

## Keyfactor Web APIs 10.5

### Reference Guide

# Table of Contents

|   |          |
|---|----------|
| <b>1.0 Introduction</b>                               | <b>1</b> |
| <b>2.0 Web APIs Reference</b>                         | <b>2</b> |
| 2.1 Overview  | 2        |
| 2.2 Transaction Security                              | 2        |
| 2.3 Web API Common Features                           | 3        |
| 2.4 Versioning  | 5        |
| 2.5 Keyfactor API                                     | 6        |
| 2.5.1 Agents  | 7        |
| 2.5.1.1 GET Agents ID                                 | 8        |
| 2.5.1.2 GET Agents                                    | 11       |
| 2.5.1.3 POST Agents Reset                             | 17       |
| 2.5.1.4 POST Agents Approve                           | 18       |
| 2.5.1.5 POST Agents Disapprove                        | 19       |
| 2.5.1.6 POST Agents ID Reset                          | 19       |
| 2.5.1.7 POST Agents ID FetchLogs                      | 20       |
| 2.5.1.8 POST Agents Set Auth Certificate Reenrollment | 21       |
| 2.5.2 Agent Blueprint                                 | 22       |
| 2.5.2.1 DELETE Agent Blueprint ID                     | 23       |
| 2.5.2.2 GET Agent Blueprint ID                        | 24       |
| 2.5.2.3 GET Agent Blueprint                           | 25       |
| 2.5.2.4 GET Agent Blueprint ID Jobs                   | 26       |
| 2.5.2.5 GET Agent Blueprint ID Stores                 | 30       |
| 2.5.2.6 POST AgentBlueprint ApplyBlueprint            | 33       |
| 2.5.2.7 POST AgentBlueprint GenerateBlueprint         | 33       |
| 2.5.3 Agent Pools                                     | 34       |
| 2.5.3.1 DELETE Agent Pools ID                         | 35       |
| 2.5.3.2 GET Agent Pools ID                            | 36       |
| 2.5.3.3 GET Agent Pools                               | 38       |
| 2.5.3.4 POST Agent Pools                              | 40       |
| 2.5.3.5 PUT Agent Pools                               | 42       |
| 2.5.3.6 GET Agent Pools Agents                        | 45       |
| 2.5.4 Alerts  | 46       |
| 2.5.4.1 Alerts Denied                                 | 46       |
| 2.5.4.2 Alerts Expiration                             | 74       |
| 2.5.4.3 Alerts Issued                                 | 114      |
| 2.5.4.4 Alerts Key Rotation                           | 148      |
| 2.5.4.5 Alerts Pending                                | 182      |
| 2.5.5 Audit   | 220      |
| 2.5.5.1 GET Audit ID                                  | 220      |
| 2.5.5.2 GET Audit ID Validate                         | 226      |
| 2.5.5.3 GET Audit                                     | 227      |
| 2.5.5.4 GET Audit Download                            | 233      |
| 2.5.5.5 GET Audit Related Entities                    | 237      |
| 2.5.6 Certificates                                    | 243      |
| 2.5.6.1 GET Certificates ID Security                  | 245      |
| 2.5.6.2 GET Certificates ID Validate                  | 246      |
| 2.5.6.3 GET Certificates Locations ID                 | 253      |
| 2.5.6.4 GET Certificates Identity Audit ID            | 256      |

# 1.0 Introduction

The *Keyfactor Command Documentation Suite* includes:

- *Keyfactor Command Reference Guide*
- *Keyfactor Web APIs Reference Guide*
- *Keyfactor Command Server Installation Guide*
- *Keyfactor Orchestrators Installation and Configuration Guide*
- *Keyfactor Command Release Notes & Upgrading*

In addition, Keyfactor offers documentation for products that are not part of the *Keyfactor Command Documentation Suite*, including the *Keyfactor Command Upgrade Overview* and installation guides for third-party CA gateways that interface with Keyfactor, which are available upon request.

## 2.0 Web APIs Reference

The Keyfactor Command solution exposes Web APIs to allow third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command in a secure manner and to provide a mechanism for automating routine or bulk tasks that would be cumbersome to perform through the browser-based user interface. The APIs complement the web components of Keyfactor Command and offer a number of HTTP method calls that provide similar functionality to that available within the portal's user interface, but which can be accessed programmatically by any system capable of making web requests. These APIs have the following goals and constraints:

- Provide a simple interface to make integration easy for third parties.
- Develop interoperability between different technology frameworks and operating systems.
- Support common certificate enrollment and management tasks.
- Deliver a securable interface.
- Preserve backward-compatibility so that existing clients continue to work, where possible.

### 2.1 Overview

Keyfactor exposes two APIs for external use:

- The Keyfactor API was introduced in Keyfactor Command version 6.1 and is the newer API. Customers should be using this API in all cases.
- The Classic API will be deprecated in Keyfactor Command version 11. All existing uses of the Classic API should be migrated to use the Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False* (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use.

### 2.2 Transaction Security

The Keyfactor Web APIs rely on SSL/TLS to protect the HTTP communications between the client and Keyfactor Command server. In a typical deployment, the APIs will be configured for Basic authentication, where client credentials are provided in an HTTP header, formatted as *DOMAIN\user:Password* and base-64-encoded. Basic Authentication itself is not a secure way to pass a set of user credentials. However, it is very interoperable and works well across all of the various technologies that use these APIs. SSL is used to protect the confidentiality of user credentials; therefore, SSL should be used with the Keyfactor Web APIs.

