To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>				
Value	Description										
Headers	<p>An array of key/value pair strings containing the header information for the request. The key is the name of the specific request header (for Keyfactor API request headers, see Table 1: Common Request Headers and the specific documentation for each endpoint) and the value is the value that should be set for that header. For a Keyfactor API request, this might look like:</p> <pre>"Headers": { "x-keyfactor-requested-with": ["APIClient"], "x-keyfactor-api-version": ["2"] }</pre> <p> Tip: For a Keyfactor API request, version 1 is assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.</p>										
DataBucketProperty	<p>A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow.</p> <p> Tip: The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i></p>

This value will be null for the final step in the chain.
Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.4 PUT Workflow Definitions Definition ID

The PUT /Workflow/Definitions/{definitionid} method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Modify*

Tip: A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [PUT Workflow Definitions Definition ID above](#)) and edit the copy to change the key.

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 577: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 578: PUT Workflow Definitions {definitionid} Response Body

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be

Name	Description										
	configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request. • PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including: <ul style="list-style-type: none"> • Where-Object • ForEach-Object • Get-Command • CustomPowerShell Run a PowerShell script. The script contents are in a file placed in </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.	ExtensionName	<p>A string indicating the type of step. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration. For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file. <div>  Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality. </div> • SubjectFormatter (Enrollment Only) On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will

Value	Description										
URL	<p>A string containing the URL for the request, including tokens, if desired. For a Keyfactor API request, this might look like:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates?pq.queryString=CN%20contains%20%22appsrvr14%22%20AND%20CertStorePath%20-ne%20NULL</pre> <p>Or, with tokens:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/\$(certid)</pre> <div>  <p>Note: To prevent REST requests from being made to inappropriate locations by malicious users, configure a system environment variable of KEYFACTOR_BLOCKED_OUTBOUND_IPS on your Keyfactor Command server pointing to the IP address or range of addresses in CIDR format that you wish to block. Both IPv4 and IPv6 addresses are supported. More than one address or range may be specified in a comma-delimited list. For example:</p> <pre>192.168.12.0/24,192.168.14.22/24</pre> <p>When a REST request is made where the URL is either configured to a blocked IP address or resolves via DNS to a blocked IP address, the REST request will fail.</p> </div>										
ContentType	<p>A string indicating the content type for the request. Supported values are:</p> <ul style="list-style-type: none"> • application/json 										

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RequestContent</td><td> <p>A string containing the body of the REST request, if needed. For a Keyfactor API request, this will vary depending on the request and might look like (for a PUT /Certificates/Metadata request):</p> <pre>{ "Id": "\${certid}", "Metadata": { "RevocationComment": "\${cmnt}" } }</pre> <p> Note: This example assumes you have a metadata field called RevocationComment.</p> </td></tr> </table> <p> Tip: Tokens (a.k.a. substitutable special text) may be used in the URL and request content fields. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—<code>\$(cmnt)</code>—and insert it into a custom metadata field in the certificate by doing a PUT /Certificates/Metadata request for the <code>\$(id)</code>.</p> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RequestContent</td><td> <p>A string containing the body of the REST request, if needed. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).												
Value	Description																		
Id	A string indicating the Keyfactor Command reference ID of the condition.																		
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).																		
Outputs	An array indicating the next step in the workflow. Possible values are:																		

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 1433](#)) to return details including the workflow steps.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Read*

Table 579: GET Workflow Definitions Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DisplayName</i> • <i>Id</i> • <i>IsPublished</i> (true or false) • <i>WorkflowType</i> (CertificateEnteredCollection, CertificateLeftCollection, Enrollment, or Revocation)
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 580: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.
DraftVersion	An integer indicating the version number of the workflow definition. If this version

Name	Description
	number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 1515](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Modify*

Tip: A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [POST Workflow Definitions above](#)) and edit the copy to change the key.

Table 581: POST Workflow Definitions Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p>Required. A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i>, this field will contain the Keyfactor Command reference ID for the certificate collection.</p> <p>Use the GET /Templates method (see GET Templates on page 1365) to retrieve a list of your certificate templates to determine the template ID.</p> <p>Use the GET /CertificateCollections method (see GET Certificate Collections on page 405) to retrieve a list of your certificate collections to determine the collection ID.</p> <p>This field cannot be modified on an edit.</p>
KeyDisplayName	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	Body	<p>Required. A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> • CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. • CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. • Enrollment (Including Renewals)

Name	In	Description
		<p>The workflow is initiated by enrollment for a new or renewed certificate. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div>  Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <div>  Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request. </div> <div>  Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>). </div>
Name	Description				
	<p>the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is:</p> <div>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</div> <p>The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPower-shellExample.ps1).</p> <ul style="list-style-type: none"> • RequireApproval Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div>  Important: Workflows are not supported with CA delegation when they contain steps that require approval. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).	Outputs	An array indicating the next step in the workflow. Possible values are:
Name	Description																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i>.</td></tr> </table> <div>  Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .														
Value	Description																		
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .																		
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference ID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference ID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).												
Value	Description																		
Id	A string indicating the Keyfactor Command reference ID of the condition.																		
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).																		
Outputs	An array indicating the next step in the workflow. Possible values are:																		

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table> </td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Read*

Table 583: GET Workflow Definitions Steps Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i> . The query fields supported for this endpoint are <i>DisplayName</i> , <i>ExtensionName</i> , and <i>SupportedWorkflowTypes</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 584: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> Where-Object ForEach-Object Get-Command CustomPowerShell <p>Run a PowerShell script. The script contents are in a file placed in the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is:</p> <div>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</div> <p>The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPowerShellExample.ps1).</p> RequireApproval <p>Require approval for a workflow step before the step can be</p>

Name	Description
	<p>completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this.</p> <div data-bbox="730 630 1406 829">  Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <div data-bbox="730 850 1406 1050">  Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request. </div> <div data-bbox="730 1071 1406 1339">  Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>). </div> <ul style="list-style-type: none"> RESTRequest Run a REST (API) request. The REST request contents are embedded within the step. It does not call out to an external file. EnrollmentAgent (Enrollment Only) On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the

Name	Description
	<p>SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="730 945 1404 1134">  <p>Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality.</p> </div> <ul style="list-style-type: none"> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template, which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p>

Name	Description
	<div data-bbox="730 273 1404 577">  Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>. </div> <ul style="list-style-type: none"> EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.
SupportedWorkflowTypes	<p>An array containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do

Name	Description
	<p>things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.</p> <ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Read*

Table 585: GET Workflow Definitions Types Input Parameters

Name	In	Description
queryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Definitions Search Feature</i> . The query field supported for this endpoint is <i>Name</i> .
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>WorkflowType</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 586: GET Workflow Definitions Types Response Data

Name	Description												
WorkflowType	A string indicating the display name of the workflow type.												
KeyType	A string indicating the key type for the workflow. The built-in enrollment and revocation workflows use <i>Templates</i> as the key type. The built-in certificate entered collection and certificate left collection workflows use <i>Certificate Collections</i> as the key type.												
ContextParameters	An object containing the tokens that the workflow type provider has the ability to replace. These will vary depending on the workflow type.												
BuiltInSteps	<p>An object containing the information about the built-in step(s) for the workflow type (e.g. the enrollment step of the enrollment type). Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>ExtensionName</td><td> A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep </td></tr> <tr> <td>Outputs</td><td> An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete. </td></tr> <tr> <td>ConfigurationParametersDefinition</td><td>An array containing the configuration parameters for the workflow definition step. These will vary depending on the step.</td></tr> <tr> <td>SignalsDefinition</td><td>An array containing the signals defined for the workflow definition step. These will vary depending on the step.</td></tr> </table> <p> Note: There are no built-in steps for workflows of types <i>certificate entered collection</i> and <i>certificate left collection</i>.</p>	Name	Description	DisplayName	A string indicating the display name for the step.	ExtensionName	A string indicating the extension name for the step. The built-in extensions are: <ul style="list-style-type: none"> • EnrollStep • RevokeStep 	Outputs	An array containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow or that the workflow is complete. SignalsDefinition	An array containing the signals defined for the workflow definition step. These will vary depending on the step.												

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.9 PUT Workflow Definitions Definition ID Steps

The PUT /Workflow/Definitions/{definitionid}/Steps method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Modify*

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 587: PUT Workflow Definitions {definitionid} Steps Input Parameters

Name	In	Description
definitionid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to update.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1479) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Name	In	Description
request	Body	

Name	Description
DisplayName	A string indicating the display name for the step.
UniqueName	A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.
ExtensionName	<p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none">Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:<ul style="list-style-type: none">Where-ObjectForEach-ObjectGet-CommandCustomPowerShell Run a PowerShell script. The script contents are in a file placed in the ExtensionLibrary\Workflow directory or a subdirectory of it on the Keyfactor Command server under the install directory for Keyfactor Command. By default, this is:<div>C:\Program Files\Keyfactor\Keyfactor Platform\ExtensionLibrary\Workflow</div><p>The file must have an extension of .ps1. A sample PowerShell script is provided in the Workflow directory (CustomPowerShellExample.ps1).</p>RequireApproval Require approval for a workflow step before the step can be

Table 588: PUT Workflow Definitions {definitionid} Steps Response Body

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be

Name	Description										
	<p>configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table data-bbox="365 527 1403 1713"> <tr> <th data-bbox="365 527 558 590">Name</th><th data-bbox="558 527 1403 590">Description</th></tr> <tr> <td data-bbox="365 590 558 684">Id</td><td data-bbox="558 590 1403 684">A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td data-bbox="365 684 558 747">DisplayName</td><td data-bbox="558 684 1403 747">A string indicating the display name for the step.</td></tr> <tr> <td data-bbox="365 747 558 873">UniqueName</td><td data-bbox="558 747 1403 873">A string indicating the unique name for the step. 	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.31.10 POST Workflow Definitions Definition ID Publish

The POST `/Workflow/Definitions/{definitionid}/Publish` method is used to mark the most recent version of the workflow definition with the specified GUID as the published, active, version. When a definition is published, all new or restarted workflow instances (see [Workflow Instances on page 1561](#)) will be able to use the updated version of the workflow. This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowDefinitions: *Modify*

Table 589: POST Workflow Definitions {definitionid} Publish Input Parameters

Name	In	Description
definitionId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to publish.</p> <p>Use the <code>GET /Workflow/Definitions</code> method (see GET Workflow Definitions on page 1479) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Table 590: POST Workflow Definitions {definitionid} Publish Response Body

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be

Name	Description										
	configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request. • PowerShell Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including: <ul style="list-style-type: none"> • Where-Object • ForEach-Object • Get-Command • CustomPowerShell Run a PowerShell script. The script contents are in a file placed in </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td>A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.</td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.32 Workflow Instances

The Workflow Instances component of the Keyfactor API includes methods necessary to programmatically retrieve, restart, delete and submit data into workflow instances.

Table 591: Workflow Instances Endpoints

Endpoint	Method	Description	Link
/ {instanceId}	DELETE	Delete the workflow instance with the specified GUID.	DELETE Workflow Instances Instance Id on the next page
/ {instanceId}	GET	Retrieve the workflow instance with the specified GUID.	GET Workflow Instances Instance ID on page 1563
/	GET	Retrieve a list of the workflow instances.	GET Workflow Instances on page 1589
/My	GET	Retrieve the workflow instances created by the user making the API request.	GET Workflow Instances My on page 1594

Endpoint	Method	Description	Link
/AssignedToMe	GET	Retrieve the workflow instances assigned to the user making the API request.	GET Workflow Instances AssignedToMe on page 1599
/InstanceID/Stop	POST	Rejects a workflow instance, preventing it from continuing.	POST Workflow Instances Instance ID Stop on page 1604
/InstanceID/Signals	POST	Input data to the workflow instance with the specified GUID.	POST Workflow Instances Instance ID Signals on page 1604
/InstanceID/Restart	POST	Restart the specified workflow instance after a failure.	POST Workflow Instances Instance ID Restart on page 1607

2.5.32.1 DELETE Workflow Instances Instance ID

The DELETE /Workflow/Instances/{instanceid} method is used to delete the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowInstances: *Manage*

Table 592: DELETE Workflow Instances {instanceid} Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to delete.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1589) to retrieve a list of all the workflow instances to determine the GUID.</p>

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.32.2 GET Workflow Instances Instance ID

The GET /Workflow/Instances/{instanceid} method is used to retrieve the initiated workflow with the specified instance GUID. Both in progress and completed workflows will be returned. This method

returns HTTP 200 OK on a success with details about the workflow instance.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowInstances: *ReadAll* OR

WorkflowInstances: *ReadAssignedToMe* OR

WorkflowInstances: *ReadMy*

Users with *ReadMy* or *ReadAssignedToMe* will only be able to retrieve the workflow instances created by them (*ReadMy*) or assigned to them (*ReadAssignedToMe*) unless they also have *ReadAll*.

Table 593: GET Workflow Instances {instanceId} Input Parameters

Name	In	Description
instanceId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to retrieve.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1589) to retrieve a list of all the workflow instances to determine the GUID. Note that the integer workflow IDs (returned with <i>GET /Workflow/Instances/{instanceId}</i>) cannot be used with the API, only the GUID from <i>GET /Workflow/Instances</i> is valid.</p>

Table 594: GET Workflow Instances {instanceId} Response Data

Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.				
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended 				
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.				
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #. 				
Signals	<p>An object containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. Possible RequireApproval values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. For a RequireAp-</td></tr> </table>	Value	Description	SignalName	A string indicating the name of the signal. For a RequireAp-

CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				

Name	Description																										
StartDate	A string indicating the date and time when the instance was initiated.

Name	Description		
	Name	Operation Type	Description
	IsPFX	Enrollment	A Boolean indicating whether the certificate enrollment type that initiated the workflow instance was PFX (true) or CSR (false).
	PfxPasswordSecretInstanceId	Enrollment	A string indicating the Keyfactor Command reference GUID for the PFX password used to secure the PFX file on download.
	InitiatingUserName	Certificate Collection, Enrollment and Revocation	A string indicating the name of the user who initiated the workflow, generally in DOMAIN\user-name format.
CurrentStateData	An array containing the data included in the workflow instance as it progresses. This will include data input from PowerShell scripts, REST requests, and signals along with the initial data. Current state workflow instance data includes:		
	Name	Operation Type	Description
	CertificateAuthority	Enrollment and Revocation	A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests.
	CertificateId	Certificate Collection and Revocation	An integer indicating the Keyfactor Command reference ID for the certificate.

2.5.32.3 GET Workflow Instances

The GET /Workflow/Instances method is used to retrieve the list of workflows that have been initiated. Both in progress and completed workflows are included. This method returns HTTP 200 OK on a success with details about the workflow instances.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowInstances: *ReadAll*

Table 595: GET Workflow Instances Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Instances Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none">• <i>DefinitionId</i> (workflow definition ID)• <i>Id</i> (workflow instance GUID)• <i>InitiatingUserName</i> (DOMAIN\username)• <i>LastModified</i>• <i>ReferenceId</i> (workflow instance integer ID)• <i>StartDate</i>• <i>Status</i>• <i>Title</i>• <i>WorkflowType</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 596: GET Workflow Instances Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #.
Definition	An array containing the workflow definition. Workflow definition data includes:

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name defined for the workflow definition.</td></tr> <tr> <td>Version</td><td>An integer indicating the version number of the workflow definition.</td></tr> <tr> <td>WorkflowType</td><td> <p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> • CertificateEnteredCollection The workflow is initiated by an automated task that runs periodically to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. • CertificateLeftCollection The workflow is initiated by an automated task that runs periodically to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. • Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. • Revocation </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition. Name	Description				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</td></tr> </table>	Name	Description		The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.
Name	Description				
	The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.				
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				
StartDate	A string indicating the date and time when the instance was initiated.				
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.				

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.32.4 GET Workflow Instances My

The GET /Workflow/Instances/My method is used to retrieve the list of initiated workflows created by the user making the API request—as a result of enrolling for a certificate, for example, or revoking a certificate. This method returns HTTP 200 OK on a success with details about the workflow instances.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowInstances: *ReadAll* OR
WorkflowInstances: *ReadMy*

Table 597: GET Workflow Instances My Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Workflow Instances Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>DefinitionId</i> (workflow definition ID) • <i>Id</i> (workflow instance GUID) • <i>InitiatingUserName</i> (DOMAIN\username) • <i>LastModified</i> • <i>ReferenceId</i> (workflow instance integer ID) • <i>StartDate</i> • <i>Status</i> • <i>Title</i> • <i>WorkflowType</i>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .

2.5.32.6 POST Workflow Instances Instance Id Stop

The POST /Workflow/Instances/{instanceId}/Stop method is used to stop the workflow instance with the specified GUID, preventing it from continuing. This endpoint returns 204 with no content upon success.

Note: Only workflow instances with a Status of *Suspended* can be stopped.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowInstances: *Manage*

Table 601: POST Workflow Instances {instanceId} Stop Input Parameters

Name	In	Description
instanceId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to stop. Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1589) to retrieve a list of all the workflow instances to determine the GUID.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.32.7 POST Workflow Instances Instance ID Signals

The POST /Workflow/Instances/{instanceId}/Signals method is used to input signals to the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Note: A locking conflict may occur if two (or more) users attempt to provide input to a workflow instance (e.g. approve a request) at exactly the same time. If this happens, input from only one of the users will be reflected in the Management Portal, and the workflow instance will not be moved along to the next step if it should have been with input from the two users. The other input is still accepted, however, and there is a scheduled task that runs daily and attempts to continue all suspended workflows that may be eligible to continue but have not done so due to locking conflicts.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature: The user executing the request must hold at least one security role ID configured in the workflow definition step for which signal data is being input.

Table 602: POST Workflow Instances {instanceid} Signals Input Parameters

Name	In	Description						
instanceId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to which to input a signal.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1589) to retrieve a list of all the workflow instances to determine the GUID.</p>						
signal	Body	<p>Required. An array containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. RequireApproval signal values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>SignalKey</td><td><p>Required. A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p><div>RequireApproval1.ApprovalStatus</div><p>Use the <i>GET /Workflow/Definitions/{definitionid}</i> method (see GET Workflow Definitions Definition ID on page 1433) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see GET Workflow Instances on page 1589, GET Workflow Instances AssignedToMe on page 1599, or GET Workflow Instances My on page 1594) to return the <i>CurrentStepUniqueName</i>.</p></td></tr><tr><td>Data</td><td><p>Required. An array containing key/value pairs providing the input information for the signal. The key (s) will vary depending on the signal. RequireApproval signal data values are:</p></td></tr></table>	Value	Description	SignalKey	<p>Required. A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <div>RequireApproval1.ApprovalStatus</div> <p>Use the <i>GET /Workflow/Definitions/{definitionid}</i> method (see GET Workflow Definitions Definition ID on page 1433) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see GET Workflow Instances on page 1589, GET Workflow Instances AssignedToMe on page 1599, or GET Workflow Instances My on page 1594) to return the <i>CurrentStepUniqueName</i>.</p>	Data	<p>Required. An array containing key/value pairs providing the input information for the signal. The key (s) will vary depending on the signal. RequireApproval signal data values are:</p>
Value	Description							
SignalKey	<p>Required. A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <div>RequireApproval1.ApprovalStatus</div> <p>Use the <i>GET /Workflow/Definitions/{definitionid}</i> method (see GET Workflow Definitions Definition ID on page 1433) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see GET Workflow Instances on page 1589, GET Workflow Instances AssignedToMe on page 1599, or GET Workflow Instances My on page 1594) to return the <i>CurrentStepUniqueName</i>.</p>							
Data	<p>Required. An array containing key/value pairs providing the input information for the signal. The key (s) will vary depending on the signal. RequireApproval signal data values are:</p>							

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td>Required. A Boolean indicating whether the request is approved (true) or denied (false).</td></tr><tr><td>Comment</td><td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td></tr></table></td></tr></table> <p>For example, to approve a Require Approval step called <i>RequireApproval1</i> with a comment:</p> <pre>{ "SignalKey": "RequireApproval1.ApprovalStatus", "Data": { "Approved": "True", "Comment": "Here is my comment." } }</pre>	Value	Description		<table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td>Required. A Boolean indicating whether the request is approved (true) or denied (false).</td></tr><tr><td>Comment</td><td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td></tr></table>	Key	Value	Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).	Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.
Value	Description											
	<table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td>Required. A Boolean indicating whether the request is approved (true) or denied (false).</td></tr><tr><td>Comment</td><td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td></tr></table>	Key	Value	Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).	Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.					
Key	Value											
Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).											
Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.											

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.32.8 POST Workflow Instances Instance Id Restart

The POST /Workflow/Instances/{instanceId}/Restart method is used to restart the workflow instance with the specified GUID. This can be used either after it has reached a failed state and the failure has been corrected (e.g. a CA was not responding when an enrollment was attempted or a PowerShell script failed to run to completion) or midstream while it's still active but in a suspended state waiting for signals to introduce a new version of the workflow definition. The workflow instance will restart from the beginning. This endpoint returns 204 with no content upon success.

 **Note:** Only workflow instances with a Status of *Failed* or *Suspended* can be restarted.

Tip: The following permissions (see [Security Overview](#)) are required to use this feature:
WorkflowInstances: *Manage*
WorkflowDefinitions: *Read*

Table 603: POST Workflow Instances {instanceid} Restart Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to restart.</p> <p>Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1589) to retrieve a list of all the workflow instances to determine the GUID.</p> <div> Note: When you restart an instance, it will be issued a new instance ID.</div>
version	Body	An integer indicating the version number of the workflow definition. If no version is specified, the workflow will be restarted using the most recently published version.

Tip: For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.6 Classic API

The Keyfactor Classic API, also known as the CMS API, is the Web API that has been provided with Keyfactor Command for several product generations. The Classic API may be needed in your environment if you're upgrading and have written API applications using the Classic API. If you're new to building an API application to work with Keyfactor Command, you should use the newer Keyfactor API (see [Keyfactor API on page 6](#)).

