the "Lookup" value. For Get and GetDefinition methods, the same structure is used but the value is not considered.

The security parameter includes a set of required flags, certain of which necessitate the inclusion of other parameters. The flags should be passed as integers, combined together using bitwise OR. The flags defined in Keyfactor Command are described in [Table 653: Metadata V3 Security Bitflags](#).

Table 653: Metadata V3 Security Bitflags

Value	Definition
00000001	Fail if certificate has been revoked or denied.
00000010	Fail if certificate has expired.
00000100	Fail if certificate status is pending or unknown.
00001000	Fail if metadata values provided for authentication do not match the values stored in Keyfactor Command.  Must be paired with an "authmetadata" field, the value of which is a dictionary formatted with {"MetadataFieldName": "AssociatedCertificateValue" pairs}. This effectively supplants the "Compare" method found in v2.
00100000	Overwrite flag – update value even if field is configured to require explicit overwrites and a value has been associated with the certificate (applies to Set method only).

The metadata argument is a JSON dictionary containing 0 or more key-value pairs. In each pair, the key must correspond to the name of a metadata field. The value, if present, must be of a data type matching the type of the

field. For Boolean and integer metadata field values, this is the JSON Boolean or integer type, respectively, while all other metadata field types are to be represented as strings. Dates should be passed in the "YYYY-M-D" format. Multi-valued entries should have a value that exactly matches one of the pre-defined values. For the Get method, values need not be provided and the empty string can be used as the value for each key. In the case where there are 0 metadata arguments, the "Metadata" key must still be present and mapped to an empty object "{}". Note that this syntax is different than previous Metadata API versions, and uses a more concise format. An example is:

```
"Metadata" : {"Email-Contact" : "user@example.com", "Contact-Name" : "John Doe", "ID-number" : 738}
```

## Metadata V3 Set

The Metadata V3 Set POST method is used to set metadata value on a certificate in Keyfactor Command. It returns a "200 OK" response with no further content on success.

### Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/3/Set HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Thumbprint",
    "Thumbprint": "<thumbprint>"
  },
  "Security": {"Flags": 3},
  "Metadata": {"Email-Contact": "bob.smith@example.com"}
}
```

### Example Request

Using serial

POST http://<host>/CMSApi/Metadata/3/Set HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Serial",
    "SerialNumber": "<serial-number>",
    "IssuerDN": "<issuer-dn>"
  },
}
```

```
"Security": {"Flags" : 3},
"Metadata": {"Email-Contact": "bob.smith@example.com"}
}
```

## Metadata V3 Get

The Metadata V3 Get POST method is used to get metadata value on a certificate in Keyfactor Command. Despite the "Get" in the Keyfactor Command method name, the HTTP method must be POST and not GET. As with metadata/3/set (see [Metadata V3 Set on the previous page](#)), the POST request body must consist of a JSON string containing the parameters used to get a certificate's metadata. The "value" attribute for each metadata entry is not used, but must be present and can be set to null or an empty string. The method returns a JSON dictionary in a format identical to the metadata parameter, with key-value pairs containing the fields and values requested.

### Example Request

POST http://<host>/CMSApi/Metadata/3/Get HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Serial",
    "SerialNumber": "<serial-number>",
    "IssuerDN": "<issuer-dn>"
  },
  "Security": {"Flags": 3},
  "Metadata ": {"Email-Contact": ""}
}
```

### Example Response

```
{
  "Email-Contact": "bob.smith@example.com"
}
```

## Metadata V3 GetDefinition

The Metadata V3 GetDefinition API endpoint will return the definition of a metadata field. Note that, while this does not operate on a certificate, the same request structure is used so the fields must be supplied, but the value will not be used. The structure of the response is given below.

Table 654: POST /GetDefinition Response Body

Parameter Name	Parameter Value
Name	Name of the metadata field.
Description	Purpose or intended usage of the field.
Hint	Sample value to be shown when users enter a value for this field in the Keyfactor Command Management Portal.
Validation	Regular Expression string capturing acceptable values for this field.
Required	Boolean indicating whether certificates added to Keyfactor Command must include a value for this field.
Message	Error message to be returned for values that do not conform to the regular expression.
Options	Comma-separated list of allowed values for "multi-valued" metadata fields.
DefaultValue	Initial value to be assigned for new certificates if a value is not provided at addition time.
AllowAPI	Boolean indicating whether values for this field are exposed through API Get and Set requests.
ExplicitUpdate	Boolean indicating whether updates require an appropriate flag to overwrite previous values.

## Example Request

POST http://<host>/CMSApi/Metadata/3/GetDefinition HTTP/1.1

```
{
  "Lookup": { "Type": "CMSID", "CMSID" : 1},
  "Security": {"Flags": 0},
  "Metadata ": {"Email-Contact": ""}
}
```

## Example Response

```
{
  "Name": "Email-Contact",
  "Description": "Email contact for the certificate.",
  "Hint": "contact@domain.com",
  "Validation": null,
  "Required": false,
  "Message": null,
```

```

    "Options": null,
    "DefaultValue": null,
    "AllowAPI": true,
    "ExplicitUpdate": true
  }

```

## 2.3.7 Security

The Security component of the Keyfactor Web APIs includes all methods necessary to programmatically add, get and delete security identities as well as get, add, edit and delete the security roles defined in Keyfactor Command. The complete set of methods in the component is given in [2.3.7 Security](#).

Table 655: Security Endpoints

Endpoint	Method	Description
/1/GetIdentities	GET	Return a list of the identities in Keyfactor Command, the roles they are assigned to and their validity
/1/AddIdentity	POST	Add an identity to Keyfactor Command
/1/DeleteIdentities	POST	Remove an identity from Keyfactor Command
/1/GetRoles	GET	Retrieve all the security roles currently defined in Keyfactor Command with all of their permissions, a description and who they are assigned to
/1/AddRole	POST	Add a security role to Keyfactor Command
/1/EditRole	POST	Edit a security role in Keyfactor Command
/1/DeleteRole	POST	Delete a security role from Keyfactor Command

### 2.3.7.1 Security GetIdentities

The GET GetIdentities request returns a list of identities known to Keyfactor Command with the type of identity (user or group), whether the identity is valid or not and the roles associated with the identity. No parameters or extra headers are necessary for this method.

#### Example Request

GET http://<host>/CMSApi/Security/1/GetIdentities HTTP/1.1

#### Example Response

Status Code: 200

```
[
  {
    "Id": <Id>,
    "AccountName": "<Domain>\\<Identity>",
    "Type": "<Identity Type>",
    "Roles": "<List of Roles>",
    "Valid": true
  }
]
```

### 2.3.7.2 Security AddIdentity

The POST AddIdentities request adds an identity to Keyfactor Command. The POST request must contain a JSON string containing the AD account name. This method returns a 200 with the Id, account name, type, roles, and validity of the identity. The request parameters can be found in [Table 656: POST AddIdentity Request Parameter](#).

Table 656: POST AddIdentity Request Parameter

Parameter Name	Parameter Value
Account	The name of the account that is to be added to CMS. This parameter is required.

#### Example Request

For a user

POST http://<host>/CMSApi/Security/1/AddIdentity HTTP/1.1

```
{
  "Account": "<Domain>\\<User>"
}
```

#### Example Request

For a group

POST http://<host>/CMSApi/Security/1/AddIdentity HTTP/1.1

```
{
  "Account": "<Domain>\\<Group>"
}
```

#### Example Response

Status Code: 200

