Template	Body	Required* A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required unless the enrollment is being done against a standalone CA.
CertificateAuthority	Body	Required* A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>host-name\\logical name</i> format or as just the <i>logical name</i> . For example: <div>corpca01.keyexample.com\\CorplIssuingCA1 OR CorplIssuingCA1</div> If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i> . This field is optional unless the enrollment is being done against a standalone CA, in which case it is required .
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate

Name	In	Description																		
		<p>once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																		
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a</td></tr></table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a

WorkflowReferenceCid	An integer containing the Keyfactor Command reference ID of the workflow instance.																

Value	Description												
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID of the request.</td></tr> <tr> <td>RequestDisposition</td><td>A string indicating the state of the request (e.g. ISSUED).</td></tr> <tr> <td>DispositionMessage</td><td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description		 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.	RequestDisposition	A string indicating the state of the request (e.g. ISSUED).	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description												
	 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.												
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).												
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).												
EnrollmentContext	An internally used Keyfactor Command field.												
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>A string containing the name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.						
Name	Description												
MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.												
Value	The value of the metadata.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.14.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 706](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 711](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 717](#)).

Tip: Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 5](#).

Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

Note: The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 267: POST Enrollment PFX v2 Input Parameters

Name	In	Description										
Stores	Body	<p>An object containing a comma delimited set of arrays indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 427) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>A string containing the alias of the certificate upon entry into the store. CustomFriendlyName	Body	<p>Required[*]. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The</p>				

Name	In	Description
		default is 12. See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i> .
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>

Name	In	Description				
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre> <p>See Certificate Metadata in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Timestamp	Body	<p>The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>				
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is required unless the enrollment is being done against a standalone CA.</p>				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr></table>	Value	Description	rfc822	RFC 822 Name

InstallIntoExistingCertificateStores	Body	<p>A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i>.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>																		
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p>																		

Name	In	Description
		<pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See Configuring Template Options in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-CertificateFormat	Header	<p>Required. The desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> • JKS Selecting the JKS option allows you to create a Java keystore with the returned PKCS12Blob. • PFX Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob. • Store If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see POST Enrollment PFX Deploy on page 711). • Zip Selecting the Zip option allows you to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.

Table 268: POST Enrollment PFX v2 Response Data

Value	Description												
SuccessfulStores	An object containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.												
CertificateInformation	<p>Information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. WorkflowInstanceId	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>														
WorkflowReferenceId	<p>An integer containing the Keyfactor Command reference ID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>														
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.														
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).														

Value	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>DispositionMessage</td><td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description						
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).						
EnrollmentContext	An internally used Keyfactor Command field.						
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>A string containing the name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See Certificate Metadata in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.
Name	Description						
MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.						
Value	The value of the metadata.						

Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 269: POST Enrollment PFX v1 Input Parameters

Name	In	Description
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
PopulateMissingValuesFromAD	Body	<p>A Boolean that sets whether to populate the information in the subject from Active Directory (true) or not (false). The default is <i>false</i>.</p>
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\ Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See Application Settings: Enrollment Tab in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
IncludeChain	Body	<p>A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i>.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p>

Name	In	Description
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
Timestamp	Body	<p>The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is required unless the enrollment is being done against a standalone CA.</p>
Metadata	Body	<p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. }</pre>

Name	In	Description																				
		<div>"TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</div> <p>See Certificate Metadata in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																				
SANs	Body	<p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprin- cipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <div>"SANs": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] }</div>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprin- cipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprin- cipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					

Name	In	Description
		<pre>}</pre>
AdditionalEnrollmentFields	Body	<p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See Configuring Template Options in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
x-CertificateFormat	Header	<p>Required. The desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> • JKS Selecting the JKS option allows you to create a Java keystore with the returned PKCS12Blob. • PFX Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob. • Store If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see POST Enrollment PFX Deploy on page 711). • Zip Selecting the Zip option allows you to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.

Table 270: POST Enrollment PFX v1 Response Data

Value	Description

2.5.14.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

Table 271: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	Required. Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 272: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	<p>An array containing key/value pairs representing all the elements in the CSR. Possible values include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Key Length</td><td>An integer indicating the desired key size of the certificate.</td></tr> <tr> <td>Key Type</td><td>A string indicating the desired key encryption of the certificate.</td></tr> <tr> <td>CN</td><td>The common name of the certificate.</td></tr> <tr> <td>O</td><td>The organization of the certificate.</td></tr> <tr> <td>OU</td><td>The organizational unit of the certificate.</td></tr> <tr> <td>L</td><td>The city of the certificate.</td></tr> <tr> <td>ST</td><td>The state of the certificate.</td></tr> <tr> <td>C</td><td>The country (two characters) of the certificate.</td></tr> <tr> <td>E</td><td>The email address of the certificate.</td></tr> <tr> <td>DNS Name</td><td>A SAN value containing a DNS name.</td></tr> <tr> <td>IP Address</td><td>A SAN value containing an IP v4 or IP v6 address.</td></tr> <tr> <td>RFC822 Name</td><td>A SAN value containing an email message.</td></tr> <tr> <td>URL</td><td>A SAN value containing a uniform resource identifier.</td></tr> <tr> <td>Directory Name</td><td>A SAN value containing a directory name.</td></tr> <tr> <td>Registered ID</td><td>A SAN value containing a registered ID.</td></tr> <tr> <td>Other name:Principal Name</td><td>A SAN value containing a user principal name (UPN) value.</td></tr> <tr> <td>Other name:DS Object Guid</td><td>A SAN value containing the MS_NTDSReplication value.</td></tr> </table>	Name	Description	Key Length	An integer indicating the desired key size of the certificate. Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				
 Note: Some of these fields cannot be added to a CSR generated within Keyfactor																																					

Name	Description
	 Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.14.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 693](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateStoreManagement: *Schedule*
CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 273: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p>Required*. An array indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 427) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p></td></tr><tr><td>Overwrite</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 253) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td><p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p></td></tr></table>	Name	Description	StoreId	<p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 427) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p>	Alias	<p>The alias of the certificate upon entry into the store. Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.				
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> . <div> Note: For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is required. The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.</div>				
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> . <p>See the note under <i>CertificateId</i> regarding when this field is required and</p>				

Name	Type	Description																		
		when it is not.																		
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.																		
StoreIds	Body	An array of the certificate store GUIDs for the stores to which the certificate should be added. The StoreIds parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but no longer required.																		
StoreTypes	Body	An array of store types used with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. The StoreTypes parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but is no longer required. Store type parameters are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeId</td><td>The type of certificate store the certificate is being deployed to. Table 274: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.14.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 693](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
 CertificateStoreManagement: *Schedule*
 CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: You could achieve the same end using the *POST /Enrollment/PFX/Deploy* method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the

POST /Enrollment/PFX/Replace method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the *POST /Enrollment/PFX/Deploy* method (see [POST Enrollment PFX Deploy on page 711](#)).

Tip: The *POST /Enrollment/PFX/Replace* method must be used within 5 minutes of acquiring a certificate with the *POST /Enrollment/PFX* or *POST /Enrollment/Renew* method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 275: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	Required. The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.
JobTime	Body	The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 276: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	<p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.14.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
 Certificates: *Read*
 CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 711](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 717](#)).

 **Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to

the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 277: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	Required *. The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Thumbprint	Body	Required *. The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Timestamp	Body	Required . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).
CertificateAuthority	Body	Required *. A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>hostname\\logical name</i> format. For example: <div>corpca01.keyexample.com\\CorpIssuingCA1</div> This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 681 or GET Enrollment Available Renewal Thumbprint on page 684).
Template	Body	Required *. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 681 or GET Enrollment Available Renewal Thumbprint on page 684).

Table 278: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.15 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 279: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	GET License below

2.5.15.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters. For more information regarding licensing, see *Licensing* in the *Keyfactor Command Reference Guide*.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SystemSettings: *Read*

Table 280: GET License Response Data

Name	Description

Name	Description												
FeatureID	A string indicating the ID code of feature.												
DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.												
Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).												
Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. <p>Unlimited is indicated by 999999999.</p>												
ExpirationDate	This field is unused and will always return <i>null</i> .												

Name	Description
	 Tip: Currently there is only one licensed product offered, which is Keyfactor Command.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.16 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 281: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	GET MacEnrollment below
/	PUTT	Updates the Mac auto-enrollment configuration.	PUT MacEnrollment on the next page

2.5.16.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SystemSettings: Read

Table 282: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.16.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SystemSettings: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 283: PUT MacEnrollment Response Data

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	<p>A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false).</p> <p>See in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.</p>
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 284: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 285: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an existing metadata field.	DELETE MetadataFields ID on the next page
/id}	GET	Returns detailed information for the specified metadata field.	GET MetadataFields ID

Endpoint	Method	Description	Link
			on page 730
/ {name}	GET	Returns detailed information for the specified metadata field.	GET MetadataFields Name on page 733
/ {id}/InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	GET MetadataFields ID InUse on page 737
/	DELETE	Deletes multiple metadata fields specified in the request body.	DELETE MetadataFields on page 738
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	GET MetadataFields on page 739
/	POST	Creates a new metadata field using values supplied in the request body.	POST MetadataFields on page 743
/	PUT	Updates an existing metadata field using values supplied in the request body.	PUT MetadataFields on page 751

2.5.17.1 DELETE MetadataFields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

Table 286: DELETE MetadataFields {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field to be deleted. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields on page 739) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET MetadataFields ID InUse on page 737) to determine whether a metadata field is in use.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.2 GET MetadataFields ID

The *GET /MetadataFields/{id}* method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 287: GET MetadataFields {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields on page 739) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 288: GET MetadataFields {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <div>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</div> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.3 GET MetadataFields Name

The GET /MetadataFields/{name} method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 289: GET MetadataFields {name} Input Parameters

Name	In	Description
name	Path	Required. A string that indicates the name of the metadata field. This value is not case sensitive.

Table 290: GET MetadataFields {name} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.4 GET MetadataFields ID InUse

The GET /MetadataFields/{id}/InUse method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is

useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 291: GET MetadataFields {id} In Use Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields on the next page) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 292: GET MetadataFields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.5 DELETE MetadataFields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. The metadata fields IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

Table 293: DELETE MetadataFields Input Parameters

Name	In	Description
ids	Body	Required. An array of Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see GET MetadataFields below) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET MetadataFields ID InUse on page 737) to determine whether a metadata field is in use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.6 GET MetadataFields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Read*

Table 294: GET MetadataFields Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Name</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 295: GET MetadataFields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326). </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
AllowAPI	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	<p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.7 POST MetadataFields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

Table 296: POST MetadataFields Input Parameters

Name	In	Description														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	Required. An integer indicating the data type of the metadata field. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></tbody></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	Body	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div><pre>^[a-zA-Z0-9'_\.\-]*@(\keyexample\.org keyexample\.com)\$</pre></div> This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, under-														

Name	In	Description								
		<p>scores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).</div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr><tr><td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr></tbody></table> <p>The default is <i>optional</i>.</p> <div> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).</div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description									
0	Optional Users have the option to either enter a value or not enter a value in the field.									
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.									
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.									
Message	Body	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>								

Name	In	Description
		 Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is required for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p>  Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1326).
AllowAPI	Body	<p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
ExplicitUpdate	Body	<p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>
DisplayOrder	Body	<p>An integer indicating the order in which the metadata field should be</p>

Name	In	Description
		displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

Table 297: POST MetadataFields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.8 PUT MetadataFields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
CertificateMetadataTypes: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 298: PUT MetadataFields Input Parameters

Name	In	Description														
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	Required. An integer indicating the data type of the metadata field. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18 Monitoring Revocation

The Monitoring Revocation component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 300: Monitoring Revocation Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes the revocation monitoring location with the specified ID.	DELETE Monitoring Revocation ID below
/id	GET	Returns details for the revocation monitoring location with the specified ID.	GET Monitoring Revocation ID on the next page
/	PUT	Edits the revocation monitoring location with the specified ID.	PUT Monitoring Revocation on page 777
/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	GET Monitoring Revocation on page 765
/	POST	Creates a new revocation monitoring location.	POST Monitoring Revocation on page 770
/ResolveOSCP	POST	Resolves the given OSCP certificate authority.	POST Monitoring Resolve OSCP on page 784
/Test	POST	Tests the revocation monitoring alert with the specified ID.	POST Monitoring Revocation Test on page 785
/TestAll	POST	Tests the revocation monitoring alerts.	POST Monitoring Revocation Test All on page 787

2.5.18.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Modify*

Table 301: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 765) to retrieve a list of all the revocation monitoring locations to determine the ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.2 GET Monitoring Revocation ID

The *GET /Monitoring/Revocation/{id}* method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Read*

Table 302: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 765) to retrieve a list of all the revocation monitoring locations to determine the ID.

Table 303: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td></tr> </table>	Value	Description		<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC																

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				
Name	Description								
	time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
OCSPParameters	<p>For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p> </td></tr> <tr> <td>AuthorityName</td><td> <p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> </td></tr> <tr> <td>AuthorityNameId</td><td> <p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> </td></tr> </table>	Value	Description	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>	AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>
Value	Description								
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>								
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>								
AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>								

Name	Description	
	Value	Description
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 304: GET Monitoring Revocation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DashboardWarningValue</i> (WarningHours value) • <i>DisplayName</i> (Name) • <i>EndpointType</i> (1-CRL, 2-OCSP) • <i>SendWarning</i> (emailreminder) (true, false) • <i>ShowOnDashboard</i> (true, false) • <i>Url</i> • <i>WarningDays</i> <div>  Tip: To return all revocation monitoring locations of type CRL, use the following query: EndpointType -eq 1 To return locations of type OCSP, use this query: EndpointType -eq 2 </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 305: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.