Important: The Classic API will be deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.

The Classic API provides various methods to retrieve the version of Keyfactor Command. For example, values for both the Classic API version and the Keyfactor Command version are returned in HTTP headers with each response to an API call. Additionally, the *Status* endpoint (see [Status on](#)

[page 1706](#)) provides additional information about the capabilities of the Classic API in its installed version.

Several endpoints of the Classic API have their own incremental versioning. For example, the CertEnroll endpoint has three versions, the most recent of which is three:

- CertEnroll/1
- CertEnroll/2
- CertEnroll/3

As the Keyfactor Web APIs have evolved and continue to evolve, an additional security constraint is available to limit access to deprecated legacy versions of API endpoints. In many cases, newer versions of an endpoint are more secure and robust, easier to use, and offer more functionality. Keyfactor highly recommends use of the newest endpoints wherever possible. To this end, it is possible to disable deprecated API endpoints in the Classic API from the API Application Settings within the Keyfactor Command Management Portal (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). This setting will disable the following endpoints:

- CertEnroll/1/Token¹
- CertEnroll/1/Status¹
- CertEnroll/1/Certificates/Pkcs10¹
- CertEnroll/1/Certificates/Pkcs12¹
- Metadata/2/Set
- Metadata/2/Get
- Metadata/2/Compare
- Certificates/1/Metafield
- Certificates/1/Import²

If the *Allow Deprecated API Calls* setting is disabled, any client attempting to access deprecated endpoints will receive an error message instead of the expected results. This will, of course, prevent client applications that rely on these endpoints from functioning, and if these applications cannot be updated to the newer endpoints then the *Allow Deprecate API Calls* setting must be enabled. Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.

The following endpoints have been removed from the Classic API and are no longer supported:

- CertEnroll/1/Templates

By default, all Classic API methods start with a base path, which corresponds to an application under IIS; this path is configurable at install time. The API component name and method name then comprise the parts of the URL, each separated by a forward slash. For example,

¹The CertEnroll v1 endpoints are deprecated.

²The Certificates/1/Import endpoint, using a multipart/form-data request, is no longer supported by Keyfactor for customers that are not currently using it.

“/CMSApi/CertEnroll/1/Token” would be the URL format for the Token method of version 1 of the CertEnroll API component in the Classic API.

Many Classic API methods operate on a certificate resource stored in Keyfactor Command, and a standardized way to identify the certificate for the operation is used in the request structure across several Classic API components; this is described in [Table 604: Classic API Certificate Lookup Structure](#). This table does not apply to the Keyfactor API.

Table 604: Classic API Certificate Lookup Structure

Parameter Name	Parameter Value
Type	One of <i>Serial</i> , <i>Thumbprint</i> , or <i>CMSID</i> .
SerialNumber	Hexadecimal serial number of referenced certificate. Required only if Type is <i>Serial</i> .
IssuerDN	Distinguished Name of the issuer of the referenced certificate. Required only if Type is <i>Serial</i> .
Thumbprint	SHA-1 thumbprint of the referenced certificate. Required only if Type is <i>Thumbprint</i> .
CMSID	Identifier assigned by Keyfactor Command to the referenced certificate. Required only if Type is <i>CMSID</i> .

2.6.1 Security Role Overview

In order to use the Classic API, certain security role permissions must be granted to the identity used by the client to authenticate to the API. Specifically, the user must have the *API Read* permission to make any requests. Beyond this, different API endpoints have different requirements (see [Classic API Security Role Requirements below](#)).

Where the table indicates that *Certificate Store Management* permissions are required, this can either be global permissions to all certificate stores or permissions granted to the specific certificate store using certificate store container security. Likewise, where *Certificates* permissions are required, this can either be global certificate permissions on all certificates or permissions granted to a specific certificate or set of certificates using certificate collection security. See the *Keyfactor Command Reference Guide* for more information about container and collection security.

Table 605: Classic API Security Role Requirements

Endpoint	Security Role Permissions
ApiApp/1/GetApiApps	System Settings: Read
ApiApp/1/AddApiApp	System Settings: Modify

Endpoint	Security Role Permissions
ApiApp/1/EditApiApp	System Settings: Modify
ApiApp/1/DeleteApiApp	System Settings: Modify
CertEnroll/1/Pkcs10	None
CertEnroll/1/Pkcs12	None
CertEnroll/1/Templates	None
CertEnroll/1/Token	None
CertEnroll/2/Pkcs10	None
CertEnroll/2/Pkcs12	None
CertEnroll/2/Templates	None
CertEnroll/2/Token	None
CertEnroll/3/Pkcs10	None
CertEnroll/3/Pkcs12	None
CertEnroll/3/Renew	Certificate Store Management: Read and Schedule
CertEnroll/3/Templates	None
Certificates/1/Metafield	Certificates: Modify and Certificate Metadata Types: Read
Certificates/2/Import	Certificates: Import
Certificates/3/Contents	Certificates: Read
Certificates/3/Count	Certificates: Read
Certificates/3/PublishCRL	PKI Management: Modify
Certificates/3/Recover	Certificates: Recover
Certificates/3/Revoke	Certificates: Revoke
Certificates/3/Search	Certificates: Read
Certstore/1/AddCert	Certificate Store Management: Read and Schedule, and Certificates: Read

Endpoint	Security Role Permissions
Certstore/1/AddCertStore	Certificate Store Management: Modify
Certstore/1/AddCertStoreServer	Certificate Store Management: Modify
Certstore/1/AddPFX	Certificate Store Management: Read and Schedule
Certstore/1/CreateJKS	Certificate Store Management: Modify
Certstore/1/EditCertStore	Certificate Store Management: Modify
Certstore/1/EditCertStoreServer	Certificate Store Management: Modify
Certstore/1/Inventory	Certificate Store Management: Read
Certstore/1/Keystores	Certificate Store Management: Read
Certstore/1/Remove	Certificate Store Management: Schedule and Certificates: Read
Certstore/1/ScheduleInventory	Certificate Store Management: Modify
Metadata/2/Compare	Certificates: Read and Certificate Metadata Types: Read
Metadata/2/Get	Certificates: Read and Certificate Metadata Types: Read
Metadata/2/Set	Certificates: Modify and Certificate Metadata Types: Read
Metadata/3/Get	Certificates: Read and Certificate Metadata Types: Read
Metadata/3/GetDefinition	Certificate Metadata Types: Read
Metadata/3/Set	Certificates: Modify and Certificate Metadata Types: Read
Security/1/GetIdentities	Security Settings: Read
Security/1/AddIdentity	Security Settings: Modify
Security/1/DeleteIdentity	Security Settings: Modify
Security/1/GetRoles	Security Settings: Read
Security/1/AddRole	Security Settings: Modify

Endpoint	Security Role Permissions
Security/1/EditRole	Security Settings: Modify
Security/1/DeleteRole	Security Settings: Modify
SSL/1/AddEndpoint	SSL Management: Modify
SSL/1/AddEndpointGroup	SSL Management: Modify
SSL/1/Agents	SSL Management: Read
SSL/1/EndpointGroups	SSL Management: Read
Workflow/1/ApproveRequest	Workflow: Read and Participate
Workflow/1/DenyRequest	Workflow: Read and Participate
Workflow/1/PendingList	Workflow: Read and Participate
Status	None
vSCEP	Configured through the Keyfactor Command Configuration Wizard or through the Application Settings page in the Keyfactor Command Management Portal.

2.6.2 ApiApp

The ApiApp component of the Keyfactor Web APIs includes all methods necessary to programmatically add, edit, get and delete API Applications. The complete set of endpoints is shown in [2.6.2 ApiApp](#).

Table 606: ApiApp Endpoints

Endpoint	Method	Description
/1/GetApiApps	GET	Returns a list of the API applications
/1/AddApiApp	POST	Add an API application to Keyfactor Command
/1/EditApiApp	POST	Edit an API application in Keyfactor Command
/1/DeleteApiApp	POST	Deletes and API application from Keyfactor Command

2.6.2.1 ApiAPP GetApiApps

The GET GetApiApps endpoint returns a list of all API Applications defined in Keyfactor Command with the Id, Name, Key, Secret, CAId, CAConfiguration, TemplateId, TemplateName, TemplateForest and whether the Application is Enabled or not. No parameters or extra headers are required for this method.

Example Request

GET http://<host>/CMSApi/ApiApp/1/GetApiApps

Example Response

Status Code: 200

```
[
  {
    "Id": "<Id>",
    "Name": "<name>",
    "Key": "<hexadecimal key>",
    "Secret": "<hexadecimal secret>",
    "Enabled": "True",
    "CAId": "<CA Id>",
    "CAConfiguration": "<CA Host Name>\\<CA Logical Name>",
    "TemplateId": "<Template Id>",
    "TemplateName": "<Template Common Name>",
    "TemplateForest": "<Template Forest>"
  }
]
```

2.6.2.2 ApiApp AddApiApp

The POST AddApiApp endpoint adds an API Application to Keyfactor Command. It returns the Id of the newly added Application. Table 8 - AddApiApp Parameters shows the parameters that are used for the creation of API Applications through the Keyfactor Web APIs.

Table 607: AddApiApp Parameters

Parameter Name	Parameter Description
Name	The name of the API Application. This parameter is required.
Key	The Key used for the API Application. This parameter is required.

Parameter Name	Parameter Description
Secret	The Secret used for the API Application. This parameter is required.
Enabled	The Enabled parameter tells whether the API Application is enabled or not. This parameter is optional.
CA	The CA parameter sets the CA for the API Application. The format used for this parameter is HostName\\LogicalName. This parameter is optional.
Template	The Template parameter sets the template that is used with the API Application. This should be the template short name. This parameter is optional.

Example Request

POST http://<host>/CMSApi/ApiApp/1/AddApiApp HTTP/1.1

```
{
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": true,
  "CA": "<CA Host Name>\\<CA Logical Name>",
  "Template": "<Template Common Name>"
}
```

Example Response

Status Code: 200

```
{
  "Id": <Id>
}
```

2.6.2.3 ApiApp EditApiApp

The POST EditApiApp endpoint allows certain aspects of an API Application definition to be updated. The only aspect of the API Application that cannot be updated is the Id. The response has the same elements as the GetApiApps call except for a single Api Application. Table 9 – EditApiApp Request Parameters holds the Parameters for the request.

Table 608: AddApiApp Parameters

Parameter Name	Parameter Description
Id	The Id of the API Application that is to be updated. This parameter is required.
Name	The name that the API Application will be updated to. This parameter is optional.
Key	The Key that the API Application will be updated to. This parameter is optional.
Secret	The Secret that the API Application will be updated to. This parameter is optional.
Enabled	The Enabled state the API Application will be updated to. This parameter is optional.
CAId	The Id of the Certification Authority the API Application will be updated to. This is an alternative to CaConfiguration. This parameter is optional.
CaConfiguration	The CA Configuration the API Application will be updated to. The format for the Configuration is Host.Name\\Logical-Name. This is an alternative to CAId. This parameter is optional.
TemplateId	The Id of the Template that the API Application will be updated to. This is an alternative to TemplateName. This parameter is optional.
TemplateName	The Name of the Template the API Application will be updated to. The name of the template should be the short name. This is an alternative to Template Id. This parameter is optional.

Example Request

POST http://<host>/CMSApi/ApiApp/1/EditApiApp

```
{
  "Id": <Id>,
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": true,
  "CAId": <CA Id>,
  "TemplateName": "<Template Common Name>"
}
```

Example Response

Status Code: 200

```
{
  "Id": "<Id>",
  "Name": "<Name>",
  "Key": "<hexadecimal key>",
  "Secret": "<hexadecimal secret>",
  "Enabled": "True",
  "CAId": "<CA Id>",
  "CAConfiguration": "<CA Host Name>\\<CA Logical Name>",
  "TemplateId": "<Template Id>",
  "TemplateName": "<Template Common Name>",
  "TemplateForest": "<Template Forest>"
}
```

2.6.2.4 ApiApp DeleteApiApp

The POST DeleteApiApp endpoint removes an API Application from Keyfactor Command. The POST request must contain a JSON string containing the Identity Id. This method returns a 200 a message stating the API App was deleted successfully.

Example Request

POST http://<host>/CMSApi/ApiApp/1/DeleteApiApp HTTP/1.1

```
{
  "Id": <Id>
}
```

Example Response

Status Code: 200

```
{
  "Message": "The Api Application was deleted"
}
```

2.6.3 CertEnroll

The CertEnroll component of the Keyfactor Web APIs includes all methods necessary to programmatically request and obtain a certificate. Keyfactor Command supports enrollment through Microsoft Active Directory Certificate Services Certificate Authorities, both in the local Active Directory forest and, by using Keyfactor Gateways, in remote domains and a variety of public CA vendors. Contact your Keyfactor representative for more information about Keyfactor Gateways,

including the most recent list of supported Certificate Authorities.) The CertEnroll component allows enrollment through all CAs configured in your Keyfactor Command environment. The API supports two variations of enrollment. The more secure variant allows the client application to generate the certificate's public/private keypair on the device issuing the request, so that the private key is never transmitted or stored anywhere else. This model is useful in scenarios where the key doesn't need to be archived or exported. The second model lets the server generate the keys, returning the resulting cert and keypair as a PFX/PKCS12 blob. This method is suitable when the key does need to be exported or archived, or when the client is not capable of generating a keypair itself.

There are three versions of the CertEnroll API, each with separate methods for the two enrollment variations, and up to three auxiliary methods to help formulate a successful enrollment request or perform related operations. The complete set of endpoints is given here in [Table 609: CertEnroll Endpoints](#).

Table 609: CertEnroll Endpoints

Endpoint	Method	Description
/1/Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility
/1/Templates	GET	Return a list of certificate templates available to this API application
/1/Token	GET	Retrieve a temporary authentication token to be used with an enrollment request
/1/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/1/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes
/2/Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility
/2/Templates	GET	Return a list of certificate templates available to this API application
/2/Token	GET	Retrieve a temporary authentication token to be used with an enrollment request
/2/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/2/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes
/3/Templates	GET	Return a list of certificate templates available to this API application
/3/Renew	POST	Obtain a new certificate based on content from an existing certificate

Endpoint	Method	Description
		in Keyfactor Command
/3/Pkcs10	POST	Obtain a certificate by providing a CSR, using a key generated by the client
/3/Pkcs12	POST	Obtain a certificate and private key from Keyfactor Command by providing certain certificate attributes

For historic reasons, slight differences in the template format necessitated differentiating the methods into a "version 1" and "version 2", with the same set of methods. Then, to allow simplification of the built-in security mechanisms, version 3 of these methods was introduced. In most cases, applications should use the CertEnrollv3 methods if taking advantage of this security mechanism (as described below) and CertEnrollv2 if not.

This Keyfactor Command API component supports an optional application authentication feature to restrict the API to selected third-party software clients. It uses a public application key and a private application secret. The application key identifies the API client application to the server and is sent as part of the HTTP headers for all enrollment endpoints. The application secret is used to compute an HMAC-SHA1 signature that is sent in an HTTP header for certain endpoints. The combination of the application key and the computed signature allows Keyfactor Command to verify the origin and the authenticity of the enrollment request. Although Basic authentication credentials are required in order to connect to the API, this allows a single user to configure different applications for different templates and have the restrictions enforced. The secret allows secure authentication and prevents attackers from attempting to replay successful enrollment requests. The calculation of this HMAC signature differs between v2 and v3 of the API. The different computations are covered in [Table 610: CertEnroll Security Headers](#).

Another difference between v1, v2 and v3 is that v3 will import the certificate immediately and sync the row from the CA database after the certificate has been issued, whereas v1 and v2 require a manual import of the certificate after it has been issued.

Each application should have its own unique application key and secret pair embedded in the application, as well as in secure storage on the server. These keys can be registered in the API Applications section of the System Settings menu on the Keyfactor Command Management Portal. Giving each application its own key and secret pair provides these advantages:

- An application can be restricted to request specific certificate templates and from specific CAs.
- One application key can be disabled while leaving other application keys enabled. This allows insecure or compromised versions of an application to be disabled without affecting up-to-date users.

Table 610: CertEnroll Security Headers

Header Name	Header Value
X-CSS-CMS-AppKey	<p>This header contains the application key assigned to this particular application. This header is a base-64-encoded string created from the key's byte sequence, and not the ASCII/UTF-8 hexadecimal representation of that byte sequence. For example, if the key is entered in the API Applications section as "0303030303030303FF", this represents the bit pattern "000000110000001100000011000000110000001100000011000000110000001100000011000000111111111", with base-64 encoding "AwMDAwMDAwMD/w==". In Python, this conversion can be accomplished with the following code:</p> <pre>import base64 hexKey = "0303030303030303FF" binKey = hexKey.decode("hex") b64Key = base64.b64encode(binKey)</pre>
X-CSS-CMS-Token	<p>This header field contains the temporary token that was previously obtained from the GET Token method. Like the application key, this header is a base-64-encoded string created from the binary form of the token, and not the ASCII/UTF-8 hexadecimal representation actually returned by the response to the GET Token. This is required for the v1 and v2 endpoints only.</p>
X-CSS-CMS-Signature	<p>This header field contains an HMAC-SHA-1 message signature computed from the request. Producing this signature proves that the client has access to the application secret value that is also present in the server's configuration, that the message has been transmitted without modification, and that transmission is recent. This is required for all enrollment endpoints, although this requirement can be disabled through the application settings in the management console. The computation of this signature differs between versions; all versions are a base-64 encoding of a SHA-1 hash, but the content to be hashed varies. In general, v1 and v2 GET methods hash the URL and Token; v1 and v2 POST methods hash the URL, Token, and request body; v3 GET methods do not require a signature; and v3 POST methods hash the request body only. The computation of HMAC signatures is significantly easier for v3 methods. Sample Python code is included in Table 611: CertEnroll HMAC computations in Python for each computation type.</p>

Table 611: CertEnroll HMAC computations in Python

Endpoints	Signature
GET Templates (v1 and v2)	<pre>token = json.loads(GET_Token_ResponseBody)["SessionTokenValue"] URLPath = "/CMSApi/CertEnroll/2/Templates" requestDataString = URLPath + token; appSecretBytes = appSecretString.decode("hex") signature = hmac.new(appSecretBytes, requestDataString, hashlib.sha1).hexdigest();</pre>

Endpoints	Signature
	<pre>headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</pre>
POST /1/Pkcs10, /1/Pkcs12, /2/Pkcs10, /2/Pkcs12	<pre>token = json.loads(GET_Token_ResponseBody)["SessionTokenValue"] URLPath = "/CMSApi/CertEnroll/2/Pkcs12" body- = '{"Flags":0,"TemplateName":"User","Pkcs12Password":"lily1234","SubjectNameAttribute- s":null}'</pre> <div>  Note: For these methods, the body must be formatted exactly as above, as far as parameter order, capitalization, and whitespace. This is one reason v3 signatures are easier to use. </div> <pre>requestDataString = URLPath + token + body appSecretBytes = appSecretString.decode("hex") signature = hmac.new(appSecretBytes, requestDataString, hashlib.sha1).hexdigest(); headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</pre>
POST /3/Pkcs10 and /3/Pkcs12	<pre>data- = '{"Flags":0,"TemplateName":"User","Pkcs12Password":"lily1234","SubjectNameAttribute- s":null}' body = '{"Timestamp": "' + datetime.datetime.utcnow().isoformat() + '", "Request": ' + data + '}'</pre> <div>  Note: For these methods, the request can be formatted in any equivalent json format without regard to capitalization, whitespace, or order of elements. This is one reason v3 signatures are easier to use. </div> <pre>appSecretBytes = appSecretString.decode("hex") signature = hmac.new(appSecretBytes, body, hashlib.sha1).hexdigest(); headers["X-CSS-CMS-Signature"] = base64.b64encode(signature.decode("hex"));</pre>

2.6.3.1 CertEnroll Token

The GET Token request returns a session token that is used in subsequent calls to v1 or v2 enrollment endpoints to authenticate the software client to the server. By default, the token has an expiration time of 10 minutes (configurable in the Keyfactor Command Management Portal Application Settings). Using a token after it is expired will result in an error.

Example Request

GET http://<host>/CMSApi/CertEnroll/1/Token HTTP/1.1

Example Response

```
{
  "SessionTokenValue": "F715F307DBE0DD5A9894260DBF0643C042173698"
}
```

2.6.3.2 CertEnroll Templates

The Templates methods return the list of templates configured and enabled for use by the application (identified by the X-CSS-CMS-AppKey HTTP header). The set of fields returned for a template differs from version 1 to version 2, but versions 2 and 3 return the same content. No parameters are required for these requests—only the app key in the header, formatted as described in [Table 610: CertEnroll Security Headers](#)—but the response formats are given in [Table 612: GET /2/Templates and /3/Templates Response Body](#).

Important: As of release 9.0 of the Classic API, version 1 of CertEnroll/1/Templates has been removed from the product and is no longer supported.

Table 612: GET /2/Templates and /3/Templates Response Body

Parameter Name	Parameter Value
DisplayName	Long/Friendly name of the template.
CommonName	Short name of the template.
Oid	Object Identifier for this template.
KeySize	String representation of Key Size in bits, or Unknown.

Example Request

GET http://<host>/CMSApi/CertEnroll/3/Templates HTTP/1.1

X-CSS-CMS-AppKey: AAAAAAAAAAAAAA==

X-CSS-CMS-Token: A0sTeMd9PT6XPw2BdqWb9PkerQk= [Version 2 only]

Example Response

Version 2 and 3

```
[
  {
    "DisplayName": "UserServer",
    "CommonName": "UserServer",
```

```

    "Oid": "1.3.6.1.4.1.311.21.8.2290866.14924250.4277929.6978074.6651290.247.14988018.16169587",
    "KeySize": "2048"
  }
]

```

2.6.3.3 CertEnroll Pkcs10

The PKCS10 method provides enrollment with on-device key generation. The basic workflow with on-device key generation is:

1. Client application retrieves list of available certificate templates using the Keyfactor Command API.
2. Client generates a public/private key pair based on the key size requirements from the selected template.
3. Client creates a PKCS10 Certificate Signing Request (CSR) using the keypair and template attributes.
4. Client sends the PKCS10 request and selected template name to the API which submits the request to the enterprise CA and returns the certificates received from the CA to the software client.