```
{
  "Id": <Id>,
  "AccountName": "<Domain>\\<Identity>",
  "Type": "<Identity Type>",
  "Roles": "<List of Roles>",
  "Valid": true
}
```

### 2.3.7.3 Security DeletIdentity

The POST AddIdentities request removes an identity from Keyfactor Command. The POST request must contain a JSON string containing the identity Id. This method returns a 200 a message stating the identity was deleted successfully. The request parameters can be found in [Table 657: POST DeletIdentity Request Parameter](#)

Table 657: POST DeletIdentity Request Parameter

Parameter Name	Parameter Value
Id	The Id of the identity that is to be deleted

#### Example Request

POST http://<host>/CMSApi/Security/1/DeletIdentity HTTP/1.1

```
{
  "Id": <Id>
}
```

#### Example Response

Status Code: 200

```
{
  "Message": "ADIdentity deleted successfully"
}
```

### 2.3.7.4 Security GetRoles

The GET GetRoles endpoint retrieves all the current security roles defined in Keyfactor Command and returns the Id, name, description, validity, permissions and associated identities. The response parameters can be found in

**Table 658: POST /GetRoles Response Body.**

*Table 658: POST /GetRoles Response Body*

Parameter Name	Parameter Value
Id	The Id of the security role.
Name	The name of the security role.
Description	The description of the security role.
Valid	The validity of the security role.
Permissions	The permissions of the security role.
Identities	The security identities of the security role.

## Example Request

GET http://<host>/CMSApi/Security/1/GetRoles HTTP/1.1

## Example Response

Status Code: 200

```
[
  {
    "Id": <Id>,
    "Name": "<Name>",
    "Description": "<Description>",
    "Valid": true,
    "Permissions": "<List of Permissions>",
    "Identities": "<List of Identities>"
  },
]
```

### 2.3.7.5 Security AddRole

The POST AddRole endpoint creates a security role in Keyfactor Command. This endpoint can be used to assign a role to an identity and permissions to a role.

The list of available permissions can be found in [Table 659: Keyfactor Command Permissions List](#).

Request parameters can be found in [Table 660: POST /AddRole Request Parameters](#).

Response parameters can be found in [Table 658: POST /GetRoles Response Body](#).

Table 659: Keyfactor Command Permissions List

Permission Name	Permission Value
AgentAutoRegistrationModify	Permission to modify agent auto registrations.
AgentAutoRegistrationRead	Permission to read agent auto registrations.
AgentManagementModify	Permission to modify agents.
APIRead	Permission to use the Keyfactor Web APIs.
CertificateCollectionsModify	Permission to modify certificate collections.
CertificateMetadataTypesModify	Permission to modify metadatatypes.
CertificateMetadataTypesRead	Permission to read metadata types.
CertificatesImport	Permission to import certificates.
CertificatesModify	Permission to modify certificates' metadata.
CertificatesRead	Permission to read certificates.
CertificatesRecover	Permission to recover certificates.
CertificatesRevoke	Permission to revoke certificates.
CertificateStoreManagementModify	Permission to modify certificate stores.
CertificateStoreManagementRead	Permission to read certificate stores.
CertificateStoreManagementSchedule	Permission to schedule certificate stores.
MacAutoEnrollManagementModify	Permission to modify Mac auto enrollment settings.
MacAutoEnrollManagementRead	Permission to read Mac auto enrollment settings.
ManagementPortalRead	Permission to read the Keyfactor Command Management Portal.
MonitoringModify	Permission to modify monitoring settings.
MonitoringRead	Permission to read monitoring settings.
MonitoringTest	Permission to test monitoring.
PKIManagementModify	Permission to modify PKI management settings.
PKIManagementRead	Permission to read PKI management settings.
ReportsModify	Permission to modify reports.

Permission Name	Permission Value
ReportsRead	Permission to read reports.
SecuritySettingsModify	Permission to modify security settings.
SecuritySettingsRead	Permission to read security settings.
SSLManagementModify	Permission to modify SSL management settings.
SSLManagementRead	Permission to read SSL management settings.
SystemSettingsModify	Permission to modify system settings.
SystemSettingsRead	Permission to read system settings.
WorkflowModify	Permission to modify alert definitions.
WorkflowParticipate	Permission to approve/deny pending certificates.
WorkflowRead	Permission to read certificates in a pending state and alert definitions.
WorkflowTest	Permission to test alerts.

Table 660: POST /AddRole Request Parameters

Parameter Name	Parameter Value
Name	The name of the security role. This parameter is <b>required</b> .
Description	A description of the security role. This parameter is <b>required</b> .
Permissions	A list of permissions for the security role. This parameter is optional.
Identities	A list of security identities that will be associated with the security role. This parameter is optional.

## Example Request

POST http://<host>/CMSApi/Security/1/AddRole

```
{
  "Name": "<Name>",
  "Description": "<Description>",
  "Permissions": [ "<Permission>", "<Permission>" ],
}
```

```
"Identities": ["<Domain>\\<Identity>", "<Domain>\\<Identity>"]
}
```

## Example Response

Status Code: 200

```
{
  "Id": <Id>, "Name": "<Name>",
  "Description": "<Description>",
  "Valid": true, "Permissions": "<List of permissions>",
  "Identities": "<List of identities>"
}
```

### 2.3.7.6 Security EditRole

The POST EditRole endpoint modifies existing security roles. The parameters for the EditRole endpoint can be found in [Table 661: POST /EditRole Request Parameters](#). The administrator role's name, description and permissions cannot be changed.

Table 661: POST /EditRole Request Parameters

Parameter Name	Parameter Value
Id	The Id of the security role to be edited. This parameter is <b>required</b> .
Name	The name to which the security role will be changed. This parameter is optional.
Description	The description of which the security role will be changed. This parameter is optional.
Permissions	The permissions to which the security role will be changed. This parameter is optional.
Identities	The identities to which the security role will be changed. This parameter can take either the Id of a security identity or the identity name. This parameter is optional.

## Example Request

POST http://<host>/CMSApi/Security/1/EditRole

```
{
  "Id":<Id>,

```

```
}
  "Identities": [<List of Identities>]
}
```

## Example Response

Status Code: 200

```
{
  "Id": <Id>,
  "Name": "<Name>",
  "Description": "<Description>",
  "Valid": true,
  "Permissions": "<List of Permissions>",
  "Identities": "List of Identities"
}
```

### 2.3.7.7 Security DeleteRole

The POST DeleteRole endpoint can be used to delete a security role from Keyfactor Command. A role can be deleted by name or Id. The administrator role cannot be deleted.

## Example Request

POST http://<host>/CMSApi/Security/1/DeleteRole