Value	Description								
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>								
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>								
AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>								

Name	Description	
	Value	Description
	AuthorityKeyId	A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the CA.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Modify*

Table 306: POST Monitoring Revocation Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	Required. An array indicating the configuration for display on the dashboard.								

Name	In	Description										
		<div>Dashboard details are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td></tr><tr><td>WarningHours</td><td>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr></table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.

Value	Description											
CertificateContents	A string indicating the certificate contents.											
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p>											

Table 307: POST Monitoring Revocation Response Data

Name	Description								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>

Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>												
AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>												
AuthorityKeyId	<p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>												
SampleSerialNumber	<p>A string indicating the serial number of the CA.</p>												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 308: PUT Monitoring Revocation {id}Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.									
Dashboard	Body	Required. An array indicating the configuration for display on the dashboard.								

Name	In	Description										
		<p>Dashboard details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td></tr><tr><td>WarningHours</td><td>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr></table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.

Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An object containing a list of strings with email addresses to which the email reminders should be sent.								
Dashboard	<p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td> <p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p> </td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	<p>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</p> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>.</p>								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr> </table>	Value	Description		If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.												
Value	Description																
	If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.																
Schedule	<p>An array containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>								
Name	Description												
	<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>												
OCSPParameters	<p>For OCSP endpoints only, an array indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p> </td></tr> <tr> <td>AuthorityName</td><td> <p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> </td></tr> <tr> <td>AuthorityNameId</td><td> <p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p> </td></tr> <tr> <td>AuthorityKeyId</td><td> <p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p> </td></tr> <tr> <td>SampleSerialNumber</td><td> <p>A string indicating the serial number of the CA.</p> </td></tr> </table>	Value	Description	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>	AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>	AuthorityKeyId	<p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>	SampleSerialNumber	<p>A string indicating the serial number of the CA.</p>
Value	Description												
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the GET /CertificateAuthority method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>												
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>												
AuthorityNameId	<p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>												
AuthorityKeyId	<p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>												
SampleSerialNumber	<p>A string indicating the serial number of the CA.</p>												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Modify*

Table 310: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	Required* . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	Required* . An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 326) to retrieve a list of all the CAs to determine the ID. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 311: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

Tip: Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*
WorkflowManagement: *Test*

Table 312: POST Monitoring Revocation Test Input Parameters

Name	In	Description								
revocationMonitoringAlertTestRequest	Body	<p>Required. An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AlertId</td><td>Required. An integer indicating the reference ID of revocation monitoring alert to test.</td></tr><tr><td>EvaluationDate</td><td>Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</td></tr><tr><td>SendAlerts</td><td>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>{ "EvaluationDate": "2022-08-31T20:51:33.528Z" "SendAlerts": true}</pre>	Name	Description	AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.	EvaluationDate	Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.	SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .
Name	Description									
AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.									
EvaluationDate	Required. A string indicating the evaluation date/time for the test, in UTC. You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.									
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .									

Table 313: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.18.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

 **Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log

for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*
WorkflowManagement: *Test*

Table 314: POST Monitoring Revocation Test All Input Parameters

Name	In	Description						
revocationMonitoringAlertTestRequest	Body	<p>Required. An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>EvaluationDate</td><td><p>Required. A string indicating the evaluation date/time for the test, in UTC.</p><p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p></td></tr></table> <p>For example:</p> <pre>{ "EvaluationDate": "2022-08-31T20:51:33.528Z" "SendAlerts": true}</pre>	Name	Description	EvaluationDate	<p>Required. A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>	SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>
Name	Description							
EvaluationDate	<p>Required. A string indicating the evaluation date/time for the test, in UTC.</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>							
SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>							

Table 315: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An object containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An object containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An object containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 316: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	GET Orchestrator Jobs Job Status Data on the next page
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	GET Orchestrator Jobs Job History on page 792
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	GET Orchestrator Jobs Scheduled Jobs on

Endpoint	Method	Description	Link
			page 798
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	POST Orchestrator Jobs Custom on page 802
/Reschedule	POST	Reschedules a failed orchestrator job.	POST Orchestrator Jobs Reschedule on page 807
/Unschedule	POST	Unschedules an active orchestrator job.	POST Orchestrator Jobs Unschedule on page 809
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	POST Orchestrator Jobs Acknowledge on page 810
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	POST Orchestrator Jobs Reschedule on page 807

2.5.19.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Read*

 **Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

 **Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:

```

2021-08-05 10:47:23.1940
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response
status code does not indicate success: 413 (Request Entity Too Large).

at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_
/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172

```

```
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri,
Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\
work\24\s\src\OrchestratorServices\HttpService.cs:line 38
```

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See *Fetch Logs* in the *Keyfactor Command Reference Guide* for more information.

Table 317: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	Required. The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History below) to retrieve a list of jobs to determine the job's history ID.

Table 318: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Read*

Table 319: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentId</i> (The GUID of the orchestrator. Run GET Agents on page 11 to find the ID) • <i>Agent</i> (ClientMachine) • <i>JobId</i> • <i>Result</i> (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown) • <i>Status</i> (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry) • <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • <i>Message</i> • <i>OperationStart</i> (DateTime) • <i>ScheduleType</i> (Schedule: null (Immediately), I_ (Interval), D_ (Daily), W_ (Weekly), M_ (Monthly), O_ (Once)) • <i>TargetPath</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 320: GET Orchestrator Jobs Job History Response Data

Name	Description												
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.												
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.												
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.												
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
JobType	A string indicating the job type (e.g. IISInventory).																

Name	Description
OperationStart	The time, in UTC, at which the orchestrator job started.
OperationEnd	The time, in UTC, at which the orchestrator job finished.
Message	A string providing the error message for the operation, if any.
Result	A string indicating the result of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Success • Warning • Failure
Status	A string indicating the status of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Waiting • In Process • Completed • Acknowledged • Completed Will Retry
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ClientMachine	A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Read*

Table 321: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentId</i> (The GUID of the orchestrator. Run GET Agents on page 11 to find the ID) • <i>Agent Machine</i> (ClientMachine) • <i>AgentPlatform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator) • <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • <i>AgentType</i> *Use -contains comparison (Capabilities in GET Agents on page 11) • <i>Requested</i> (DateTime) • <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_(Monthly), O_(Once)) • <i>TargetPath</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 322: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Modify*

Tip: Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 792](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 791](#)) to retrieve the data.

Table 323: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description								
AgentId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 11) with a query of <i>Status -eq 2 and Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 11) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>								
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 635) to retrieve a list of your defined custom job types to determine the job type name to use.</p>								
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p>

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).													

Name	In	Description
		<div>  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <div> <pre>"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> </div> <div>  Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value. </div> <p>Use the <code>GET /JobTypes/Custom</code> method (see GET Custom Job Types on page 635) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <div>  Tip: The built-in Fetch Logs job does not have any optional job fields. </div>

Table 324: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.
RequestTimestamp	The date, in UTC, when the custom job was submitted.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.5 POST Orchestrator Jobs Reschedule

The POST /OrchestratorJobs/Reschedule method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 543](#)).
- Custom Jobs scheduled to run Immediately or Exactly Once
A new custom job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 802](#)).

- **Fetch Logs**
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 802](#)).
- **SSL Discovery and Monitoring**
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1296](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator**
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 368](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Modify*
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Tip: Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 325: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 792) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Job History Search Feature section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 543](#)).
- SSH Synchronization
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1162](#)).
- SSL Discovery and Monitoring
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1296](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 368](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Modify*
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 326: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p>Required*. An array of GUIDs indicating the job IDs of the jobs that should be unscheduled.</p> <p>Use the <code>GET /OrchestratorJobs/ScheduledJobs</code> method (see GET Orchestrator Jobs Scheduled Jobs on page 798) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to unschedule (e.g. <code>field1 -eq value1 AND field2 -gt value2</code>). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Orchestrator Scheduled Job Search Feature section.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.7 POST Orchestrator Jobs Acknowledge

The `POST /OrchestratorJobs/Acknowledge` method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see [Application Settings: Agents Tab](#) in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: AgentManagement: *Modify*

Table 327: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 792) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgement:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Job History Search Feature section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.19.8 POST Orchestrator Jobs Custom Bulk

The POST /OrchestratorJobs/Custom/Bulk method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
AgentManagement: *Modify*

Tip: Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the [GET /OrchestratorJobs/JobHistory](#) method (see [GET Orchestrator Jobs Job History on page 792](#)) to determine the *JobHistoryId* of the completed job and then use the [GET /OrchestratorJobs/JobStatus/Data](#) method (see [GET Orchestrator Jobs Job Status Data on page 791](#)) to retrieve the data.

Table 328: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description												
Orches- tratorIds	Body	<p>Required. A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 11) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 11) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>												
JobTypeNam- e	Body	<p>Required. A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 635) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description									
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).					
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).									
JobFields	Body	<p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre>"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> <div> Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along</div>								

Name	In	Description
		<p> with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> <p>Use the GET /JobTypes/Custom method (see GET Custom Job Types on page 635) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <p> Tip: The built-in Fetch Logs job does not have any optional job fields.</p>

Table 329: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
OrchestratorJobPairs	<p>An array containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>JobId</td><td>A string indicating the Keyfactor Command reference GUID for the job.</td></tr> <tr> <td>OrchestratorId</td><td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td></tr> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobTypeName	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of key/value pairs that set the values for any optional job fields configured for the custom job type.						
RequestTimestamp	The date, in UTC, when the custom job was submitted.						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20 PAM Providers

Privileged Access Management (PAM) functionality in Keyfactor Web APIs allows for configuration of third party PAM providers to secure certificate stores. In the current release, both CyberArk and Delinea (formerly Thycotic) are supported. The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM Providers.

Table 330: PamProviders Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes a PAM provider.	DELETE PAM Providers ID below
/ {id}	GET	Returns information for the specified PAM provider.	GET PAM Providers ID on the next page
/Types	GET	Returns a list of all available PAM provider types.	GET PAM Providers Types on page 827
/Types	POST	Creates a new PAM provider type.	POST PAM Providers Types on page 830
/	GET	Returns a list of all the configured PAM providers.	GET PAM Providers on page 833
/	POST	Creates a new PAM provider.	POST PAM Providers on page 843
/	PUT	Updates a PAM provider.	PUT PAM Providers on page 862

2.5.20.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: PrivilegedAccessManagement: *Modify*

Table 331: DELETE PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 833) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.2 GET PAM Providers ID

The *GET /PamProviders/{id}* method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PrivilegedAccessManagement: *Read*
SystemSettings: *Read*

Table 332: GET PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see GET PAM Providers on page 833) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 333: GET PamProviders {id} Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new</td></tr> </table> </td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider type.	Name	A string indicating the name of the provider type. Value	Description												
	and certificate store records.												
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
PrivilegedAccessManagement: *Read*
SystemSettings: *Read*

Table 334: GET PamProviders Types Response Data

DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.	DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> 1 = String 2 = Secret 	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).
Value	Description																														
Id	<p>An integer indicating the ID of the type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Private Ark Safe</td></tr> <tr> <td>2</td><td>PrivateArk Folder Name</td></tr> <tr> <td>3</td><td>PrivateArk Protected Password Name</td></tr> <tr> <td>4</td><td>Application ID</td></tr> <tr> <td>5</td><td>Secret Server Url</td></tr> <tr> <td>6</td><td>Rule Name</td></tr> <tr> <td>7</td><td>Thycotic Secret ID</td></tr> <tr> <td>8</td><td>Rule Key</td></tr> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key												
Value	Description																														
1	Private Ark Safe																														
2	PrivateArk Folder Name																														
3	PrivateArk Protected Password Name																														
4	Application ID																														
5	Secret Server Url																														
6	Rule Name																														
7	Thycotic Secret ID																														
8	Rule Key																														
Name	A string indicating the internal name for the PAM provider type parameter.																														
DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.																														
DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> 1 = String 2 = Secret 																														
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).																														

Example: For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:

- PrivateArk Safe: The name of the safe in CyberArk containing the certificate

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PrivilegedAccessManagement: *Modify*
SystemSettings: *Read*

Table 335: POST PamProviders Types Input Parameters

Name	Description										
Name	A string containing the name of the PAM provider type.										
Parameters	<p>An array containing parameters for the provider type. Parameter details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> <tr> <td>DataType</td><td> <p>An integer indicating the data type for the parameter. Name	Description	
	Value	Description
		<div>  <pre> { "Id": 1, "Name": "Safe", "DisplayName": "PrivateArk Safe", "DataType": 1, "InstanceLevel": false "ProviderType": null }, { "Id": 4, "Name": "AppId", "DisplayName": "Application ID", "DataType": 1, "InstanceLevel": false "ProviderType": null } </pre> </div> <p>When you configure a certificate store to use CyberArk as a credential provider, you enter the name of the folder in the CyberArk safe where the protected object is stored and you enter the name of the projected object in the CyberArk safe containing the username or password used to access the certificate store. Because these fields are configured on the certificate store level, they appear as InstanceLevel=True like so:</p> <div> <pre> { "Id": 2, "Name": "Folder", "DisplayName": "PrivateArk Folder Name", "DataType": 1, "InstanceLevel": true "ProviderType": null }, { "Id": 3, "Name": "Object", "DisplayName": "PrivateArk Protected Password Name", </pre> </div>

Name	Description	
	Value	Description
		 <pre>"DataType": 1, "InstanceLevel": true "ProviderType": null }</pre> <p>In both cases, the <i>values</i> for the fields (e.g. the actual name of the object in CyberArk where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
PrivilegedAccessManagement: *Read*
SystemSettings: *Read*

Table 336: GET PamProviders Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Area</i> • <i>Name</i> • <i>ProviderType</i> • <i>SecuredAreald</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 337: GET PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	<p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Value	Description												
	and certificate store records.												
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

- CertificateStoreManagement: *Modify*
- PrivilegedAccessManagement: *Modify*
- SystemSettings: *Read*

Table 338: POST PamProviders Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.