Keyfactor recommends that any device using these APIs already be configured to trust the SSL certificate presented by Keyfactor Command, allowing the SSL connection to be established without error. The process for this will depend on the platform and operating environment of the connecting

client, but the appropriate documentation or support for your platform should outline the necessary steps for this.

Access to the API methods can be limited per client to a maximum request frequency. The amount of time required between calls can be configured in the Keyfactor Command Management Portal Application Settings for the APIs (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). Increasing this interval can mitigate certain threats such as denial of service or dictionary attacks against passwords and other sensitive data. However, setting this too high can negatively impact performance of client applications that need to make a large number of requests.

## 2.3 Web API Common Features

Some aspects of the Web API request and response formats are consistent across all endpoints. This includes a small set of HTTP headers, HTTP statuses returned by the server for successful requests, and various error conditions. Common request headers are given in [Table 1: Common Request Headers](#), common response headers (for successful requests and certain unsuccessful requests) are given in [Table 2: Common Response Headers](#), and HTTP statuses are given in [Table 3: HTTP Statuses](#).

By default, all Keyfactor API methods start with a base path, which corresponds to an application under IIS; this path is configurable at install time. For the Keyfactor API, the default base path is *KeyfactorApi*. The API component name and method name then comprise the parts of the URL, each separated by a forward slash. For example, “/KeyfactorApi/Certificates/Import” would be the URL format for the Import method of the Certificates component in the Keyfactor API.

Table 1: Common Request Headers

| Header Name    | API Version | Header Value                              | Description   |
|----------------|-------------|---|---|
| Content-Type   | Both        | application/json<br>OR<br>application/xml | POST methods use application/json. When application/xml is needed, it is specifically indicated on the endpoint page. |
| Accept         | Both        | application/json; charset=utf-8           | Most methods returning complex values will use this content type.   |
| Authorization  | Both        | Basic <base-64<br>DOMAIN\user:pass>       | In most cases, Web API clients will use Basic authentication over SSL/TLS.  |
| Host           | Both        | <Keyfactor Command<br>server hostname>    | Address of Keyfactor Command server. Automatically generated in most clients.   |
| Content-Length | Both        | Request length in bytes                   | Optional, but automatically generated by most clients.  |

| Header Name                | API Version   | Header Value   | Description   |
|----------------------------|---------------|----------------|---|
| X-Keyfactor-Requested-With | Both          | XMLHttpRequest | This is mandatory to send in a request to the Keyfactor API on POSTs, PUTs, and DELETEs, and the value is case sensitive. This is for security. |
| X-Keyfactor-API-Version    | Keyfactor API | 1 or 2         | Desired version of the endpoint. If not provided, this defaults to version 1.   |

Table 2: Common Response Headers

| Header Name                 | API Version   | Header Value     | Description  |
|-----------------------------|---------------|------------------|--|
| Cache-Control               | Both          | no-cache         | API requests are generally not cacheable. Note that this is not respected by all client systems. |
| Pragma                      | Both          | no-cache         | API requests are generally not cacheable. Note that this is not respected by all client systems. |
| Content-Length              | Both          | <varies>         | Length of the HTTP response.   |
| Content-Type                | Both          | application/json | Most calls return application/json, but occasionally text/plain or text/xml.                     |
| Expires                     | Both          | -1               | Usually ignored.   |
| Server                      | Both          | <varies>         | Software version reported by IIS platform hosting Keyfactor Command.                             |
| X-Keyfactor-Product-Version | Keyfactor API | <varies>         | Keyfactor Command platform version.  |
| X-Total-Count               | Keyfactor API | <varies>         | Total number of elements returned.   |
| X-AspNet-Version            | Both          | <varies>         | Version of ASP.NET supporting Keyfactor Command installation.                                    |
| X-Powered-By                | Both          | ASP.NET          | Header added by underlying ASP.NET implementation.   |

| Header Name | API Version | Header Value | Description                     |
|-------------|-------------|--------------|---------------------------------|
| Date        | Both        | <varies>     | Timestamp of the HTTP response. |

Table 3: HTTP Statuses

| Number/Name               | Description  |
|---------------------------|--|
| 200 OK                    | Request successful; results in response body   |
| 204 No Content            | Request successful; no content in response body  |
| 400 Bad Request           | Malformed or invalid data; additional information may be available in the response body and/or Keyfactor Command server logs                                   |
| 401 Unauthorized          | Invalid credentials (user unauthenticated)   |
| 403 Forbidden             | Can often indicate that the credentials map to a user without permissions for this action in Keyfactor Command (user unauthorized)                             |
| 404 Page not Found        | Invalid request path   |
| 500 Internal Server Error | Keyfactor Command encountered an unexpected error attempting to handle the request. See response body and Keyfactor Command server logs for details.           |
| 502 Bad Gateway           | Keyfactor Command attempted to contact a CA or other upstream server to process the request, but was unable to. See Keyfactor Command server logs for details. |

## 2.4 Versioning

The Keyfactor Web APIs are versioned as a set and released in conjunction with Keyfactor Command at the same version level (e.g. version 10.5). In addition, the Keyfactor API may have multiple versions of select endpoints.