```
{
  "Id": <Id>
}
```

## Example Response

Status Code: 200

```
{
  "Message": "Successfully deleted Role: <Name of Role>"
}
```

## 2.3.8 SSL

Keyfactor Command allows, through the Keyfactor Command Windows Agent, various network segments to be scanned for endpoints serving SSL certificates as well as endpoints presenting a certificate to be monitored for changes in status. An SSL scan is executed against an Endpoint Group, which is a collection of network endpoints, along with a scan schedule. Two types of endpoint groups exist:

- **Discovery**  
A Discovery endpoint group contains endpoints to be scanned for certificates.
- **Monitoring**  
A Monitoring group allows endpoints that presented a certificate in a discovery scan to be repeatedly scanned for changes.

The SSL Web API component allows SSL scan configuration to be retrieved and updated in order to facilitate rapid configuration of large numbers of network endpoints. The methods included in this component are given in [Table 662: SSL Endpoints](#). As with the Certstore API component, the SSL component only has 1 version and all endpoints can be accessed through a URL path including `/SSL/1/`.

Table 662: SSL Endpoints

Endpoint	Method	Description
AddEndpoint	POST	Add a new endpoint to an endpoint group
AddEndpointGroup	POST	Add a new endpoint group to an agent.
Agents	GET	Return a list of Agents that can perform SSL scans.
EndpointGroups	GET	Returns a list of established endpoint groups for a particular agent

### 2.3.8.1 SSL AddEndpoint

The AddEndpoint method allows an endpoint to be added to an endpoint group. It returns HTTP 200 OK with response body "true" for successful requests or an appropriate 4xx error with a message on a failure.

Table 663: POST /AddEndpoint Request Body

Parameter Name	Parameter Value
EndpointGroupId	GUID of the endpoint group to which the endpoint should be added, which can be obtained through a combination of the GET SSL/1/Agents and GET SSL/1/EndpointGroups methods.
ItemType	Format in which the network endpoint is defined. Possible values are:

Parameter Name	Parameter Value	
	Value	Description
	1	IPAddress
	2	DnsName
	3	NetworkNotation
Value	String representing the endpoint. Should be formatted to match the expected format of the ItemType, e.g. "192.168.41.171:443" for IPAddress, "www.example.com:443" for DnsName, or "192.168.0.0/16:443" for NetworkNotation (corresponding to the IP address range 192.168.0.1-192.168.255.254, on port 443 for all endpoints).	

## Example Request

POST http://<host>/CMSApi/SSL/1/AddEndpoint HTTP/1.1

```
{
  "EndpointGroupId": <GUID>,
  "ItemType": 3,
  "Value": "192.168.0.0/24:443"
}
```

### 2.3.8.2 SSL AddEndpointGroup

The AddEndpoint Group method allows a new endpoint group to be added for an agent. This requires the two fields shown in [Table 664: POST /AddEndpointGroup Request Body](#). When successful, the GUID and Name of the created endpoint group are returned.

Table 664: POST /AddEndpointGroup Request Body

Parameter Name	Parameter Value
AgentId	GUID of the Agent that will scan endpoints in this group.
FriendlyName	Name of the group to be created.

Table 665: POST /AddEndpointGroup Response Body

Parameter Name	Parameter Value
Guid	Identifier for this endpoint group within Keyfactor Command.
Name	Name of the endpoint group used by Keyfactor Command.

## Example Request

POST http://<host>/CMSApi/SSL/1/AddEndpointGroup HTTP/1.1

```
{
  "AgentId": "<GUID>",
  "FriendlyName": "local-endpoints"
}
```

## Example Response

```
{
  "Guid": "0a44f8af-6808-40ad-9816-d08c2c45d45a",
  "Name": "local-endpoints"
}
```

### 2.3.8.3 SSL Agents

The Agents HTTP Get method takes no parameters and returns a list of agents that can perform SSL scans. The result will be an array of structures, each with a GUID and name.

Table 666: GET /Agents Response Body

Parameter Name	Parameter Value
Guid	Identifier for this agent within Keyfactor Command.
Name	Hostname of the agent used by Keyfactor Command.

## Example Request

GET http://<host>/CMSApi/SSL/1/Agents

## Example Response

```
[
  {
    "Guid": "956282ef-f01b-4ae3-8cd2-57327749e15c",
    "Name": "Dev1.jdk.com"
  }
]
```

### 2.3.8.4 SSL EndpointGroups

The EndpointGroups method returns the list of endpoint groups that have been defined for a particular agent. Unlike most methods in the Keyfactor Web APIs, this is a GET request that takes a parameter as part of the URL query string. The "agentId" required argument is the GUID of the agent for the endpoint groups that should be listed. This value can be retrieved from the GET /CMSApi/SSL/1/Agents response (see [SSL Agents on the previous page](#)). The response returned from this method will be an array of endpoint groups with the same structure as the response to AddEndpointGroup (see [Table 665: POST /AddEndpointGroup Response Body](#)).

#### Example Request

GET http://<host>/CMSApi/SSL/1/EndpointGroups?agentId=956282ef-f01b-4ae3-8cd2-57327749e15c HTTP/1.1

#### Example Response

```
[
  {
    "Guid": "bbf3c3ce-9d7f-48b1-ae5c-c8d38f41d2f1",
    "Name": "MyDiscoveryGroup"
  }
]
```

## 2.3.9 Workflow

Workflow in Keyfactor Command refers to the process through which pending certificate requests are approved or denied. The Workflow API provides the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. This component, like several others, currently encompasses only one version, and methods can all be accessed with the /Workflow/1/ prefix. The methods within this component are listed in [Table 667: Workflow Endpoints](#)

Table 667: Workflow Endpoints

Endpoint	Method	Description
Approve	POST	Approve a given pending certificate request

Endpoint	Method	Description
Deny	POST	Deny a given pending certificate request
PendingList	POST	Retrieve a list of outstanding pending certificate requests
Status	GET	Synonym for GET CMSApi/Status (see <a href="#">Status on page 1478</a> )

### 2.3.9.1 Workflow Approve and Deny

The Approve POST method will attempt to approve the provided pending certificate enrollment request(s), while POST Deny will attempt to deny the request(s). In both cases, the structure of the pending request(s) is the same—an array of pending certificate enrollment requests must be provided in the format given in [Table 669: POST /Approve and /Deny PendingRequests Details](#). If only one request is to be sent, it should be provided as a list with one element. The one difference between the request formats for the two methods is that Deny supports an optional "Comments" field, which provides an opportunity to describe the reason for the request denial, shown in [Table 668: POST /Approve and /Deny Request Body](#). In both cases, an array of successful, failed and forbidden requests will be returned. The method will accept various inputs used to qualify the request to be approved, as shown in [Table 669: POST /Approve and /Deny PendingRequests Details](#).

Table 668: POST /Approve and /Deny Request Body

Parameter Name	Parameter Value
PendingRequests	Array of requests to be approved or denied. Required for both methods.
Comments	String describing the reason for the request denial. Optional for Deny and not permitted for Approve.

Table 669: POST /Approve and /Deny PendingRequests Details

Parameter Name	Parameter Value
CMSRequestId	The Keyfactor Command request database identifier. This parameter is the most specific, and can be used without any other parameters provided. An exception will be returned if this identifier is not found within Keyfactor Command.
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CALogicalName and CARequestId parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and request ID is not found within Keyfactor Command.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CAHost and CARequestId parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and

Parameter Name	Parameter Value
	request ID is not found within Keyfactor Command.
CARequestId	Request/row identifier of the request for certificate authority defined by CAHost and CALogicalName. This parameter also requires the CALogicalName and CAHost parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and request ID is not found within Keyfactor Command.

Table 670: POST /Approve and /Deny Response Body

Parameter Name	Parameter Value
Successes	An array of the successful approval response details (see table below in this section).
Failures	An array of the failed approval response details (see table below in this section). Failures of this type are generally exceptions.
Denials	An array of the approval requests that were denied (see table below in this section). Denials are usually created by insufficient user permissions required to perform the approval.

Table 671: POST /Approve and /Deny Result Details

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted.
CMSRequestId	The Keyfactor Command request database identifier.
CARequestId	Request/row identifier of the request for certificate authority defined by CAHost and CALogicalName.
Comment	Brief description of the reason for the failure or denial, or simply 'Success' if the request succeeded.

## Example Request

Providing only a CMSRequestId

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [
    {"CMSRequestId": <cms-request-id1>},
    {"CMSRequestId": <cms-request-id2>}
  ]
}
```