			Provider-TypeParams
			An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.
SecureAreald	Body	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM</p>	

Name	In	Description
		<p>provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>

Table 339: POST PamProviders Response Data

Name	Description																
ID	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.

InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.	Provider	An array containing information about the provider.	Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.														
Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).														
InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.														
InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.														
Provider	An array containing information about the provider.														
Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:														

Name	Description		
	Value	Description	
		Value	Description
		Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
		DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> 1 = String 2 = Secret
		InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (<i>False</i>) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (<i>True</i>). See example, above.
		Provider-Type	An array containing details for the provider type. Provider type parameters include:

Name	Description		
	Value	Description	
		Value	Description
		Value	Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider

Value	Description												
	and certificate store records.												
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
 CertificateStoreManagement: *Modify*
 PrivilegedAccessManagement: *Modify*
 SystemSettings: *Read*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 340: PUT PamProviders Input Parameters

Name	In	Description																
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	Body	Required. A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.																
ProviderType	Body	<div>An array containing details about the provider type for the provider.<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).	InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.	InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.	Provider	An array containing information about the provider.	Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.														
Value	A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).														
InstanceId	An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.														
InstanceGuid	A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.														
Provider	An array containing information about the provider.														
Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:														

Name	Description		
	Value	Description	
		Value	Description
		Id	An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		DisplayName	A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.
		DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> 1 = String 2 = Secret
		InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (<i>False</i>) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (<i>True</i>). See example, above.
		Provider-Type	An array containing details for the provider type. Provider type parameters include:

Name	Description		
	Value	Description	
		Value	Description
		Value	Description
		Id	The Keyfactor Command reference GUID for the PAM provider type parameter.
		Name	A string indicating the internal name for the PAM provider type parameter.
		Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider

Name	Description

	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>and certificate store records.</td></tr> </table>	Value	Description		and certificate store records.								
Value	Description												
	and certificate store records.												
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p>												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 342: Reports Endpoints

Endpoint	Method	Description	Link
/id	GET	Returns the built-in report with the specified ID.	GET Reports ID on page 884

Endpoint	Method	Description	Link
/Custom/{id}	DELETE	Deletes the custom report with the specified ID.	DELETE Reports Custom ID on page 892
/Custom/{id}	GET	Returns the custom report with the specified ID.	GET Reports Custom ID on page 893
/Schedules/{id}	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	DELETE Reports Schedules ID on page 894
/Schedules/{id}	GET	Returns the schedule for the built-in report with the specified schedule ID.	GET Reports Schedules ID on page 895
/ {id} /Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	GET Reports ID Parameters on page 899
/ {id} /Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	PUT Reports ID Parameters on page 901
/	GET	Returns all built-in reports with filtering and output options.	GET Reports on page 903
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	PUT Reports on page 906
/Custom	GET	Returns all custom reports with filtering and output options.	GET Reports Custom on page 909
/Custom	POST	Creates a custom report.	POST Reports Custom on page 911
/Custom	PUT	Updates the custom report with the specified ID.	PUT Reports Custom on page 913
/ {id} /Schedules	GET	Returns the schedule for the built-in report with the specified report ID.	GET Reports ID Schedules on page 914
/ {id} /Schedules	POST	Creates a schedule for the built-in report with the specified report ID.	POST Reports ID Schedules on page 919
/ {id} /Schedules	PUT	Updates a schedule for the built-in report with the specified report ID.	PUT Reports ID Schedules on page 929

2.5.21.1 GET Reports ID

The GET /Reports/{id} method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 343: GET Reports {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report that should be retrieved. Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.

Table 344: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certi- </div>

Name	Description								
	<p>★ ficate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 407). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>								
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).								
ReportParameter	<p>An array containing the parameters for the report. . Report parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the report parameter.</td></tr> <tr> <td>ParameterName</td><td>A string containing the short reference name for the report parameter (e.g. EvalDate).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod </td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report parameter .	ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).	ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
Name	Description								
Id	The Keyfactor Command reference ID of the report parameter .								
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).								
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod 								

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).</td></tr> <tr> <td>Description</td><td>A string containing the description for the parameter.</td></tr> <tr> <td>DefaultValue</td><td> A string containing the default value for the parameter. <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div> </td></tr> <tr> <td>DisplayOrder</td><td>An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.</td></tr> <tr> <td>ParameterVisibility</td><td>A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i>. The alternative setting is <i>Hidden</i>.</td></tr> </table>	Name	Description	DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).	Description	A string containing the description for the parameter.	DefaultValue	A string containing the default value for the parameter. <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>	DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.	ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .
Name	Description												
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).												
Description	A string containing the description for the parameter.												
DefaultValue	A string containing the default value for the parameter. <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>												
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.												
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .												
Schedules	<p>An array containing the configured schedules for running the report, if any. Schedules include the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the report schedule.</td></tr> <tr> <td>SendReport</td><td>A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).</td></tr> <tr> <td>SaveReport</td><td>A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).</td></tr> <tr> <td>SaveReportPath</td><td>A string containing the UNC path to which the report will be written, if configured.</td></tr> <tr> <td>ReportFormat</td><td> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> PDF </td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the report schedule .	SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).	SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).	SaveReportPath	A string containing the UNC path to which the report will be written, if configured.	ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> PDF
Name	Description

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>Monthly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").	Monthly	A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:				
Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																
Monthly	A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:																

Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <div>  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> </td></tr> <tr> <td>EmailRe-cipients</td><td>An array containing the email addresses of users configured as recipients of the scheduled report, if any.</td></tr> <tr> <td>RuntimePara-meters</td><td>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <div>  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.	EmailRe-cipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.	RuntimePara-meters	Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:
Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> <div>  Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.								
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														
EmailRe-cipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.														
RuntimePara-meters	Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:														

Name	Description																								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												
AcceptedScheduleFormats	An array containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 345: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link to be deleted. Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 909) to retrieve a list of your custom report links to determine the report ID to use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.3 GET Reports Custom ID

The *GET /Reports/Custom/{id}* method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 346: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID for the report link that should be retrieved.

Table 347: GET Reports Custom {id} Response Data

Name	Description
CustomURL	A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).  Tip: Custom reports are automatically opened in a new browser tab.
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 348: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the GET /Reports method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID and then GET /Reports/{id} (see GET Reports ID on page 884) to retrieve the details for that report to determine the schedule ID to use.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.5 GET Reports Schedules ID

The GET /Reports/Schedules/{id} method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 914](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 349: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 884) to retrieve the details for that report to determine the schedule ID to use.

Table 350: GET Reports Schedules {id} Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").	Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																		
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																		
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																		
Day	The number of the day, in the month, to run the job.																		

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Time": "2022-02-27T17:30:00Z" }</pre>												
Name	Description																
	<pre>"Time": "2022-02-27T17:30:00Z" }</pre>																
EmailRecipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr> <tr> <td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr> <tr> <td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr> <tr> <td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr> <tr> <td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.
Name	Description																
CertAuth	The certificate authority or authorities selected to report on.																
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Metadata	The custom metadata fields selected to include in the report.																
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr> <tr> <td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description												
PeriodSize	The selected reporting period (day, weeks or months).												
Requesters	The certificate requesters selected to include in the report.												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Read*

Table 351: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 352: GET Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	<p>A string containing the default value for the parameter.</p> <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 353: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. The Keyfactor Command reference ID of the report parameter . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 884) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter. <div> Tip: Default values that are integers are also stored as strings in this parameter.</div>

Table 354: PUT Reports {id} Parameters Response Data

Name	Description
Id	The Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	<p>A string containing the default value for the parameter.</p> <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 884](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 355: GET Reports Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Categories</i> (CertificateCounts, CertificateLifecycle, CertificateLocations, PKIOperations, SecurityVulnerability, SSHKeys) • <i>Custom</i> • <i>Favorite</i> (true, false) • <i>InNavigator</i> (true, false) • <i>Scheduled</i> (Number of schedules) <div>  <p>Tip: This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category:</p> <p><code>Categories -contains "PKIOperations"</code></p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 356: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).

Name	Description
	 Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 407). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 919](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 929](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 901](#)). This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Modify*

Table 357: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p>Required. The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <p>Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 407). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 358: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one </div>

Name	Description
	 certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 407). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 359: GET Reports Custom Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Categories</i> (CertificateCounts, CertificateLifecycle, CertificateLocations, PKIOperations, SecurityVulnerability, SSHKeys) • <i>Custom</i> • <i>Favorite</i> (true, false) • <i>InNavigator</i> (true, false) • <i>Scheduled</i> (Number of schedules)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 360: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Modify*

Table 361: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p>Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div>  Tip: Custom reports are automatically opened in a new browser tab. </div>
DisplayName	Body	<p>Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 362: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div>  Tip: Custom reports are automatically opened in a new browser tab. </div>
Id	<p>An integer containing the Keyfactor Command reference ID for the report link.</p>
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).</p>
Favorite	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 363: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).  Tip: Custom reports are automatically opened in a new browser tab.
Id	Body	Required. An integer containing the Keyfactor Command reference ID for the report link. Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 909) to retrieve a list of your custom report links to determine the report ID to use.
DisplayName	Body	Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 364: PUT Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.13 GET Reports ID Schedules

The GET `/Reports/{id}/Schedules` method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the `GET /Reports/Schedules/{id}` method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 895](#)).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
Reports: *Read*

Table 365: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 366: GET Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																		
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																		
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.												
Name	Description																		
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																		
Day	The number of the day, in the month, to run the job.																		

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Time": "2022-02-27T17:30:00Z" }</pre>												
Name	Description																
	<pre>"Time": "2022-02-27T17:30:00Z" }</pre>																
EmailRecipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr> <tr> <td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr> <tr> <td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr> <tr> <td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr> <tr> <td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.
Name	Description																
CertAuth	The certificate authority or authorities selected to report on.																
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Metadata	The custom metadata fields selected to include in the report.																
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr> <tr> <td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description												
PeriodSize	The selected reporting period (day, weeks or months).												
Requesters	The certificate requesters selected to include in the report.												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 367: POST Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.</p>
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p>Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing “\” in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV
KeyfactorSchedule	Body	<p>Required. An array providing the schedule for the report. The schedule can be one of:</p>

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																							
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
Metadata	The custom metadata fields selected to include in the report.																							
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																							
OrchestratorPool	The orchestrator pool selected to report on.																							
PeriodCount	The number of days, weeks or months selected to report on.																							
PeriodSize	The selected reporting period (day, weeks or months).																							
Requesters	The certificate requesters selected to include in the report.																							
SSHKeyType	The SSH key type(s) selected to report on.																							
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																							
		<p>For example:</p> <pre>"RuntimeParameters": { "StartDate": "60-Day-Before", "EndDate": "7-Day-Before", "Metadata": "AppOwnerFirstName, AppOwnerLastName", "Requesters": "jsmith" }</pre>																						

Name	In	Description
		This field is required for reports that have runtime parameters.

Table 368: POST Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description												
PeriodSize	The selected reporting period (day, weeks or months).												
Requesters	The certificate requesters selected to include in the report.												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 369: PUT Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 903) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. The Keyfactor Command reference ID of the report schedule . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 884) to retrieve the details for the desired report to determine the schedule ID to use.
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p>Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> Do not use a trailing “\” in the report path. Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> PDF Excel CSV
KeyfactorSchedule	Body	Required. An array providing the schedule for the report.

Name	In	Description

Name	Description																							
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
Metadata	The custom metadata fields selected to include in the report.																							
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																							
OrchestratorPool	The orchestrator pool selected to report on.																							
PeriodCount	The number of days, weeks or months selected to report on.																							
PeriodSize	The selected reporting period (day, weeks or months).																							
Requesters	The certificate requesters selected to include in the report.																							
SSHKeyType	The SSH key type(s) selected to report on.																							
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																							

For example:

```
"RuntimeParameters": {  
  "StartDate": "60-Day-Before",  
  "EndDate": "7-Day-Before",  
  "Metadata": "AppOwnerFirstName, AppOwnerLastName",  
  "Requesters": "jsmith"  
}
```

Name	In	Description
		This field is required for reports that have runtime parameters.