If successful, the response from the CA will be a PKCS#7 message containing the issued certificate and (optionally) the certificate chain. Once the response is received, a software client can construct a PKCS12 package with the previously generated key pair and the issued certificates, import the keys and certificates into an application-specific store, such as [Apple's KeyChain Services](#) or a Java Keystore, or perform any other processing required. The flow (for versions 1 and 2) is shown in [Figure 7: Pkcs#10-Based Enrollment Request](#). The version 3 flow is identical except that a token is not required for enrollment, so the initial exchange with the *token* endpoint is not needed. The difference in version 3 is explained in [Table 610: CertEnroll Security Headers](#).

Figure 7: Pkcs#10-Based Enrollment Request

The PKCS10-based method is the most secure way to enroll for certificates with Keyfactor Command. The PKCS10 method utilizes on-device key generation instead of the server-based key generation used for the PKCS12 method. The PKCS10 method also requires the use of a certificate template that populates the subject and/or subject alternate name from Active Directory. This reliance on certificate templates allows Keyfactor Command to utilize the security mechanisms built into the Microsoft CA Services.

To use this method, the following configuration should be present on the Keyfactor Command server and in its domain:

- IIS application pool configured with a non-administrator domain member account
- API Application with valid key, secret, template, and CA
- Certificate template configured to:
 - Populate subject and/or subject alternate name (SAN) fields from AD as needed. While the PKCS#10 request may contain data for these fields, the selected certificate template may

replace those values with information from Active Directory.

- Not allow private key exportation
- Grant enroll permission to all users who may enroll for a certificate

The request parameters that should be sent for version 1 and 2 of the enrollment are listed in [Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body](#) and for version 3 in [Table 614: POST /3/Pkcs10 Request Body](#), while the response format (for all versions) is given in [Table 615: POST /*/Pkcs10 Response Body](#):

Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body

Parameter Name	Parameter Value
Flags	Bit flags that determine the enrollment behavior. At this time, the only available bit flag is: <ul style="list-style-type: none">• 0x01 = Include certificate only (default is to return certificate + trust chain)
TemplateName	Name of the certificate template to use for enrollment. This name must match one of the template names configured for this application key in the API Applications page.
Pkcs10Request	Contains a base-64-encoded PKCS#10 request generated on the device. The key sizes used to generate the PKCS#10 request must match the key size specified in the certificate template.
MetadataList	A list of key value pairs for each metadata item that is to be set on the issued certificate in Keyfactor Command. This parameter is optional.

In version 3 of the API, the fields used by versions 1 and 2 are wrapped in an outer envelope and sent along with a timestamp. By including this timestamp in the request body and using this as part of the HMAC signature computation, the need for a current API access token is eliminated without reducing security. The request structure for version 3 of this endpoint is shown in [Table 614: POST /3/Pkcs10 Request Body](#):

Table 614: POST /3/Pkcs10 Request Body

Parameter Name	Parameter Value
Timestamp	ISO 8601 Timestamp in UTC timezone, e.g. "2018-11-22T20:41:08.440Z"
Request	JSON object in the same format as a version 1/2 Pkcs10 enrollment request (see Table 613: POST /1/Pkcs10 and /2/Pkcs10 Request Body).

Table 615: POST /*/Pkcs10 Response Body

Parameter Name	Parameter Value
SerialNumber	String containing the hexadecimal serial number of the issued certificate.
IssuerDN	Distinguished Name of the certificate's issuer.
Thumbprint	Thumbprint of the issued certificate.
CMSID	Identifier for this certificate in Keyfactor Command. Can be used to identify the cert in future API requests.
CMSRequestId	Identifier for the certificate request in Keyfactor Command. Can be used if certificate is pending issuance.
Certificates	If the CERT_ONLY flag (0x01) is set in the request, then the response is a base-64 encoding of the DER-encoded cert. If the CERT_ONLY flag is not set, the response is a base-64 encoding of a PKCS7 containing the cert and its chain.
RequestDisposition	Value returned by the CA in response to this certificate request
DispositionMessage	Message accompanying the disposition value returned by the CA

Example Request

Versions 1 and 2

POST http://<host>/CMSApi/CertEnroll/1/Pkcs10 HTTP/1.1

```
{
  "Flags":0,
  "TemplateName": "User",
  "Pkcs10Request":"-----BEGIN CERTIFICATE REQUEST-----
    <base64-encoded-certificate-request>
    -----END CERTIFICATE REQUEST-----\n"
}
```

Example Request

Version 3

```
{
  "Timestamp" : "2017-12-18T19:56:12.365Z",
```

```

    "Request": {
      "Flags": 0,
      "TemplateName": "User",
      "Pkcs10Request": "-----BEGIN CERTIFICATE REQUEST-----
<base64-encoded-certificate-request>
-----END CERTIFICATE REQUEST-----",
      "MetadataList": {"<metadata type name>": "<metadata value>", "<metadata type name>": "<metadata
value">}}
    }
  }
}

```

Example Response

```

{
  "SerialNumber": "2684C97728678A944A67C03E7192785B",
  "IssuerDN": "CN=CorpCA1, DC=keyexample, DC=com",
  "Thumbprint": "FDB3A0F4ADCF9C39A2BB639898EE1670DFDBF5BB",
  "CMSID": 5,
  "CMSRequestId": 3,
  "Certificates": <PEM-encoded certificates>
  "RequestDisposition": "Issued",
  "DispositionMessage": ""
}

```

2.6.3.4 CertEnroll Pkcs12

The PKCS12-based POST enrolls for a certificate with a server-generated private key. It generates a PKCS#12 file that is protected by the password specified in the request and returns a base-64-encoded PKCS#12 response if successful.

The basic workflow with server-based key generation is:

1. Third-party software client retrieves a list of available certificate templates using the Keyfactor Command API.
2. Third-party software client sends the selected template name and a password to the API. The Keyfactor Command component will:
 - a. Generate the RSA key pair.
 - b. Submit the request to the CA configured for the API application and retrieve the issued certificate.
 - c. Create a PKCS12 blob with the private key, the issued certificate, and the certificate trust

chain using the supplied password.

d. Return the PKCS12 blob to the API client.

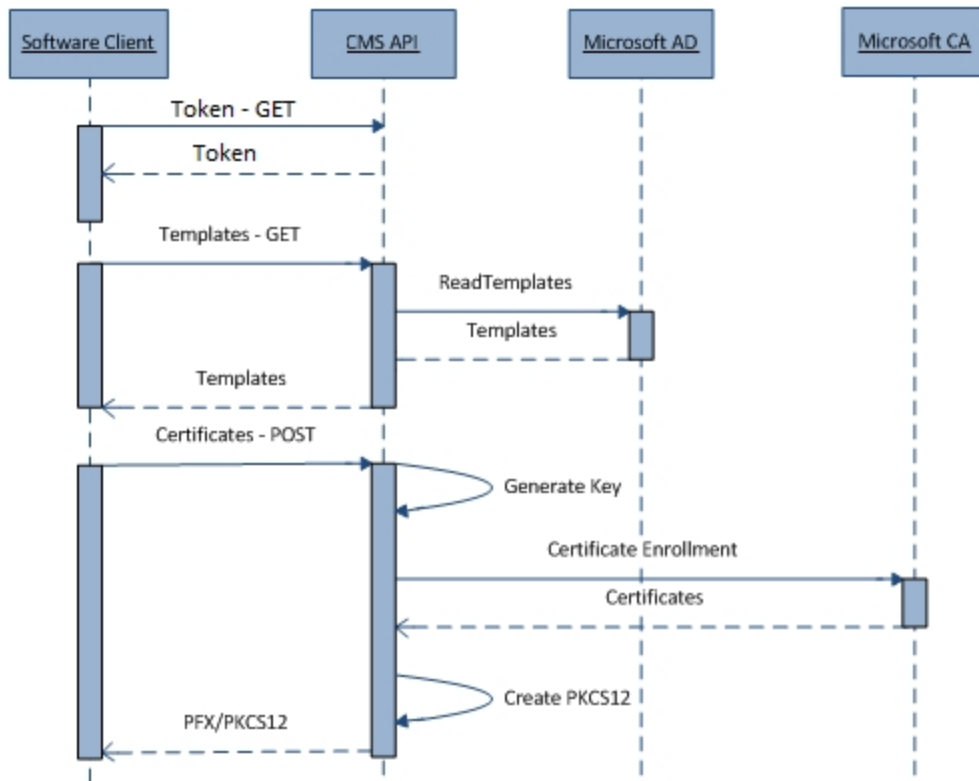

Figure 8: Pkcs#12-Based Enrollment Request

As with the Pkcs10 methods, versions 1 and 2 use the flow shown in [Figure 8: Pkcs#12-Based Enrollment Request](#), while version 3 does not require a token and uses a timestamp instead. For these methods, keys are generated on the server and returned to the client in the form of a P12 (PFX) file. This requires that the certificate's private key is transmitted over the network and temporarily stored on the server, which can present a security risk. For this reason, Keyfactor recommends that clients which are capable of generating their own keypair and submitting a CSR use the Pkcs10 enrollment. When clients do not have the capability or the processing power to do this, the Pkcs12 offers an alternate method. Certificate templates are used on the Microsoft CA; however, the private key must be marked as exportable in the template.

To use this method, the following configuration needs to be present on the Keyfactor Command server:

- Certificate template configured to:
 - Allow the requestor (Keyfactor Command) to supply the subject and subject alternate name details
 - Allow the private key to be exported

- Grant enroll permission to the Keyfactor Command application pool user—no other user needs enroll permissions for this template and for best security, none should be granted to other users
- IIS application pool user configured to be a non-administrative domain member account
- The *Load User Profile* option configured to **true** under the advanced settings for the application pool

The format of a Pkcs12 request is given in [Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body](#) and [Table 617: POST /3/Pkcs12 Request Body](#), while the response format is given in [Table 618: POST /*/Pkcs12 Response Body](#).

Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body

Parameter Name	Parameter Value						
Flags	Bit flags that determine the enrollment behavior. At this time, there are no available bit flags so this value should be set to "0" (zero).						
TemplateName	Name of the certificate template used for enrollment. This name must match- one of the allowed template names.						
Pkcs12Password	PKCS12 password. Must be 8 or more characters.						
SubjectNameAttributes	Token values that are substituted into the API subject format string. When needed values are not provided, Keyfactor Command will attempt to use the corresponding field from the requester's AD account. If no attributes are needed in the request, you must still include this attribute and set the value to null. Also, note that, although the terms are similar, SubjectNameAttributes are NOT the same as Subject Alternative Names, which are supplied separately in the SubjectAltNameElements field. Values can be supplied either as an array of key/value pairs or as a dictionary in the form {"Field1" : "Value1", "Field2" : "Value2"}.						
SubjectAltNameElements	<p>Contains an array of key/value pairs that represent the elements for Keyfactor Command to use when generating the certificate's subject alternative name. This parameter is optional. The key will be the numeric subject alternative name flag (in string form), associated with the value. The valid subject alternative name flags are as follows:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>UPN</td></tr> </table>	Value	Definition	0	None	1	UPN
Value	Definition						
0	None						
1	UPN						

Parameter Name	Parameter Value																		
	<table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>2</td><td>RFC822</td></tr> <tr> <td>3</td><td>DNS</td></tr> <tr> <td>4</td><td>IP Address</td></tr> <tr> <td>5</td><td>URI</td></tr> <tr> <td>6</td><td>Email</td></tr> <tr> <td>7</td><td>GUID</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>9</td><td>Directory name</td></tr> </table>	Value	Definition	2	RFC822	3	DNS	4	IP Address	5	URI	6	Email	7	GUID	8	Registered Id	9	Directory name
Value	Definition																		
2	RFC822																		
3	DNS																		
4	IP Address																		
5	URI																		
6	Email																		
7	GUID																		
8	Registered Id																		
9	Directory name																		
MetadataList	A list of key value pairs for each metadata item that is to be set on the issued certificate in Keyfactor Command. This parameter is optional.																		

Table 617: POST /3/Pkcs12 Request Body

Parameter Name	Parameter Value
Timestamp	ISO 8601 Timestamp, e.g. "2018-11-22T20:41:08.440000"
Request	JSON object in the same format as a version 1/2 Pkcs10 enrollment request (see Table 616: POST /1/Pkcs12 and /2/Pkcs12 Request Body).

Table 618: POST /*/Pkcs12 Response Body

Parameter Name	Parameter Value
SerialNumber	String containing the hexadecimal serial number of the issued certificate.
IssuerDN	Distinguished Name of the certificate's issuer.
Thumbprint	Thumbprint of the issued certificate.

Parameter Name	Parameter Value
CMSID	Identifier for this certificate in Keyfactor Command. Can be used to identify the cert in future API requests.
CMSRequestId	Identifier for the certificate request in Keyfactor Command. Can be used if certificate is pending issuance.
Pkcs12Blob	Base-64-encoded representation of the Pkcs#12 certificate that was issued, if any.
RequestDisposition	Value returned by the CA in response to this certificate request.
DispositionMessage	Message accompanying the disposition value returned by the CA.

This method allows additional attributes to be included in the certificate's subject name. A common use for this is the inclusion of a device class identifier, such as "iPhone 4S". On the Keyfactor Command server there is a configuration property to define the format of the subject name. An example is:

```
"CN={cn},OU=Device Model {deviceType}"
```

For each of the tokens given in {brackets}, Keyfactor Command will replace the value with the corresponding value in the SubjectNameAttributes field of the request, if present. If no value is provided, it will attempt to look up the value in the requester's AD account. In this example, Keyfactor Command might replace the string "{deviceType}" with attribute value "deviceType" supplied in the SubjectNameAttributes key-value-pair structure inside of the JSON request from the API client, and (if "cn" is not specified in the request) the "{cn}" string would be replaced with the value of the "cn" property from the user's Active Directory properties. If a matching token cannot be found either in the request or in AD, no value is substituted.

Example Request

Versions 1 and 2

POST http://<host>/CMSApi/CertEnroll/2/Pkcs12 HTTP/1.1

```
{
  "Flags":0,
  "Pkcs12Password": "12341234",
  "TemplateName": "User",
  "SubjectNameAttributes": {"deviceid":"iPad"}}
}
```

Example Request

Version 3

POST http://<host>/CMSApi/CertEnroll/3/Pkcs12 HTTP/1.1

```
{
  "Timestamp" : "2017-12-18T19:56:12.365Z",
  "Request": {
    "Flags":0,
    "Pkcs12Password": "12341234",
    "TemplateName": "User",
    "SubjectNameAttributes": [{"key":"deviceid","value":"iPad"}],
    "MetadataList":{"<metadata type name>":"<value>","<metadata type name>":"<value>"}
  }
}
```

Example Response

Status Code: 200

```
{
  "SerialNumber": "690003CC096AC71023934747AA00000003CC09",
  "IssuerDN": "CN=jdk-CA1, DC=jdk, DC=com",
  "Thumbprint": "04259811B3BC522093532FBA5F4C1FA3C0969A87",
  "CMSID": 8,
  "CMSRequestId": 6,
  "Pkcs12Blob": <base64-encoded PKCS#12>,
  "RequestDisposition": "Issued",
  "DispositionMessage": ""
}
```

2.6.3.5 CertEnroll Renew

Certificate renewal in Keyfactor Command allows a certificate to be issued based on data from an existing certificate. Some configurations, such as the issuing CA and template, can be made to differ between the original certificate and the renewed one. At renewal time, the new certificate can also be automatically delivered to different certificate stores managed by Keyfactor Command Agents, replacing the old certificates. This provides an easy mechanism to quickly replace expiring or compromised certificates, migrate deployed certificates from one PKI to another, or replace certificates with similar certificates using more secure cryptographic algorithms. The Renew Web API method, along with the web console and expiration alert handlers, allows access to this renewal functionality. The structure of a renew request is given [Table 619: POST /3/Renew Request Body](#), and the response in [Table 620: POST /3/Renew Response Body](#).

Table 619: POST /3/Renew Request Body

Parameter Name	Parameter Value
Lookup	Description of the certificate to be renewed. See Table 604: Classic API Certificate Lookup Structure .
CertStores	Array of GUIDs listing the certificate stores where the new certificate should be delivered. This must be a subset of the CertStores containing the original certificate.
Template	Certificate template to be used for the new certificate request.
CACConfiguration	Certificate authority for the new certificate, in the form "hostname\\logical name" (double-backslash required for JSON formatting).
Metadata	Optional dictionary of metadata fields and values to be associated with the newly issued certificate.
CustomPassword	Password to protect the private key of the new certificate. This field is optional and Keyfactor Command will use a randomly assigned password if this is not set.

Table 620: POST /3/Renew Response Body

Parameter Name	Parameter Value
Thumbprint	Thumbprint of the issued certificate.
CMSRequestId	Identifier for the certificate request in Keyfactor Command, if certificate is pending issuance.
RequestDisposition	Value returned by the CA in response to this certificate request.
DispositionMessage	Message accompanying the disposition value returned by the CA.
RenewedCertStores	List of certstores that had a certificate addition job scheduled successfully. The certstores will be listed in the format "<Store machine >-<Store path>".

Example Request

POST http://<host>/CMSApi/CertEnroll/3/Renew HTTP/1.1

```
{
  "Lookup": {"Type" : "CMSID", "CMSID" : 7},
  "CertStores": ["&lt;Guid&gt;"],
```

```

    "Template": "UserServer",
    "CAConfiguration" : "CA1.jdk.com\\jdk-CA1",
    "Metadata":{"Email-Contact":"a.b@example.com"}
}

```

Example Response

```

{
  "RenewedCertStores": ["192.168.41.171-/home/pi/cherry/cherrystore"],
  "Thumbprint": "46CCE7023bce5c434f4206b74473fd614df56218",
  "CMSRequestId": 0,
  "RequestDisposition": "Issued",
  "DispositionMessage": "The certificate renewal has been completed successfully. Agent jobs to install the new certificate have been created."
}

```

2.6.4 Certificates

The Certificates component of the Web API supports certificate lifecycle and management tasks apart from enrollment. The complete set of methods in this component is given in [Table 621: Certificates Endpoints](#).

Table 621: Certificates Endpoints

Endpoint	Method	Description
/3/Contents	POST	Return the certificate contents in PEM format
/3/Count	POST	Return the number of certificates in the Keyfactor Command database matching a given search query
/1/Metafield	POST	Associate a metadata value with a certificate in the Keyfactor Command database.
/2/Import	POST	Add an existing certificate into the Keyfactor Command database.
/3/Revoke	POST	Revoke a given certificate.
/3/Recover	POST	Recover a given certificate
/3/PublishCRL	POST	Request a CA to publish a new CRL
/3/Search	POST	Return the full set of certificates in the Keyfactor Command database matching a given search query

Endpoint	Method	Description

2.6.4.1 Certificates Metafield

The metafield POST method is used to import individual certificate metadata field values into Keyfactor Command. This method offers limited functionality and security measures compared to the Metadata v2 and v3 methods described in the Metadata section (see [Metadata on page 1668](#)), but is included for backward-compatibility. A JSON string must be submitted with the POST request containing the data shown in [Table 622: POST /1/Metafield Request Body](#). This method returns HTTP 200 OK with message body "true" on success or an appropriate 4xx status with an accompanying error message in the body on failure.

Table 622: POST /1/Metafield Request Body

Parameter Name	Parameter Value
CertificateId	The Keyfactor Command database row identifier associated with the existing certificate. Many times this will be the certificate id returned by the import API call.
MetadataFieldTypeName	The string name of the metadata field type for which the value is provided.
Value	The metadata field value to be associated with the provided certificate identifier.

Example Request

POST http://<host>/CMSApi/Certificates/1/Metafield HTTP/1.1

```
{
  "CertificateId": 1,
  "MetadataFieldTypeName": "Email-Contact",
  "Value": "support@example.com"
}
```

2.6.4.2 Certificates Import

The certificate import POST method is used to import a certificate (.cer) file into Keyfactor Command while also allowing the simultaneous definition of metadata values for the imported certificate. The POST request must contain a JSON string containing the certificate and any metadata

items that should be associated with the certificate but does not require the content-disposition or multi-part form found in version 1. This method returns HTTP 200 OK with message body "true" on success or an appropriate 4xx status with an accompanying error message in the body on failure.

Important: Support for version 1 of the Classic API certificate import method (Certificates/1/Import) will end in an upcoming release of the product. All applications should be migrated to a newer Import endpoint.