The current strategy is to increment the version of an API when changes are made that might break backwards compatibility for existing clients. New endpoints are generally implemented in the most recent version of their API.

Generally, updates to an existing version of an endpoint are restricted to updates that should not break existing clients. Updates may be made that add HTTP response headers or response body parameters, or that correct existing bugs, or must be made to conform to newer or more granular

security constraints. When an update cannot be made without breaking existing clients, a new endpoint is added in a later API version.

Figure 1: Select a Version in the Keyfactor API Endpoint Utility

Most Keyfactor API endpoints have only one version, though a second version has been released for a select few endpoints. The Keyfactor API uses the `x-keyfactor-api-version` request header to differentiate between versions 1 and 2 of a given endpoint. If a version isn't specified, version 1 is assumed.

**Important:** The Classic API will be deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to Keyfactor API prior to upgrading to Keyfactor Command version 11. If these applications cannot be updated to the newer endpoints then the **Allow Deprecate API Calls** setting must be set to *False*. Otherwise, Keyfactor recommends that these endpoints be disabled to reduce exposure to unauthorized or unintended use (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*).

## 2.5 Keyfactor API

The Keyfactor API allows for integration with other systems to automate certificate lifecycle management tasks. It will continue to be developed going forward to expose more core functionality that is built into the main product to allow for more in-depth integrations.

Documentation for the Keyfactor API is available as two companion pieces—this document (the *Keyfactor Web APIs Reference Guide*), which provides an overview of the API's endpoints, parameters to be provided in them, and data expected back from them, and the interactive code examples installed with your Keyfactor Command instance in the *Keyfactor API Endpoint Utility*.

**Tip:** Click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Logout** button to find the embedded web copies of the *Keyfactor Command Documentation Suite* and the *Keyfactor API Endpoint Utility*.

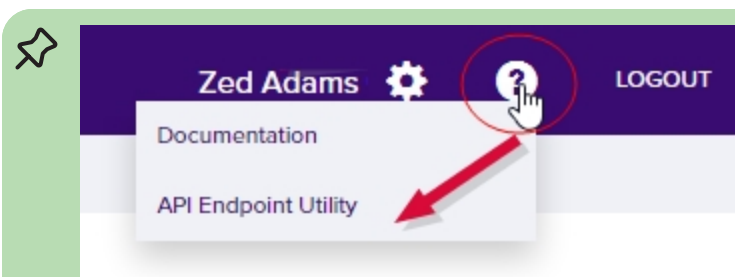

Figure 2: Documentation in the Help Dropdown

You can also browse to the *Keyfactor API Endpoint Utility* directly using the following link (where *keyfactor.keyexample.com* is the fully qualified domain name of your Keyfactor Command server or the DNS alias you are using to reference your Keyfactor Command server, if applicable):

`https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#`

This link assumes that the Keyfactor API has been installed in the default IIS virtual directory (KeyfactorAPI). If you have installed in an alternate virtual directory, your path will be different.

## 2.5.1 Agents

The Agents component of the Keyfactor API includes methods necessary to list orchestrators and agents and schedule jobs to retrieve log files for orchestrators and agents that support that functionality.

Table 4: Agents Endpoints

| Endpoint | Method | Description  | Link   |
|----------|--------|--|--|
| / {id}   | GET    | Returns details for a single orchestrator or agent.  | <a href="#">GET Agents ID on the next page</a> |
| /        | GET    | Returns a list of all orchestrators and agents according to the provided filters and input parameters. | <a href="#">GET Agents on page 11</a>          |
| /Reset   | POST   | Resets one or more orchestrators or agents to a new state and clears jobs.                             | <a href="#">POST Agents Reset on page 17</a>   |
| /Approve | POST   | Approves an orchestrator.  | <a href="#">POST Agents Approve on page 18</a> |

| Endpoint                        | Method | Description  | Link   |
|---------------------------------|--------|--|--|
| /Disapprove                     | POST   | Disapproves an orchestrator.   | <a href="#">POST Agents Disapprove on page 19</a>                        |
| /id}/Reset                      | POST   | Resets a single orchestrator or agent to a new state and clears jobs.  | <a href="#">POST Agents ID Reset on page 19</a>                          |
| /id}/FetchLogs                  | POST   | Schedules a job on the orchestrator or agent to retrieve log files.  | <a href="#">POST Agents ID FetchLogs on page 20</a>                      |
| /SetAuthCertificateReenrollment | POST   | Configures an orchestrator or agent to either request or require a new client authentication certificate on its next session registration. | <a href="#">POST Agents Set Auth Certificate Reenrollment on page 21</a> |

### 2.5.1.1 GET Agents ID

The GET /Agents/{id} method is used to retrieve a single orchestrator or agent registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: Read

Table 5: GET Agents{id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The GUID of the orchestrator to retrieve.<br>Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID. |