Table 370: PUT Reports {id} Schedules Response Data

Name	Description												
Id	The Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description																
	<pre>"Time": "2022-02-27T17:30:00Z" }</pre>																
EmailRecipients	An array containing the email addresses of users configured as recipients of the scheduled report, if any.																
RuntimeParameters	<p>Any array containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected. Runtime parameters may include things such as:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr> <tr> <td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr> <tr> <td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr> <tr> <td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr> <tr> <td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr> <tr> <td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr> </table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.
Name	Description																
CertAuth	The certificate authority or authorities selected to report on.																
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).																
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																
Metadata	The custom metadata fields selected to include in the report.																
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																
OrchestratorPool	The orchestrator pool selected to report on.																
PeriodCount	The number of days, weeks or months selected to report on.																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr> <tr> <td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr> <tr> <td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr> <tr> <td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr> <tr> <td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr> </table>	Name	Description	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description												
PeriodSize	The selected reporting period (day, weeks or months).												
Requesters	The certificate requesters selected to include in the report.												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.22 Security Identities

The Security Identities component of the Keyfactor API includes methods necessary to list, add, and delete security identities. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 371: Security Identities Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the security identity with the specified ID.	DELETE Security Identities ID below
/id}	GET	Returns permission details for the security identity with the specified ID.	GET Security Identities ID below
/Lookup	GET	Validates that the identity with the specified name exists.	GET Security Identities Lookup on page 944
/	GET	Returns all security identities with filtering and output options.	GET Security Identities on page 945
/	POST	Adds a new security identity into Keyfactor Command.	POST Security Identities on page 969

2.5.22.1 DELETE Security Identities ID

The DELETE /Security/Identities/{id} method is used to delete the security identity with the specified ID from Keyfactor Command. Use the [GET /Security/Identities](#) method (see [GET Security Identities on page 945](#)) to determine the ID of the security identity you wish to delete. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 372: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security identity that should be deleted from Keyfactor Command.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.22.2 GET Security Identities ID

The GET /Security/Identities/{id} method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: *Read*

Table 373: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security identity to retrieve. Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 945) to retrieve a list of all the security identities to determine the identity's ID.

Table 374: GET Security Identities {id} Response Data

Name	Description						
Identity	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>						
SecuredAreaPermissions	<p>An object containing a series of arrays with information about the global permissions granted to the security identity. Global permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td></tr> <tr> <td>GrantedByRoles</td><td>An object containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre>"SecuredAreaPermissions": [{ "Permission": "AdminPortal:Read", "GrantedByRoles": ["Read Only", "Staff"] }, { "Permission": "Reports:Read", "GrantedByRoles": ["Read Only"] },]</pre> <p>For more information about global permissions, see the Security Roles and Identities page in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
CollectionPermissions	<p>An object containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p>						

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre>"CollectionPermissions": [{ "Permission": "Issued in the Last Week:Certificates_Read", "GrantedByRoles": ["Staff", "Power Users"] }, { "Permission": "Web Server Certs:Certificates_EditMetadata", "GrantedByRoles": ["Power Users"] },]</pre> <p>For more information about collection permissions, see the Certificate Permissions page in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.						
GrantedByRoles	An array containing a list of roles that grant that permission.						
ContainerPermissions	<p>An object containing information about the global permissions granted to the security identity. Container permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table>	Name	Description	Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						

Name	Description
	<p>For example:</p> <pre> "ContainerPermissions": [{ "Permission": "IIS Personal:CertificateStoreManagement_Read", "GrantedByRoles": ["Power Users", "Staff"] }, { "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_Schedule", "GrantedByRoles": ["Power Users"] },] </pre> <p>For more information about container permissions, see the Container Permissions page in the <i>Keyfactor Command Reference Guide</i>.</p>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.22.3 GET Security Identities Lookup

The GET `/Security/Identities/Lookup` method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using `POST /Security/Identities` (see [POST Security Identities on page 969](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: `SecuritySettings: Read`

Table 375: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	Required. The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@-domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 376: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.22.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Read*

Table 377: GET Security Identities Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .
queryString		<i>Not used.</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 378: GET Security Identities Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security identity.																								
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>																								
IdentityType	A string indicating the type of identity—User or Group.																								
Roles	<div>An array containing information about the security roles assigned to the security identity. Role information includes:</div> <table><tr><th>Name</th><th>In</th><th>Description</th></tr><tr><td>Id</td><td>Body</td><td>Required. An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.</td></tr><tr><td>Name</td><td>Body</td><td>Required. A string containing the short reference name for the security role.</td></tr><tr><td>Description</td><td>Body</td><td>Required. A string containing the description for the security role.</td></tr><tr><td>Enabled</td><td>Body</td><td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>. This is considered deprecated and may be removed in a future release.</td></tr><tr><td>Immutable</td><td>Body</td><td>A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.</td></tr><tr><td>Valid</td><td>Body</td><td>A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.</td></tr><tr><td>Private</td><td>Body</td><td>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</td></tr></table>	Name	In	Description	Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.	Name	Body	Required. A string containing the short reference name for the security role.	Description	Body	Required. A string containing the description for the security role.	Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.	Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.	Valid	Body	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.	Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .
Name	In	Description																							
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.

				alerts, and configure the pending alert delivery schedule.
		WorkflowManagement (a.k.a. Alerts)	Test	Users can test the pending alerts, including sending email to recipients. Users must also have Read permissions for <i>Workflow</i> .
		WorkflowManagement (a.k.a. Certificate Requests)	Participate	Users can participate in the pending, issued and denied workflow process by approving or denying certificate requests from the Certificate Requests page or from the individual pages reached from links included in alerts in the Management Portal and with related API endpoints.
		For example:		
		<pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>		
Valid	A Boolean indicating whether the security identity’s audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.			

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.22.5 POST Security Identities

The POST /Security/Identities method is used to create a new security identity in Keyfactor Command. Use the GET /Security/Identities/Lookup method (see [GET Security Identities Lookup on page 944](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Tip: This method cannot be used to assign roles to an identity. Use the PUT /Security/Roles method (see [PUT Security Roles on page 1061](#)) to assign roles to an identity.

Table 379: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	Required. A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>

Table 380: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, container and collection-level.

Table 381: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/{{id}}/Permisssions	GET	Returns all permissions associated with the security role that matches the id	GET Security Roles ID Permissions on the next page
/{{id}}/Permisssions/Global	GET	Returns all global permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Global on page 973
/{{id}}/Permisssions/Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	POST Security Roles ID Permissions Global on page 974
/{{id}}/Permisssions/Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	PUT Security Roles ID Permissions Global on page 999
/{{id}}/Permisssions/Containers	GET	Returns all container permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Containers on page 1025
/{{id}}/Permisssions/Containers	POST	Adds container permissions to the security role that matches the ID.	POST Security Roles ID Permissions Containers on page 1026
/{{id}}/Permisssions/Containers	PUT	Sets container permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Containers on page 1028

Endpoint	Method	Description	Link
/ {id} /Permissions/Collections	GET	Returns all collection permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Collections on page 1030
/ {id} /Permissions/Collections	POST	Adds collection permissions to the security role that matches the ID.	POST Security Roles ID Permissions Collections on page 1031
/ {id} /Permissions/Collections	PUT	Sets collection permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Collections on page 1032

2.5.23.1 GET Security Roles ID Permissions

The GET /Security/Roles/{id}/Permissions method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: Read

Table 382: GET Security Roles {id} Permissions Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the security role for which to retrieve permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 383: GET Security Roles {id} Permissions Response Data

Name	Description								
	<p>An object containing information about the permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Type</td><td>A string containing the area at which the permission is applied to (global, container, or collection).</td></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr> </table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. Certificates).								
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).								

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.2 GET Security Roles ID Permissions Global

The GET /Security/Roles/{id}/Permissions/Global method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 384: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the security role for which to retrieve global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 385: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.3 POST Security Roles ID Permissions Global

The POST /Security/Roles/{id}/Permissions/Global method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

 **Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 386: POST Security Roles {id}Global Permissions Input Parameters

Table 387: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.4 PUT Security Roles ID Permissions Global

The PUT /Security/Roles/{id}/Permissions/Global method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 388: PUT Security Roles {id}Global Permissions Input Parameters

Table 389: PUT Security Roles {id} Global Permissions Response Data

Name	Description						
	<p>An object containing information about the global permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr> </table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: Read

Table 390: GET Security Roles {id} Permissions Containers Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve certificate store container permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.

Table 391: GET Security Roles {id} Permissions Containers Response Data

Name	Description								
	An object containing information about the certificate store container permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td>An integer containing the container ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate store container.</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.6 POST Security Roles ID Permissions Containers

The POST */Security/Roles/{id}/Permissions/Containers* method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 392: POST Security Roles {id} Permissions Containers Input Parameters

Name	In	Description						
id	Path	Required. The Keyfactor Command reference ID of the security role for which to set certificate store container permissions. Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role’s ID.						
containerPermissions	Body	<p>An object containing information about the permissions granted to certificate store containers for this security role. Container details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td>Required. Name	Description								
	An object containing information about the certificate store container permissions granted to the security role. Details include:								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>ContainerId</td><td>An integer containing the container ID.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate store container.</td></tr> <tr> <td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr> </table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.7 PUT Security Roles ID Permissions Containers

The PUT /Security/Roles/{id}/Permissions/Containers method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 394: PUT Security Roles {id} Permissions Containers Input Parameters

Permission	A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Read*

Table 396: GET Security Roles {id} Permissions Collections Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.

Table 397: GET Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>An integer containing the collection ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate collection .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.9 POST Security Roles ID Permissions Collections

The POST/Security/Roles/{id}/Permissions/Collections method is used to add new collection permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

 **Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 398: POST Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	Required. The Keyfactor Command reference ID of the security role for which to set certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.						
collectionPermissions	Body	An object containing information about the permissions granted to certificate collection for this security role. Collection details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission granted on the collection for this role—<i>Read</i>, <i>EditMetadata</i>, <i>Recover</i>, <i>Revoke</i>, or <i>Delete</i>.</td></tr></table>	Name	Description	CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.	Permission	Required. 2.5.23.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

 **Important:** Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 400: PUT Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	Required. The Keyfactor Command reference ID of the security role for which to set certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.						
collectionPermissions	Body	An object containing information about the permissions granted to certificate collection for this security role. Collection details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission granted on the collection for this role—<i>Read</i>, <i>EditMetadata</i>, <i>Recover</i>, <i>Revoke</i>, or <i>Delete</i>.</td></tr></table>	Name	Description	CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.	Permission	Required. A string containing the name of the certificate collection . </td></tr> <tr> <td>Permission</td><td> Required. A string indicating the permission granted on the entity for this role. </td></tr> </table>	Name	Description	CollectionId	Required. An integer containing the collection ID.	Name	Required. A string containing the name of the certificate collection .	Permission	Required. A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	Required. An integer containing the collection ID.								
Name	Required. A string containing the name of the certificate collection .								
Permission	Required. A string indicating the permission granted on the entity for this role.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 402: Security Roles Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the security role with the specified ID.	DELETE Security Roles ID below
/ {id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and security identities assigned the role.	GET Security Roles ID on the next page
/ {id} /Identities	GET	Returns the security identities assigned to the security role with the specified ID.	GET Security Roles ID Identities on page 1037
/ {id} /Identities	PUT	Updates the security identities assigned to the security role with the specified ID.	PUT Security Roles ID Identities on page 1038
/	GET	Returns all security roles with filtering and output options.	GET Security Roles on page 1039
/	POST	Adds a new security role.	POST Security Roles on page 1042
/	PUT	Updates the security role with the specified ID.	PUT Security Roles on page 1061
/ {id} /Copy	POST	Adds a new security role by copying the existing security role with the specified ID.	POST Security Roles ID Copy on page 1080

2.5.24.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 1039](#)) to determine the ID of

the security role you wish to delete. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 403: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security role that should be deleted from Keyfactor Command.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Read*

Table 404: GET Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.

Table 405: GET Security Roles {id} Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: KEYEXAMPLE\PKI Administrators										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.										

Name	Description
	<p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.3 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: Read

Table 406: GET Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the security role for which to retrieve security identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.</p>

Table 407: GET Security Roles {id} Identities Response Data

Name	Description						
	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>Name</td><td> <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p> </td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.4 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 408: PUT Security Roles {id} Identities Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the security role for which to update identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see GET Security Roles on the next page) to retrieve a list of all the security roles to determine the role's ID.</p>
identities	Body	<p>An array in which you provide a complete list of the identities that are associated with an Security Role Id.</p> <p>Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 945) to retrieve a list of all the security identities to determine the identity ID(s).</p>

Table 409: PUT Security Roles {id} Identities Response Data

Name	Description						
	<p>An array containing information about the security identities assigned to the security role. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p> </td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>
Name	Description						
Id	An integer containing the Keyfactor Command identifier for the security identity.						
Name	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.5 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 410: GET Security Roles Input Parameters

Name	In	Description
validate	Query	A boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Security Role Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Name</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 411: GET Security Roles Response Data

Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security role.										
Name	A string containing the short reference name for the security role.										
Description	A string containing the description for the security role.										
Enabled	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.										
Immutable	A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.										
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.										
Private	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.										
Identities	<p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code></td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>	IdentityType	A string indicating the type of identity—User or Group.	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description										
Id	An integer containing the Keyfactor Command identifier for the security identity.										
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <code>KEYEXAMPLE\PKI Administrators</code>										
IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.										