Table 623: POST /2/Import Request Body

Parameter Name	Parameter Value														
X509Base64	String containing the certificate blob. This may include the "-----BEGIN CERTIFICATE-----" and "-----END CERTIFICATE-----" references or these may be left out.														
MetadataList	<div>A comma-delimited list of metadata fields, each containing two parts:<table><tr><th>Name</th><th>Description</th></tr><tr><td>MetadataFieldName</td><td>The metadata field name—e.g. Email-Address</td></tr><tr><td>Value</td><td>The metadata value—e.g. bob.-smith@example.com</td></tr></table><p>The metadataList parameter is not required, but if you choose to include it, you must include both the name and the value for each metadata value to be imported.</p></div>	Name	Description	MetadataFieldName	The metadata field name—e.g. Email-Address	Value	The metadata value—e.g. bob.-smith@example.com								
Name	Description														
MetadataFieldName	The metadata field name—e.g. Email-Address														
Value	The metadata value—e.g. bob.-smith@example.com														
CertState	<div>Used to manually set the state of the imported certificate. The following values are accepted:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Active</td></tr><tr><td>2</td><td>Revoked</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Failed</td></tr><tr><td>5</td><td>Pending</td></tr></table></div>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending
Value	Description														
0	Unknown														
1	Active														
2	Revoked														
3	Denied														
4	Failed														
5	Pending														

Parameter Name	Parameter Value	
	Value	Description
	6	Certificate Authority
	7	Parent Certificate Authority

Example Request

POST http://<host>/CMSApi/Certificates/2/Import HTTP/1.1

```
{
  "x509Base64": "-----BEGIN CERTIFICATE-----
<base64-encoded-certificate-contents>
-----END CERTIFICATE-----",
  "MetadataList": [
    { "MetadataFieldName": "Email-Contact",
      "Value": "john.doe@example.com" }
  ]
}
```

2.6.4.3 Certificates Contents

The Contents method retrieves the contents of a specified certificate. The request requires only enough information to identify a certificate in Keyfactor Command, and the body of a successful response will consist solely of the PEM-encoded representation of that certificate. Unlike most methods, for successful requests the response content type will be "text/plain".

Table 624: POST /3/Contents Request Body

Parameter Name	Parameter Value
Lookup	Description of the certificate to be retrieved. See Table 604: Classic API Certificate Lookup Structure .

Example Request

POST http://<host>/CMSApi/Certificates/3/Contents HTTP/1.1

```
{
  "Lookup": {"type": "CMSID", "CMSID": <cms-certificate-id>}
}
```

Example Response

```
<base64-encoded-certificate-contents>
```

2.6.4.4 Certificates PublishCRL

The PublishCRL method will cause Keyfactor Command to make a request to the provided Certificate Authority to publish a new CRL to the locations configured by the CA. This method requires only a single parameter and returns no response body on a successful request. On an unsuccessful request, an appropriate HTTP status code along with a string in the response body describing the error is returned.

Table 625: POST /3/PublishCRL Request Body

Parameter Name	Parameter Value
CertificateAuthority	Certificate authority for the new CRL, in the form "hostname\\logical name" (double-backslash required for JSON formatting).

Example Request

POST http://<host>/CMSApi/Certificates/3/PublishCRL HTTP/1.1

```
{
  "CertificateAuthority" : "CA1.corp.com\\Issuing-CA1"
}
```

2.6.4.5 Certificates Recover

The Recover method allows a user to recover an archived private key for an issued certificate. For recovery to succeed, the CA that issued the certificate must have been configured to archive the private key, and the Key Recovery Agent certificate must be imported into the personal certificate store of the Keyfactor Command API IIS Application Pool's user account on the Keyfactor Command API server. If successful, the method will return the certificate and recovered private key as a base64-encoded PFX file. On error, an appropriate HTTP status code and message will be returned. See *Configuring Key Recovery for Keyfactor Command* in the *Keyfactor Command Reference Guide* for information about configuring key recovery.

Table 626: POST /3/Recover Request Body

Parameter Name	Parameter Value				
Lookup	Description of the certificate to be renewed. See Table 604: Classic API Certificate Lookup Structure .				
Details	Information to complete the recovery operation. This contains just a single field: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>Password</td><td>Password for the archived private key.</td></tr> </table>	Parameter Name	Parameter Value	Password	Password for the archived private key.
Parameter Name	Parameter Value				
Password	Password for the archived private key.				

Example Request

POST http://<host>/CMSApi/Certificates/3/Recover HTTP/1.1

```
{
  "Lookup" : {"Type" : "CMSID", "CMSID" : 248852},
  "Details": {"Password": "MyPassword1234"}
}
```

Example Response

```
{
  "pfx" : "<PEM-encoded pfx>"
}
```

2.6.4.6 Certificates Revoke

The Revoke method will attempt to revoke a certificate stored in Keyfactor Command. The certificate to be revoked can be identified using the *lookup* request body parameter (see [Table 604: Classic API Certificate Lookup Structure](#)). In addition, the message may contain string parameters describing the revocation. Caution is advised when programmatically revoking certificates as the operation generally cannot be undone. The method returns a 200 OK response if successful or an appropriate HTTP code and error message if unsuccessful.

Table 627: POST /3/Revoke Request Body

Parameter Name	Parameter Value
Lookup	Criteria to specify the certificate to be revoked. See Table 604: Classic API Certificate Lookup Structure .
Details	Details used to define the revocation operation. See Table 628: Certificate Revocation Details .

Table 628: Certificate Revocation Details

Parameter Name	Parameter Value																
Reason	<p>Integer code for certificate revocation reason, as per IETF RFC 5280 ReasonFlags. This field is optional and will default to "0" (zero - unspecified). Allowed values are listed below:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> </table>	Value	Definition	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold
Value	Definition																
0	Unspecified																
1	Key Compromised																
2	CA Compromised																
3	Affiliation Changed																
4	Superseded																
5	Cessation of Operation																
6	Certificate Hold																
Comment	Explanation of revocation reason. Optional and will default to the empty string "".																
EffectiveDate	Date on which the revocation will take effect. Optional and will default to the current time if not specified.																
noCRL	If provided and set to "true", Keyfactor Command will not attempt to have the CA publish a new CRL. Optional and treated as "false" by default.																

Example Request

POST http://<host>/CMSApi/Certificates/3/Revoke HTTP/1.1

```
{
  "Lookup": {"Type": "CMSID", "CMSID": 45},
  "Details": {"Reason": 4, "EffectiveDate" : "2017-12-29", "Comment": "Reissued 12-27"}
}
```

2.6.4.7 Certificates Search and Count

The Search method will return the set of certificates known to Keyfactor Command that satisfy certain criteria. The criteria that can be searched on and the syntax by which queries are formed is the same as in the Advanced Certificate Search within the Keyfactor Command Management Portal. This is largely consistent with PowerShell comparison notation, but Keyfactor does not publish a complete specification of this query language. Instead, developers are encouraged to examine the query strings formed in the Keyfactor Command Management Portal and model their API queries based on this. The response will contain a JSON body with an array whose entries each represent a single matching certificate. The Count method expects the same parameters as the Search query but simply returns a count of the records that would be returned if the same parameters were provided to the Search endpoint. For Count, the sorting parameters will have no effect.

Table 629: POST /3/Search and /3/Count Request Body

Parameter Name	Parameter Value
IncludeRevoked	Boolean denoting if revoked certificates should be included in the search results.
IncludeExpired	Boolean denoting if expired certificates should be included in the search results.
Query	Search query criteria, as defined above.
SortField	Name of the result field by which the results should be sorted. The field must be one returned within the results. This parameter is optional and the Keyfactor Command certificate id will be used if not provided. The available fields are the same as in Table 630: POST /3/Search Response Body .
SortAscending	Boolean value denoting if the SortField should be sorted in ascending order. This parameter is optional and ascending will be used if not provided.
SkipCount	Number of records that should be skipped in the results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Numeric value of the limit of records to be returned. This field is optional and 5000 will be used if not provided.

Table 630: POST /3/Search Response Body

Parameter Name	Parameter Value																		
Id	Certificate ID assigned by Keyfactor Command, which can be used for service chaining to other many other Web API requests by providing this value as a <i>CMSID</i> in the <i>Lookup</i> section of the request. See Table 604: Classic API Certificate Lookup Structure .																		
IssuedCN	Issued Common Name																		
IssuedDN	Issued Distinguished Name																		
NotBefore	Beginning date for certificate validity																		
NotAfter	Ending (expiration) date for certificate validity																		
IssuerDN	Issuer Distinguished Name																		
PrincipalName	Subject Principal Name																		
RequesterName	Requester Name																		
TemplateName	Certificate Template Name																		
CertState	<p>Certificate State. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Definition</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>CertificateAuthority</td></tr> <tr> <td>7</td><td>ParentCertificateAuthority</td></tr> </table>	Value	Definition	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	CertificateAuthority	7	ParentCertificateAuthority
Value	Definition																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	CertificateAuthority																		
7	ParentCertificateAuthority																		
KeySize	Bit-length of the public/private keys.																		
KeyType	Cryptographic algorithm used for the public/private key. Will take one of the following values:																		

Parameter Name	Parameter Value	
	Value	Definition
	0	Unknown
	1	RSA
	2	DSA
	3	ECC
	4	DH
SerialNumber	The hexadecimal serial number of the certificate.	
Thumbprint	The hexadecimal thumbprint of the certificate.	

Example Request

POST http://<host>/CMSApi/Certificates/3/Search HTTP/1.1

```
{
  "includeRevoked": true,
  "includeExpired": true,
  "query": "(ExpirationDate -eq \"2018-05-10\")"
}
```

Example Response

```
[{
  "Id": "<certificate-id>",
  "IssuedCN": "<cn>",
  "IssuedDN": "<dn>",
  "NotBefore": "2017-05-10T18:59:57",
  "NotAfter": "2018-05-10T18:59:57",
  "IssuerDN": "<issuer-dn>",
  "PrincipalName": null,
  "RequesterName": null,
  "TemplateName": null,
  "CertState": 0,
  "KeySize": 4096,
}
```

```
"KeyType": 1  
}]
```

2.6.5 Certstore

The Certstore Web API (formerly known as the Jks API) provides a set of methods to support management of certificate locations. Keyfactor Command currently supports management of certificates in the following remote locations:

- Java Keystore
- PEM file
- F5 BigIP Web Server
- F5 BigIP SSL Profiles
- Windows Machine Personal, Revoked, and Trusted Roots stores
- Citrix NetScaler virtual servers

Keyfactor Command can, through different Keyfactor Command Agents and Orchestrators, inventory, install, and remove certificates for each of these store types. For certain store types, additional actions are supported as well. The certstore API provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the [Reference Guide](#) and [Installing Orchestrators](#) guide, or contact your Keyfactor representative. This API component currently has only one version, but for backward-compatibility, it can be accessed through the component name "Certstore" (e.g. /CMSApi/Certstore/1/AddCert) or the legacy name "Jks" (e.g. /CMSApi/Jks/1/AddCert). The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed below in [Table 631: Certstore Endpoints](#).

Table 631: Certstore Endpoints

Endpoint	Method	Description
AddCert	POST	Add given certificate (without private key) to a given certificate store (as well as Keyfactor Command)
AddCertStore	POST	Define a new certstore in Keyfactor Command
AddCertStoreServer	POST	Define a new remote server (e.g. F5, NetScaler) in Keyfactor Command to be managed by a Keyfactor Command agent
AddPFX	POST	Add a PFX file (with private key) to a given certificate store (as well as Keyfactor Command)
AddCertStoreType	POST	Add a Certificate Store Type to be used by a certificate store

Endpoint	Method	Description
CreateJKS	POST	Create a Java Keystore on the file system on target machine
EditCertStore	POST	Update a definition of an existing certificate store in Keyfactor Command
EditCertStoreServer	POST	Update a definition of an existing remote server managed by a Keyfactor Command agent
GetCertStoreTypes	GET	List all certificate store types
Inventory	POST	Retrieve the inventory of a given certificate store
Keystores	GET	Get a list of certificate stores defined in Keyfactor Command
Remove	POST	Remove a certificate from a certificate store
ScheduleInventory	POST	Schedule a certificate store inventory job schedule
ScheduleJob	POST	Schedule a certificate store management job
Status	GET	A synonym for GET /Status, included on this path for backwards-compatibility

2.6.5.1 CertStore AddCert

The POST AddCert method will schedule the addition of the provided certificate to the specified alias/name within the provided certificate stores. The request and response objects will contain the fields shown in [Table 632: POST /AddCert Request Body](#) and [Table 633: POST /AddCert Response Body](#).

Table 632: POST /AddCert Request Body

Parameter Name	Parameter Value
Keystores	Array of the certificate stores to which the provided entry should be added, with the same format as the response to GET /Keystores (see Table 647: GET /Keystores Response Body).
Alias	Name of the entry to which the certificate should be added. This parameter can also take a list of Certificate Store Type and Alias entries. If just a name is given, the certificate will have the same alias in all certificate stores it is added to. If a list is given, the certificate will have the same alias for each given store with the same certificate store type.
Overwrite	Boolean denoting if the entry should be overwritten, if one exists. An error will be

Parameter Name	Parameter Value
	returned if this is set to false, and an entry with the same alias/name exists.
Contents	PEM of the certificate to be added. This field is optional if a CertificateId is provided.
CertificateId	Database identifier within Keyfactor Command of the certificate to be added. This field is optional if the Contents are provided.

Table 633: POST /AddCert Response Body

Parameter Name	Parameter Value																		
Result	Numerical code indicating the result of the operation, as described in Table 637: POST /AddCertStoreServer Response Body .																		
Message	Description of the result of the operation, e.g. "The operation completed successfully".																		
InvalidKeystores	<p>Array of certstores provided in the request for which the operation could not be completed. Entries will be formatted as follows:</p> <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>KeystoreId</td><td>Guid of the certstore</td></tr> <tr> <td>ClientMachine</td><td>Machine hosting the certstore</td></tr> <tr> <td>StorePath</td><td>File path to the store on its machine</td></tr> <tr> <td>Alias</td><td>Alias for certificate to be added</td></tr> <tr> <td>Reason</td><td> <p>Numerical code for the failure. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td>0</td><td>The certificate store was not found.</td></tr> <tr> <td>1</td><td>A job to add this certificate to this</td></tr> </table> </td></tr> </table>	Parameter Name	Parameter Value	KeystoreId	Guid of the certstore	ClientMachine	Machine hosting the certstore	StorePath	File path to the store on its machine	Alias	Alias for certificate to be added	Reason	<p>Numerical code for the failure. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td>0</td><td>The certificate store was not found.</td></tr> <tr> <td>1</td><td>A job to add this certificate to this</td></tr> </table>	Value	Error Message	0	The certificate store was not found.	1	A job to add this certificate to this
Parameter Name	Parameter Value																		
KeystoreId	Guid of the certstore																		
ClientMachine	Machine hosting the certstore																		
StorePath	File path to the store on its machine																		
Alias	Alias for certificate to be added																		
Reason	<p>Numerical code for the failure. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td>0</td><td>The certificate store was not found.</td></tr> <tr> <td>1</td><td>A job to add this certificate to this</td></tr> </table>	Value	Error Message	0	The certificate store was not found.	1	A job to add this certificate to this												
Value	Error Message																		
0	The certificate store was not found.																		
1	A job to add this certificate to this																		

Parameter Name	Parameter Value												
	<table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td></td><td>alias already exists.</td></tr> <tr> <td>2</td><td>No agent is available to perform this job.</td></tr> </table> </td></tr> <tr> <th>Explanation</th><td>A description of the failure encountered.</td></tr> </table>	Parameter Name	Parameter Value		<table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td></td><td>alias already exists.</td></tr> <tr> <td>2</td><td>No agent is available to perform this job.</td></tr> </table>	Value	Error Message		alias already exists.	2	No agent is available to perform this job.	Explanation	A description of the failure encountered.
Parameter Name	Parameter Value												
	<table> <tr> <th>Value</th><th>Error Message</th></tr> <tr> <td></td><td>alias already exists.</td></tr> <tr> <td>2</td><td>No agent is available to perform this job.</td></tr> </table>	Value	Error Message		alias already exists.	2	No agent is available to perform this job.						
Value	Error Message												
	alias already exists.												
2	No agent is available to perform this job.												
Explanation	A description of the failure encountered.												

Example Request

Multiple Alias entries

POST http://<host>/CMSApi/CertStore/1/AddCert HTTP/1.1

```
{
  "Keystores":
  [
    {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
    {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
  ],
  "Alias": {"<store type Id>":"<alias>","<store type Id>":"alias"},
  "Overwrite": true,
  "CertificateId": "<certificate-id>",
  "Contents": "-----BEGIN CERTIFICATE-----
<base64-encoded-certificate-contents>
-----END CERTIFICATE-----"
}
```

Example Request

String Alias

POST http://<host>/CMSApi/CertStore/1/AddCert HTTP/1.1

```
{
  "Keystores":
```

```
[
  {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
  {"Id": "", "ClientMachine": "<client-machine>", "StorePath": "<store-path>"},
],
"Alias": "<alias>",
"Overwrite":true,
"CertificateId":"<certificate-id>",
"Contents": "-----BEGIN CERTIFICATE-----
<base64-encoded-certificate-contents>
-----END CERTIFICATE-----"
}
```

Example Response

```
{
  "Result": 1,
  "Message" : "The operation completed successfully.",
  "InvalidKeystores": []
}
```

2.6.5.2 CertStore AddCertStore

The AddCertStore method allows a client to define a new certificate store within Keyfactor Command. The structure is as follows:

Table 634: POST /AddCertStore Request Body

Parameter Name	Parameter Value										
StoreType	Type of certificate store to be defined. This field is required and allowed values are: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Java Keystore</td></tr> <tr> <td>2</td><td>PEM file</td></tr> <tr> <td>3</td><td>F5 SSL Profiles</td></tr> <tr> <td>4</td><td>IIS Trusted Root Certificates</td></tr> </table>	Parameter Name	Parameter Value	0	Java Keystore	2	PEM file	3	F5 SSL Profiles	4	IIS Trusted Root Certificates
Parameter Name	Parameter Value										
0	Java Keystore										
2	PEM file										
3	F5 SSL Profiles										
4	IIS Trusted Root Certificates										

Parameter Name	Parameter Value														
	<table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>5</td><td>NetScaler</td></tr> <tr> <td>6</td><td>IIS Personal Certificates</td></tr> <tr> <td>7</td><td>F5 Web Server</td></tr> <tr> <td>8</td><td>IIS Revoked Certificates</td></tr> <tr> <td>100</td><td>Amazon Web Services</td></tr> <tr> <td>101</td><td>File Transfer Protocol</td></tr> </table>	Parameter Name	Parameter Value	5	NetScaler	6	IIS Personal Certificates	7	F5 Web Server	8	IIS Revoked Certificates	100	Amazon Web Services	101	File Transfer Protocol
Parameter Name	Parameter Value														
5	NetScaler														
6	IIS Personal Certificates														
7	F5 Web Server														
8	IIS Revoked Certificates														
100	Amazon Web Services														
101	File Transfer Protocol														
ClientMachine	Machine where the certificate store resides (or will reside). Required.														
StorePath	Path on the client machine where the store should be defined. Required for Java Keystore, PEM file, F5 SSL Profiles, and NetScaler (categories 0, 2, 3, and 5).														
AgentId	Identifier of agent that will service the request. Either AgentId or AgentName must be provided for F5 (categories 3 and 7), IIS (categories 4, 6, and 8), and NetScaler stores (category 5).														
AgentName	Machine name of agent that will service the request. Either AgentId or AgentName must be provided for F5 (categories 3 and 7), IIS (categories 4, 6, and 8), and NetScaler stores (category 5).														
Container	Certificate store container that should contain the certificate store. This is optional and no certstore container will be assigned if it is not provided. See the <i>Keyfactor Command Reference Guide</i> for information on certificate store containers.														
Password	Password used to access the store. Required for Java Keystore and optional for PEM file.														
PrivateKeyPath	Path on the client machine where the private key should be stored. Supported only for PEM files, and is optional in that case. If no path is provided for a PEM file, the private key will be stored in the same PEM file as the certificate.														

Table 635: POST /AddCertStore Response Body

Parameter Name	Parameter Value
Message	Description of the result of the operation, e.g. "The operation completed successfully".
Result	Numerical code for the outcome of the operation, as given in Table 637: POST /AddCertStoreServer Response Body .
Id	GUID of the created store, if successful.

Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStore HTTP/1.1

```
{
  "ClientMachine": "192.168.41.171",
  "StorePath": "/opt/cms-java-agent/config/trust.jks",
  "StoreType": 0,
  "Password": "changeit"
}
```

Example Response

```
{
  "Result": 1,
  "Message": "The operation completed successfully.",
  "Id": "b195c1f9-1957-4bdb-a15d-f45159482611"
}
```

2.6.5.3 CertStore AddCertStoreServer

Some certificate stores are managed by agents accessing the store through a third-party Web API. This currently includes F5 BigIP devices and Citrix NetScaler devices. These stores require the definition of a certstore server before the store itself can be defined in Keyfactor Command. Each server can be configured with a location and user credentials to access the client machine via the appropriate third-party API. This Keyfactor Command Web API method allows such configuration. The structure shown in [Table 636: POST /AddCertStoreServer Request Body](#) should be used for requests.

Table 636: POST /AddCertStoreServer Request Body

Parameter Name	Parameter Value						
Name	Hostname of the machine the agent will connect to.						
ServerType	Platform for this server, defining what certstore types are supported. Allowed values are: <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>F5</td></tr> <tr> <td>1</td><td>NetScaler</td></tr> </table>	Parameter Name	Parameter Value	0	F5	1	NetScaler
Parameter Name	Parameter Value						
0	F5						
1	NetScaler						
UseSSL	Boolean denoting whether the agent should connect to the client API using https or http.						
Username	Username to provide to the client API.						
Password	Password corresponding to the login for the given Username to access the client API.						

Table 637: POST /AddCertStoreServer Response Body

Parameter Name	Parameter Value								
Result	Status code for the operation. Will take one of the following values: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Success</td></tr> <tr> <td>2</td><td>Failure</td></tr> <tr> <td>3</td><td>Warning</td></tr> </table>	Value	Description	1	Success	2	Failure	3	Warning
Value	Description								
1	Success								
2	Failure								
3	Warning								
Message	Description of the operation outcome, e.g. "The operation completed successfully".								

Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStoreServer HTTP/1.1

```
{
  "Name": "192.168.23.100",
  "UseSSL" : true,
  "Username": "nsroot",
  "Password": "nsroot",
  "ServerType": 1
}
```

Example Response

```
{
  "Result": 1,
  "Message": "The operation completed successfully."
}
```

2.6.5.4 CertStore AddCertStoreType

The POST /AddCertStoreType method will create a certificate store type that will be used for a custom certificate store that extends the Keyfactor Command Agent's Any Agent functionality. The parameters that can be used for this endpoint are shown in [Table 638: POST /AddCertStoreType Request Body](#), while the response format can be found in [Table 639: POST /AddCertStoreType Response Body](#).