## Example Request

Providing the certificate authority information

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [{
    "CAHost": "<ca-host>", "CALogicalName": "<ca-name>", "CAREquestId": <ca-request-id>
  }]
}
```

## Example Request

Providing both types of information

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [
    {"CMSRequestId": <cms-request-id1>},
    {"CAHost": "<ca-host>", "CALogicalName": "<ca-name>", "CAREquestId": <ca-request-id>}
  ]
}
```

## Example Response

(Successful)

```
{
  "Successes":
  [{
```

```

    "CAHost": "<ca-host>",
    "CALogicalName": "<ca-name>",
    "CARequestId": <ca-request-id>,
    "Comment": "Successful"
  }],
  "Failures": [],
  "Denials": []
}

```

## Example Response

(Invalid identifier)

```

{
  "Successes": [],
  "Failures": [{
    "CAHost": "<ca-host>",
    "CALogicalName": "<ca-name>",
    "CARequestId": <ca-request-id>,
    "CMSRequestId": <cms-request-id>,
    "Comment": "Unable to approve the request: <ca request id> for the certificate authority: '<ca-host-name>\<ca-logical-name>' \r\nfor the current user: '<requester>': No request for: CMS Request Id: 0, CA Host: <ca-host>, CA Logical Name: <ca-name>, CA Request Id: <ca-request-id>"
  }],
  "Denials": []
}

```

### 2.3.9.2 PendingList

The POST PendingList method will return the current set of pending certificate enrollment requests stored within Keyfactor Command matching the provided parameters. The response will be a JSON object with a single field , PendingRequests, mapped to an array where each entry represents a single pending certificate request that matches the parameters provided in the HTTP request. Each of these entries will have the format given in [Table 673: POST /PendingList Response Body](#).

Table 672: POST /PendingList Request Body

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CALogicalName parameter to be provided in the request. An exception will be returned if a certificate authority with this host and logical name is not found within Keyfactor Command.

Parameter Name	Parameter Value
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CAHost parameter to be provided in the request. An exception will be returned if a certificate authority with this host and logical name is not found within Keyfactor Command.
LowerDate	Any pending requests prior to this date should be ignored. Optional.
UpperDate	Any pending requests after this date should be ignored. Optional.

Table 673: POST /PendingList Response Body

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted.
CARquestId	Identifier associated with the request within the certificate authority.
CertificateAuthority	Combination of the CAHost and CALogicalName (CAHost\CALogicalName).
CMSRequestId	Database identifier associated with the request within Keyfactor Command.
CommonName	Common name requested for the certificate.
DistinguishedName	Distinguished name requested for the certificate.
TemplateName	Certificate template for which the certificate was requested.
KeySize	Number of bits in the certificate's private key.
Requester	User or principal who requested the certificate, generally formatted "DOMAIN\user".
SubmissionDate	ISO-8601 formatted timestamp at which the certificate request was received.
SubjectAlternativeName	Array of SANs requested for the certificate. The entries each correspond to one requested SAN element, and each one will be in the form given in <a href="#">Table 674: POST /PendingList SubjectAlternativeName Details</a>

Table 674: POST /PendingList SubjectAlternativeName Details

Parameter Name	Parameter Value																										
Type	<div>Type of this SAN element on the certificate request. Will take one of the following values:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Other</td></tr><tr><td>1</td><td>RFC 822 name (e-mail address)</td></tr><tr><td>2</td><td>DNS name</td></tr><tr><td>3</td><td>X400 address</td></tr><tr><td>4</td><td>Directory Name</td></tr><tr><td>5</td><td>Edi Party Name</td></tr><tr><td>6</td><td>URI</td></tr><tr><td>7</td><td>IP address</td></tr><tr><td>8</td><td>Registered ID</td></tr><tr><td>100</td><td>Microsoft NT Principal Name</td></tr><tr><td>101</td><td>Microsoft NTDS Replication</td></tr><tr><td>999</td><td>Unknown</td></tr></table></div>	Value	Description	0	Other	1	RFC 822 name (e-mail address)	2	DNS name	3	X400 address	4	Directory Name	5	Edi Party Name	6	URI	7	IP address	8	Registered ID	100	Microsoft NT Principal Name	101	Microsoft NTDS Replication	999	Unknown
Value	Description																										
0	Other																										
1	RFC 822 name (e-mail address)																										
2	DNS name																										
3	X400 address																										
4	Directory Name																										
5	Edi Party Name																										
6	URI																										
7	IP address																										
8	Registered ID																										
100	Microsoft NT Principal Name																										
101	Microsoft NTDS Replication																										
999	Unknown																										
Value	String representation of the value requested for this SAN element.																										

Example Request

POST http://<host>/CMSApi/Workflow/1/PendingList HTTP/1.1

```
{
  "CAHost": "<ca-host>",
  "CALogicalName": "<ca-name>",
  "LowerDate": <date or null or left out completely>,
  "UpperDate": <date or null or left out completely>
}
```

Example Response

```
{
  "PendingRequests":
  [{
    "CAHost": "<ca-host>",
    "CABLogicalName": "<ca-name>",
    "CARequestId": "<ca-request-id>",
    "CMSRequestId": "<cms-request-id>"
  }]
}
```

## 2.3.10 Workflow Expiration Alerts

Workflow in Keyfactor Command refers to the process through which pending certificate requests are approved or denied. The Workflow Expiration Alert APIs provides the ability to manage expiration alerts, event handlers, registered event handlers and schedules.

### 2.3.10.1 Workflow Expiration Alerts Endpoints

The Workflow Expiration Alert API provides the ability to list, create, update and delete expiration alerts for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 675: Workflow Expiration Alerts Endpoints](#)

Table 675: Workflow Expiration Alerts Endpoints

Endpoint	Method	Description
ExpirationAlerts	GET	List all Expiration Alerts or a get a single expiration alert definition.
ExpirationAlerts	POST	Create a new expiration alert definition.
ExpirationAlerts	PUT	Update an existing expiration alert definition.
ExpirationAlerts	DELETE	Delete an existing expiration alert definition.

## Workflow Expiration Alerts

**Note:** For the GET (single), PUT, and DELETE methods you will need the expiration alert ID. You will need to run the GET (list) method to acquire the ID in order to proceed with those methods.

**Note:** For the POST and PUT methods, if you are using Registered Event Handlers, you will need to run the Event handler GET (list) method to acquire the ID prior to issuing the expiration alert method (see [Workflow Expiration Alert Handler Parameters Endpoints on page 1473](#)).