Table 6: GET Agent {id} Response Data

| Name          | Description  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
|---------------|--|-------|-----------------|---|---------|---|--------------------------------|---|----------------------|---|-------------------------------------|---|-------------------------|---|------------------------|---|-----------------------------|---|----------------------------------|
| AgentId       | A string indicating the GUID of the orchestrator.  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| ClientMachine | A string indicating the client machine on which the orchestrator is installed.   |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| Username      | A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |

| Blueprint        | A string indicating the name of the blueprint associated with the orchestrator.  |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| Thumbprint       | A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.   |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| LegacyThumbprint | A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the  |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |

| Name                        | Description  |       |             |   |   |   |   |   |   |
|-----------------------------|--|-------|-------------|---|---|---|---|---|---|
|                             | orchestrator successfully registers with the new thumbprint.   |       |             |   |   |   |   |   |   |
| AuthCertificateReenrollment | <p>An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table> | Value | Description | 0 | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value). | 1 | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual. | 2 | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. |
| Value                       | Description  |       |             |   |   |   |   |   |   |
| 0                           | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).  |       |             |   |   |   |   |   |   |
| 1                           | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.  |       |             |   |   |   |   |   |   |
| 2                           | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.  |       |             |   |   |   |   |   |   |
| LastThumbprintUsed          | A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .   |       |             |   |   |   |   |   |   |
| LastErrorCode               | An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.  |       |             |   |   |   |   |   |   |
| LastErrorMessage            | A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.  |       |             |   |   |   |   |   |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.1.2 GET Agents

The GET /Agents method is used to retrieve a list of orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator

details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 7: GET Agents Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Orchestrator Management Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i></li> <li>• <i>Blueprint</i></li> <li>• <i>Capabilities</i> (See <a href="#">Table 8: GET Agent Response Data Capabilities</a>)</li> <li>• <i>ClientMachine</i></li> <li>• <i>ErrorCode</i></li> <li>• <i>ErrorMessage</i> (last error message)</li> <li>• <i>Identity</i> (Username)</li> <li>• <i>LastSeen</i> (DateTime)</li> <li>• <i>Platform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• <i>Status</i> (1-New, 2-Approved, 3-Disapproved)</li> <li>• <i>Version</i></li> </ul> <div>  <b>Tip:</b> Use the following query to return only approved orchestrators:<br/> <pre>Status -eq "2"</pre> <p>A value of 1 will return orchestrators with a status of <i>New</i> and a value of 3 will return orchestrators with a status of <i>Disapproved</i>.</p> </div> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0  |

| Name | In | Description  |
|------|----|--|
|      |    | sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. |

Table 8: GET Agent Response Data

| Name          | Description  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
|---------------|--|-------|-----------------|---|---------|---|--------------------------------|---|----------------------|---|-------------------------------------|---|-------------------------|---|------------------------|---|-----------------------------|---|----------------------------------|
| AgentId       | A string indicating the GUID of the orchestrator.  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| ClientMachine | A string indicating the client machine on which the orchestrator is installed.   |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| Username      | A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| AgentPlatform | <p>An integer indicating the platform for the orchestrator. Possible values are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Keyfactor Windows Orchestrator</td></tr> <tr> <td>2</td><td>Keyfactor Java Agent</td></tr> <tr> <td>3</td><td>Keyfactor Mac Auto-Enrollment Agent</td></tr> <tr> <td>4</td><td>Keyfactor Android Agent</td></tr> <tr> <td>5</td><td>Keyfactor Native Agent</td></tr> <tr> <td>6</td><td>Keyfactor Bash Orchestrator</td></tr> <tr> <td>7</td><td>Keyfactor Universal Orchestrator</td></tr> </table> | Value | Parameter Value | 0 | Unknown | 1 | Keyfactor Windows Orchestrator | 2 | Keyfactor Java Agent | 3 | Keyfactor Mac Auto-Enrollment Agent | 4 | Keyfactor Android Agent | 5 | Keyfactor Native Agent | 6 | Keyfactor Bash Orchestrator | 7 | Keyfactor Universal Orchestrator |
| Value         | Parameter Value  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| 0             | Unknown  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| 1             | Keyfactor Windows Orchestrator   |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| 2             | Keyfactor Java Agent   |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |
| 3             | Keyfactor Mac Auto-Enrollment Agent  |       |                 |   |         |   |                                |   |                      |   |                                     |   |                         |   |                        |   |                             |   |                                  |

| LOGS             | Fetch Logs   |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| TemplateSync     | Template Synchronization   |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| Blueprint        | A string indicating the name of the blueprint associated with the orchestrator.  |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| Thumbprint       | A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.   |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |
| LegacyThumbprint | A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the  |       |             |     |                     |    |           |            |                      |            |                      |            |                       |     |     |     |                        |    |   |    |                      |     |                              |               |                    |     |               |     |           |      |            |              |                          |

| Name                        | Description  |       |             |   |   |   |   |   |   |
|-----------------------------|--|-------|-------------|---|---|---|---|---|---|
|                             | orchestrator successfully registers with the new thumbprint.   |       |             |   |   |   |   |   |   |
| AuthCertificateReenrollment | <p>An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table> | Value | Description | 0 | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value). | 1 | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual. | 2 | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. |
| Value                       | Description  |       |             |   |   |   |   |   |   |
| 0                           | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).  |       |             |   |   |   |   |   |   |
| 1                           | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.  |       |             |   |   |   |   |   |   |
| 2                           | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.  |       |             |   |   |   |   |   |   |
| LastThumbprintUsed          | A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .   |       |             |   |   |   |   |   |   |
| LastErrorCode               | An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.  |       |             |   |   |   |   |   |   |
| LastErrorMessage            | A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.  |       |             |   |   |   |   |   |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.1.3 POST Agents Reset

The POST /Agents/Reset method is used to reset one or more orchestrators, including:

- Remove all current orchestrator jobs for the selected orchestrator(s).
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator(s) to allow them to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 AgentManagement: *Read*  
 AgentManagement: *Modify*

Table 9: POST Agents Reset Input Parameters

| Name     | In   | Description  |
|----------|------|--|
| agentIds | Body | <b>Required.</b> An array of GUIDs of the orchestrators to reset.<br>Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.1.4 POST Agents Approve

The POST /Agents/Approve method is used to approve one or more orchestrators (a.k.a. agents). An orchestrator must be approved before jobs for it can be scheduled or carried out. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 AgentManagement: *Read*  
 AgentManagement: *Modify*

Table 10: POST Agents Approve Input Parameters

| Name     | In   | Description  |
|----------|------|--|
| agentIds | Body | <b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to approve.<br>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.1.5 POST Agents Disapprove

The POST /Agents/Disapprove method is used to disapprove one or more orchestrators (a.k.a. agents). When an orchestrator is disapproved, operations with Keyfactor Command can no longer be carried out by this orchestrator. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 11: POST Agents Disapprove Input Parameters

| Name     | In   | Description  |
|----------|------|--|
| agentIds | Body | <b>Required.</b> An array of strings indicating the orchestrator GUIDs to disapprove. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.1.6 POST Agents ID Reset

The POST /Agents/{id}/Reset method is used to reset a single orchestrator, including:

- Remove all current orchestrator jobs for the selected orchestrator.
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator to allow it to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

## AgentManagement: *Modify*

Table 12: POST Agents {id} Reset Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The GUID of the orchestrator to reset.<br>Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.1.7 POST Agents ID FetchLogs

The POST /Agents/{id}/FetchLogs method is used to schedule a job on a Native Agent to retrieve log files. The job will be scheduled to run immediately, which means it should complete within a few minutes depending on other activity occurring at the same time. This method is currently only supported for the Native Agent. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

**Tip:** To schedule a job to retrieve logs from a Keyfactor Universal Orchestrator, use the POST /OrchestratorJobs/Custom method (see [POST Orchestrator Jobs Custom on page 802](#)).

Table 13: POST Agents {id} FetchLogs Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The GUID of the orchestrator to schedule the job for.<br>Use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.1.8 POST Agents Set Auth Certificate Reenrollment

The POST /Agents/SetAuthCertificateReenrollment method is used to request or require that one or more orchestrators (a.k.a. agents) enroll for a new client authentication certificate on the orchestrator’s next session registration. This method returns HTTP 200 OK on a success with details

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 14: POST Agents Set Auth Certificate Reenrollment Input Parameters

| Name            | In  | Description  |       |             |   |   |   |   |   |   |
|-----------------|---|--|-------|-------------|---|---|---|---|---|---|
| OrchestratorIds | Body  | <b>Required.</b> An array of strings indicating the GUIDs of the orchestrators on which you want to change the AuthCertificateReenrollment value to request or require the orchestrator(s) to enroll for a new client authentication certificate on the next session registration. Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.  |       |             |   |   |   |   |   |   |
| Status          | Body  | An integer indicating the value that AuthCertificateReenrollment should be set to. Status options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr><tr><td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr><tr><td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr></table> | Value | Description | 0 | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value). | 1 | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual. | 2 | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. |
| Value           | Description   |  |       |             |   |   |   |   |   |   |
| 0               | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).   |  |       |             |   |   |   |   |   |   |
| 1               | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.   |  |       |             |   |   |   |   |   |   |
| 2               | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. |  |       |             |   |   |   |   |   |   |

Table 15: POST Agents Set Auth Certificate Reenrollment Response Data

| Name                  | Description   |       |             |   |   |   |   |   |   |
|-----------------------|---|-------|-------------|---|---|---|---|---|---|
| FailedOrchestratorIds | An array of strings indicating the GUIDs of orchestrators that failed to update.  |       |             |   |   |   |   |   |   |
| Status                | <p>A string indicating the value for AuthCertificateReenrollment that was requested. Status options are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table> | Value | Description | 0 | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value). | 1 | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual. | 2 | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate. |
| Value                 | Description   |       |             |   |   |   |   |   |   |
| 0                     | None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).   |       |             |   |   |   |   |   |   |
| 1                     | Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.   |       |             |   |   |   |   |   |   |
| 2                     | Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.   |       |             |   |   |   |   |   |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.2 Agent BluePrint

The Agent BluePrint component of the Keyfactor API includes methods necessary to list, generate, and apply orchestrator and orchestrator blueprints for orchestrators and agents that support blueprint functionality.