Table 638: POST /AddCertStoreType Request Body

Parameter Name	Parameter Value
Name	The name the certificate store type will have in Keyfactor Command. This parameter is required .
ShortName	The short name of the certificate store type. This parameter is required .
AddSupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be added to. This parameter is required .
CreateSupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be created if missing. This parameter is required .
DiscoverySupported	A Boolean that sets if the certificate store of this certificate store type is allowed to be discovered in a discovery scan. This parameter is required .
RemoveSupported	A Boolean that sets if the certificate store of this certificate store type allows certificates to be removed from it. This parameter is required .

Parameter Name	Parameter Value								
EnrollmentSupported	A Boolean that sets if the certificate store of this certificate store type supports reenrollment. This parameter is required .								
EntryPasswordSupported	A Boolean that sets if the certificate store of this certificate store type supports an entry password. This parameter is required .								
PrivateKeyAllowed	<p>A parameter that sets requirements on the private key of a certificate being entered into the certificate store. This parameter is required. Valid values are:</p> <table> <tr> <th>Value</th><th>Name</th></tr> <tr> <td>0</td><td>Forbidden</td></tr> <tr> <td>1</td><td>Optional</td></tr> <tr> <td>2</td><td>Required</td></tr> </table>	Value	Name	0	Forbidden	1	Optional	2	Required
Value	Name								
0	Forbidden								
1	Optional								
2	Required								
LocalStore	A Boolean that sets if the certificate store of this certificate store type requires a certificate store server. This parameter is required .								
StorePasswordRequired	A Boolean that sets if the certificate store of this type requires a password. This parameter is required .								
StorePathType	<p>The type used for the certificate store path.</p> <table> <tr> <th>Option</th><th>Description</th></tr> <tr> <td>Empty</td><td>Path will be a free form field.</td></tr> <tr> <td>String</td><td>Path will only be the specified string.</td></tr> <tr> <td>Comma Separated String</td><td>Path will need to be chosen from the list given.</td></tr> </table>	Option	Description	Empty	Path will be a free form field.	String	Path will only be the specified string.	Comma Separated String	Path will need to be chosen from the list given.
Option	Description								
Empty	Path will be a free form field.								
String	Path will only be the specified string.								
Comma Separated String	Path will need to be chosen from the list given.								
CustomAliasAllowed	A Boolean that sets whether the certificate store of this type allows a custom alias. This parameter is optional.								
Powershell	A Boolean that sets whether the certificate store of this type uses PowerShell. This parameter is optional.								
ServerRegistration	A Boolean that sets whether Keyfactor Command needs to prompt for credentials for each client machine that has that certificate store type. This parameter is optional.								

Parameter Name	Parameter Value												
JobProperties	A comma separated string defining properties that are required when performing management jobs on a certificate store of this type. This parameter is optional.												
Properties	<p>A dictionary of any extra properties a certificate store of this type would need. This parameter is optional. If this property is provided, a type is required. Parameters of a property are:</p> <table> <tr> <th>Field</th><th>Description</th></tr> <tr> <td>DisplayName</td><td>The name of the property. This parameter is optional.</td></tr> <tr> <td>Type</td><td>The type of the property. This parameter is required. Valid values are: String, Bool, MC, and Secret</td></tr> <tr> <td>Required</td><td>A Boolean that sets whether the property is required in the certificate store.</td></tr> <tr> <td>Depends</td><td>If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.</td></tr> <tr> <td>Value</td><td>A default Value of the property.</td></tr> </table>	Field	Description	DisplayName	The name of the property. This parameter is optional.	Type	The type of the property. This parameter is required . Valid values are: String, Bool, MC, and Secret	Required	A Boolean that sets whether the property is required in the certificate store.	Depends	If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.	Value	A default Value of the property.
Field	Description												
DisplayName	The name of the property. This parameter is optional.												
Type	The type of the property. This parameter is required . Valid values are: String, Bool, MC, and Secret												
Required	A Boolean that sets whether the property is required in the certificate store.												
Depends	If this is not the first property, this property can depend on another property. The property name is used to determine which property is being depended on.												
Value	A default Value of the property.												

Table 639: POST /AddCertStoreType Response Body

Parameter Name	Parameter Value								
Message	Description of the operation outcome, e.g. "The operation completed successfully".								
Result	<p>Status code for the operation. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Success</td></tr> <tr> <td>2</td><td>Failure</td></tr> <tr> <td>3</td><td>Warning</td></tr> </table>	Value	Description	1	Success	2	Failure	3	Warning
Value	Description								
1	Success								
2	Failure								
3	Warning								

Parameter Name	Parameter Value	
Data		
	Value	Description
	Name	The name of the type.
	ShortName	The ShortName of the type.
	StoreType	The Id of the store
	LocalStore	A Boolean if the certificate store is on the local server of the agent.
	ServerRegistration	Tells whether server registration is needed by Keyfactor Command.
	ImportType	A value to indicate the source of a certificate record in the Keyfactor Command audit logs.
	InventoryJobType	The GUID of the inventory job type that is used to register with the Any Agent.
	ManagementJobType	The GUID of the management job type that is used to register with the Any Agent.
	AddSupported	A Boolean stating whether an add job will be supported by the certificate store.
	RemoveSupported	A Boolean stating whether a remove job will be supported by the certificate store.
	CreateSupported	A Boolean stating whether a create job will be supported by the certificate store.
	DiscoverySupported	A Boolean stating whether a discovery job will be supported by the certificate store.
	EnrollmentSupported	A Boolean stating whether an enrollment job will be supported by the certificate store.
	InventoryEndpoint	The endpoint that will be hit by the agent.
	Properties	A list of properties that reflect those given in the request.
	EntryPasswordSupported	A Boolean stating whether an entry password

Parameter Name	Parameter Value																						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>will be supported by the certificate store.</td></tr> <tr> <td>StorePasswordRequired</td><td>A Boolean stating whether a store password will be required by the certificate store.</td></tr> <tr> <td>PrivatekeyAllowed</td><td> An integer notifying the state of the private keys in the certificate store. <table> <tr> <th>Value</th><th>Name</th></tr> <tr> <td>0</td><td>Forbidden</td></tr> <tr> <td>1</td><td>Optional</td></tr> <tr> <td>2</td><td>Required</td></tr> </table> </td></tr> <tr> <td>StorePathType</td><td>The value of the store path. If value is an empty string, the field is free form.</td></tr> <tr> <td>CustomAliasAllowed</td><td>A Boolean stating whether a custom alias will be supported by the certificate store.</td></tr> <tr> <td>JobProperties</td><td>The properties that will be required when performing a management job on the certificate store with this type.</td></tr> </table>	Value	Description		will be supported by the certificate store.	StorePasswordRequired	A Boolean stating whether a store password will be required by the certificate store.	PrivatekeyAllowed	An integer notifying the state of the private keys in the certificate store. <table> <tr> <th>Value</th><th>Name</th></tr> <tr> <td>0</td><td>Forbidden</td></tr> <tr> <td>1</td><td>Optional</td></tr> <tr> <td>2</td><td>Required</td></tr> </table>	Value	Name	0	Forbidden	1	Optional	2	Required	StorePathType	The value of the store path. If value is an empty string, the field is free form.	CustomAliasAllowed	A Boolean stating whether a custom alias will be supported by the certificate store.	JobProperties	The properties that will be required when performing a management job on the certificate store with this type.
Value	Description																						
	will be supported by the certificate store.																						
StorePasswordRequired	A Boolean stating whether a store password will be required by the certificate store.																						
PrivatekeyAllowed	An integer notifying the state of the private keys in the certificate store. <table> <tr> <th>Value</th><th>Name</th></tr> <tr> <td>0</td><td>Forbidden</td></tr> <tr> <td>1</td><td>Optional</td></tr> <tr> <td>2</td><td>Required</td></tr> </table>	Value	Name	0	Forbidden	1	Optional	2	Required														
Value	Name																						
0	Forbidden																						
1	Optional																						
2	Required																						
StorePathType	The value of the store path. If value is an empty string, the field is free form.																						
CustomAliasAllowed	A Boolean stating whether a custom alias will be supported by the certificate store.																						
JobProperties	The properties that will be required when performing a management job on the certificate store with this type.																						

Example Request

POST http://<host>/CMSApi/CertStore/1/AddCertStoreType HTTP/1.1

```
{
  "Name": "<Type Name>",
  "ShortName": "<Type Short Name>",
  "AddSupported": true,
  "CreateSupported": false,
  "DiscoverySupported": true,
  "RemoveSupported": true,
  "EnrollmentSupported": true,
  "EntryPasswordSupported": true,
  "PrivateKeyAllowed": <integer 0-2>,
}
```

```

"LocalStore": true,
"StorePasswordRequired": true,
"Powershell": false,
"CustomAliasAllowed": false,
"JobProperties": "<List of Job Properties>",
"ServerRegistration": false,
"Properties": {
  "<Property Name>": {
    "type": "<Property Type>",
    "DisplayName": "<Display Name>"
  },
  "<Property Name>": {
    "type": "<Type>",
    "displayName": "<Display Name>"
    "value": "<Value>"
  }
},
"StorePathType": <Path Type>
}

```

Example Response

Status Code: 200

```

{
  "Message": "The operation completed successfully.",
  "Result": 1,
  "Data": {
    "Name": "<Name>",
    "ShortName": "<Short Name>",
    "StoreType": <Store Type Id>,
    "LocalStore": true,
    "ServerRegistration": null,
    "ImportType": <Import Type>,
    "InventoryJobType": "<Inventory Job Type Guid>",
    "ManagementJobType": "<Management Job Type Guid>",
    "AddSupported": false,
    "RemoveSupported": true,
    "CreateSupported": false,
    "DiscoveryJobType": "<Discovery Job Type Guid>",
    "EnrollmentJobType": "<Enrollment Job Type Guid>",
    "InventoryEndpoint": "<Inventory Endpoint>",
    "Properties": {
      "<Property Name>": {

```

```

        "Type": "<Type>",
        "DisplayName": "<Display Name>",
        "Required": false,
        "Depends": null,
        "Value": <Value>
    },
    "<Property Name>": {
        "Type": "<Type>",
        "DisplayName": "<Display Name> ",
        "Required": false,
        "Depends": null,
        "Value": "<Value>"
    }
},
"EntryPasswordSupported": true,
"StorePasswordRequired": true,
"PrivateKeyAllowed": <Integer 0-2>,
"StorePathType": <Store Path Type>,
"CustomAliasAllowed": false,
"JobProperties": "<Job Properties>"
}
}

```

2.6.5.5 CertStore AddPFX

The POST AddPfx method will schedule the addition of the provided PFX(s) to the specified alias/-name within the provided certificate store(s). The request should contain the fields shown in [Table 640: POST /AddPfx Request Body](#), while the response format will be the same as for AddCert (see [Table 633: POST /AddCert Response Body](#)).

Table 640: POST /AddPfx Request Body

Parameter Name	Parameter Value
Keystores	Array of certificate stores to which the provided entry should be added, with the same format as the response to GET /Keystores (see Table 647: GET /Keystores Response Body).
Alias	Name of the entry to which the certificate should be added.
Overwrite	Boolean denoting if the entry should be overwritten, if one exists. An error will be returned if this is set to false but an entry with the same alias/name exists.
Contents	PEM of the PFX to be added. Do not include the ...BEGIN... AND ...END... lines.

Parameter Name	Parameter Value
PfxPassword	Password of the PFX.
HasEntryPassword	Boolean denoting if the password required for the entry is different than that of the certificate store itself.
EntryPassword	Password for the certificate store entry. Required if the HasEntryPassword is set to true.

Example Request

POST http://<host>/CMSApi/CertStore/1/AddPfx HTTP/1.1

```
{
  "Keystores":
  [{
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  },
  {
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }],
  "Alias": "<alias>",
  "Overwrite": "true",
  "HasEntryPassword": "true",
  "EntryPassword": "<entry-password>",
  "PfxPassword": "<pfx-password>",
  "Contents": "<base64-encoded PFX>"
}
```

2.6.5.6 CertStore CreateJKS

In most cases, certificate stores will already exist on the client machine prior to configuration within Keyfactor Command. For example, the IIS Personal Store exists on each windows machine independently of Keyfactor Command installation. In other cases, such as PEM files, the file can be created when a certificate is added. However, with a Java Keystore, creating the store on the file system and adding certificates to it are different operations. The CreateJKS method supports scheduling creation of a Java Keystore as a Keyfactor Command Agent job. The structure of this request is given in [Table 641: POST /CreateJKS Request Body](#) while the response is the same as for AddCertStore (see [Table 635: POST /AddCertStore Response Body](#)).

Table 641: POST /CreateJKS Request Body

Parameter Name	Parameter Value
ClientMachine	Machine on which the certificate store will reside.
StorePath	Path and filename of the certificate store to be created.
Password	Password to use for the new store.

Example Request

POST http://<host>/CMSApi/CertStore/1/CreateJKS HTTP/1.1

```
{
  "ClientMachine" : "192.168.41.171",
  "StorePath" : "/opt/cms-java-agent/config/trust.jks",
  "Password" : "changeit"
}
```

2.6.5.7 CertStore EditCertStore

The EditCertStore method allows certain aspects of a cert store definition to be updated. Some aspects, such as the store type and client machine, cannot be updated. The format of the request given in [Table 642: POST /EditCertStore Request Body](#), while the response will be as it is for [Table 637: POST /AddCertStoreServer Response Body](#).

Table 642: POST /EditCertStore Request Body

Parameter Name	Parameter Value
Id	Guid – Unique identifier of the certificate store. This field is the most specific, and does not require either the ClientMachine or StorePath fields to be provided.
ClientMachine	Machine on which the store resides. This field is required if the Id field is not provided.
StorePath	Path and filename of the certificate store. This field is required if the Id field is not provided.
NewStorePath	New path on the machine filesystem where the certstore resides.
NewContainer	Reassign the certstore container in Keyfactor Command where this store is configured.

Parameter Name	Parameter Value
NewPassword	Change the password used by the agent to access the store.
NewPrivateKeyPath	Change the path of a private key stored separately from a PEM file certificate
NewAgentId	Change the agent managing a remote certstore by providing its GUID. Cannot be used with NewAgentName.
NewAgentName	Change the agent managing a remote certstore by providing the name it reports to Keyfactor Command. Cannot be used with NewAgentId.

Example Request

POST http://<host>/CMSApi/CertStore/1/EditCertStore HTTP/1.1

```
{
  "ClientMachine": "192.168.23.100",
  "StorePath" : "/nsconfig/ssl",
  "NewStorePath" : "/nsconfig/ssl/vserver1",
  "NewContainer": "NetScaler"
}
```

2.6.5.8 CertStore EditCertStoreServer

A cert store server is a machine that hosts a store that is remotely managed by a Keyfactor Command Agent, such as a NetScaler or F5 device. The CertStoreServer configuration contains the data that allows the agent to connect to the host via the host platform's API. This method allows configuration of an existing CertStoreServer to be updated. The request format is shown in [Table 643: POST /EditCertStoreServer Request Body](#), while the response format is the same as for AddCertStoreServer (see [Table 637: POST /AddCertStoreServer Response Body](#)).

Table 643: POST /EditCertStoreServer Request Body

Parameter Name	Parameter Value
Name	Hostname of the machine the agent will connect to. Required if Id is not provided.
Id	Identifier of the certstore server to update. Required if Name is not provided.
UseSSL	Boolean denoting whether the agent should connect to the client API using https or http.

Parameter Name	Parameter Value
NewUsername	Username to provide to the client API. Required if NewPassword is provided.
NewPassword	Password corresponding to the login for the given Username to access the client API. Required if NewUsername is provided.

Example Request

POST http://<host>/CMSApi/CertStore/1/EditCertStoreServer HTTP/1.1

```
{
  "Name": "192.168.23.100",
  "UseSSL" : true,
  "newUsername" : "myNetScalerAdmin",
  "newPassword": "S1deways-Grassh0pper4979"
}
```

2.6.5.9 CertStore GetCertStoreTypes

The GET CertStoreTypes method returns a list of all certificate store types. The format for each element in the list can be found in [Table 644: GET /GetCertStoreTypes Response Body](#).

Table 644: GET /GetCertStoreTypes Response Body

Parameter Name	Parameter Value
Name	The name of the type.
ShortName	The short name of the type.
StoreType	The Id of the type.
LocalServer	A Boolean stating if the certificate store server is the same machine as the agent.
ServerRegistration	A Boolean stating whether Keyfactor Command needs to prompt for credentials for each client machine that has this certificate store type.
InventoryJobType	The GUID of the Inventory Job.
ManagementJobType	The GUID of the management job.
DiscoveryJobType	The GUID of the discovery job.

Parameter Name	Parameter Value
EnrollmentJobType	The GUID of the enrollment job.
InventoryEndpoint	The server endpoint to which the agent publishes its inventory results.
Properties	The added properties of the certificate store that uses this type.
EntryPasswordSupported	A Boolean stating if an entry password is supported by the certificate store that uses this type.
StorePasswordRequired	A Boolean stating if a store password is required by the certificate store that uses this type.
PrivateKeyAllowed	A Boolean stating if a private key is allowed by the certificate store that uses this type.
StorePathType	The value for the store path. Can be null, a string or a comma-separated string for free form, the specified path or a list of paths to choose from respectively.

2.6.5.10 CertStore Inventory

The POST Inventory method returns a list of the entries within the provided certificate store. The request body is formatted the same as the response to GET /Keystores (see [Table 647: GET /Keystores Response Body](#)).

Table 645: POST /Inventory Response Body

Parameter Name	Parameter Value
Alias	Alias/name of the certificate store entry.
PrivateKeyEntry	Boolean value denoting if the entry has an associated private key.
Certificates	Array of the certificates contained within the certificate store (see Table 646: POST /Inventory Response Certificates Fields).

Table 646: POST /Inventory Response Certificates Fields

Parameter Name	Parameter Value
ChainLevel	Position of the certificate within the chain. This is only applicable for private key entries.

Parameter Name	Parameter Value
CertificateId	Database identifier of the certificate within Keyfactor Command.
Thumbprint	Thumbprint of the certificate.

Example Request

POST http://<host>/CMSApi/CertStore/1/Inventory HTTP/1.1

```
{
  "Id": "<certificate-store-id>",
  "ClientMachine": "<client-machine>",
  "StorePath": "<store-path>"
}
```

Example Response

```
[
  {
    "Alias": "<alias1>",
    "PrivateKeyEntry": false,
    "Certificates": [{"ChainLevel": 0, "CertificateId": <id>, "Thumbprint": "<thumbprint>"}]
  },
  {
    "Alias": "<alias2>",
    "PrivateKeyEntry": true,
    "Certificates": [
      {
        "ChainLevel": 0, "CertificateId": <id>, "Thumbprint": "<thumbprint>"
      },
      {
        "ChainLevel": 1, "CertificateId": <id>, "Thumbprint": "<thumbprint>"
      },
      {
        "ChainLevel": 2, "CertificateId": <id>, "Thumbprint": "<thumbprint>"
      }
    ]
  }
]
```

2.6.5.11 CertStore Keystores

The GET Keystores method returns a list of the certificate stores within Keyfactor Command. This method requires no parameters. An array of the certificate stores is returned. The information shown in [Table 647: GET /Keystores Response Body](#) is returned for each certificate store in the array.

Table 647: GET /Keystores Response Body

Parameter Name	Parameter Value
Id	The Keyfactor Command request database identifier of the certificate store.
ClientMachine	Host name of the machine on which the certificate store resides.
StorePath	Path or other identifier of the certificate store (e.g. "IIS Personal" for IIS Personal stores).

Example Request

GET http://<host>/CMSApi/Certstore/1/Keystores

Example Response

```
[
  {
    "Id": "<certificate-store-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  },
  {
    "Id": "<certificate-store-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }
]
```

2.6.5.12 CertStore Remove

The POST Remove method will schedule the removal of the provided entry associated with the specified alias/name within the provided certificate store(s). The request should contain the fields shown in [Table 648: POST /Remove Request Body](#), while the response will be formatted as it is for AddCert and AddPfx (see [Table 633: POST /AddCert Response Body](#)).

Table 648: POST /Remove Request Body

Parameter Name	Parameter Value
Keystores	Array of the certificate stores from which the provided entry should be removed,

Parameter Name	Parameter Value
	formatted as with the GET /Keystores response (see Table 647: GET /Keystores Response Body).
Alias	Name of the entry from which the certificate should be removed.
Thumbprint	Thumbprint of the certificate to be removed. This field is optional if the CertificateId is provided.
CertificateId	Database identifier within Keyfactor Command of the certificate to be removed. This field is optional if the Thumbprint is provided.