Table 676: Workflow Expiration Alert Parameters

Parameter Name	Parameter Value
Id/Alert ID	The database ID of the Alert
DisplayName	Alert display name
Subject	The subject field of the alert
Message	The message field of the alert
UseHandler	True/False, whether or not the Use Handler checkbox is checked for the alert
Days	The number of days to alert before expiration
RegisteredEventHandlerId	Id of the Event Handler to use. See ( <a href="#">Workflow Expiration Alert Handler Parameters Endpoints on page 1473</a> )
CertificateQuery	Name, and/or Id, of the certificate collection of the alert
ExpirationAlertRecipients	Id and/or Recipient email address in a comma separated list of objects. So there could be multiple addresses chunks in curly brackets{}, comma separated in the array in the square brackets []

## LIST all expiration alerts:

### Example Request

GET ~/ExpirationAlerts/1/List?page=<page number>&returnlimit=<max results to get>&sortname=<field to sort by>&sortorder=<asc or desc>

no body

### Example Response

```
[
  {
    "Id": <id>,
    "DisplayName": "Alert display name",
    "QueryName": "Certificate query name",
    "Days": <number of days to alert before expiration>,
    "HandlerName": "Name of the Event Handler if any"
```

```
}  
]
```

## Get a single alert definition

### Example Request

GET ~/ExpirationAlerts/1/<Alert Id>

no body

### Example Response

```
[  
  {  
    "Id": <id>,  
    "DisplayName": "Alert display name",  
    "Subject": "Alert Subject",  
    "Message": "Alert message body",  
    "UseHandler": <true/false>,  
    "Days": <number of days to alert before expiration>,  
    "RegisteredEventHandlerId": <Id of the Event Handler to use>,  
    "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },  
    "ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]  
  }  
]
```

## Create New Expiration Alert

### Example Request

POST ~/ExpirationAlerts/1/

```
{  
  "DisplayName": "Alert display name",  
  "Subject": "Alert Subject",  
}
```

```

"Message": "Alert message body",
"UseHandler": <true/false>,
"Days": <number of days to alert before expiration>,
"RegisteredEventHandlerId": <Id of the Event Handler to use>,
"CertificateQuery": { "Id": <Cert query id> },
"ExpirationAlertRecipients": [ { "Email": "Recipient email address" } ]
}

```

## Example Response

```

{
  "Id": <id>,
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },
  "ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]
}

```

## Update Existing Expiration Alert

### Example Request

PUT ~/ExpirationAlerts/1/<Alert Id>

```

{
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id> },
  "ExpirationAlertRecipients": [ { "Email": "Recipient email address" } ]
}

```

### Example Response

```
{
  "Id": <id>,
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },
  "ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]
}
```

## Delete Expiration Alert

### Example Request

DELETE ~/ExpirationAlerts/1/<Alert Id>

no body

### Example Response

204 No Content

## 2.3.10.2 Workflow Expiration Alert Event Handler Parameters API

The Workflow Expiration Alert Event Handler Parameter API provides the ability to list, create, update and delete expiration alert event handler parameters for specific Keyfactor Command expiration alerts via the Keyfactor API. The methods within this component are listed in [Table 677: Workflow Expiration Alerts Event Handler Parameters Endpoints](#)

Table 677: Workflow Expiration Alerts Event Handler Parameters Endpoints

Endpoint	Method	Description
HandlerParameters	GET	List all, or a given, expiration alert Handler Parameter(s) for an expiration alert.
HandlerParameters	POST	Create a new handler parameter for an expiration alert.
HandlerParameters	PUT	Update an existing expiration alert handler parameter for an expiration alert.
HandlerParameters	DELETE	Delete an existing expiration alert handler parameter for an expiration alert.

# Workflow Expiration Alert Handler Parameters Endpoints

**Note:** For the GET (single), PUT, and DELETE methods you will need the handler parameter ID. You will need to run the GET (list) method to acquire the ID in order to proceed with those methods.

Table 678: Workflow Expiration Alert Handler Parameters

Parameter Name	Parameter Value																
Id/Alert ID	The database ID of the handler parameter																
Key	The parameter name																
DefaultValue	The given value for the handler parameter																
ParameterType	<div>The event handler parameter type number<table><tr><th>Type</th><th>Number</th></tr><tr><td>Special Text</td><td>0</td></tr><tr><td>Static Value</td><td>1</td></tr><tr><td>PowerShell Script Name</td><td>2</td></tr><tr><td>Logging Target Machine</td><td>3</td></tr><tr><td>Renewal URL</td><td>4</td></tr><tr><td>Renewal Template</td><td>5</td></tr><tr><td>Renewal Certificate Authority</td><td>6</td></tr></table></div>	Type	Number	Special Text	0	Static Value	1	PowerShell Script Name	2	Logging Target Machine	3	Renewal URL	4	Renewal Template	5	Renewal Certificate Authority	6
Type	Number																
Special Text	0																
Static Value	1																
PowerShell Script Name	2																
Logging Target Machine	3																
Renewal URL	4																
Renewal Template	5																
Renewal Certificate Authority	6																
ExpirationAlertDefinitionId	The database ID of the expiration alert definition																

## List All Handler Parameters for an Expiration Alert:

### Example Request

GET ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/List?page=<page number>&returnlimit=<max results to get>&sortname=<field to sort by>&sortorder=<asc or desc>

no body

## Example Response

```
[
  {
    "Id": <id>,
    "Key": "Parameter Key name",
    "DefaultValue": "default value for parameter",
    "ParameterType": <Event Handler Parameter Type number>,
    "ExpirationAlertDefinitionId": <alert Id>
  }
]
```

## Get Handler Parameter by Id

### Example Request

GET ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

no body

### Example Response

```
[
  {
    "Id": <id>,
    "Key": "Parameter Key name",
    "DefaultValue": "default value for parameter",
    "ParameterType": <Event Handler Parameter Type number>,
    "ExpirationAlertDefinitionId": <alert Id>
  }
]
```

## Create New Handler Parameter

### Example Request

POST ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters

```
{
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

## Example Response

```
{
  "Id": <id>,
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

## Update Existing Handler Parameter

### Example Request

PUT ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

```
{
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

### Example Response

```
{
  "Id": <id>,
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

## Delete Handler Parameter

### Example Request

DELETE ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

no body

### Example Response

204 No Content

## 2.3.10.3 Workflow Expiration Alert Registered Event Handlers API

The Workflow Expiration Alert Registered Event Handlers API provides the ability to list expiration alert registered event handlers: for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 679: Workflow Expiration Alerts Registered Event Handlers Endpoints](#)

Table 679: Workflow Expiration Alerts Registered Event Handlers Endpoints

Endpoint	Method	Description
RegisteredEventHandlers	GET	Get list of Registered Event Handlers

## Workflow Expiration Alert Registered Event Handlers Parameters

Table 680: Workflow Expiration Alert Registered Event Handlers Parameters

Parameter Name	Parameter Value
Id	The database ID of the registered event handler
Classname	Fully qualified class name of the registered event handler implementation in the associated assembly
DisplayName	The display name of registered event handler
Enabled	True/False, whether or not the Use Handler checkbox is checked for the alert
RegisteredEventAssemblyId	The Id of the registered event handler assembly

### LIST all Registered Event Handlers:

## Example Request

GET ~/ExpirationAlerts/1/RegisteredEventHandlers/List?page=<page number>&returnlimit=<max results to get>

no body

## Example Response

```
{
  "Id": <registered event handler Id>,
  "ClassName": "class name of event handler",
  "DisplayName": "display name of event handler",
  "Enabled": <true/false>,
  "RegisteredEventAssemblyId": <id of the registered event assembly>
}
```

### 2.3.10.4 Workflow Expiration Alert Schedule API

The Workflow Expiration Alert Schedule API provides the ability to list, create, and set expiration alert schedules for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 681: Workflow Expiration Alerts Schedule Endpoints](#)

Table 681: Workflow Expiration Alerts Schedule Endpoints

Endpoint	Method	Description
Schedule	GET	Get the schedule set for all expiration alerts.
Schedule	POST	Create a new schedule for an expiration alert.