Table 16: Agent BluePrint Endpoints

| Endpoint | Method | Description   | Link   |
|----------|--------|---|--|
| / {id}   | DELETE | Deletes the orchestrator blueprint with the specified GUID. | <a href="#">DELETE Agent BluePrint ID on the next page</a> |

| Endpoint           | Method | Description   | Link   |
|--------------------|--------|---|--|
| / {id}             | GET    | Returns details for the orchestrator blueprint with the specified GUID.   | <a href="#">GET Agent Blueprint ID on the next page</a>          |
| /                  | GET    | Returns details for all orchestrator blueprints.  | <a href="#">GET Agent Blueprint on page 25</a>                   |
| / {id} /Jobs       | GET    | Returns details of the certificate store scheduled jobs for the orchestrator blueprint with the specified GUID. | <a href="#">GET Agent Blueprint ID Jobs on page 26</a>           |
| / {id} /Stores     | GET    | Returns details of the certificate stores for the orchestrator blueprint with the specified GUID.               | <a href="#">GET Agent Blueprint ID Stores on page 30</a>         |
| /ApplyBlueprint    | POST   | Applies an orchestrator blueprint to one or more orchestrators.   | <a href="#">POST AgentBlueprint ApplyBlueprint on page 33</a>    |
| /GenerateBlueprint | POST   | Creates a new orchestrator blueprint from an orchestrator.  | <a href="#">POST AgentBlueprint GenerateBlueprint on page 33</a> |

### 2.5.2.1 DELETE Agent Blueprint ID

The DELETE /AgentBlueprint/{id} method is used to delete an existing orchestrator blueprint with the specified blueprint GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 AgentManagement: *Read*  
 AgentManagement: *Modify*

Table 17: DELETE AgentBlueprint {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be deleted.<br>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 25</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.2.2 GET Agent Blueprint ID

The GET /AgentBlueprint/{id} method is used to retrieve information about the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with information about the blueprint.

**Tip:** To see the certificate stores or scheduled jobs associated with the blueprint, use the GET /AgentBlueprint/{id}/Jobs method (see [GET Agent Blueprint ID Jobs on page 26](#)) or GET /AgentBlueprint/{id}/Stores method (see [GET Agent Blueprint ID Stores on page 30](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: Read

Table 18: GET AgentBlueprint {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved.<br>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on the next page</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID. |

Table 19: GET AgentBlueprint {id} Response Data

| Name                 | Description   |
|----------------------|---|
| AgentBlueprintId     | A string indicating the GUID of the blueprint.  |
| Name                 | A string indicating the name of the blueprint.  |
| RequiredCapabilities | An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM). |
| LastModified         | A string indicating the date and time the blueprint was created.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.2.3 GET Agent Blueprint

The GET /AgentBlueprint method is used to retrieve a list of blueprints defined for the orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all blueprint details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 20: GET AgentBlueprint Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> . |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 21: GET AgentBlueprint Response Data

| Name                 | Description   |
|----------------------|---|
| AgentBlueprintId     | A string indicating the GUID of the blueprint.  |
| Name                 | A string indicating the name of the blueprint.  |
| RequiredCapabilities | An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM). |
| LastModified         | A string indicating the date and time the blueprint was created.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.2.4 GET Agent Blueprint ID Jobs

The GET /AgentBlueprint/{id}/Jobs method is used to retrieve details of the scheduled certificate store jobs for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint scheduled job details, including certificate stores.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 22: GET AgentBlueprint {id} Jobs Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| id            | Path  | <b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved.<br>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on the previous page</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID. |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .                              |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 23: GET AgentBlueprint {id} Jobs Response Data

| Name                  | Description   |
|-----------------------|---|
| AgentBlueprintJobId   | A string indicating the GUID of the certificate store job associated with the blueprint.  |
| AgentBlueprintStoreId | A string indicating the GUID of the certificate store associated with the blueprint.  |
| AgentBlueprintId      | A string indicating the GUID of the blueprint.  |
| JobType               | A string indicating the GUID of the certificate store job type.   |
| JobTypeName           | A string indicating the certificate store job type (e.g. JksInventory).   |
| OperationType         | An integer indicating the type of operation (e.g. 2 = add to certificate store, 3 = remove from certificate store).   |
| Thumbprint            | A string indicating the thumbprint of the certificate to add to or remove from the certificate store. This field is populated only for management jobs.   |
| Contents              | A string containing the certificate to be added to the certificate store. This field is populated only for management add to certificate store jobs.  |
| Alias                 | A string indicating the alias to be used for the certificate upon entry into or removal from the certificate store. The function of the alias varies depending on the certificate store type. For example, for a Java keystore, it is user-generated and stored in the keystore associated with the certificate while for PEM stores it is the thumbprint of the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field is populated only for management jobs. |
| PrivateKeyEntry       | A Boolean indicating whether the certificate store has a separate private key file. This field is populated only for management jobs.   |
| Overwrite             | A Boolean indicating whether the certificate already in the certificate store should be overwritten with the new certificate, if applicable. This field is populated only for management jobs.  |
| HasEntryPassword      | A Boolean indicating whether the certificate in the certificate store has a different password from the certificate store itself. This field is populated only for management jobs.   |
| HasPfxPassword        | A Boolean indicating whether the certificate being added to the certificate store has a private key. This field is populated only for management jobs.  |
| RequestTimestamp      | A string indicating the time at which the management job was requested. This  |