Example Request

POST http://<host>/CMSApi/CertStore/1/Remove HTTP/1.1

```
{
  "Keystores":
  [{
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  },
  {
    "Id": "<keystore-id>",
    "ClientMachine": "<client-machine>",
    "StorePath": "<store-path>"
  }],
  "Alias": "<alias>",
  "CertificateId": "<certificate-id>",
  "Thumbprint": "<thumbprint>"
}
```

2.6.5.13 CertStore ScheduleInventory

Keyfactor Command Agents typically monitor the contents of cert stores they manage on a pre-configured interval, either once per day or every n minutes. The ScheduleInventory endpoint allows this interval configuration to be updated or switched on and off. Requests are formatted as follows, while the response is formatted as for AddCertStoreServer (see [Table 637: POST /AddCertStoreServer Response Body](#)):

Table 649: POST /ScheduleInventory Request Body

Parameter Name	Parameter Value								
Id	Guid – Unique identifier of the certificate store. This field is the most specific, and does not require either the ClientMachine or StorePath fields to be provided.								
ClientMachine	Machine on which the certificate store resides. This field is optional if the Id field is provided. It is required if used in conjunction with the ClientMachine field.								
StorePath	Path and filename of the certificate store. This field is optional if the Id field is provided. It is required if used in conjunction with the ClientMachine field.								
ScheduleType	<p>Value indicating whether inventory should be off, on an interval, or daily. Possible values are:</p> <table> <tr> <th>Parameter Name</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Off</td></tr> <tr> <td>1</td><td>Interval</td></tr> <tr> <td>2</td><td>Daily</td></tr> </table>	Parameter Name	Parameter Value	0	Off	1	Interval	2	Daily
Parameter Name	Parameter Value								
0	Off								
1	Interval								
2	Daily								
ScheduleTime	Time of day (hour and minute) that the inventory should run. Used for ScheduleType "Daily".								
ScheduleInterval	Integer number of minutes that should elapse between inventories. Used for ScheduleType "Interval".								
Overwrite	Boolean indicating whether a previous schedule configuration, if it exists, should be overwritten with the provided schedule configuration.								

Example Request

POST http://<host>/CMSApi/CertStore/1/ScheduleInventory HTTP/1.1

```
{
  "ID": "832f87c7-0af7-4043-9840-3022faeeae45",
  "ClientMachine": "192.168.41.171",
  "StorePath": "/home/pi/cherry/cherrystore",
  "ScheduleType": 2,
  "ScheduleTime": "23:00",
  "Overwrite": true
}
```

Example Response

Status Code: 200

```
{
  "Message": "The operation completed successfully.",
  "Result": 1
}
```

2.6.6 Metadata

Metadata in Keyfactor Command allows dynamic information about a certificate, or other data associated with a certificate that isn't included in the cert itself, to be associated with the certificate within Keyfactor Command. A metadata field can be defined within Keyfactor Command of a given type with a variety of other attributes, such as default values and security constraints. Currently, the supported metadata types are:

- String
Alphanumeric text field limited to 400 characters.
- Integer
Supports whole numbers only.
- Date
- Multiple Choice
- Big Text
Big Text fields are limited to 4000 characters. String fields support additional indexing, and so may be preferable to Big Text fields for large databases where possible.
- Boolean
True/False

Every certificate in Keyfactor Command can be assigned a value for each metadata field defined. The Metadata Web API component supports assignment, retrieval, and comparison of metadata values associated with a certificate, as well as retrieval of metadata field definitions. The supported methods are listed in [Table 650: Metadata Endpoints](#).

NOTE: Since the Certificates/1/Metafield endpoint (see [Certificates Metafield on page 1635](#)) is considered "Version 1" of this API component, version numbering here starts at 2.

Table 650: Metadata Endpoints

Endpoint	Method	Description
/2/Compare	POST	Compare the stored value for a metadata field associated with a given certificate against the value given in the request, and return a Boolean indicating whether the values match.
/2/Get	POST	Return the value for a metadata field associated with a given certificate.

Endpoint	Method	Description
/2/Set	POST	Assign a value for a metadata field to a given certificate.
/3/Get	POST	Return the value for a metadata field associated with a given certificate.
/3/GetDefinition	POST	Return the definition for the metadata field with given name.
/3/Set	POST	Assign a value for a metadata field to a given certificate.

2.6.6.1 Metadata V2

The *Metadata/2/...* calls all have a common request format and set of response codes. The request body is always a JSON-formatted string containing a set of fields used to identify the certificate the operation is to be performed on and a list of key-value pairs defining the metadata fields of interest. In the case of the Set method, the values to which each field should be set must also be provided.

Table 651: POST Metadata/2/* Request Body

Parameter Name	Parameter Value
Key	The key value can either be "Thumbprint" or "Serial" to identify the certificate. If you choose serial, you must include both the SerialNumber and the IssuerDN fields.
SerialNumber	The serial number of the certificate. Required only if Key is set to "Serial".
IssuerDN	The issuer of the certificate. Required only if Key is set to "Serial".
Thumbprint	The thumbprint of the certificate. Required only if Key is set to "Thumbprint".
metadatalist	Metadata field/value entries in one of the following forms: <ul style="list-style-type: none"> [{"MetadataFieldType": "<field1-name>", "Value": "<field1-value>"}, {...}, {...}] {"<field1-name>": "<field1-value>", "<field2-name>": "<field2-value>"}

Metadata V2 Set

The Metadata V2 Set POST method is used to set metadata value on a certificate in Keyfactor Command. The POST request body must consist of a JSON string containing the parameters used to set a certificate's metadata. If the request is successful, a 200 OK will be returned with "true" in the message body. If it is not, an appropriate 4xx HTTP status code is returned, and the body will contain a JSON object with a message about the error.

Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/2/Set

```
{
  "Key": "Thumbprint",
  "Thumbprint": "<thumbprint>",
  "metadatalist" : [{"EmailAddress":"bob.smith@example.com"}]
}
```

Example Request

Using serial

POST http://<host>/CMSApi/Metadata/2/Set HTTP/1.1

```
{
  "Key": "Serial",
  "SerialNumber": "<serial-number>",
  "SerialIssuer": "<issuing-ca>",
  "metadatalist": [{"EmailAddress": "bob.smith@example.com"}]
}
```

Example Response

(Unsuccessful)

```
{
  "Message": "The following metadata errors were found: 'myInvalidField' was not a valid MetadataFieldTypeName."
}
```

Metadata V2 Get

The Metadata V2 Get POST method is used to get metadata value on a certificate in Keyfactor Command. Despite the "Get" in the Keyfactor Command method name, the HTTP method must be POST and not GET. As with metadata/2/set (see [Metadata V2 Set on the previous page](#)), the POST request body must consist of a JSON string containing the parameters used to get a certificate's metadata. The "value" attribute for each entry in the metadatalist is not used, but must be present and can be set to null or an empty string.

Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/2/Get HTTP/1.1

```
{
  "Key": "Thumbprint",
  "Thumbprint": "<thumbprint>",
  "metadatalist": [{"MetadataFieldName": "EmailAddress", "Value": ""}]
}
```

Example Response

```
{
  "EmailAddress" : "bob.smith@example.com"
}
```

Metadata V2 Compare

The Metadata V2 Compare method takes a collection of metadata and returns a true/false response depending on whether the values for the fields provided match the values stored in Keyfactor Command. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method a metadata attribute can be used along with the certificate itself as a second authentication factor to third-party applications.

Example Request

POST http://<host>/CMSApi/Metadata/2/Compare HTTP/1.1

```
{
  "Key": "Thumbprint",
  "Thumbprint": <Thumbprint>
  "metadatalist": [{"MetadataFieldName": "EmailAddress",
    "Value": "example@example.com"}]
}
```

2.6.6.2 Metadata V3

Version 3 of the metadata API allows more flexibility in certificate lookup and security measures than version 2, while allowing more to be done in a single API call and with a more concise JSON representation. Requests to metadata v3 API methods include 3 parts as shown in [Table 652: Metadata V3 Request Body](#).

Table 652: Metadata V3 Request Body

Parameter Name	Parameter Value
Lookup	Given in Table 604: Classic API Certificate Lookup Structure .
Security	Given in Table 653: Metadata V3 Security Bitflags
Metadata	Dictionary of key-value pairs, where the key represents the metadata field and (for the set method) the value represents the value to be associated to the certificate referenced in the "Lookup" value. For Get and GetDefinition methods, the same structure is used but the value is not considered.

The security parameter includes a set of required flags, certain of which necessitate the inclusion of other parameters. The flags should be passed as integers, combined together using bitwise OR. The flags defined in Keyfactor Command are described in [Table 653: Metadata V3 Security Bitflags](#).

Table 653: Metadata V3 Security Bitflags

Value	Definition
00000001	Fail if certificate has been revoked or denied.
00000010	Fail if certificate has expired.
00000100	Fail if certificate status is pending or unknown.
00001000	Fail if metadata values provided for authentication do not match the values stored in Keyfactor Command. Must be paired with an "authmetadata" field, the value of which is a dictionary formatted with {"MetadataFieldName" : "AssociatedCertificateValue" pairs}. This effectively supplants the "Compare" method found in v2.
00100000	Overwrite flag – update value even if field is configured to require explicit overwrites and a value has been associated with the certificate (applies to Set method only).

The metadata argument is a JSON dictionary containing 0 or more key-value pairs. In each pair, the key must correspond to the name of a metadata field. The value, if present, must be of a data type matching the type of the field. For Boolean and integer metadata field values, this is the JSON Boolean or integer type, respectively, while all other metadata field types are to be represented as strings. Dates should be passed in the "YYYY-M-D" format. Multi-valued entries should have a value that exactly matches one of the pre-defined values. For the Get method, values need not be provided and the empty string can be used as the value for each key. In the case where there are 0 metadata arguments, the "Metadata" key must still be present and mapped to an empty object "{}". Note that this syntax is different than previous Metadata API versions, and uses a more concise format. An example is:

```
"Metadata" : {"Email-Contact" : "user@example.com", "Contact-Name" : "John Doe", "ID-number" : 738}
```

Metadata V3 Set

The Metadata V3 Set POST method is used to set metadata value on a certificate in Keyfactor Command. It returns a "200 OK" response with no further content on success.

Example Request

Using thumbprint

POST http://<host>/CMSApi/Metadata/3/Set HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Thumbprint",
    "Thumbprint": "<thumbprint>"
  },
  "Security": {"Flags": 3},
  "Metadata": {"Email-Contact": "bob.smith@example.com"}
}
```

Example Request

Using serial

POST http://<host>/CMSApi/Metadata/3/Set HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Serial",
    "SerialNumber": "<serial-number>",
    "IssuerDN": "<issuer-dn>"
  },
  "Security": {"Flags" : 3},
  "Metadata": {"Email-Contact": "bob.smith@example.com"}
}
```

Metadata V3 Get

The Metadata V3 Get POST method is used to get metadata value on a certificate in Keyfactor Command. Despite the "Get" in the Keyfactor Command method name, the HTTP method must be POST and not GET. As with metadata/3/set (see [Metadata V3 Set on the previous page](#)), the POST request body must consist of a JSON string containing the parameters used to get a certificate's metadata. The "value" attribute for each metadata entry is not used, but must be present and can be set to null or an empty string. The method returns a JSON dictionary in a format identical to the metadata parameter, with key-value pairs containing the fields and values requested.

Example Request

POST http://<host>/CMSApi/Metadata/3/Get HTTP/1.1

```
{
  "Lookup":
  {
    "Type": "Serial",
    "SerialNumber": "<serial-number>",
    "IssuerDN": "<issuer-dn>"
  },
  "Security": {"Flags": 3},
  "Metadata ": {"Email-Contact": ""}
}
```

Example Response

```
{
  "Email-Contact": "bob.smith@example.com"
}
```

Metadata V3 GetDefinition

The Metadata V3 GetDefinition API endpoint will return the definition of a metadata field. Note that, while this does not operate on a certificate, the same request structure is used so the fields must be supplied, but the value will not be used. The structure of the response is given below.

Table 654: POST /GetDefinition Response Body

Parameter Name	Parameter Value
Name	Name of the metadata field.

Parameter Name	Parameter Value
Description	Purpose or intended usage of the field.
Hint	Sample value to be shown when users enter a value for this field in the Keyfactor Command Management Portal.
Validation	Regular Expression string capturing acceptable values for this field.
Required	Boolean indicating whether certificates added to Keyfactor Command must include a value for this field.
Message	Error message to be returned for values that do not conform to the regular expression.
Options	Comma-separated list of allowed values for "multi-valued" metadata fields.
DefaultValue	Initial value to be assigned for new certificates if a value is not provided at addition time.
AllowAPI	Boolean indicating whether values for this field are exposed through API Get and Set requests.
ExplicitUpdate	Boolean indicating whether updates require an appropriate flag to overwrite previous values.

Example Request

POST http://<host>/CMSApi/Metadata/3/GetDefinition HTTP/1.1

```
{
  "Lookup": { "Type": "CMSID", "CMSID" : 1},
  "Security": {"Flags": 0},
  "Metadata ": {"Email-Contact": ""}
}
```

Example Response

```
{
  "Name": "Email-Contact",
  "Description": "Email contact for the certificate.",
  "Hint": "contact@domain.com",
  "Validation": null,
  "Required": false,
```

```

    "Message": null,
    "Options": null,
    "DefaultValue": null,
    "AllowAPI": true,
    "ExplicitUpdate": true
  }

```

2.6.7 Security

The Security component of the Keyfactor Web APIs includes all methods necessary to programmatically add, get and delete security identities as well as get, add, edit and delete the security roles defined in Keyfactor Command. The complete set of methods in the component is given in [2.6.7 Security](#).

Table 655: Security Endpoints

Endpoint	Method	Description
/1/GetIdentities	GET	Return a list of the identities in Keyfactor Command, the roles they are assigned to and their validity
/1/AddIdentity	POST	Add an identity to Keyfactor Command
/1/DeleteIdentities	POST	Remove an identity from Keyfactor Command
/1/GetRoles	GET	Retrieve all the security roles currently defined in Keyfactor Command with all of their permissions, a description and who they are assigned to
/1/AddRole	POST	Add a security role to Keyfactor Command
/1/EditRole	POST	Edit a security role in Keyfactor Command
/1/DeleteRole	POST	Delete a security role from Keyfactor Command

2.6.7.1 Security GetIdentities

The GET GetIdentities request returns a list of identities known to Keyfactor Command with the type of identity (user or group), whether the identity is valid or not and the roles associated with the identity. No parameters or extra headers are necessary for this method.

Example Request

GET http://<host>/CMSApi/Security/1/GetIdentities HTTP/1.1

Example Response

Status Code: 200

```
[
  {
    "Id": <Id>,
    "AccountName": "<Domain>\\<Identity>",
    "Type": "<Identity Type>",
    "Roles": "<List of Roles>",
    "Valid": true
  }
]
```

2.6.7.2 Security AddIdentity

The POST AddIdentities request adds an identity to Keyfactor Command. The POST request must contain a JSON string containing the AD account name. This method returns a 200 with the Id, account name, type, roles, and validity of the identity. The request parameters can be found in [Table 656: POST AddIdentity Request Parameter](#).

Table 656: POST AddIdentity Request Parameter

Parameter Name	Parameter Value
Account	The name of the account that is to be added to CMS. This parameter is required.

Example Request

For a user

POST http://<host>/CMSApi/Security/1/AddIdentity HTTP/1.1

```
{
  "Account": "<Domain>\\<User>"
}
```

Example Request

For a group

POST http://<host>/CMSApi/Security/1/AddIdentity HTTP/1.1

```
{
  "Account": "<Domain>\\<Group>"
}
```

Example Response

Status Code: 200

```
{
  "Id": <Id>,
  "AccountName": "<Domain>\\<Identity>",
  "Type": "<Identity Type>",
  "Roles": "<List of Roles>",
  "Valid": true
}
```

2.6.7.3 Security DeletelDentity

The POST AddIdentities request removes an identity from Keyfactor Command. The POST request must contain a JSON string containing the identity Id. This method returns a 200 a message stating the identity was deleted successfully. The request parameters can be found in [Table 657: POST DeletelDentity Request Parameter](#)

Table 657: POST DeletelDentity Request Parameter

Parameter Name	Parameter Value
Id	The Id of the identity that is to be deleted

Example Request

POST http://<host>/CMSApi/Security/1/DeletelDentity HTTP/1.1

```
{
  "Id": <Id>
}
```

Example Response

Status Code: 200

```
{
  "Message": "ADIdentity deleted successfully"
}
```

2.6.7.4 Security GetRoles

The GET GetRoles endpoint retrieves all the current security roles defined in Keyfactor Command and returns the Id, name, description, validity, permissions and associated identities. The response parameters can be found in [Table 658: POST /GetRoles Response Body](#).

Table 658: POST /GetRoles Response Body

Parameter Name	Parameter Value
Id	The Id of the security role.
Name	The name of the security role.
Description	The description of the security role.
Valid	The validity of the security role.
Permissions	The permissions of the security role.
Identities	The security identities of the security role.

Example Request

GET http://<host>/CMSApi/Security/1/GetRoles HTTP/1.1

Example Response

Status Code: 200

```
[
  {
    "Id": <Id>,
    "Name": "<Name>",
    "Description": "<Description>",
    "Valid": true,
    "Permissions": "<List of Permissions>",
    "Identities": "<List of Identities>"
  },
]
```

2.6.7.5 Security AddRole

The POST AddRole endpoint creates a security role in Keyfactor Command. This endpoint can be used to assign a role to an identity and permissions to a role.

The list of available permissions can be found in [Table 659: Keyfactor Command Permissions List](#).

Request parameters can be found in [Table 660: POST /AddRole Request Parameters](#).

Response parameters can be found in [Table 658: POST /GetRoles Response Body](#).

Table 659: Keyfactor Command Permissions List

Permission Name	Permission Value
AgentAutoRegistrationModify	Permission to modify agent auto registrations.
AgentAutoRegistrationRead	Permission to read agent auto registrations.
AgentManagementModify	Permission to modify agents.
APIRead	Permission to use the Keyfactor Web APIs.
CertificateCollectionsModify	Permission to modify certificate collections.
CertificateMetadataTypesModify	Permission to modify metadatatypes.
CertificateMetadataTypesRead	Permission to read metadata types.
CertificatesImport	Permission to import certificates.
CertificatesModify	Permission to modify certificates' metadata.
CertificatesRead	Permission to read certificates.
CertificatesRecover	Permission to recover certificates.
CertificatesRevoke	Permission to revoke certificates.
CertificateStoreManagementModify	Permission to modify certificate stores.
CertificateStoreManagementRead	Permission to read certificate stores.
CertificateStoreManagementSchedule	Permission to schedule certificate stores.
MacAutoEnrollManagementModify	Permission to modify Mac auto enrollment settings.
MacAutoEnrollManagementRead	Permission to read Mac auto enrollment settings.
ManagementPortalRead	Permission to read the Keyfactor Command Management Portal.

Permission Name	Permission Value
MonitoringModify	Permission to modify monitoring settings.
MonitoringRead	Permission to read monitoring settings.
MonitoringTest	Permission to test monitoring.
PKIManagementModify	Permission to modify PKI management settings.
PKIManagementRead	Permission to read PKI management settings.
ReportsModify	Permission to modify reports.
ReportsRead	Permission to read reports.
SecuritySettingsModify	Permission to modify security settings.
SecuritySettingsRead	Permission to read security settings.
SSLManagementModify	Permission to modify SSL management settings.
SSLManagementRead	Permission to read SSL management settings.
SystemSettingsModify	Permission to modify system settings.
SystemSettingsRead	Permission to read system settings.
WorkflowModify	Permission to modify alert definitions.
WorkflowParticipate	Permission to approve/deny pending certificates.
WorkflowRead	Permission to read certificates in a pending state and alert definitions.
WorkflowTest	Permission to test alerts.

Table 660: POST /AddRole Request Parameters

Parameter Name	Parameter Value
Name	The name of the security role. This parameter is required .
Description	A description of the security role. This parameter is required .
Permissions	A list of permissions for the security role. This parameter is optional.

Parameter Name	Parameter Value
Identities	A list of security identities that will be associated with the security role. This parameter is optional.

Example Request

POST http://<host>/CMSApi/Security/1/AddRole

```
{
  "Name": "<Name>",
  "Description": "<Description>",
  "Permissions": [ "<Permission>", "<Permission>" ],
  "Identities": [ "<Domain>\\<Identity>", "<Domain>\\<Identity>" ]
}
```

Example Response

Status Code: 200

```
{
  "Id": <Id>, "Name": "<Name>",
  "Description": "<Description>",
  "Valid": true, "Permissions": "<List of permissions>",
  "Identities": "<List of identities>"
}
```

2.6.7.6 Security EditRole

The POST EditRole endpoint modifies existing security roles. The parameters for the EditRole endpoint can be found in [Table 661: POST /EditRole Request Parameters](#). The administrator role's name, description and permissions cannot be changed.

Table 661: POST /EditRole Request Parameters

Parameter Name	Parameter Value
Id	The Id of the security role to be edited. This parameter is required .

Parameter Name	Parameter Value
Name	The name to which the security role will be changed. This parameter is optional.
Description	The description of which the security role will be changed. This parameter is optional.
Permissions	The permissions to which the security role will be changed. This parameter is optional.
Identities	The identities to which the security role will be changed. This parameter can take either the Id of a security identity or the identity name. This parameter is optional.

Example Request

POST http://<host>/CMSApi/Security/1/EditRole

```
{
  "Id":<Id>,
  "Identities":[<List of Identities>]
}
```

Example Response

Status Code: 200

```
{
  "Id": <Id>,
  "Name": "<Name>",
  "Description": "<Description>",
  "Valid": true,
  "Permissions": "<List of Permissions>",
  "Identities": "List of Identities"
}
```

2.6.7.7 Security DeleteRole

The POST DeleteRole endpoint can be used to delete a security role from Keyfactor Command. A role can be deleted by name or Id. The administrator role cannot be deleted.

Example Request

POST http://<host>/CMSApi/Security/1/DeleteRole

```
{
  "Id": <Id>
}
```

Example Response

Status Code: 200

```
{
  "Message": "Successfully deleted Role: <Name of Role>"
}
```

2.6.8 SSL

Keyfactor Command allows, through the Keyfactor Command Windows Agent, various network segments to be scanned for endpoints serving SSL certificates as well as endpoints presenting a certificate to be monitored for changes in status. An SSL scan is executed against an Endpoint Group, which is a collection of network endpoints, along with a scan schedule. Two types of endpoint groups exist:

- **Discovery**
A Discovery endpoint group contains endpoints to be scanned for certificates.
- **Monitoring**
A Monitoring group allows endpoints that presented a certificate in a discovery scan to be repeatedly scanned for changes.