### Workflow Expiration Alert Schedule Parameters

Table 682: Workflow Expiration Alert Schedule Parameters

Parameter Name	Parameter Value
Daily	The display name of registered event handler
Time	The ISO string of time to schedule run

## LIST Expiration Alert Schedule

## Example Request

GET ~/ExpirationAlerts/1/Schedule

no body

## Example Response

```
{
  "Daily": {
    "Time": "ISO string of time to schedule run"
  }
}
```

## Set Alerts Schedule

### Example Request

POST ~/ExpirationAlerts/1/Schedule

```
{
  "Daily": {
    "Time": "ISO string of time to schedule run"
  }
}
```

### Example Response

204 No Content

## 2.3.11 Status

The Status Web API component provides a single method to retrieve various aspects of the Keyfactor Command server state. This method is an HTTP GET Status request with no parameters required. As of Keyfactor Command 5.0, the Status endpoint generally is not needed by a Web API client application, as the Keyfactor Command version is passed back in an HTTP header with every response to every Web API request. However, it is included to preserve compatibility with applications already using it or applications requiring more information.

### Example Request

GET http://<host>/CMSApi/Status HTTP/1.1

## Example Response

Status Code: 200

```
{
  "ApiMajorRev": 2,
  "ApiMinorRev": 0,
  "ProductMajorVersion": 5,
  "ProductMinorVersion": 0,
  "ProductBranchVersion": 0,
  "ProductBuildVersion": 1,
  "LicenseStatus": "Licensed",
  "Modules": [{
    "Name": "CertEnroll",
    "Versions": [1, 2, 3]
  },
  {
    "Name": "Certificates",
    "Versions": [1, 2, 3]
  },
  {
    "Name": "CertStore",
    "Versions": [1]
  },
  {
    "Name": "Metadata",
    "Versions": [2, 3]
  },
  {
    "Name": "Ssl",
    "Versions": [1]
  },
  {
    "Name": "Status",
    "Versions": null
  },
  {
    "Name": "Workflow",
    "Versions": [1]
  }
]
```

## 2.3.12 vSCEP

The vSCEP API method supports enrollment through the Keyfactor Command implementation of the SCEP protocol. The single method—GET CMSValidation/api/vSCEP—is used to retrieve a SCEP challenge, while also associating that challenge with the specified certificate subject information. This method differs from the other Web API methods in that it is not included in the CMSApi virtual directory, but in the separate "CMSValidation/api" directory. It also differs in that, while it is a GET method, it does take request parameters, which means that these parameters must be URL-encoded in the query string. Like the other Web API methods, however, it requires the Accept and Authorization headers, and returns a 200 OK status if a connection was successfully made to the vSCEP server or an appropriate 4XX status if a connection could not be made. The request and response formats are given in the below tables and example. All fields in the request are optional, and all but the Subject parameter may be submitted multiple times (for example, to include two different DNS SANs in the same certificate).

Table 683: GET /CMSValidation/api/vSCEP Query String Parameters

Parameter Name	Parameter Value
Subject	Distinguished Name that should be used as the certificate subject.
DNS	Subject Alternative Name representing a DNS record.
IP	Subject Alternative Name representing an IP address.
RFC822	Subject Alternative Name representing an RFC822 Name (email address).
NTPrincipal	Subject Alternative Name representing an NT Principal Name.

Table 684: GET /CMSValidation/api/vSCEP Response Body

Parameter Name	Parameter Value
Status Code	HTTP Status Code vSCEP received from the SCEP server. This will be 200 if the request was successful.
Message	Status message for the request. In the case of an error retrieving a SCEP challenge, this will provide more detailed error information.
Challenge	SCEP Challenge represented as a hex string. In the case of an error, this will be null.
Hash	MD5 hash of the CA certificate associated with the SCEP server. In the case of an error, this will be null.

### Example Request

GET http://<host>/CMSValidation/api/vSCEP?subject=CN%3DBob%20Smith%20CO%3DExample%20Company&RFC822=bob.smith%40mail.example.com HTTP/1.1

### Example Response

Status Code: 200

```
{
  "Challenge": "247FAFEEABA1F9B7",
  "Hash": "01940B86 9C6C03DC 79BF2E5B 741779DF",
  "StatusCode": 200,
  "Message": "Request stored successfully"
}
```

## 2.4 API Change Log

In this section you will find the change history for the Keyfactor Command API endpoints from version 9.0 on.

Find the change log for Keyfactor API below.

#### 2.4.1.1 API Change Log v9.0

API changes for Keyfactor Command version 9.0 Major release

Table 685: API Change Log v9.0

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/Copy	POST	Add	
/Certificates/{id}/History	GET	Add	
/Certificates/{id}/Security	GET	Add	
/Certificates/{id}/Validate	GET	Add	
/Certificates/Locations/{id}	GET	Add	
/Certificates/Metadata/Compare	GET	Add	
/Certificates/Metadata/All	PUT	Add	
/Certificates/RevokeAll	POST	Add	
/CertificateStoreContainers	GET	Add	
/CertificateStoreContainers/{id}	GET	Add	
/CertificateStores/Certificates/Add	POST	Add	
/CertificateStores/Certificates/Remove	POST	Add	
/Enrollment/CSR/Context/My	GET	Add	
/Enrollment/PFX/Context/My	GET	Add	
/JobTypes/Custom	GET, POST, PUT	Add	
/JobTypes/Custom/{id}	GET, DELETE	Add	
/OrchestratorJobs/Custom	POST	Add	
/OrchestratorJobs/JobHistory	GET	Add	
/OrchestratorJobs/JobStatus/Data	GET	Add	
/Reports	GET, PUT	Add	
/Reports/{id}	GET	Add	

Endpoint	Method	Action	Notes
/Reports/{id}/Parameters	GET, PUT	Add	
/Reports/{id}/Schedules	GET, POST, PUT	Add	
/Reports/Custom	GET, POST, PUT	Add	
/Reports/Custom/{id}	GET, DELETE	Add	
/Reports/Schedules/{id}	GET, DELETE	Add	
/Security/Identities	GET, POST	Add	
/Security/Identities/{id}	DELETE	Add	
/Security/Identities/Lookup	GET	Add	
/Security/Roles	GET, POST, PUT	Add	
/Security/Roles/{id}	GET, DELETE	Add	
/SSH/Keys/Unmanaged	DELETE	Add	
/SSH/ServiceAccounts	DELETE	Add	
/SSH/Users/Access	POST	Add	
/SSL/Networks/{id}/Scan	POST	Add	

### 2.4.1.2 API Change Log v9.1

API changes for Keyfactor Command version 9.1 incremental release

Table 686: API Change Log v9.1

Endpoint	Methods	Action	Notes
/CertificateStores/{id}/Inventory	GET	Add	
/Enrollment/PFX/Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/PFX/Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/Certificates/Add	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateStores/Certificates/Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/{id}/Permissions	GET	Deprecate	

### 2.4.1.3 API Change Log v9.2

API changes for Keyfactor Command version 9.2 incremental release

Table 687: API Change Log v9.2

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/JobHistory	GET	Fix	Request no longer fails for 'Dynamic' job types.
/Reports/Schedules/{id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

### 2.4.1.4 API Change Log v9.3

API changes for Keyfactor Command version 9.3 incremental release

Table 688: API Change Log v9.3

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

### 2.4.1.5 API Change Log v9.4

API changes for Keyfactor Command version 9.4 incremental release

Table 689: API Change Log v9.4

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

### 2.4.1.6 API Change Log v9.5

API changes for Keyfactor Command version 9.5 incremental release

Table 690: API Change Log v9.5

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

### 2.4.1.7 API Change Log v9.6

API changes for Keyfactor Command version 9.6 incremental release.