Name	Description
	<p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.6 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
SecuritySettings: *Modify*

Table 412: POST Security Roles Input Parameters

Name	In	Description															
Name	Body	Required. A string containing the short reference name for the security role.															
Description	Body	Required. A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal (a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Read</td><td>Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Modify</td><td>Users can modify the agent auto-registration settings.</td></tr> <tr> <td>AgentManagement</td><td>Read</td><td>Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> • View orches- </td></tr> </table>	Name	Value	Description	AdminPortal (a.k.a. 				trators, including filtering the orchestrator management grid <ul style="list-style-type: none"> • View orches- trator jobs, including status, sched- ules, failures and warnings
		AgentManagement	Modify	Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> • Manage orchestrators, including approving and disapproving them • Unschedule and reschedule orchestrator jobs
		API	Read	Users can call the Classic (CMS) API endpoints.
		ApplicationSettings	Read	Users can view the application settings.
		ApplicationSettings	Modify	Users can modify the application settings.
		Auditing	Read	Users can access the

Name	In	Description		
				Audit Log page in the Management Portal, and will be able to make API requests to obtain data from the audit log (query, etc.). The System Settings drop-down menu will display the Audit Log option to users with the <i>Auditing Read</i> permission.
		CertificateCollections	Modify	Users can add or edit certificate collections. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
		CertificateEnrollment	EnrollPFX	Users can use the PFX Enrollment page in the Management Portal and use the PFX enrollment related API endpoints.
		CertificateEnrollment	EnrollCSR	Users can use the CSR Enrollment page in the Management Portal and use the CSR enrollment related API endpoints.
		CertificateEnrollment	CsrGeneration	Users can use the CSR Generation page in the Management Portal and use the CSR generation related API endpoints.
		CertificateEnrollment	PendingCsr	Users can use manage pending CSRs.

Name	In	Description		
		Name	Value	Description
		CertificateMetadataTypes	Read	Users can read custom metadata attribute definitions on the Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateMetadataTypes	Modify	Users can add, edit, and delete custom metadata attribute definitions on the Certificate Metadata page in the Management Portal and with related API endpoints.
		CertificateStoreManagement	Read	Users can view certificate stores—including the stores and containers but not discovery records—and certificate store types. Users who also have Read permissions for <i>Certificates</i> can view inventory for a certificate store. <i>See Container Permissions in the Keyfactor Command Reference Guide for more information.</i>
		CertificateStoreManagement	Modify	Users can manage certificate stores—including the stores, containers, and discovery process—and certificate store types. Note that this permission does not

Name	In	Description		
		Name	Value	Description
				control additions of certificates to certificate stores.
		CertificateStoreManagement	Schedule	Users can add certificates to certificate stores, renew/reissue certificates, and remove certificates from certificate stores.
		Certificates	Read	Users can view certificates in certificate search and certificate collections in the Management Portal and with related API endpoints, including certificate history, and can download certificates. Users who also have Read permissions for <i>Certificate Store Management</i> or container permissions can add certificates to certificate stores. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Certificates	Import	Users can import certificates through Add Certificate in the Management Portal and with related API endpoints. Users who also have Read permissions for <i>Certi-</i>		

Name	In	Description		
				<i>ificate Store Management</i> or container permissions can add certificates to certificate stores from Add Certificate.
		Certificates	Recover	Users can download the certificates with their private key.
		Certificates	Revoke	Users can revoke certificates through Certificate Search and Certificate Collections in the Management Portal and with related API endpoints.
		Certificates	Delete	Users can delete certificates and, if applicable, the private keys of the certificates from the Keyfactor Command database.
		Certificates	ImportPrivateKey	Users can save the private key for the certificate in the Keyfactor Command database.
		Certificates	EditMetadata	Users can modify certificate metadata for certificates accessed through Certificate Search and Certificate Collections in the Management Portal and with related API endpoints.

Name	In	Description		
		Name	Value	Description
		Dashboard	Read	Users can view the panels on their personalized dashboard and add and remove them.
		Dashboard	RiskHeader	Users can view the risk header at the top of the dashboard.
		EventHandlerRegistration	Read	Users can view the event handler registration settings.
		EventHandlerRegistration	Modify	Users can modify the event handler registration settings.
		MacAutoEnrollManagement	Read	Users can view the Mac Auto-Enroll Management settings.
		MacAutoEnrollManagement	Modify	Users can modify the Mac Auto-Enroll Management settings.
		Monitoring	Read	Users can view the expiration alerts in the Certificate Alerts in the Management Portal and with related API endpoints, including the alert schedule.
		Monitoring	Modify	Users can modify the expiration alerts, including the alert text, recipients and event handlers. Users can also add new alerts, delete alerts and configure the expiration alert delivery schedule.

Name	In	Description		
		Name	Value	Description
		Monitoring	Test	Users can test the expiration alerts, including sending email to recipients. Users must also have Read permissions for <i>Monitoring</i> .
		PkiManagement	Read	<p>Users can view the Keyfactor Command PKI management settings within the following Management Portal areas and use related endpoints:</p> <ul style="list-style-type: none"> • Certificate Authorities • Certificate Templates • Revocation Monitoring
		PkiManagement	Modify	<p>Users can modify the Keyfactor Command PKI management settings:</p> <ul style="list-style-type: none"> • Import, add, edit, and delete certificate authorities • Import certificate templates • Add, edit, delete, and test revocation monitoring endpoints • Configure revocation

Name	In	Description		
				monitoring schedule <ul style="list-style-type: none"> • Configure revocation monitoring recipients
		Priv-ilegedAccessManagement	Read	Users can view PAM providers.
		Priv-ilegedAccessManagement	Modify	Users can add, edit, and delete PAM providers.
		Reports	Read	Users can generate and view reports.
		Reports	Modify	Users can modify the delivery schedule for reports in Report Manager in the Management Portal and add, edit, and delete custom reports. <div>  Note: Report scheduling is limited by collection permissions. Users in roles that have <i>Reports: Read and Modify</i> permissions will also need to have <i>Read</i> collection permissions on individual collections to have the ability to add, </div>

Name	In	Description		
				 edit and delete schedules associated with collections. The user will not have access to add, edit and delete schedules for any collections for which they do not have collection <i>Read</i> permissions in addition to <i>Reports</i> permissions.
		SecuritySettings	Read	Users can view the settings for Security Roles and Security Identities. Users must also have the Read permission for <i>System Settings</i> .
		SecuritySettings	Modify	Users can modify the settings for Security Roles and Security Identities in the Management Portal and with related API endpoints.
		SSH	User	Users can generate their own SSH keys.
		SSH	ServerAdmin	Users can use all SSH functions, except creating server groups and assigning server

Name	In	Description		
				group owners. Users have limited access to some functions based on server group ownership. <i>See SSH Permissions in the Keyfactor Command Reference Guide for more information.</i>
		SSH	EnterpriseAdmin	Users can use all SSH functions. <i>See SSH Permissions in the Keyfactor Command Reference Guide for more information.</i>
		SslManagement	Read	Users can view the SSL Network Discovery and Monitoring area in the Management Portal and with related API endpoints, including defined networks and the network ranges configured for them, agent pools, and scan results. Users can use the query tool on the Results tab to find discovered endpoints and then view the discovered endpoints, including the details for the endpoints.
		SslManagement	Modify	Users can modify the SSL Network Discovery and Monitoring settings: <ul style="list-style-type: none"> Create, edit,

Name	In	Description		
		Name	Value	Description
				<p>and delete networks, including scan schedules and notification recipients</p> <ul style="list-style-type: none"> • Add, edit, and delete network ranges for networks • Add, edit, and delete agent pools • Add and remove discovered endpoints from monitoring
		SystemSettings	Read	<p>Users can view the System Settings for:</p> <ul style="list-style-type: none"> • Application Settings • Event Handler Registration to view built-in or custom event handlers • API Applications allowed to use the APIs for certificate lifecycle management • SMTP Configuration for email delivery of reports and alerts

Name	In	Description		
				<ul style="list-style-type: none"> • Installed components • Licensing • Alerts and Warnings about the health of the Keyfactor Command system
		SystemSettings	Modify	<p>Users can modify the System Settings for:</p> <ul style="list-style-type: none"> • Application Settings to configure many options for Keyfactor Command • Event Handler Registration to add or remove built-in or custom event handlers • Update SMTP Configuration for email delivery of reports and alerts • Installed components, including removing servers from use • Licensing, including the

Name	In	Description		
				option to replace the existing license file
		WorkflowDefinitions	Read	Users can view the configured workflow definitions.
		WorkflowDefinitions	Modify	Users can modify both the built-in and any custom workflow definitions, including the name and description and the configuration for the steps. Users can also add new workflow definitions, delete workflow definitions, publish workflow definitions, and import and export workflow definitions.
		WorkflowInstances	Manage	Users can manage initiated workflow instances, including stopping, restarting, and deleting them.
		WorkflowInstances	ReadAssignedToMe	Users can view the workflow instances that have been initiated and are awaiting input from them.
		<div> Tip: There is not a security permission at this level that</div>		

Name	In	Description		
				 controls whether users can provide input (a signal) to a workflow instance. This is controlled using the security roles configured on the specific workflow definition. Any user who holds one of the roles configured in the workflow step that requires a signal may provide the necessary input. The user does not need to hold the <i>ReadAssignedToMe WorkflowInstances</i> permission in order to provide the input.
		WorkflowInstances	ReadAll	Users can view all the workflow instances that have been initiated.
		WorkflowInstances	ReadMy	Users can view the workflow instances that have been initiated by them (e.g. because they enrolled for a certificate).

Name	In	Description		
		Name	Value	Description
		WorkflowManagement (a.k.a. Alerts)	Read	Users can view the pending, issued, and denied workflow alerts.
		WorkflowManagement (a.k.a. Alerts)	Modify	Users can modify the pending, issued, and denied workflow alerts, including the alert text, recipients, and event handlers. Users can also add new alerts, delete alerts, and configure the pending alert delivery schedule.
		WorkflowManagement (a.k.a. Alerts)	Test	Users can test the pending alerts, including sending email to recipients. Users must also have Read permissions for <i>Workflow</i> .
		WorkflowManagement (a.k.a. Certificate Requests)	Participate	Users can participate in the pending, issued and denied workflow process by approving or denying certificate requests from the Certificate Requests page or from the individual pages reached from links included in alerts in the Management Portal and with related API endpoints.
For example:				
<pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"</pre>

IdentityType	A string indicating the type of identity—User or Group.										
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.										
Permissions	An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.										

Name	Description
	<p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.7 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 414: PUT Security Roles Input Parameters

Name	In	Description															
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1039) to retrieve a list of all the security roles to determine the role's ID.															
Name	Body	Required. A string containing the short reference name for the security role.															
Description	Body	Required. A string containing the description for the security role.															
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.															
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.															
Permissions	Body	<p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal (a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. Endpoint	Method	Description	Link
		selection query.	Keys Unmanaged on page 1098
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1098
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID on page 1101
/Logons/{id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on page 1102
/Logons/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1104
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1106
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1109
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on page 1111
/Servers/{id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 1112
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 1116
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on

Endpoint	Method	Description	Link
			page 1118
/Servers/	POST	Creates a new SSH server.	POST SSH Servers on page 1123
/Servers/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1128
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1133
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1135
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on page 1138
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on page 1139
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 1143
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1147
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1150
/ServerGroups/	POST	Creates a new SSH server group.	POST SSH

Endpoint	Method	Description	Link
			Server Groups on page 1154
/ServerGroups/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1162
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1170
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1173
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID on page 1176
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1179
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 1186
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1190
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1192
/ServiceAccounts/	POST	Creates a new SSH service account.	POST SSH Service

Endpoint	Method	Description	Link
			Accounts on page 1200
/ServiceAccounts/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1210
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1218
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID on page 1222
/Users/{id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on page 1223
/Users/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1228
/Users/	POST	Creates a new SSH user.	POST SSH Users on page 1239
/Users/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1240
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1242

2.5.25.1 SSH Keys

The SSH Keys component of the Keyfactor Web APIs includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see *SSH Permissions* in the *Keyfactor Command Reference Guide*) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 419: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID below
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on the next page
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 1089
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 1092
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 1096
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 1098
Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1098

DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 420: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1098) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged ID

The *GET /SSH/Keys/Unmanaged/{id}* method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 421: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1098) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 422: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 1092](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *User* OR
SSH: *ServerAdmin* OR

Table 423: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	Required* . A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>true</i> .  Tip: This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.

Table 424: GET SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 1109](#), [POST SSH Server Groups Access on page 1173](#), and [POST SSH Servers Access on page 1135](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *User* OR

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

Table 425: POST SSH Keys My Key Input Parameters

Name	In	Description								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	ECDSA	2	Ed25519	3	RSA
Numeric Value	Text Value									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>OpenSSH</td></tr><tr><td>2</td><td>PKCS8</td></tr></table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	OpenSSH	2	PKCS8		
Numeric Value	Text Value									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required[*]. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div> Tip: This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see GET SSH Keys My Key on page 1089) and encrypt it with a different pass-</div>								

Name	In	Description
		 word, if desired.
Comment	Body	<p>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p> <p>  Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery. </p>

Table 426: POST SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *User* OR
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 427: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	Required. The Keyfactor Command reference ID for the SSH key.
Email	Body	Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comment	Body	<p>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div> Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</div>

Table 428: PUT SSH Keys My Key Response Data

Name	Description
ID	The Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 429: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4, 27, 89]</pre> <p>Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged below) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged

The GET /SSH/Keys/Unmanaged method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 430: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Unmanaged Keys Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>DiscoveredDate</i>• <i>KeyComments</i>• <i>KeyLength</i>• <i>KeyType</i>• <i>ServerId</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 431: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	The date, in UTC, on which the SSH key was discovered.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.25.2 SSH Logons

The SSH Logons component of the Keyfactor Web APIs includes methods necessary to view and manage the Linux user accounts associated with authorized_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 432: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID below
/id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on the next page
/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1104
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1106
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1109

DELETE SSH Logons ID

The DELETE /SSH/Logons/{id} method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 433: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH logon to be deleted. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Logons ID

The *GET /SSH/Logons/{id}* method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 434: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 435: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 436: GET SSH Logons Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Id</i> (Login ID) • <i>LastLogon</i> • <i>Hostname</i> (Logon Server Name) • <i>LogonUserUsername</i> • <i>ServerId</i> • <i>UnmanagedKeyId</i> • <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 437: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 438: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	Required. A string indicating the user's logon name on the Linux server.
ServerId	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1118) to retrieve a list of all the SSH servers to determine the server's ID.</p>
UserIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format:</p> <div>[4,7,19]</div> <p>See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.</p> <p>Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1228) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.</p>

Table 439: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>Details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of key/value pairs providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Logons Access

The POST /SSH/Logons/Access method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 440: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <div>[4,7,19]</div> Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1228) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.