| Name                  | Description   |      |             |                       |  |                  |  |
|-----------------------|---|------|-------------|-----------------------|--|------------------|--|
|                       | field is populated only for management jobs.  |      |             |                       |  |                  |  |
| KeyfactorSchedule     | The schedule for the certificate store job. This field is populated only for inventory and discovery jobs.  |      |             |                       |  |                  |  |
| Subject               | A string containing the reenrollment subject name using X.500 format. This field is populated only for reenrollment jobs.   |      |             |                       |  |                  |  |
| Directories           | A string containing the directory or directories to search during a discovery job. This field is populated only for discovery jobs.   |      |             |                       |  |                  |  |
| IgnoredDirectories    | A string containing the directories that should not be included in the search during discovery jobs. This field is populated only for discovery jobs.   |      |             |                       |  |                  |  |
| SymLinks              | A Boolean indicating whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file during discovery jobs. This option is ignored on Windows. This field is populated only for discovery jobs.  |      |             |                       |  |                  |  |
| Compatibility         | A Boolean indicating whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false) during Java keystore discovery jobs. This field is populated only for discovery jobs.  |      |             |                       |  |                  |  |
| FileExtensions        | A string containing the file extensions for which to search during a discovery job. For example, search for files with the extension “jks” in order to exclude files with other extensions such as “txt”. This field is populated only for discovery jobs.  |      |             |                       |  |                  |  |
| FileNamePatterns      | A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. “myjks”) during discovery jobs. This field is populated only for discovery jobs.  |      |             |                       |  |                  |  |
| AgentBlueprintStores  | <p>An array that includes the certificate store information of the job. The following certificate store details are included:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentBlueprintStoreId</td><td>A string indicating the GUID of the certificate store associated with the blueprint.</td></tr> <tr> <td>AgentBlueprintId</td><td>A string indicating the GUID of the blueprint.</td></tr> </table> | Name | Description | AgentBlueprintStoreId | A string indicating the GUID of the certificate store associated with the blueprint. | AgentBlueprintId | A string indicating the GUID of the blueprint. |
| Name                  | Description   |      |             |                       |  |                  |  |
| AgentBlueprintStoreId | A string indicating the GUID of the certificate store associated with the blueprint.  |      |             |                       |  |                  |  |
| AgentBlueprintId      | A string indicating the GUID of the blueprint.  |      |             |                       |  |                  |  |

| Name              | Description   |      |             |           |   |             |  |               |  |                   |   |          |  |                 |   |
|-------------------|---|------|-------------|-----------|---|-------------|--|---------------|--|-------------------|---|----------|--|-----------------|---|
|                   | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StorePath</td><td>A string indicating the path to the certificate store on the target. ### 2.5.2.5 GET Agent BluePrint ID Stores

The GET /AgentBluePrint/{id}/Stores method is used to retrieve details of the certificate stores for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint certificate store details.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 24: GET AgentBlueprint {id} Stores Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| id            | Path  | <b>Required.</b> A string indicating the GUID of the orchestrator blueprint that should be retrieved.<br>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 25</a> ) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID. |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .                    |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 25: GET AgentBlueprint {id} Stores Response Data

| Name                  | Description   |
|-----------------------|---|
| AgentBlueprintStoreId | A string indicating the GUID of the certificate store associated with the blueprint.  |
| AgentBlueprintId      | A string indicating the GUID of the blueprint.  |
| StorePath             | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |
| ContainerId           | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| CertStoreType         | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| CertStoreTypeName     | A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).   |
| Approved              | A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing       | A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties            | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for more information).  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.2.6 POST AgentBlueprint ApplyBlueprint

The POST /AgentBlueprint/ApplyBlueprint method is used to apply a blueprint with associated certificate stores and scheduled jobs to an orchestrator. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 26: POST AgentBlueprint Apply Input Parameters

| Name       | In   | Description  |
|------------|------|--|
| agentIds   | Body | <p><b>Required.</b> An array of strings indicating the GUIDs of the orchestrators to which the blueprint should be applied.</p> <p>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 11</a>) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p> <div> <b>Note:</b> Orchestrators must be approved before a blueprint can be applied.</div> |
| templateId | Body | <p>A string indicating the GUID of the blueprint to apply to the orchestrator(s).</p> <p>Use the <i>GET AgentBlueprint</i> method (see <a href="#">GET Agent Blueprint on page 25</a>) to retrieve a list of all the blueprints to determine the blueprint GUIDs.</p>  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.2.7 POST AgentBlueprint GenerateBlueprint

The POST /AgentBlueprint/GenerateBlueprint method is used to create a new blueprint based on the certificate stores and scheduled jobs of one orchestrator. This method returns HTTP 200 OK on a success with details of the new blueprint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*  
AgentManagement: *Modify*

Table 27: POST AgentBlueprint Generate Input Parameters

| Name     | In   | Description  |
|----------|------|--|
| agentIds | Body | <b>Required.</b> A string indicating the GUID of the orchestrator that should be used to generate the blueprint.<br>Use the <i>GET Agents</i> method (see <a href="#">GET Agents on page 11</a> ) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators. |
| name     | Body | <b>Required.</b> A string indicating the name for the new blueprint.   |

Table 28: POST AgentBlueprint Generate Response Data

| Name                 | Description   |
|----------------------|---|
| AgentBlueprintId     | A string indicating the GUID of the blueprint.  |
| Name                 | A string indicating the name of the blueprint.  |
| RequiredCapabilities | An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM). |
| RequiredCapabilities | An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM). |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.3 Agent Pools

The Agent Pools component of the Keyfactor API includes methods necessary to programmatically add, edit, get, and delete Agent Pools. An orchestrator (a.k.a. agent) pool is a group of Keyfactor Command Windows Orchestrators and/or Universal Orchestrators that have the SSL capability. Each pool is used to divide the work of scanning a network between all orchestrators that are members of it.