The SSL Web API component allows SSL scan configuration to be retrieved and updated in order to facilitate rapid configuration of large numbers of network endpoints. The methods included in this component are given in [Table 662: SSL Endpoints](#). As with the Certstore API component, the SSL component only has 1 version and all endpoints can be accessed through a URL path including `/SSL/1/`.

Table 662: SSL Endpoints

Endpoint	Method	Description
AddEndpoint	POST	Add a new endpoint to an endpoint group
AddEndpointGroup	POST	Add a new endpoint group to an agent.
Agents	GET	Return a list of Agents that can perform SSL scans.
EndpointGroups	GET	Returns a list of established endpoint groups for a particular agent

2.6.8.1 SSL AddEndpoint

The AddEndpoint method allows an endpoint to be added to an endpoint group. It returns HTTP 200 OK with response body "true" for successful requests or an appropriate 4xx error with a message on a failure.

Table 663: POST /AddEndpoint Request Body

Parameter Name	Parameter Value								
EndpointGroupId	GUID of the endpoint group to which the endpoint should be added, which can be obtained through a combination of the GET SSL/1/Agents and GET SSL/1/EndpointGroups methods.								
ItemType	Format in which the network endpoint is defined. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>IPAddress</td></tr><tr><td>2</td><td>DnsName</td></tr><tr><td>3</td><td>NetworkNotation</td></tr></table>	Value	Description	1	IPAddress	2	DnsName	3	NetworkNotation
Value	Description								
1	IPAddress								
2	DnsName								
3	NetworkNotation								
Value	String representing the endpoint. Should be formatted to match the expected format of the ItemType, e.g. "192.168.41.171:443" for IPAddress, "www.example.com:443" for DnsName, or "192.168.0.0/16:443" for NetworkNotation (corresponding to the IP address range 192.168.0.1-192.168.255.254, on port 443 for all endpoints).								

Example Request

POST http://<host>/CMSApi/SSL/1/AddEndpoint HTTP/1.1

```
{
  "EndpointGroupId": <GUID>,
  "ItemType": 3,
  "Value": "192.168.0.0/24:443"
}
```

2.6.8.2 SSL AddEndpointGroup

The AddEndpoint Group method allows a new endpoint group to be added for an agent. This requires the two fields shown in [Table 664: POST /AddEndpointGroup Request Body](#). When successful, the GUID and Name of the created endpoint group are returned.

Table 664: POST /AddEndpointGroup Request Body

Parameter Name	Parameter Value
AgentId	GUID of the Agent that will scan endpoints in this group.
FriendlyName	Name of the group to be created.

Table 665: POST /AddEndpointGroup Response Body

Parameter Name	Parameter Value
Guid	Identifier for this endpoint group within Keyfactor Command.
Name	Name of the endpoint group used by Keyfactor Command.

Example Request

POST http://<host>/CMSApi/SSL/1/AddEndpointGroup HTTP/1.1

```
{
  "AgentId": "<GUID>",
  "FriendlyName": "local-endpoints"
}
```

Example Response

```
{
  "Guid": "0a44f8af-6808-40ad-9816-d08c2c45d45a",
  "Name": "local-endpoints"
}
```

2.6.8.3 SSL Agents

The Agents HTTP Get method takes no parameters and returns a list of agents that can perform SSL scans. The result will be an array of structures, each with a GUID and name.

Table 666: GET /Agents Response Body

Parameter Name	Parameter Value
Guid	Identifier for this agent within Keyfactor Command.
Name	Hostname of the agent used by Keyfactor Command.

Example Request

GET http://<host>/CMSApi/SSL/1/Agents

Example Response

```
[
  {
    "Guid": "956282ef-f01b-4ae3-8cd2-57327749e15c",
    "Name": "Dev1.jdk.com"
  }
]
```

2.6.8.4 SSL EndpointGroups

The EndpointGroups method returns the list of endpoint groups that have been defined for a particular agent. Unlike most methods in the Keyfactor Web APIs, this is a GET request that takes a parameter as part of the URL query string. The "agentId" required argument is the GUID of the agent for the endpoint groups that should be listed. This value can be retrieved from the GET /CMSApi/SSL/1/Agents response (see [SSL Agents on the previous page](#)). The response returned from this method will be an array of endpoint groups with the same structure as the response to AddEndpointGroup (see [Table 665: POST /AddEndpointGroup Response Body](#)).

Example Request

GET http://<host>/CMSApi/SSL/1/EndpointGroups?agentId=956282ef-f01b-4ae3-8cd2-57327749e15c HTTP/1.1

Example Response

```
[
  {
    "Guid": "bbf3c3ce-9d7f-48b1-ae5c-c8d38f41d2f1",
    "Name": "MyDiscoveryGroup"
  }
]
```

```
}  
]
```

2.6.9 Workflow

Workflow in Keyfactor Command refers to the process through which pending certificate requests are approved or denied. The Workflow API provides the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. This component, like several others, currently encompasses only one version, and methods can all be accessed with the `/Workflow/1/` prefix. The methods within this component are listed in [Table 667: Workflow Endpoints](#)

Table 667: Workflow Endpoints

Endpoint	Method	Description
Approve	POST	Approve a given pending certificate request
Deny	POST	Deny a given pending certificate request
PendingList	POST	Retrieve a list of outstanding pending certificate requests
Status	GET	Synonym for GET CMSApi/Status (see Status on page 1706)

2.6.9.1 Workflow Approve and Deny

The Approve POST method will attempt to approve the provided pending certificate enrollment request(s), while POST Deny will attempt to deny the request(s). In both cases, the structure of the pending request(s) is the same—an array of pending certificate enrollment requests must be provided in the format given in [Table 669: POST /Approve and /Deny PendingRequests Details](#). If only one request is to be sent, it should be provided as a list with one element. The one difference between the request formats for the two methods is that Deny supports an optional “Comments” field, which provides an opportunity to describe the reason for the request denial, shown in [Table 668: POST /Approve and /Deny Request Body](#). In both cases, an array of successful, failed and forbidden requests will be returned. The method will accept various inputs used to qualify the request to be approved, as shown in [Table 669: POST /Approve and /Deny PendingRequests Details](#).

Table 668: POST /Approve and /Deny Request Body

Parameter Name	Parameter Value
PendingRequests	Array of requests to be approved or denied. Required for both methods.
Comments	String describing the reason for the request denial. Optional for Deny and not permitted for Approve.

Table 669: POST /Approve and /Deny PendingRequests Details

Parameter Name	Parameter Value
CMSRequestId	The Keyfactor Command request database identifier. This parameter is the most specific, and can be used without any other parameters provided. An exception will be returned if this identifier is not found within Keyfactor Command.
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CALogicalName and CRequestId parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and request ID is not found within Keyfactor Command.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CAHost and CRequestId parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and request ID is not found within Keyfactor Command.
CRequestId	Request/row identifier of the request for certificate authority defined by CAHost and CALogicalName. This parameter also requires the CALogicalName and CAHost parameters to be provided in the request. An exception will be returned if a certificate authority with this host, logical name and request ID is not found within Keyfactor Command.

Table 670: POST /Approve and /Deny Response Body

Parameter Name	Parameter Value
Successes	An array of the successful approval response details (see table below in this section).
Failures	An array of the failed approval response details (see table below in this section). Failures of this type are generally exceptions.
Denials	An array of the approval requests that were denied (see table below in this section). Denials are usually created by insufficient user permissions required to perform the approval.

Table 671: POST /Approve and /Deny Result Details

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted.
CMSRequestId	The Keyfactor Command request database identifier.
CARequestId	Request/row identifier of the request for certificate authority defined by CAHost and CALogicalName.
Comment	Brief description of the reason for the failure or denial, or simply 'Success' if the request succeeded.

Example Request

Providing only a CMSRequestId

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [
    {"CMSRequestId": <cms-request-id1>},
    {"CMSRequestId": <cms-request-id2>}
  ]
}
```

Example Request

Providing the certificate authority information

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [{
    "CAHost": "<ca-host>", "CALogicalName": "<ca-name>", "CARequestId": "<ca-request-id>"
  }]
}
```

Example Request

Providing both types of information

POST http://<host>/CMSApi/Workflow/1/Approve HTTP/1.1

```
{
  "PendingRequests":
  [
    {"CMSRequestId":<cms-request-id1>},
    {"CAHost": "<ca-host>", "CALogicalName": "<ca-name>", "CARequestId":<ca-request-id>}
  ]
}
```

Example Response

(Successful)

```
{
  "Successes":
  [{
    "CAHost": "<ca-host>",
    "CALogicalName": "<ca-name>",
    "CARequestId": <ca-request-id>,
    "Comment": "Successful"
  }],
  "Failures": [],
  "Denials": []
}
```

Example Response

(Invalid identifier)

```
{
  "Successes": [],
  "Failures": [{
    "CAHost": "<ca-host>",
    "CALogicalName": "<ca-name>",
    "CARequestId": <ca-request-id>,
    "CMSRequestId": <cms-request-id>,
    "Comment": "Unable to approve the request: <ca request id> for the certificate authority: '<ca-host-name>\<ca-logical-name>' \r\nfor the current user: '<requester>': No request for: CMS Request Id: 0, CA Host: <ca-host>, CA Logical Name: <ca-name>, CA Request Id: <ca-request-id>"
  }],
}
```

```

    "Denials": []
  }
}

```

2.6.9.2 PendingList

The POST PendingList method will return the current set of pending certificate enrollment requests stored within Keyfactor Command matching the provided parameters. The response will be a JSON object with a single field , PendingRequests, mapped to an array where each entry represents a single pending certificate request that matches the parameters provided in the HTTP request. Each of these entries will have the format given in [Table 673: POST /PendingList Response Body](#).

Table 672: POST /PendingList Request Body

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CALogicalName parameter to be provided in the request. An exception will be returned if a certificate authority with this host and logical name is not found within Keyfactor Command.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted. This parameter also requires the CAHost parameter to be provided in the request. An exception will be returned if a certificate authority with this host and logical name is not found within Keyfactor Command.
LowerDate	Any pending requests prior to this date should be ignored. Optional.
UpperDate	Any pending requests after this date should be ignored. Optional.

Table 673: POST /PendingList Response Body

Parameter Name	Parameter Value
CAHost	Host name of the certificate authority against which the certificate enrollment request was submitted.
CALogicalName	Logical name of the certificate authority against which the certificate enrollment request was submitted.
CAResquestId	Identifier associated with the request within the certificate authority.
CertificateAuthority	Combination of the CAHost and CALogicalName (CAHost\\CALogicalName).

Parameter Name	Parameter Value
CMSRequestId	Database identifier associated with the request within Keyfactor Command.
CommonName	Common name requested for the certificate.
DistinguishedName	Distinguished name requested for the certificate.
TemplateName	Certificate template for which the certificate was requested.
KeySize	Number of bits in the certificate's private key.
Requester	User or principal who requested the certificate, generally formatted "DOMAIN\user".
SubmissionDate	ISO-8601 formatted timestamp at which the certificate request was received.
SubjectAlternativeName	Array of SANs requested for the certificate. The entries each correspond to one requested SAN element, and each one will be in the form given in Table 674: POST /PendingList SubjectAlternativeName Details

Table 674: POST /PendingList SubjectAlternativeName Details

Parameter Name	Parameter Value														
Type	<p>Type of this SAN element on the certificate request. Will take one of the following values:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other</td></tr> <tr> <td>1</td><td>RFC 822 name (e-mail address)</td></tr> <tr> <td>2</td><td>DNS name</td></tr> <tr> <td>3</td><td>X400 address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Edi Party Name</td></tr> </table>	Value	Description	0	Other	1	RFC 822 name (e-mail address)	2	DNS name	3	X400 address	4	Directory Name	5	Edi Party Name
Value	Description														
0	Other														
1	RFC 822 name (e-mail address)														
2	DNS name														
3	X400 address														
4	Directory Name														
5	Edi Party Name														

Parameter Name	Parameter Value														
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>6</td><td>URI</td></tr> <tr> <td>7</td><td>IP address</td></tr> <tr> <td>8</td><td>Registered ID</td></tr> <tr> <td>100</td><td>Microsoft NT Principal Name</td></tr> <tr> <td>101</td><td>Microsoft NTDS Replication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	6	URI	7	IP address	8	Registered ID	100	Microsoft NT Principal Name	101	Microsoft NTDS Replication	999	Unknown
Value	Description														
6	URI														
7	IP address														
8	Registered ID														
100	Microsoft NT Principal Name														
101	Microsoft NTDS Replication														
999	Unknown														
Value	String representation of the value requested for this SAN element.														

Example Request

POST http://<host>/CMSApi/Workflow/1/PendingList HTTP/1.1

```
{
  "CAHost": "<ca-host>",
  "CALogicalName": "<ca-name>",
  "LowerDate": <date or null or left out completely>,
  "UpperDate": <date or null or left out completely>
}
```

Example Response

```
{
  "PendingRequests":
  [{
    "CAHost": "<ca-host>",
    "CALogicalName": "<ca-name>",
    "CARequestId": <ca-request-id>,
    "CMSRequestId": <cms-request-id>
  }]
}
```

2.6.10 Workflow Expiration Alerts

Workflow in Keyfactor Command refers to the process through which pending certificate requests are approved or denied. The Workflow Expiration Alert APIs provides the ability to manage expiration alerts, event handlers, registered event handlers and schedules.

2.6.10.1 Workflow Expiration Alerts Endpoints

The Workflow Expiration Alert API provides the ability to list, create, update and delete expiration alerts for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 675: Workflow Expiration Alerts Endpoints](#)

Table 675: Workflow Expiration Alerts Endpoints

Endpoint	Method	Description
ExpirationAlerts	GET	List all Expiration Alerts or a get a single expiration alert definition.
ExpirationAlerts	POST	Create a new expiration alert definition.
ExpirationAlerts	PUT	Update an existing expiration alert definition.
ExpirationAlerts	DELETE	Delete an existing expiration alert definition.

Workflow Expiration Alerts

 **Note:** For the GET (single), PUT, and DELETE methods you will need the expiration alert ID. You will need to run the GET (list) method to acquire the ID in order to proceed with those methods.

 **Note:** For the POST and PUT methods, if you are using Registered Event Handlers, you will need to run the Event handler GET (list) method to acquire the ID prior to issuing the expiration alert method (see [Workflow Expiration Alert Handler Parameters Endpoints on page 1700](#)).

Table 676: Workflow Expiration Alert Parameters

Parameter Name	Parameter Value
Id/Alert ID	The database ID of the Alert
DisplayName	Alert display name
Subject	The subject field of the alert

Parameter Name	Parameter Value
Message	The message field of the alert
UseHandler	True/False, whether or not the Use Handler checkbox is checked for the alert
Days	The number of days to alert before expiration
RegisteredEventHandlerId	Id of the Event Handler to use. See (Workflow Expiration Alert Handler Parameters Endpoints on page 1700)
CertificateQuery	Name, and/or Id, of the certificate collection of the alert
ExpirationAlertRecipients	Id and/or Recipient email address in a comma separated list of objects. So there could be multiple addresses chunks in curly brackets{}, comma separated in the array in the square brackets []

LIST all expiration alerts:

Example Request

GET ~/ExpirationAlerts/1/List?page=<page number>&returnlimit=<max results to get>&sort-name=<field to sort by>&sortorder=<asc or desc>

no body

Example Response

```
[
  {
    "Id": <id>,
    "DisplayName": "Alert display name",
    "QueryName": "Certificate query name",
    "Days": <number of days to alert before expiration>,
    "HandlerName": "Name of the Event Handler if any"
  }
]
```

Get a single alert definition

Example Request

GET ~/ExpirationAlerts/1/<Alert Id>

no body

Example Response

```
[
  {
    "Id": <id>,
    "DisplayName": "Alert display name",
    "Subject": "Alert Subject",
    "Message": "Alert message body",
    "UseHandler": <true/false>,
    "Days": <number of days to alert before expiration>,
    "RegisteredEventHandlerId": <Id of the Event Handler to use>,
    "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },
    "ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]
  }
]
```

Create New Expiration Alert

Example Request

POST ~/ExpirationAlerts/1/

```
{
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id> },
  "ExpirationAlertRecipients": [ { "Email": "Recipient email address" } ]
}
```

Example Response

```
{
  "Id": <id>,
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },
  "ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]
}
```

Update Existing Expiration Alert

Example Request

PUT ~/ExpirationAlerts/1/<Alert Id>

```
{
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id> },
  "ExpirationAlertRecipients": [ { "Email": "Recipient email address" } ]
}
```

Example Response

```
{
  "Id": <id>,
  "DisplayName": "Alert display name",
  "Subject": "Alert Subject",
  "Message": "Alert message body",
  "UseHandler": <true/false>,
  "Days": <number of days to alert before expiration>,
  "RegisteredEventHandlerId": <Id of the Event Handler to use>,
  "CertificateQuery": { "Id": <Cert query id>, "Name": "Cert query name" },
}
```

```
"ExpirationAlertRecipients": [ { "Id": <recipient Id>, "Email": "Recipient email address" } ]
}
```

Delete Expiration Alert

Example Request

DELETE ~/ExpirationAlerts/1/<Alert Id>

no body

Example Response

204 No Content

2.6.10.2 Workflow Expiration Alert Event Handler Parameters API

The Workflow Expiration Alert Event Handler Parameter API provides the ability to list, create, update and delete expiration alert event handler parameters for specific Keyfactor Command expiration alerts via the Keyfactor API. The methods within this component are listed in [Table 677: Workflow Expiration Alerts Event Handler Parameters Endpoints](#)

Table 677: Workflow Expiration Alerts Event Handler Parameters Endpoints

Endpoint	Method	Description
HandlerParameters	GET	List all, or a given, expiration alert Handler Parameter(s) for an expiration alert.
HandlerParameters	POST	Create a new handler parameter for an expiration alert.
HandlerParameters	PUT	Update an existing expiration alert handler parameter for an expiration alert.
HandlerParameters	DELETE	Delete an existing expiration alert handler parameter for an expiration alert.

Workflow Expiration Alert Handler Parameters Endpoints

Note: For the GET (single), PUT, and DELETE methods you will need the handler parameter ID. You will need to run the GET (list) method to acquire the ID in order to proceed with those methods.

Table 678: Workflow Expiration Alert Handler Parameters

Parameter Name	Parameter Value																
Id/Alert ID	The database ID of the handler parameter																
Key	The parameter name																
DefaultValue	The given value for the handler parameter																
ParameterType	<div><div>The event handler parameter type number</div><table><tr><th>Type</th><th>Number</th></tr><tr><td>Special Text</td><td>0</td></tr><tr><td>Static Value</td><td>1</td></tr><tr><td>PowerShell Script Name</td><td>2</td></tr><tr><td>Logging Target Machine</td><td>3</td></tr><tr><td>Renewal URL</td><td>4</td></tr><tr><td>Renewal Template</td><td>5</td></tr><tr><td>Renewal Certificate Authority</td><td>6</td></tr></table></div>	Type	Number	Special Text	0	Static Value	1	PowerShell Script Name	2	Logging Target Machine	3	Renewal URL	4	Renewal Template	5	Renewal Certificate Authority	6
Type	Number																
Special Text	0																
Static Value	1																
PowerShell Script Name	2																
Logging Target Machine	3																
Renewal URL	4																
Renewal Template	5																
Renewal Certificate Authority	6																
ExpirationAlertDefinitionId	The database ID of the expiration alert definition																

List All Handler Parameters for an Expiration Alert:

Example Request

GET ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/List?page=<page number>&returnlimit=<max results to get>&sortname=<field to sort by>&sortorder=<asc or desc>

no body

Example Response

```
[
  {
    "Id": <id>,
    "Key": "Parameter Key name",
    "DefaultValue": "default value for parameter",
    "ParameterType": <Event Handler Parameter Type number>,
    "ExpirationAlertDefinitionId": <alert Id>
  }
]
```

Get Handler Parameter by Id

Example Request

GET ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

no body

Example Response

```
[
  {
    "Id": <id>,
    "Key": "Parameter Key name",
    "DefaultValue": "default value for parameter",
    "ParameterType": <Event Handler Parameter Type number>,
    "ExpirationAlertDefinitionId": <alert Id>
  }
]
```

Create New Handler Parameter

Example Request

POST ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters

```
{
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

Example Response

```
{
  "Id": <id>,
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

Update Existing Handler Parameter

Example Request

PUT ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

```
{
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
  "ParameterType": <Event Handler Parameter Type number>,
}
```

Example Response

```
{
  "Id": <id>,
  "Key": "Parameter Key name",
  "DefaultValue": "default value for parameter",
}
```

```
"ParameterType": <Event Handler Parameter Type number>,  
}
```

Delete Handler Parameter

Example Request

DELETE ~/ExpirationAlerts/1/<Alert Id>/HandlerParameters/<handler param Id>

no body

Example Response

204 No Content

2.6.10.3 Workflow Expiration Alert Registered Event Handlers API

The Workflow Expiration Alert Registered Event Handlers API provides the ability to list expiration alert registered event handlers: for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 679: Workflow Expiration Alerts Registered Event Handlers Endpoints](#)

Table 679: Workflow Expiration Alerts Registered Event Handlers Endpoints

Endpoint	Method	Description
RegisteredEventHandlers	GET	Get list of Registered Event Handlers

Workflow Expiration Alert Registered Event Handlers Parameters

Table 680: Workflow Expiration Alert Registered Event Handlers Parameters

Parameter Name	Parameter Value
Id	The database ID of the registered event handler
Classname	Fully qualified class name of the registered event handler implementation in the associated assembly
DisplayName	The display name of registered event handler

Parameter Name	Parameter Value
Enabled	True/False, whether or not the Use Handler checkbox is checked for the alert
RegisteredEventAssemblyId	The Id of the registered event handler assembly

LIST all Registered Event Handlers:

Example Request

GET ~/ExpirationAlerts/1/RegisteredEventHandlers/List?page=<page number>&returnlimit=<max results to get>

no body

Example Response

```
{
  "Id": <registered event handler Id>,
  "ClassName": "class name of event handler",
  "DisplayName": "display name of event handler",
  "Enabled": <true/false>,
  "RegisteredEventAssemblyId": <id of the registered event assembly>
}
```

2.6.10.4 Workflow Expiration Alert Schedule API

The Workflow Expiration Alert Schedule API provides the ability to list, create, and set expiration alert schedules for Keyfactor Command via the Keyfactor API. The methods within this component are listed in [Table 681: Workflow Expiration Alerts Schedule Endpoints](#)

Table 681: Workflow Expiration Alerts Schedule Endpoints

Endpoint	Method	Description
Schedule	GET	Get the schedule set for all expiration alerts.
Schedule	POST	Create a new schedule for an expiration alert.