Table 441: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	<p>An array of key/value pairs providing information about the users mapped to the logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.25.3 SSH Servers

The SSH Servers component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 442: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on the next page
/id	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 1112
/Access/id	GET	Retrieves Linux logons along with users and service accounts granted access to those logons	GET SSH Servers Access

Endpoint	Method	Description	Link
		for the specified SSH server.	ID on page 1116
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 1118
/	POST	Creates a new SSH server.	POST SSH Servers on page 1123
/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1128
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1133
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1135

DELETE SSH Servers ID

The DELETE /SSH/Servers/{id} method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 443: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server to be deleted. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1118) to retrieve a list of all the SSH servers to determine the server's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers ID

The GET /SSH/Servers/{id} method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 444: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server to be retrieved. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1118) to retrieve a list of all the SSH servers to determine the server's ID.

Table 445: GET SSH Servers {id} Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <p> Tip: If the server group associated with the SSH server is in <i>inventory and</i></p>										

Name	Description						
	 <i>publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers Access ID

The GET /SSH/Servers/Access/{id} method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 446: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on the next page) to retrieve a list of all the SSH servers to determine the server's ID.

Table 447: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<div>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td><div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div></td></tr></table></div>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be

used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 448: GET SSH Servers Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>Agent</i> (Agent ID)• <i>Hostname</i>• <i>Orchestrator</i> (ClientMachine)• <i>ServerGroup</i> (Server Group Id)• <i>ServerGroupName</i>• <i>ServerGroupOwner</i> (Username)• <i>EnforcePublishPolicy</i> (UnderManagement) (true, false)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Hostname</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 449: GET SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <p> Tip: If the server group associated with the SSH server is in <i>inventory and</i></p>										

Name	Description						
	 <i>publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1154](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 11](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 450: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	Required. A string indicating the hostname of the SSH server.
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).  Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 451: POST SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <p> Tip: If the server group associated with the SSH server is in <i>inventory and</i></p>										

Name	Description						
	 <i>publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\username format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 452: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	Required. The Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). <div> Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</div>
Port	Body	The port that is configured for SSH on the SSH server. The default is 22.

Table 453: PUT SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	<p>A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).</p> <p> Tip: If the server group associated with the SSH server is in <i>inventory and</i></p>										

Name	Description						
	 <i>publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An array that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 454: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	Required. An array containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 455: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<div>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td><div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div></td></tr></table></div>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<div>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Servers Access

The POST /SSH/Servers/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns

HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 456: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. The Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	Required. An array containing information for the Linux logon(s) to update. The following information should be included: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td></tr></table></div> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 457: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.25.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor Web APIs includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 458: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID below
/id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on the next page
/name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 1143
/Access/id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1147
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1150
/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 1154
/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1162
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1170
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1173

DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *EnterpriseAdmin*

Table 459: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1150) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups ID

The *GET /SSH/ServerGroups/{id}* method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 460: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1150) to retrieve a list of all the SSH server groups to determine the server group's GUID.

Table 461: GET SSH Server Groups {id} Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.

Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												
Under-	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False)												

Name	Description
Management	or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Name	In	Description
		<pre> "SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } } </pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 464: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1150) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 465: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 466: GET SSH Server Groups Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Server Group Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• <i>GroupId</i>• <i>GroupName</i>• <i>Owner</i> (Owner ID)• <i>OwnerName</i> (Username)• <i>EnforcePublishPolicy</i> (Under Management) (true, false)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 467: GET SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												
Under-	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False)												

Name	Description
Management	or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *EnterpriseAdmin*

Table 468: POST SSH Server Groups Input Parameters

Name	In	Description												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>												
GroupName	Body	<p>Required. A string indicating the name of the SSH server group.</p>												
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description													
Off	Turn off a previously configured schedule.													
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.									
Name	Description													
Minutes	An integer indicating the number of minutes between each interval.													
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:													

Name	In	Description																	
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Note: Although the Swagger *Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.

For example:

```
"SyncSchedule": {  
  "Weekly": {  
    "Days": [  
      "Monday",  
      "Wednesday",  
      "Friday"  
    ],  
    "Time": "2022-11-20T14:00:00Z"  
  }  
}
```

Name	In	Description
		<pre>} }</pre> <p>The default is unset.</p>
Under- Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). The default is False.

Table 469: POST SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.						
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												
Under-	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False)												

Name	Description
Management	or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 470: PUT SSH Server Groups Input Parameters

Name	In	Description												
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>												
GroupName	Body	Required. A string indicating the name of the SSH server group.												
SyncSchedule	Body	<p>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description													
Off	Turn off a previously configured schedule.													
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.									
Name	Description													
Minutes	An integer indicating the number of minutes between each interval.													
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.							
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Name	In	Description
		<pre> "SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } } </pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 472: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<p>An array containing information for the Linux logon(s) to update. The following information should be included:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.							

Table 473: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 474: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. The Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	Required. An array containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.							

Table 475: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	The Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of user objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that is associated with the logon.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.25.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 476: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID below
/id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1179
/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 1186
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1190
/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1192
/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 1200
/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1210
/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1218

DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/{id} method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 477: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1192) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div>  <p>Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. </div>

Name	In	Description
		 <ul style="list-style-type: none"> • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1186](#)).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 478: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1192) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>

Table 479: GET SSH Service Accounts {id} Response Data

Name	Description														
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp-p@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts Key ID

The GET /SSH/ServiceAccounts/Key/{id} method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 480: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information. Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1192) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  Tip: Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a GET /SSH/ServiceAccounts: </div> <pre> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1- 8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg =", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11- 17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_ access2@appsrvr80.keyexample.com" } } </pre>

Name	In	Description
		 <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key. Use this one to request the key.
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Passphrase header must be supplied.

Table 481: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	The date, in UTC, on which the SSH key pair was created.
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 482: DELETE SSH Service Accounts Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre>[4,12,17]</pre> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on the next page) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <div>  <p>Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre>{ "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } }</pre> </div>

Name	In	Description
		 It contains three IDs: <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1186](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 483: GET SSH Service Accounts Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Service Account Key Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CreationDate</i> • <i>Id</i> • <i>Comments</i> (Key comments) • <i>KeyLength</i> • <i>KeyType</i> • <i>ServerGroup</i> (Server Group ID) • <i>ServerGroupName</i> • <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 484: GET SSH Service Accounts Response Data

Name	Description														
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:														

Name	Description

Name	Description										
	application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1154](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 11](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Name	In	Description						
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>myapp@appsrvr75).</td></tr><tr><td>LogonIds</td><td>An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.</td></tr></table>	Name	Description		myapp@appsrvr75).	LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.
Name	Description							
	myapp@appsrvr75).							
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that should be associated with the service account in order to publish the service account's public key to the servers on which the logons are located.							
ClientHostname	Body	Required. A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. user-name@client_hostname). The naming convention is to use the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast).						
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						

Table 486: POST SSH Service Accounts Response Data

Name	Description														
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. Name	Description										
	application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 487: PUT SSH Service Accounts Input Parameters

Name	In	Description								
KeyUpdateRequest	Body	<p>Required. An array that sets the information to include in the SSH service account key update request. Key update request information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>Required. The Keyfactor Command reference ID for the service account's key.</td></tr><tr><td>Email</td><td>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.</td></tr><tr><td>Comment</td><td>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</td></tr></table>	Name	Description	Id	Required. The Keyfactor Command reference ID for the service account's key.	Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.	Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Id	Required. The Keyfactor Command reference ID for the service account's key.									
Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.									
Comment	An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<p>Required. The Keyfactor Command reference ID for the service account.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1192) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>								

Table 488: PUT SSH Service Accounts Response Data

Name	Description														
ID	The Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An array that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An array providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Service Accounts Rotate ID

The POST /SSH/ServiceAccounts/Rotate/{id} method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 489: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information. Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1192) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  <p>Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre>{ "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_ access2@appsrvr80.keyexample.com" } }</pre> </div>

Name	In	Description								
		<div> It contains three IDs:<ul style="list-style-type: none">ID 2: The service account's ID. Use this one to rotate the key.ID 7: The service account user's ID.ID 36: The ID of the service account user's key.</div>								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA

Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p>								
Comment	Body	<p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may</p>								

Name	In	Description
		can contain any characters supported for string fields, including spaces and most punctuation marks.

Table 490: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.25.6 SSH Users

The SSH Users component of the Keyfactor Web APIs includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 491: SSH Users Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID below
/ {id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on the next page
/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1228
/	POST	Creates a new SSH user.	POST SSH Users on page 1239
/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1240
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1242

DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin*

Table 492: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1228) to retrieve a list of all the SSH users to determine the user's ID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1089](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1186](#)) for a service account.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 5](#).

Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 493: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1228) to retrieve a list of all the SSH users to determine the user's ID.

Table 494: GET SSH Users {id} v2 Response Data

Name	Description

See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	The date, in UTC, on which the SSH key pair was created.																		
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Comments</td><td>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.</td></tr> <tr> <td>LigonCount</td><td>An integer indicating the number of Linux logons associated with the SSH key pair.</td></tr> </table>	Name	Description	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Name	Description						
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

GET SSH Users

The GET /SSH/Users method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1089](#)) for user accounts and the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1186](#)) for service accounts.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 5](#).

Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 497: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1118) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1150) to determine ownership of a server or server group.</p> <div>  <p>Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div>  <p>Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. </div>

Name	In	Description
		<p> Gina does a GET /SSH/Users with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the SSH Server Search</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Email</i> • <i>Fingerprint</i> • <i>IsServiceAccount</i> • <i>KeyLength</i> • <i>KeyType</i> • <i>LogonCount</i> • <i>LogonServerGroupId</i> • <i>LogonServerId</i> • <i>ServiceAccountId</i> • <i>StaleDate</i> • <i>Username</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The

Name	In	Description
		default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	The date, in UTC, on which the SSH key pair was created.																		
StaleDate	The date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description						
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Comments</td><td>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.</td></tr><tr><td>LogonCount</td><td>An integer indicating the number of Linux logons associated with the SSH key pair.</td></tr></table>	Name	Description	Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\\username format (e.g. KEYEXAMPLE\\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Users

The *POST /SSH/Users* method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 501: POST SSH Users Input Parameters

Name	In	Description
Username	Body	<p>Required. A string indicating the full username of the <i>user</i> or <i>service account</i>.</p> <p>For a <i>user</i> account, the username is given in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a <i>service account</i>, the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast). The full service account name is given in the form user-name@clienthostname (e.g. svc_myapp@appsrvr75).</p>
LogonIds	Body	<p>An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p>

Table 502: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be

published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 503: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID of the SSH user. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1228) to retrieve a list of all the SSH users to determine the user's ID.
LogonIds	Body	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: <div>[12, 27, 39]</div> Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID(s).  Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1228) before updating and provide both existing and new logon IDs.

Table 504: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

POST SSH Users Access

The POST /SSH/Users/Access method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SSH: *ServerAdmin* OR
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 505: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the GET /SSH/Users method (see GET SSH Users on page 1228) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the GET /SSH/Logons method (see GET SSH Logons on page 1104) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div>  <p>Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1228) before updating and provide both existing and new logon IDs.</p> </div>

Table 506: POST SSH Users Access Response Data

Name	Description

IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.26 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 507: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	GET SMTP below
/	PUT	Updates settings for the SMTP configuration profile.	PUT SMTP on page 1248
/Test	POST	Sends a test email message to confirm SMTP configuration.	POST SMTP Test on page 1251

2.5.26.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SystemSettings: *Read*

Table 508: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future release.</p>						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.26.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SystemSettings: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 509: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<p>An integer indicating the type of authentication used to connect to the mail server. Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<p>Required*. A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>No data is output in this field on a GET.</p>						
RelayUsername	Body	<p>Required*. A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	Required. A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthentic-</i>						

Name	In	Description
		<i>ationType</i> .
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 510: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.26.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SystemSettings: *Modify*

Table 511: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	Required. An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Anonymous</td></tr><tr><td>2</td><td>Explicit Credentials</td></tr></table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<p>Required[*]. A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>No data is output in this field on a GET.</p>						
RelayUsername	Body	<p>Required[*]. A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	Body	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future</p>						

Name	In	Description
		release.
SenderName	Body	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .
TestRecipient	Body	Required. A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 512: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
TestRecipient	A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 513: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	GET SSL Parts ID on page 1257
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	GET SSL Endpoints ID on page 1259
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	DELETE SSL NetworkRanges ID on page 1260
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	GET SSL NetworkRanges ID on page 1261
/Networks/{identifier}	GET	Returns information about the specified SSL network.	GET SSL Networks Identifier on page 1262
/	GET	Returns the results of an SSL scan based on query information.	GET SSL on page 1271
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	GET SSL Networks on page 1273
/Networks	POST	Creates a new SSL network.	POST SSL Networks on page 1283
/Networks	PUT	Updates an existing SSL network.	PUT SSL Networks on page 1296

Endpoint	Method	Description	Link
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	GET SSL Endpoints ID History on page 1310
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	GET SSL Networks ID Parts on page 1316
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	POST SSL NetworkRanges on page 1318
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	PUT SSL NetworkRanges on page 1319
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	PUT SSL Endpoints Review Status on page 1320
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	PUT SSL Endpoints Monitor Status on page 1321
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Review All on page 1321
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Monitor All on page 1322
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	POST SSL Networks ID Scan on page 1323
/NetworkRanges/Validate	POST	Validates all SSL networks given.	POST SSL NetworkRanges Validate on page 1324
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	DELETE SSL Networks ID on page 1324

2.5.27.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 1316](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 514: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved. Use the <i>GET /SSL/Networks/{id}/Parts</i> method (see GET SSL Networks ID Parts on page 1316) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.