No API endpoint changes were made in this release.

### 2.4.1.8 API Change Log v9.7

API changes for Keyfactor Command version 9.7 incremental release

Table 691: API Change Log v9.7

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

### 2.4.1.9 API Change Log v9.8

API changes for Keyfactor Command version 9.8 incremental release.

No API endpoint changes were made in this release.

### 2.4.1.10 API Change Log v9.9

API changes for Keyfactor Command version 9.9 incremental release

Table 692: API Change Log v9.9

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

## 2.4.2 v10 API Change Log

Find the version 10 change log for Keyfactor API below.

[Link to Change Logs](#)

[API Change Log v10.0 below](#)

### 2.4.2.1 API Change Log v10.0

API changes for Keyfactor Command version 10.0 Major release

Table 693: API Change Log v10.0

Endpoint	Methods	Action	Notes
/Agents/{id}	GET	Add	
/Agents/Reset	POST	Add	
/AgentBlueprint	GET	Add	
/AgentBlueprint/{id}	GET, DELETE	Add	
/AgentBlueprint/{id}/Jobs	GET	Add	
/AgentBlueprint/{id}/Stores	GET	Add	
/AgentBluePrint/ApplyBlueprint	POST	Add	
/AgentBluePrint/GenerateBluePrint	POST	Add	
/Alerts/Denied	GET, PUT, POST	Add	
/Alerts/Denied/{id}	GET, DELETE	Add	
/Alerts/Expiration	GET, PUT, POST	Add	
/Alerts/Expiration/{id}	GET, DELETE	Add	
/Alerts/Expiration/Schedule	GET, PUT	Add	
/Alerts/Expiration/Test	POST	Add	
/Alerts/Expiration/TestAll	POST	Add	
/Alerts/IssuedAlerts	GET, PUT, POST	Add	
/Alerts/IssuedAlerts/{id}	GET, DELETE	Add	
/Alerts/Issued/Schedule	GET, PUT	Add	
/Alerts/KeyRotation	GET, PUT, POST	Add	
/Alerts/KeyRotation/{id}	GET, DELETE	Add	
/Alerts/KeyRotation/Schedule	GET, PUT	Add	

Endpoint	Methods	Action	Notes
/Alerts/KeyRotation/Test	POST	Add	
/Alerts/KeyRotation/TestAll	POST	Add	
/Alerts/Pending	GET, PUT, POST	Add	
/Alerts/Pending/{id}	GET, DELETE	Add	
/Alerts/Pending/Schedule	GET, PUT	Add	
/Alerts/Pending/Test	POST	Add	
/Alerts/Pending/Test/{id}	POST	Add	
/CertificateAuthorities	GET	Update	Schedules are now included in the results.
/CertificateAuthorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	DELETE	Update	Deletion is now prevented if schedules are associated.
/CertificateCollections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/CertificateCollections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	
/CertificateStoreContainers	POST	Add	
/CertificateStoreContainers/{id}	PUT, DELETE	Add	
/CertificateStores/Server	GET, POST, PUT	To Be Deprec- ated	Server usernames, server passwords, and the UseSSL flag are managed by

Endpoint	Methods	Action	Notes
			the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/CertificateStores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring
/Monitoring/Revocation/{id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}
/Monitoring/Revocation/Test	POST	Add	
/Monitoring/Revocation/TestAll	POST	Add	
/Orchestrators/JobHistory	GET	Update	Added JobId field.
/Orchestrators/ScheduledJobs	GET	Add	
/OrchestratorJobs/Reschedule	POST	Add	

Endpoint	Methods	Action	Notes
/OrchestratorJobs/Unschedule	POST	Add	
/OrchestratorJobs/Acknowledge	POST	Add	
/Security/Identities/{id}	GET	Add	
/Security/Roles/{id}/Identities	GET, POST	Add	
/Security/Roles/{id}/Containers	GET, POST	Add	
/Security/Roles/{id}/Copy	POST	Add	
/Security/Roles/{id}/Permissions	GET	Add	
/Security/Roles/{id}/Permissions/Global	GET, POST, PUT	Add	
/Security/Roles/{id}/Permissions/Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/{id}/Permissions endpoint functionality.
/Security/Roles/{id}/Permissions/Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/{id}	GET	Update	Includes template defaults.
/Templates/Settings	GET, PUT	Update	Includes global template policies.
/Template/SubjectParts	GET	Add	
/Templates/Global/Settings	GET, PUT	Add	
/Templates/Import	POST	Add	
/Workflow/Certificates/Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/Definitions/Steps/{extensionName}	GET	Add	

Endpoint	Methods	Action	Notes
/Workflow/Definitions/{definitionId}	GET, PUT, DELETE	Add	
/Workflow/Definitions	GET, POST	Add	
/Workflow/Definitions/Steps	GET	Add	
/Workflow/Definitions/Types	GET	Add	
/Workflow/Definitions/{definitionId}/Steps	PUT	Add	
/Workflow/Definitions/{definitionId}/Publish	POST	Add	
/Workflow/Instances/{instanceId}	GET, DELETE	Add	
/Workflow/Instances	GET	Add	
/Workflow/Instances/My	GET	Add	
/Workflow/Instances/AssignedToMe	GET	Add	
/Workflow/Instances/{instanceId}/Stop	POST	Add	
/Workflow/Instances/{instanceId}/Signals	POST	Add	
/Workflow/Instances/{instanceId}/Restart	POST	Add	

### 2.4.2.2 API Change Log v10.1

API changes for Keyfactor Command version 10.1 incremental release

Table 694: API Change Log v10.1

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

### 2.4.2.3 API Change Log v10.2

API changes for Keyfactor Command version 10.2 incremental release

Table 695: API Change Log v10.2

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

## 3.0 Glossary

## A

---

### AIA

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

### AnyAgent

The AnyAgent, one of Keyfactor's suite of orchestrators, is used to allow management of certificates regardless of source or location by allowing customers to implement custom agent functionality via an API.

### AnyGateway

The Keyfactor AnyGateway is a generic third party CA gateway framework that allows existing CA gateways and custom CA connections to share the same overall product framework.

### API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

### Argument

A parameter or argument is a value that is passed into a function in an application.

### Authority Information Access

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

## B

---

### Bash Orchestrator

The Bash Orchestrator, one of Keyfactor's suite of orchestrators, is used to discover and manage SSH keys across an enterprise.

### Blueprint

A snapshot of the certificate stores and scheduled jobs on one orchestrator, which can be used to create matching certificate stores and jobs on another orchestrator with just a few clicks.

## C

---

### CA

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

### Certificate Authority

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

### Certificate Revocation List

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

### Certificate Signing Request

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

**CN**

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

**Collection**

The certificate search function allows you to query the Keyfactor Command database for certificates from any available source based on any criteria of the certificates and save the results as a collection that will be available in other places in the Management Portal (e.g. expiration alerts and certain reports).

**Common Name**

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

**Configuration Tenant**

A grouping of CAs. The Microsoft concept of forests is not used in EJBCA so to accommodate the new EJBCA functionality, and to avoid confusion, the term forest needed to be renamed. The new name is configuration tenant. For EJBCA, there would be one configuration tenant per EJBCA server install. For Microsoft, there would be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA cannot exist on the same configuration tenant.