Workflow Expiration Alert Schedule Parameters

Table 682: Workflow Expiration Alert Schedule Parameters

Parameter Name	Parameter Value
Daily	The display name of registered event handler
Time	The ISO string of time to schedule run

LIST Expiration Alert Schedule

Example Request

GET ~/ExpirationAlerts/1/Schedule

no body

Example Response

```
{
  "Daily": {
    "Time": "ISO string of time to schedule run"
  }
}
```

Set Alerts Schedule

Example Request

POST ~/ExpirationAlerts/1/Schedule

```
{
  "Daily": {
    "Time": "ISO string of time to schedule run"
  }
}
```

Example Response

204 No Content

2.6.11 Status

The Status Web API component provides a single method to retrieve various aspects of the Keyfactor Command server state. This method is an HTTP GET Status request with no parameters required. As of Keyfactor Command 5.0, the Status endpoint generally is not needed by a Web API client application, as the Keyfactor Command version is passed back in an HTTP header with every response to every Web API request. However, it is included to preserve compatibility with applications already using it or applications requiring more information.

Example Request

GET http://<host>/CMSApi/Status HTTP/1.1

Example Response

Status Code: 200

```
{
  "ApiMajorRev": 2,
  "ApiMinorRev": 0,
  "ProductMajorVersion": 5,
  "ProductMinorVersion": 0,
  "ProductBranchVersion": 0,
  "ProductBuildVersion": 1,
  "LicenseStatus": "Licensed",
  "Modules": [{
    "Name": "CertEnroll",
    "Versions": [1, 2, 3]
  },
  {
    "Name": "Certificates",
    "Versions": [1, 2, 3]
  },
  {
    "Name": "CertStore",
    "Versions": [1]
  },
  {
    "Name": "Metadata",
    "Versions": [2, 3]
  },
  ]
}
```

```

{
    {
        "Name": "Ssl",
        "Versions": [1]
    },
    {
        "Name": "Status",
        "Versions": null
    },
    {
        "Name": "Workflow",
        "Versions": [1]
    }
}

```

2.6.12 vSCEP

The vSCEP API method supports enrollment through the Keyfactor Command implementation of the SCEP protocol. The single method—GET CMSValidation/api/vSCEP—is used to retrieve a SCEP challenge, while also associating that challenge with the specified certificate subject information. This method differs from the other Web API methods in that it is not included in the CMSApi virtual directory, but in the separate "CMSValidation/api" directory. It also differs in that, while it is a GET method, it does take request parameters, which means that these parameters must be URL-encoded in the query string. Like the other Web API methods, however, it requires the Accept and Authorization headers, and returns a 200 OK status if a connection was successfully made to the vSCEP server or an appropriate 4XX status if a connection could not be made. The request and response formats are given in the below tables and example. All fields in the request are optional, and all but the Subject parameter may be submitted multiple times (for example, to include two different DNS SANs in the same certificate).

Table 683: GET /CMSValidation/api/vSCEP Query String Parameters

Parameter Name	Parameter Value
Subject	Distinguished Name that should be used as the certificate subject.
DNS	Subject Alternative Name representing a DNS record.
IP	Subject Alternative Name representing an IP address.
RFC822	Subject Alternative Name representing an RFC822 Name (email address).
NTPrincipal	Subject Alternative Name representing an NT Principal Name.

Table 684: GET /CMSValidation/api/vSCEP Response Body

Parameter Name	Parameter Value
Status Code	HTTP Status Code vSCEP received from the SCEP server. This will be 200 if the request was successful.
Message	Status message for the request. In the case of an error retrieving a SCEP challenge, this will provide more detailed error information.
Challenge	SCEP Challenge represented as a hex string. In the case of an error, this will be null.
Hash	MD5 hash of the CA certificate associated with the SCEP server. In the case of an error, this will be null.

Example Request

GET http://<host>/CMSValidation/api/vSCEP?subject=CN%3DBob%20Smith%2CO%3DExample%20Company& RFC822-2=bob.smith%40mail.example.com HTTP/1.1

Example Response

Status Code: 200

```
{
  "Challenge": "247FAFEEABA1F9B7",
  "Hash": "01940B86 9C6C03DC 79BF2E5B 741779DF",
  "StatusCode": 200,
  "Message": "Request stored successfully"
}
```

2.7 API Change Log

In this section you will find the change history for the Keyfactor Command API endpoints from version 9.0 on.

2.7.1.1 API Change Log v9.0

API changes for Keyfactor Command version 9.0 Major release

Table 685: API Change Log v9.0

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/Copy	POST	Add	
/Certificates/{id}/History	GET	Add	
/Certificates/{id}/Security	GET	Add	
/Certificates/{id}/Validate	GET	Add	
/Certificates/Locations/{id}	GET	Add	
/Certificates/Metadata/Compare	GET	Add	
/Certificates/Metadata/All	PUT	Add	
/Certificates/RevokeAll	POST	Add	
/CertificateStoreContainers	GET	Add	
/CertificateStoreContainers/{id}	GET	Add	
/CertificateStores/Certificates/Add	POST	Add	
/CertificateStores/Certificates/Remove	POST	Add	
/Enrollment/CSR/Context/My	GET	Add	
/Enrollment/PFX/Context/My	GET	Add	
/JobTypes/Custom	GET, POST, PUT	Add	
/JobTypes/Custom/{id}	GET, DELETE	Add	
/OrchestratorJobs/Custom	POST	Add	
/OrchestratorJobs/JobHistory	GET	Add	
/OrchestratorJobs/JobStatus/Data	GET	Add	
/Reports	GET, PUT	Add	

Endpoint	Method	Action	Notes
/Reports/{id}	GET	Add	
/Reports/{id}/Parameters	GET, PUT	Add	
/Reports/{id}/Schedules	GET, POST, PUT	Add	
/Reports/Custom	GET, POST, PUT	Add	
/Reports/Custom/{id}	GET, DELETE	Add	
/Reports/Schedules/{id}	GET, DELETE	Add	
/Security/Identities	GET, POST	Add	
/Security/Identities/{id}	DELETE	Add	
/Security/Identities/Lookup	GET	Add	
/Security/Roles	GET, POST, PUT	Add	
/Security/Roles/{id}	GET, DELETE	Add	
/SSH/Keys/Unmanaged	DELETE	Add	
/SSH/ServiceAccounts	DELETE	Add	
/SSH/Users/Access	POST	Add	
/SSL/Networks/{id}/Scan	POST	Add	

2.7.1.2 API Change Log v9.1

API changes for Keyfactor Command version 9.1 incremental release

Table 686: API Change Log v9.1

Endpoint	Methods	Action	Notes
/CertificateStores/{id}/Inventory	GET	Add	
/Enrollment/PFX/Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/PFX/Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/Certificates/Add	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateStores/Certificates/Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/{id}/Permissions	GET	Deprecate	

2.7.1.3 API Change Log v9.2

API changes for Keyfactor Command version 9.2 incremental release

Table 687: API Change Log v9.2

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/JobHistory	GET	Fix	Request no longer fails for 'Dynamic' job types.
/Reports/Schedules/{id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

2.7.1.4 API Change Log v9.3

API changes for Keyfactor Command version 9.3 incremental release

Table 688: API Change Log v9.3

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

2.7.1.5 API Change Log v9.4

API changes for Keyfactor Command version 9.4 incremental release

Table 689: API Change Log v9.4

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

2.7.1.6 API Change Log v9.5

API changes for Keyfactor Command version 9.5 incremental release

Table 690: API Change Log v9.5

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

2.7.1.7 API Change Log v9.6

API changes for Keyfactor Command version 9.6 incremental release.

No API endpoint changes were made in this release.

2.7.1.8 API Change Log v9.7

API changes for Keyfactor Command version 9.7 incremental release

Table 691: API Change Log v9.7

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

2.7.1.9 API Change Log v9.8

API changes for Keyfactor Command version 9.8 incremental release.

No API endpoint changes were made in this release.

2.7.1.10 API Change Log v9.9

API changes for Keyfactor Command version 9.9 incremental release

Table 692: API Change Log v9.9

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

2.7.2 v10 API Change Log

Find the version 10 change log for Keyfactor API below.

Link to Change Logs

[API Change Log v10.0 on the next page](#)

2.7.2.1 API Change Log v10.0

API changes for Keyfactor Command version 10.0 Major release

Table 693: API Change Log v10.0

Endpoint	Methods	Action	Notes
/Agents/{id}	GET	Add	
/Agents/Reset	POST	Add	
/AgentBlueprint	GET	Add	
/AgentBlueprint/{id}	GET, DELETE	Add	
/AgentBlueprint/{id}/Jobs	GET	Add	
/AgentBlueprint/{id}/Stores	GET	Add	
/AgentBluePrint/ApplyBlueprint	POST	Add	
/AgentBluePrint/GenerateBluePrint	POST	Add	
/Alerts/Denied	GET, PUT, POST	Add	
/Alerts/Denied/{id}	GET, DELETE	Add	
/Alerts/Expiration	GET, PUT, POST	Add	
/Alerts/Expiration/{id}	GET, DELETE	Add	
/Alerts/Expiration/Schedule	GET, PUT	Add	
/Alerts/Expiration/Test	POST	Add	
/Alerts/Expiration/TestAll	POST	Add	
/Alerts/IssuedAlerts	GET, PUT, POST	Add	
/Alerts/IssuedAlerts/{id}	GET, DELETE	Add	
/Alerts/Issued/Schedule	GET, PUT	Add	
/Alerts/KeyRotation	GET, PUT, POST	Add	

Endpoint	Methods	Action	Notes
/Alerts/KeyRotation/{id}	GET, DELETE	Add	
/Alerts/KeyRotation/Schedule	GET, PUT	Add	
/Alerts/KeyRotation/Test	POST	Add	
/Alerts/KeyRotation/TestAll	POST	Add	
/Alerts/Pending	GET, PUT, POST	Add	
/Alerts/Pending/{id}	GET, DELETE	Add	
/Alerts/Pending/Schedule	GET, PUT	Add	
/Alerts/Pending/Test	POST	Add	
/Alerts/Pending/Test/{id}	POST	Add	
/CertificateAuthorities	GET	Update	Schedules are now included in the results.
/CertificateAuthorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	DELETE	Update	Deletion is now prevented if schedules are associated.
/CertificateCollections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/CertificateCollections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	

Endpoint	Methods	Action	Notes
/CertificateStoreContainers	POST	Add	
/CertificateStoreContainers/{id}	PUT, DELETE	Add	
/CertificateStores/Server	GET, POST, PUT	To Be Deprecated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/CertificateStores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring

Endpoint	Methods	Action	Notes
/Monitoring/Revocation/{id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}
/Monitoring/Revocation/Test	POST	Add	
/Monitoring/Revocation/TestAll	POST	Add	
/Orchestrators/JobHistory	GET	Update	Added JobId field.
/Orchestrators/ScheduledJobs	GET	Add	
/OrchestratorJobs/Reschedule	POST	Add	
/OrchestratorJobs/Unschedule	POST	Add	
/OrchestratorJobs/Acknowledge	POST	Add	
/Security/Identities/{id}	GET	Add	
/Security/Roles/{id}/Identities	GET, POST	Add	
/Security/Roles/{id}/Containers	GET, POST	Add	
/Security/Roles/{id}/Copy	POST	Add	
/Security/Roles/{id}/Permissions	GET	Add	
/Security/Roles/{id}/Permissions/Global	GET, POST, PUT	Add	
/Security/Roles/{id}/Permissions/Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/{id}/Permissions endpoint functionality.
/Security/Roles/{id}/Permissions/Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/{id}	GET	Update	Includes template defaults.

Endpoint	Methods	Action	Notes
/Templates/Settings	GET, PUT	Update	Includes global template policies.
/Template/SubjectParts	GET	Add	
/Templates/Global/Settings	GET, PUT	Add	
/Templates/Import	POST	Add	
/Workflow/Certificates/Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/Definitions/Steps/{extensionName}	GET	Add	
/Workflow/Definitions/{definitionId}	GET, PUT, DELETE	Add	
/Workflow/Definitions	GET, POST	Add	
/Workflow/Definitions/Steps	GET	Add	
/Workflow/Definitions/Types	GET	Add	
/Workflow/Definitions/{definitionId}/Steps	PUT	Add	
/Workflow/Definitions/{definitionId}/Publish	POST	Add	
/Workflow/Instances/{instanceId}	GET, DELETE	Add	
/Workflow/Instances	GET	Add	
/Workflow/Instances/My	GET	Add	
/Workflow/Instances/AssignedToMe	GET	Add	
/Workflow/Instances/{instanceId}/Stop	POST	Add	
/Workflow/Instances/{instanceId}/Signals	POST	Add	
/Workflow/Instances/{instanceId}/Restart	POST	Add	

2.7.2.2 API Change Log v10.1

API changes for Keyfactor Command version 10.1 incremental release

Table 694: API Change Log v10.1

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

2.7.2.3 API Change Log v10.2

API changes for Keyfactor Command version 10.2 incremental release

Table 695: API Change Log v10.2

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

3.0 Glossary

A

AIA

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

AnyAgent

The AnyAgent, one of Keyfactor's suite of orchestrators, is used to allow management of certificates regardless of source or location by allowing customers to implement custom agent functionality via an API.

AnyGateway

The Keyfactor AnyGateway is a generic third party CA gateway framework that allows existing CA gateways and custom CA connections to share the same overall product framework.

API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Argument

A parameter or argument is a value that is passed into a function in an application.

Authority Information Access

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

B

Bash Orchestrator

The Bash Orchestrator, one of Keyfactor's suite of orchestrators, is used to discover and manage SSH keys across an enterprise.

Blueprint

A snapshot of the certificate stores and scheduled jobs on one orchestrator, which can be used to create matching certificate stores and jobs on another orchestrator with just a few clicks.

C

CA

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Authority

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Revocation List

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

Certificate Signing Request

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor

Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

CN

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Collection

The certificate search function allows you to query the Keyfactor Command database for certificates from any available source based on any criteria of the certificates and save the results as a collection that will be available in other places in the Management Portal (e.g. expiration alerts and certain reports).

Common Name

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Configuration Tenant

A grouping of CAs. The Microsoft concept of forests is not used in EJBCA so to

accommodate the new EJBCA functionality, and to avoid confusion, the term forest needed to be renamed. The new name is configuration tenant. For EJBCA, there would be one configuration tenant per EJBCA server install. For Microsoft, there would be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA cannot exist on the same configuration tenant.

CRL

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

CSR

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

D

DER

A DER format certificate file is a DER-encoded binary certificate. It contains a single certificate and does not support storage of private keys. It sometimes has an extension of .der but is often seen with .cer or .crt.

Distinguished Name

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs,

separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DN

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DNS

The Domain Name System is a service that translates names into IP addresses.

E

ECC

Elliptical curve cryptography (ECC) is a public key encryption technique based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys. ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers.

Endpoint

An endpoint is a URL that enables the API to gain access to resources on a server.

Enrollment

Certificate enrollment refers to the process by which a user requests a digital certificate. The user must submit the request to a certificate authority (CA).

EOBO

A user with an enrollment agent certificate can enroll for a certificate on behalf of another user. This is often used when provisioning technology such as smart cards.

F

Forest

An Active Directory forest (AD forest) is the top most logical container in an Active Directory configuration that contains domains, and objects such as users and computers.

G

Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

H

Host Name

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

Hosted Config Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor

Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hosted Configuration Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hostname

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

J

Java Agent

The Java Agent, one of Keyfactor's suite of orchestrators, is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed.

Java Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

JKS

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based

applications for authentication and encryption.

K

Key Length

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Pair

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Key Size

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Type

The key type identifies the type of key to create when creating a symmetric or asymmetric key. It references the signing algorithm and often key size (e.g. AES-256, RSA-2048, Ed25519).

Keyfactor CA Management Gateway

The Keyfactor CA Management Gateway is made up of the Keyfactor Gateway Connector, installed in the customer forest to provide a connection to the local CA, and the Azure-hosted and Keyfactor managed Hosted Configuration Portal. The solution is used to provide a connection between a customer's on-premise CA and an Azure-hosted instance of Keyfactor Command for synchronization, enrollment, and management of certificates.

Keyfactor Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

Keyfactor Universal Orchestrator

The Keyfactor Universal Orchestrator, one of Keyfactor's suite of orchestrators, is used to interact with Windows servers (a.k.a. IIS certificate stores) and FTP capable devices for certificate management, run SSL discovery and management tasks, and manage synchronization of certificate authorities in remote forests. With the addition of custom extensions, it can run custom jobs to provide certificate management capabilities on a variety of platforms and devices (e.g. F5 devices, NetScaler devices, Amazon Web Services (AWS) resources) and execute tasks outside the standard list of certificate management functions. It runs on either Windows or Linux.

Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

L

Logical Name

The logical name of a CA is the common name given to the CA at the time it is created. For Microsoft CAs, this name can be seen at the top of the Certificate

Authority MMC snap-in. It is part of the FQDN\Logical Name string that is used to refer to CAs when using command-line tools and in some Keyfactor Command configuration settings (e.g. `ca2.keyexample.-com\Corp Issuing CA Two`).

M

MAC Agent

The MAC Agent, one of Keyfactor's suite of orchestrators, is used to manage certificates on any keychains on the Mac on which the Keyfactor MAC Agent is installed.

Metadata

Metadata provides information about a piece of data. It is used to summarize basic information about data, which can make working with the data easier. In the context of Keyfactor Command, the certificate metadata feature allows you to create custom metadata fields that allow you to tag certificates with tracking information about certificates.

O

Object Identifier

Object identifiers or OIDs are a standardized system for identifying any object, concept, or "thing" with a globally unambiguous persistent name.

OID

Object identifiers or OIDs are a standardized system for identifying any object, concept, or "thing" with a globally unambiguous persistent name.

Orchestrator

Keyfactor orchestrators perform a variety of functions, including managing certificate

stores and SSH key stores.

P

P12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

P7B

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

P7C

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

Parameter

A parameter or argument is a value that is passed into a function in an application.

PEM

A PEM format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PEM certificates always begin and end with entries like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. PEM certificates can contain a single certificate or a full certificate chain and may contain a private key. Usually, extensions of .cer and .crt are certificate files with no private key, .key is a separate private key file, and .pem is both a certificate and private key.

PFX

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKCS #7

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like ---- BEGIN CERTIFICATE---- and ----END CERTIFICATE----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

PKCS#12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKI

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

Private Key

Private keys are used in cryptography (symmetric and asymmetric) to encrypt or sign content. In asymmetric cryptography, they are used together in a key pair with a public key. The private or secret key is retained by the key's creator, making it highly secure.

Public Key

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Public Key Infrastructure

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

R

Rogue Key

A rogue key, in the context of Keyfactor Command, is an SSH public key that appears in an `authorized_keys` file on a server managed by the SSH orchestrator without authorization.

Root of Trust

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RoT

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RPC

Remote procedure call (RPC) allows one program to call a function from a program located on another computer on a network without specifying network details. In the context of Keyfactor Command, RPC errors often indicate Kerberos authentication or delegation issues.

rsyslog

Rsyslog is an open-source software utility used on UNIX and Unix-like computer systems for forwarding log messages in an IP network.

S

SAN

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

server name indication

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SMTP

Short for simple mail transfer protocol, SMTP is a protocol for sending email messages between servers.

SNI

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SSH

The SSH (secure shell) protocol provides for secure connections between computers. It provides several options for authentication, including public key, and protects the communications with strong encryption.

SSL

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Subject Alternative Name

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of

SAN formats are supported, with DNS name being the most common.

T

Template

A certificate template defines the policies and rules that a CA uses when a request for a certificate is received.

TLS

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Trusted CA

A certificate authority in the forest in which Keyfactor Command is installed or in a forest in a two-way trust with the forest in which Keyfactor Command is installed.

U

Untrusted CA

A certificate authority in a forest in a one-way trust with the forest in which Keyfactor Command is installed or in a forest that is untrusted by the forest in which Keyfactor Command is installed. Non-domain-joined standalone CAs also fall into this category.

W

Web API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Windows Orchestrator

The Windows Orchestrator, one of Keyfactor's suite of orchestrators, is used to manage synchronization of certificate authorities in remote forests, run SSL discovery and management tasks, and interact with Windows servers as well as F5 devices, NetScaler devices, Amazon Web Services (AWS) resources, and FTP capable devices, for certificate management. In addition, the AnyAgent capability of the Windows Orchestrator allows it to be extended to create custom certificate store types and management capabilities regardless of source platform or location.

Workflow

A workflow is a series of steps necessary to complete a process. In the context of Keyfactor Command, it refers to the workflow builder, which allows you automate event-driven tasks when a certificate is requested or revoked.

X

x.509

In cryptography, X.509 is a standard defining the format of public key certificates. An X.509 certificate contains a public key and an identity (e.g. a host name or an organization or individual name), and is either signed by a certificate authority or self-signed. When a certificate is signed by a trusted certificate authority it can be used to establish trusted secure communications with the owner of the corresponding private key. It can also be used to verify digitally signed documents and emails.