Table 515: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	The Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	The Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	The Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	<p>An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning.</p> <p>The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in <i>Application Settings: Agents Tab</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 516: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see GET SSL on page 1271) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 517: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
NetworkId	The Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	The Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	The IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.3 DELETE SSL NetworkRanges ID

The DELETE /SSL/NetworkRanges/{id} method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Tip: To delete some but not all of the network ranges for a network, use the *PUT /SSL/Networks* method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 1296](#)).

Table 518: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.4 GET SSL NetworkRanges ID

The *GET /SSL/NetworkRanges/{id}* method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: Read

Table 519: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 520: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>IP Address</td></tr> <tr> <td>2</td><td>Host Name</td></tr> <tr> <td>3</td><td>Network Notation</td></tr> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.5 GET SSL Networks Identifier

The GET /SSL/Networks/{identifier} method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 521: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 522: GET SSL Networks {id} Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. 5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <i>GET /SSL/Networks</i> method. Use the <i>GET /SSL/Networks/{id}</i> method to return data in this field. </div>																

Name	Description
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 523: GET SSL Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentPoolName</i> • <i>CertificateCN</i> • <i>CertificateFound</i> (True, False) • <i>Status</i> (6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4-Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown) • <i>IpAddress</i> • <i>IsMonitored</i> (True, False) • <i>IssuerDN</i> • <i>NetworkName</i> • <i>Port</i> • <i>ReverseDNS</i> • <i>Reviewed</i> (True, False) • <i>SelfSigned</i> (True, False) • <i>SNIName</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 524: GET SSL Response Data

Name	Description
EndpointId	The Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 525: GET SSL Networks Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Name</i> • <i>Pool</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 526: GET SSL Networks Response Data

Name	Description										
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).				
Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled		
Value	Description								
0	Unknown								
1	Not Scheduled								

Name	Description

Value	Description																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <i>GET /SSL/Networks</i> method. Use the <i>GET /SSL/Networks/{id}</i> method to return data in this field. </div>																

Name	Description
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.8 POST SSL Networks

The POST /SSL/Networks method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 527: POST SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<div>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Day</td><td>The number of the day, in the month, to run the job.</td></tr></table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Day	The number of the day, in the month, to run the job.												
Name	Description																
Day	The number of the day, in the month, to run the job.																
ExactlyOnce		<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).											
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).																
DiscovererPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.															

Name	In	Description																
Monit- orPer- centComplete	Bod- y	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Bod- y	An integer indicating the status of the discovery job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov- erLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																

Name	In	Description
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Bod- y	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre>"QuietHours": [{ "StartDay": "Monday", "StartTime": "2022-11-21T14:00:08Z",</pre>

Name	In	Description
		<pre> "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }] </pre>

Table 528: POST SSL Networks Response Data

Name	Description
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	 Note: To improve performance in requests, data is not returned in this field for the <i>GET /SSL/Networks</i> method. Use the <i>GET /SSL/Networks/{id}</i> method to return data in this field.
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.9 PUT SSL Networks

The PUT /SSL/Networks method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 529: PUT SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<div>An array providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</div><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div></td></tr></table></div>	Name	Description	Immediate	<div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</div> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov- erLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																

Name	In	Description
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Bod- y	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	<p>An array providing the list of scheduled quiet hour periods. For example:</p> <pre>"QuietHours": [{ "StartDay": "Monday", "StartTime": "2022-11-21T14:00:08Z",</pre>

Name	In	Description
		<pre> "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }] </pre>

Table 530: PUT SSL Networks Response Data

Name	Description
NetworkId	The Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AgentPoolId	The Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An array providing the discovery schedule for the SSL network group.
MonitorSchedule	An array providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	 Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array providing the list of scheduled quiet hour periods.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.10 GET SSL Endpoints ID History

The `GET /SSL/Endpoints/{id}/History` method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the specified endpoint.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 531: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint for which to return history information. Use the <i>GET /SSL</i> method (see GET SSL on page 1271) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 532: GET SSL Endpoints {id} History Response Data

Name	Description																																
HistoryId	The Keyfactor Command reference GUID for the history entry.																																
EndpointId	The Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	The Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	The date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>TimeOutConnecting</td></tr> <tr> <td>2</td><td>ExceptionConnecting</td></tr> <tr> <td>3</td><td>TimeoutDownloading</td></tr> <tr> <td>4</td><td>ExceptionDownloading</td></tr> <tr> <td>5</td><td>NotSsl</td></tr> <tr> <td>6</td><td>CertificateFound</td></tr> <tr> <td>7</td><td>ExceptionInSql</td></tr> <tr> <td>8</td><td>InvalidOrUnreachableHost</td></tr> <tr> <td>9</td><td>ConnectionRefused</td></tr> <tr> <td>10</td><td>BadSslHandshake</td></tr> <tr> <td>11</td><td>ClientAuthenticationFailed</td></tr> <tr> <td>12</td><td>NoCertificate</td></tr> <tr> <td>13</td><td>SslRefused</td></tr> <tr> <td>14</td><td>NotProbed</td></tr> </table>	Value	Description	0	Unknown	1	TimeOutConnecting	2	ExceptionConnecting	3	TimeoutDownloading	4	ExceptionDownloading	5	NotSsl	6	CertificateFound	7	ExceptionInSql	8	InvalidOrUnreachableHost	9	ConnectionRefused	10	BadSslHandshake	11	ClientAuthenticationFailed	12	NoCertificate	13	SslRefused	14	NotProbed
Value	Description																																
0	Unknown																																
1	TimeOutConnecting																																
2	ExceptionConnecting																																
3	TimeoutDownloading																																
4	ExceptionDownloading																																
5	NotSsl																																
6	CertificateFound																																
7	ExceptionInSql																																
8	InvalidOrUnreachableHost																																
9	ConnectionRefused																																
10	BadSslHandshake																																
11	ClientAuthenticationFailed																																
12	NoCertificate																																
13	SslRefused																																
14	NotProbed																																
JobType	An integer containing the type of scan job from which the history entry was created. The possible values are:																																

Name	Description														
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Discovery</td></tr> <tr> <td>2</td><td>Monitoring</td></tr> <tr> <td>3</td><td>Compliance</td></tr> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance				
Value	Description														
0	Unknown														
1	Discovery														
2	Monitoring														
3	Compliance														
ProbeType	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>SSLv2</td></tr> <tr> <td>3</td><td>TLS</td></tr> </table>	Value	Description	2	SSLv2	3	TLS								
Value	Description														
2	SSLv2														
3	TLS														
ReverseDNS	A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.														
HistoryCertificates	<p>An array of certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>The date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>The date, in UTC, on which the certificate expires.</td></tr> <tr> <td>SigningAlgorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	The date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the certificate.														
IssuedDN	A string indicating the distinguished name of the certificate.														
SerialNumber	A string indicating the serial number of the certificate.														
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.														
NotAfter	The date, in UTC, on which the certificate expires.														
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.														

Name	Description	
	Name	Description
	Thumbprint	A string indicating the thumbprint of the certificate.
	IssuerDN	A string indicating the distinguished name of the issuer.
	IssuedCN	A string indicating the common name of the certificate.

Name	Description
SubjectAltNameElements	
</	

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). The results from this method are of the currently in progress job or the latest completed job.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 533: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Network Scan Details Search</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 534: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	The date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	The date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 535: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	Required. The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see GET SSL Networks on page 1273) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 536: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	Required. The Keyfactor Command reference GUID for the SSL network. Use the GET /SSL/Networks method (see GET SSL Networks on page 1273) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.
Ranges	Body	Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443). For example: <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 537: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the GET /SSL method (see GET SSL on page 1271) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SslManagement: *Modify*

Table 538: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the <i>GET /SSL</i> method (see GET SSL on page 1271) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SslManagement: *Modify*

Table 539: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: SslManagement: *Modify*

Table 540: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.18 POST SSL Networks ID Scan

The POST /SSL/Networks/{id}/Scan method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 541: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network’s GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.19 POST SSL Networks ID Reset

The POST /SSL/Networks/{id}/Reset method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 542: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the GET /SSL/Networks method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.20 POST SSL NetworkRanges Validate

The POST /SSL/NetworkRanges/Validate method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network range before using POST /SSL/NetworkRanges or PUT /SSL/NetworkRanges to configure it for an SSL network.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Read*

Table 543: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
networkRangesToVerify	Body	Required. An array of network ranges to validate. For example: <pre>["10.5.4.0/24:443", "192.168.12.0/16:443,22", "keyexample.com:443"]</pre>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.27.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
SslManagement: *Modify*

Table 544: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1273) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.28 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 545: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	GET Status Endpoints below

2.5.28.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. There are no input parameters for this method. This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
None

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 546: Templates Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns information about the specified template.	GET Templates ID below
/Settings	GET	Returns the global template policy settings.	GET Templates Settings on page 1342
/Settings	PUT	Sets global values for template policy.	PUT Templates Settings on page 1350
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	GET Templates Subject Parts on page 1365
/	GET	Returns a list of templates.	GET Templates on page 1365
/	PUT	Updates selected settings for the specified template.	PUT Templates on page 1378
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	POST Templates/Import on page 1409

2.5.29.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Read*

Table 547: GET Templates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see GET Templates on page 1365) to retrieve a list of all the templates to determine the template ID.

Table 548: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object

Name	Description										
	<p>contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform </div>										

Name	Description																
	<div>  required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p>																

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_.\-\]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td></tr> <tr> <td>Enrollment</td><td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the</td></tr> </table> </td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_.\-\]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the</td></tr> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the

In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.														
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).														
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).														
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot														

Name	Description
	make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AllowedRequesters	An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div>  <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  </div> <p><i>Figure 3: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:

Name	Description																																	
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in Active Directory.</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						
Curve	A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings.

 **Tip:** Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1378](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Read*

There are no input parameters for this method.

Table 549: GET Templates Settings Response Data

Value	Description										
TemplateRege- xes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SubjectPa- rt</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>RegEx</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1365) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one char-</p> </td></tr> </table> </td></tr> </table>	Name	Description	SubjectPa- rt	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1365) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one char-</p> </td></tr> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one char-</p>
Name	Description										
SubjectPa- rt	A string indicating the portion of the subject the regular expression applies to (e.g. CN).

Value	Description												
	allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.												
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).												
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).												
	<p>For example:</p> <pre> "TemplatePolicy": { "RSAValidKeySizes": [2048, 4096], "ECCValidCurves": ["1.2.840.10045.3.1.7", "1.3.132.0.34" "1.3.132.0.35"], "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "AllowEd448": false, "AllowEd25519": false } </pre>												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

Tip: Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1378](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Note: Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Modify*

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 550: PUT Templates Settings Input Parameters

Value	Description										
TemplateRege- xes	<p>An object containing the system-wide template regular expression settings. AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
Value	Description												
	allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.												
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).												
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).												
<p>For example:</p> <pre> "TemplatePolicy": { "RSAValidKeySizes": [2048, 4096], "ECCValidCurves": ["1.2.840.10045.3.1.7", "1.3.132.0.34" "1.3.132.0.35"], "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "AllowEd448": false, "AllowEd25519": false } </pre>													

Table 551: PUT Templates Settings Response Data

Value	Description										
TemplateRege- xes	<p>An object containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Regular expression details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>RegEx</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1365) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_-\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one char-</p> </td></tr> </table> </td></tr> </table>	Name	Description	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN). AllowKeyReuse	A Boolean that indicates whether private key reuse is								

Value	Description												
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>allowed (true) or not (false). This option allows to certificate renewals.</td></tr> <tr> <td>AllowWildcards</td><td>A Boolean that indicates whether wildcards are allowed (true) or not (false).</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</td></tr> <tr> <td>AllowEd448</td><td>A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).</td></tr> <tr> <td>AllowEd25519</td><td>A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).</td></tr> </table>	Value	Description		allowed (true) or not (false). This option allows to certificate renewals.	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.	AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).	AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
Value	Description												
	allowed (true) or not (false). This option allows to certificate renewals.												
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false).												
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.												
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).												
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).												
<p>For example:</p> <pre> "TemplatePolicy": { "RSAValidKeySizes": [2048, 4096], "ECCValidCurves": ["1.2.840.10045.3.1.7", "1.3.132.0.34" "1.3.132.0.35"], "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "AllowEd448": false, "AllowEd25519": false } </pre>													