**CRL**

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

**CSR**

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

---

**D**

---

**DER**

A DER format certificate file is a DER-encoded binary certificate. It contains a single certificate and does not support storage of private keys. It sometimes has an extension of .der but is often seen with .cer or .crt.

**Distinguished Name**

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

**DN**

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

## DNS

The Domain Name System is a service that translates names into IP addresses.

## E

---

### ECC

Elliptical curve cryptography (ECC) is a public key encryption technique based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys. ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers.

### Endpoint

An endpoint is a URL that enables the API to gain access to resources on a server.

### Enrollment

Certificate enrollment refers to the process by which a user requests a digital certificate. The user must submit the request to a certificate authority (CA).

### EOBO

A user with an enrollment agent certificate can enroll for a certificate on behalf of another user. This is often used when provisioning technology such as smart cards.

## F

---

### Forest

An Active Directory forest (AD forest) is the top most logical container in an Active Directory configuration that contains domains, and objects such as users and computers.

## G

---

### Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

## H

---

### Host Name

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

### Hosted Config Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

### Hosted Configuration Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

### Hostname

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g.

servername.keyexample.com) and sometimes just as a short name (e.g. servername).

## J

---

### Java Agent

The Java Agent, one of Keyfactor's suite of orchestrators, is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed.

### Java Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

## JKS

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

## K

---

### Key Length

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

### Key Pair

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

### Key Size

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

### Key Type

The key type identifies the type of key to create when creating a symmetric or asymmetric key. It references the signing algorithm and often key size (e.g. AES-256, RSA-2048, Ed25519).

### Keyfactor CA Management Gateway

The Keyfactor CA Management Gateway is made up of the Keyfactor Gateway Connector, installed in the customer forest to provide a connection to the local CA, and the Azure-hosted and Keyfactor managed Hosted Configuration Portal. The solution is used to provide a connection between a customer's on-premise CA and an Azure-hosted instance of Keyfactor Command for synchronization, enrollment, and management of certificates.

### Keyfactor Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

### Keyfactor Universal Orchestrator

The Keyfactor Universal Orchestrator, one of Keyfactor's suite of orchestrators, is used to interact with Windows servers (a.k.a. IIS certificate stores) and FTP capable devices for certificate management, run SSL discovery and management tasks, and manage synchronization of certificate authorities in remote forests. With the addition of custom extensions, it can run custom jobs to provide certificate management capabilities on a variety of platforms and devices (e.g. F5 devices, NetScaler devices, Amazon Web Services (AWS) resources) and execute tasks outside the standard list of certificate management functions. It runs on either Windows or Linux.

## Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

## L

---

## Logical Name

The logical name of a CA is the common name given to the CA at the time it is created. For Microsoft CAs, this name can be seen at the top of the Certificate Authority MMC snap-in. It is part of the FQDN\Logical Name string that is used to refer to CAs when using command-line tools and in some Keyfactor Command configuration settings (e.g. ca2.keyexample.com\Corp Issuing CA Two).

## M

---

## MAC Agent

The MAC Agent, one of Keyfactor's suite of orchestrators, is used to manage certificates on any keychains on the Mac on which the Keyfactor MAC Agent is installed.

## Metadata

Metadata provides information about a piece of data. It is used to summarize basic information about data, which can make working with the data easier. In the context of Keyfactor Command, the certificate metadata feature allows you to create custom metadata fields that allow you to tag certificates with tracking information about certificates.

## O

---

## Object Identifier

Object identifiers or OIDs are a standardized system for identifying any object, concept, or

"thing" with a globally unambiguous persistent name.

## OID

Object identifiers or OIDs are a standardized system for identifying any object, concept, or "thing" with a globally unambiguous persistent name.

## Orchestrator

Keyfactor orchestrators perform a variety of functions, including managing certificate stores and SSH key stores.

## P

---

## P12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

## P7B

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ---- END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

## P7C

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ---- END CERTIFICATE----. Unlike PEM files, PKCS #7

files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

### Parameter

A parameter or argument is a value that is passed into a function in an application.

### PEM

A PEM format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PEM certificates always begin and end with entries like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. PEM certificates can contain a single certificate or a full certificate chain and may contain a private key. Usually, extensions of .cer and .crt are certificate files with no private key, .key is a separate private key file, and .pem is both a certificate and private key.

### PFX

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

### PKCS #7

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

### PKCS#12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

### PKI

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

### Private Key

Private keys are used in cryptography (symmetric and asymmetric) to encrypt or sign content. In asymmetric cryptography, they are used together in a key pair with a public key. The private or secret key is retained by the key's creator, making it highly secure.

### Public Key

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

### Public Key Infrastructure

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

## R

---

### Rogue Key

A rogue key, in the context of Keyfactor Command, is an SSH public key that appears in an

authorized\_keys file on a server managed by the SSH orchestrator without authorization.

### Root of Trust

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

### RoT

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

### RPC

Remote procedure call (RPC) allows one program to call a function from a program located on another computer on a network without specifying network details. In the context of Keyfactor Command, RPC errors often indicate Kerberos authentication or delegation issues.

### rsyslog

Rsyslog is an open-source software utility used on UNIX and Unix-like computer systems for forwarding log messages in an IP network.

## S

---

### SAN

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

### server name indication

Server name indication (SNI) is an extension to TLS that provides for including the hostname of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

### SMTP

Short for simple mail transfer protocol, SMTP is a protocol for sending email messages between servers.

### SNI

Server name indication (SNI) is an extension to TLS that provides for including the hostname of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

### SSH

The SSH (secure shell) protocol provides for secure connections between computers. It provides several options for authentication, including public key, and protects the communications with strong encryption.

### SSL

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

### Subject Alternative Name

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

**T**

---

**Template**

A certificate template defines the policies and rules that a CA uses when a request for a certificate is received.

**TLS**

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

**Trusted CA**

A certificate authority in the forest in which Keyfactor Command is installed or in a forest in a two-way trust with the forest in which Keyfactor Command is installed.

**U**

---

**Untrusted CA**

A certificate authority in a forest in a one-way trust with the forest in which Keyfactor Command is installed or in a forest that is untrusted by the forest in which Keyfactor Command is installed. Non-domain-joined standalone CAs also fall into this category.

**W**

---

**Web API**

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

**Windows Orchestrator**

The Windows Orchestrator, one of Keyfactor's suite of orchestrators, is used to manage

synchronization of certificate authorities in remote forests, run SSL discovery and management tasks, and interact with Windows servers as well as F5 devices, NetScaler devices, Amazon Web Services (AWS) resources, and FTP capable devices, for certificate management. In addition, the AnyAgent capability of the Windows Orchestrator allows it to be extended to create custom certificate store types and management capabilities regardless of source platform or location.

**Workflow**

A workflow is a series of steps necessary to complete a process. In the context of Keyfactor Command, it refers to the workflow builder, which allows you automate event-driven tasks when a certificate is requested or revoked.

**X**

---

**x.509**

In cryptography, X.509 is a standard defining the format of public key certificates. An X.509 certificate contains a public key and an identity (e.g. a host name or an organization or individual name), and is either signed by a certificate authority or self-signed. When a certificate is signed by a trusted certificate authority it can be used to establish trusted secure communications with the owner of the corresponding private key. It can also be used to verify digitally signed documents and emails.