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Read*

Table 552: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Read*

Table 553: GET Templates Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Template Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AllowedEnrollmentType</i> (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None) • <i>DisplayName</i> • <i>FriendlyName</i> • <i>ForestRoot</i> (deprecated) • <i>ConfigurationTenant</i> • <i>HasPrivateKeyRetention</i> (True, False) • <i>IsDefaultTemplate</i> (True, False) • <i>KeyType</i> (Unknown, RSA, DSA, ECC, DH) • <i>ShortName</i> <div>  <p>Tip: To filter out all the built-in Active Directory templates and display only your custom templates, use the following query:</p> <pre>IsDefaultTemplate -eq "false"</pre> <p>To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query:</p> <pre>AllowedEnrollmentType -eq "3"</pre> <p>A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment.</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command

Name	In	Description
		Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 554: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object

Name	Description										
	<p>contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform </div>										

Name	Description																
	<div>  required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment

7	CSR Enrollment, PFX Enrollment & CSR Generation												
TemplateRegexes	<p>An object containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1342. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>TemplateId</td><td>The Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>Regex</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1365) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common</td><td>This regular expression specifies that the</td></tr> </table> </td></tr> </table>	Name	Description	TemplateId	The Keyfactor Command reference ID of the certificate template the regular expression is associated with. UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to														

Name	Description
	<p>select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	<p>An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>
DisplayName	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1056 1404 1648"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 4: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p>

Name	Description																																	
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
	Value	Function	Description																															
	0	None	No key usage parameters.																															
	1	Encipherment Only	The key can be used for encryption only.																															
	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																															
	4	Key Certificate Signing	The key can be used to sign certificates.																															
	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																															
	16	Data Encipherment	The key can be used for data encryption.																															
	32	Key Encipherment	The key can be used for key encryption.																															
	64	Nonrepudiation	The key can be used for authentication.																															
	128	Digital Signature	The key can be used as a digital signature.																															
32768	Decipherment Only	The key can be used for decryption only.																																
	<p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>																																	
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in Active Directory.</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Modify*

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 555: PUT Templates Input Parameters

Name	In	Description										
Id	Body	Required. An integer indicating the ID of the template in Keyfactor Command.										
KeySize	Body	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.										
KeyType	Body	A string indicating the key type of the template as defined by the CA. The field is not configurable.										
FriendlyName	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	Body	<div><p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>None</td><td>The private key will not be retained.</td></tr><tr><td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr><tr><td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr><tr><td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr></table></div>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
KeyRetentionDays	Body	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										

Name	In	Description																
EnrollmentFields	Body	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none">• Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.• Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</div> <p>The enrollment fields object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr><tr><td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr><tr><td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr><tr><td>DataType</td><td>An integer indicating the parameter type. The options are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table></td></tr></table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																	
Id	An integer indicating the ID of the custom enrollment field.																	
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																	
Options	For multiple choice values, an array of strings containing the value choices.																	
DataType	An integer indicating the parameter type. The options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.											
Value	Description																	
1	String: A free-form data entry field.																	
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																	

Name	In	Description										
		<p>For example:</p> <pre>"EnrollmentFields": [{ "Id": 3, "Name": "MyCustomField", "Options": ["Green", "Red", "Yellow", "Blue"], "DataType": 2 }]</pre>										
MetadataFields	Body	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none">• Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>.• The <i>default value</i> for the metadata field.• A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message.• For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr><tr><td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr><tr><td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr><tr><td>Validation</td><td>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field.</td></tr></table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field.
Name	Description											
Id	The Keyfactor Command reference ID of the template-specific metadata setting.											
DefaultValue	A string containing the default value defined for the metadata field for the specific template.											
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.											
Validation	A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field.											

Name	In	Description															
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><p>For example:</p><div>^[a-zA-Z0-9'_\.\-]*@ (keyexample\.org keyexample\.com)\$</div><p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p><p>This field is only supported for metadata fields with data type <i>string</i>.</p></td></tr><tr><td>Enrollment</td><td></td><td><p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
Value	Description													
	option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.													
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.													
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.													
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).													
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).													

For example:

```
"TemplatePolicy": {
  "TemplateId": 17,
  "RSAValidKeySizes": [
    2048,
    4096
  ],
  "ECCValidCurves": [
    "1.2.840.10045.3.1.7",
    "1.3.132.0.34"
    "1.3.132.0.35"
  ]
}
```

Name	In	Description
		<pre>], "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "AllowEd448": false, "AllowEd25519": false } </pre>
UseAllowedRequesters	Body	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	Body	<p>An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template. For example:</p> <pre> "AllowedRequesters": ["Administrator", "Power Users", "Revokers"] </pre>
RequiresApproval	Body	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div>  Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager </div>

Name	In	Description																											
		<p> approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 5: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>																											
KeyUsage	Body	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table> <tr> <th>Value</th><th>Function</th><th>Description</th></tr> <tr> <td>0</td><td>None</td><td>No key usage parameters.</td></tr> <tr> <td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr> <tr> <td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr> <tr> <td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr> <tr> <td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr> <tr> <td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr> <tr> <td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr> <tr> <td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.
Value	Function	Description																											
0	None	No key usage parameters.																											
1	Encipherment Only	The key can be used for encryption only.																											
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																											
4	Key Certificate Signing	The key can be used to sign certificates.																											
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																											
16	Data Encipherment	The key can be used for data encryption.																											
32	Key Encipherment	The key can be used for key encryption.																											
64	Nonrepudiation	The key can be used for authentication.																											

Name	In	Description									
		<table> <tr> <th>Value</th><th>Function</th><th>Description</th></tr> <tr> <td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr> <tr> <td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description									
128	Digital Signature	The key can be used as a digital signature.									
32768	Decipherment Only	The key can be used for decryption only.									
Curve	Body	<p>A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 									

Table 556: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as defined by the CA. The field is not configurable.
KeyType	A string indicating the key type of the template as defined by the CA. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.
KeyRetention	A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object

Name	Description										
	<p>contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform </div>										

Name	Description																
	<div>  required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An object containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p> <p>The metadata fields object contains the following parameters:</p>																

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>The Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_.\-\]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td></tr> <tr> <td>Enrollment</td><td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the</td></tr> </table> </td></tr> </table>	Name	Description	Id	The Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_.\-\]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).
Value	Description														
	<ul style="list-style-type: none"> 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 <p>When specifying by friendly name, do not include a slash (use “P-256”, not “P-256/prime256v1/secp256r1”).</p>														
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.														
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.														
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.														
AllowEd448	A Boolean that indicates whether Ed448 key type is allowed (true) or not (false).														
AllowEd25519	A Boolean that indicates whether Ed25519 key type is allowed (true) or not (false).														
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot														

Name	Description
	<p>make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	<p>An object containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.</p>
DisplayName	<p>A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.</p>
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="483 919 1404 1507"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 6: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>
KeyUsage	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p>

Name	Description																																	
	<table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An object containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in Active Directory.</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in Active Directory.																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in Active Directory.																																	

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description						
Oid	A string containing the object ID of the extended key usage.						
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).						
Curve	A string indicating the OID of the elliptic curve algorithm configured for the template, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 						

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.29.7 POST Templates/Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
PkiManagement: *Modify*

Table 557: POST Templates/Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions](#) in the *Keyfactor Command Reference Guide*) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

Table 558: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	GET Workflow Certificates ID below
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	GET Workflow Certificates Denied on page 1413
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	GET Workflow Certificates Pending on page 1416
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	GET Workflow Certificates External Validation on page 1419
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	POST Workflow Certificates Approve on page 1424
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	POST Workflow Certificates Deny on page 1423

2.5.30.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This

method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

 **Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

 **Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 559: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1416) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 560: GET Workflow Certificates {id} Input Parameters

Name	Description								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An object containing a comma delimited list of strings listing the subject alternative name elements of the certificate request.								
CertStores	<p>An object containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>EntryName</td><td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the machine on which the certificate store is located.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td></tr> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 								
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div>  Note: The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command. </div>								

Name	Description
CARquestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate. The possible values are: <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8)
StateString	A string indicating the request state of the certificate (e.g. Pending).
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30.2 GET Workflow Certificates Denied

The GET /Workflow/Certificates/Denied method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the

CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 561: GET Workflow Certificates Denied Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) <p>This method only returns records of type (State) 3.</p> <ul style="list-style-type: none"> • <i>SubmissionDate</i> • <i>Template</i> <div>  Tip: For example, for recent denied requests from requester key_service: <pre>SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 562: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CAResultId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 3 (denied).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Denied state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the

CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowManagement: *Read*

Table 563: GET Workflow Certificates Pending Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 5. • <i>SubmissionDate</i> • <i>Template</i> <div>  Tip: For example, for recent pending requests from requester key_service: <pre>SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 564: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CAResultId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpNetIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 5 (pending).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Pending state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor

Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Read*

Table 565: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>CAHostname</i> • <i>CALogical</i> • <i>CommonName</i> • <i>Requester</i> • <i>RequestType</i> (3 Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8. • <i>SubmissionDate</i> • <i>Template</i> <div>  Tip: For example, for recent external validation requests from requester key_service: SubmissionDate -ge "2022-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service" </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 566: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARRequestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 8 (external validation).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with an External Validation state.
Metadata	An array containing the metadata fields populated for the certificate request.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30.5 POST Workflow Certificates Deny

The POST /Workflow/Certificates/Deny method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

 **Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1426](#) and [Workflow Instances on page 1561](#)).

 **Note:** Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Participate*

Table 567: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	Required. An array of Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: <div>[23,45,12]</div> Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1416) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 568: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of the successful denial response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARquestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.30.6 POST Workflow Certificates Approve

The POST /Workflow/Certificates/Approve method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. The certificate

request IDs should be supplied in the request body as a JSON array of integers. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on the next page](#) and [Workflow Instances on page 1561](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Participate*

Table 569: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	<p>Required. An array of Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name):</p> <div>[23, 45, 12]</div> <p>Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1416) to retrieve a list of all the certificate requests to determine the certificate request's IDs.</p>

Table 570: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of the successful approval response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARquestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A reason or description about why the request denials succeeded, failed or were denied.</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow’s type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template or certificate collection) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven’t created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used. The addition and removal of certificates from certificate collections can be configured to flow through workflow as well, but there are no global workflows for these.

For more information about workflows, see *Workflow Definitions* in the *Keyfactor Command Reference Guide*.

Table 571: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	GET Workflow Definitions Steps Extension Name on the next page
/ {definitionId}	DELETE	Deletes the workflow definition with the specified GUID.	DELETE Workflow Definitions Definition ID on page 1432
/ {definitionId}	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	GET Workflow Definitions Definition ID on page 1433
/ {definitionId}	PUT	Updates the name and description of the workflow definition with the specified GUID.	PUT Workflow Definitions Definition ID on page 1456
/	GET	Returns a list of workflow definitions, without steps.	GET Workflow Definitions on page 1479
/	POST	Creates a new workflow definition, without steps.	POST Workflow Definitions on page 1482
/Steps	GET	Returns information about the structure of the workflow definition.	GET Workflow Definitions Steps on

Endpoint	Method	Description	Link
		itions.	page 1506
/Types	GET	Returns a list of the defined workflow definition types.	GET Workflow Definitions Types on page 1512
/ {definitionId} /Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	PUT Workflow Definitions Definition ID Steps on page 1515
/ {definitionId} /Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	POST Workflow Definitions Definition ID Publish on page 1539

2.5.31.1 GET Workflow Definitions Steps Extension Name

The GET /Workflow/Definitions/Steps/{extensionName} method is used to retrieve the workflow definition step structure for the step with the specified extensionName. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: Read

Table 572: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	<p>Required. A string indicating the <i>extensionName</i> of the workflow definition step to retrieve.</p> <p>Use the <i>GET /Workflow/Definitions/Steps</i> method (see GET Workflow Definitions Steps on page 1506) to retrieve a list of all the workflow definition steps to determine the extensionName.</p>

Table 573: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> Where-Object ForEach-Object Get-Command CustomPowerShell <p>Run a PowerShell script. The script contents are in a file placed in the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is:</p> <div>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</div> <p>The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPowerShellExample.ps1).</p> RequireApproval <p>Require approval for a workflow step before the step can be</p>

Name	Description
	<p>completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this.</p> <div data-bbox="730 630 1404 829">  Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <div data-bbox="730 850 1404 1050">  Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request. </div> <div data-bbox="730 1071 1404 1333">  Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>). </div> <ul style="list-style-type: none"> • RESTRequest Run a REST (API) request. The REST request contents are embedded within the step. It does not call out to an external file. • EnrollmentAgent (Enrollment Only) On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the

Name	Description
	<p>SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="730 945 1404 1134">  <p>Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> <ul style="list-style-type: none"> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p>

Name	Description
	<div>  Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>. </div> <ul style="list-style-type: none"> • EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. • NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. • RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.
Outputs	An object containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowDefinitions: *Modify*

Note: The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 574: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to delete. Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1479) to retrieve a list of all the workflow definitions to determine the GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.3 GET Workflow Definitions Definition ID

The *GET /Workflow/Definitions/{definitionid}* method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowDefinitions: *Read*

Table 575: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1479) to retrieve a list of all the workflow definitions to determine the GUID.</p>
definitionVersion	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see Security Roles on page 1034) in the workflow definition should be removed from the response (true) or not (false). A value of <i>true</i> allows for the workflow definition to be exported without role-specific data. The default is <i>false</i> .

Table 576: GET Workflow Definitions {definitionsid} Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayN- ame	A string indicating the display name defined for the workflow definition.
Descrip- tion	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDis- playNam- e	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPub- lished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
Work- flowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be

Name	Description										
	configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request. • PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including: <ul style="list-style-type: none"> • Where-Object • ForEach-Object • Get-Command • CustomPowerShell Run a PowerShell script. The script contents are in a file placed in </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	<p>A string indicating the type of step.