Table 29: Agent Pool Endpoints

| Endpoint | Method | Description                              | Links  |
|----------|--------|--|--|
| /id}     | DELETE | Deletes the specified orchestrator pool. | <a href="#">DELETE Agent Pools ID on the next page</a> |

| Endpoint | Method | Description  | Links   |
|----------|--------|--|---|
| / {id}   | GET    | Returns limited information about the orchestrators in the specified pool.                                       | <a href="#">GET Agent Pools ID on the next page</a> |
| /        | GET    | Returns a list of all orchestrator pools with limited information about the orchestrators assigned to each pool. | <a href="#">GET Agent Pools on page 38</a>          |
| /        | POST   | Creates an orchestrator pool based on information in the request.  | <a href="#">POST Agent Pools on page 40</a>         |
| /        | PUT    | Updates an orchestrator pool based on information in the request.  | <a href="#">PUT Agent Pools on page 42</a>          |
| /Agents  | GET    | Returns a list of orchestrators associated with the Default Agent Pool.  | <a href="#">GET Agent Pools Agents on page 45</a>   |

### 2.5.3.1 DELETE Agent Pools ID

The DELETE /AgentPools/{id} method is used to delete an existing orchestrator (a.k.a. agent) pool. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 SslManagement: *Read*  
 SslManagement: *Modify*

Table 30: DELETE AgentPools {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> A string indicating the GUID of the orchestrator pool to delete. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on page 38</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID. The Default Agent Pool cannot be deleted. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.3.2 GET Agent Pools ID

The GET /AgentPools/{id} method is used to return information about a single orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with details about the requested orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*

Table 31: GET AgentPools {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> A string indicating the GUID of the orchestrator pool to retrieve. Use the <i>GET /AgentPools</i> method (see <a href="#">GET Agent Pools on page 38</a> ) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID. |

Table 32: GET AgentPools {id} Response Data

| Name                | Description  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
|---------------------|--|------|-------------|---------|---|----------------|--|---------------|---|---------|--|----------------|--|---------------|---|---------------|--|
| AgentPoolId         | A string indicating the GUID of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Name                | A string indicating the name of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| DiscoverAgentsCount | An integer specifying the number of orchestrators in the pool that can perform discovery jobs.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| MonitorAgentsCount  | An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Agents              | <p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table> | Name | Description | AgentId | A string indicating the GUID of the orchestrator. | EnableDiscover | A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false). | EnableMonitor | A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false). | Version | A string indicating the version of the orchestrator. | AllowsDiscover | A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false). | AllowsMonitor | A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false). | ClientMachine | A string indicating the client machine on which the orchestrator is installed. |
| Name                | Description  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AgentId             | A string indicating the GUID of the orchestrator.  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| EnableDiscover      | A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| EnableMonitor       | A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Version             | A string indicating the version of the orchestrator.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AllowsDiscover      | A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AllowsMonitor       | A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| ClientMachine       | A string indicating the client machine on which the orchestrator is installed.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.3.3 GET Agent Pools

The GET /AgentPools method is used to retrieve all orchestrator (a.k.a. agent) pools. This method returns HTTP 200 OK on a success with a list of all agent pool details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SslManagement: *Read*

Table 33: GET AgentPools Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Id</i> (AgentPoolID)</li><li>• <i>Name</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 34: GET AgentPools Response Data

| Name                | Description  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
|---------------------|--|------|-------------|---------|---|----------------|--|---------------|---|---------|--|----------------|--|---------------|---|---------------|--|
| AgentPoolId         | A string indicating the GUID of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Name                | A string indicating the name of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| DiscoverAgentsCount | An integer specifying the number of orchestrators in the pool that can perform discovery jobs.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| MonitorAgentsCount  | An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Agents              | <p>An array containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table> | Name | Description | AgentId | A string indicating the GUID of the orchestrator. | EnableDiscover | A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false). | EnableMonitor | A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false). | Version | A string indicating the version of the orchestrator. | AllowsDiscover | A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false). | AllowsMonitor | A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false). | ClientMachine | A string indicating the client machine on which the orchestrator is installed. |
| Name                | Description  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AgentId             | A string indicating the GUID of the orchestrator.  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| EnableDiscover      | A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| EnableMonitor       | A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Version             | A string indicating the version of the orchestrator.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AllowsDiscover      | A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| AllowsMonitor       | A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| ClientMachine       | A string indicating the client machine on which the orchestrator is installed.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |

#### 2.5.3.4 POST Agent Pools

The POST /AgentPools method is used to create a new orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*  
SslManagement: *Modify*

Table 35: POST AgentPools Input Parameters

| Name           | In   | Description   |      |             |         |   |                |   |               |  |
|----------------|--|---|------|-------------|---------|---|----------------|---|---------------|--|
| Name           | Body   | <b>Required.</b> A string indicating the name of the orchestrator pool.   |      |             |         |   |                |   |               |  |
| Agents         | Body   | <p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AgentId</td><td><b>Required.</b> A string indicating the GUID of the orchestrator being assigned.</td></tr><tr><td>EnableDiscover</td><td><b>Required*</b>. A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td></tr><tr><td>EnableMonitor</td><td><b>Required*</b>. A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b>.</td></tr></table> | Name | Description | AgentId | <b>Required.</b> A string indicating the GUID of the orchestrator being assigned. | EnableDiscover | <b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> . | EnableMonitor | <b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> . |
| Name           | Description  |   |      |             |         |   |                |   |               |  |
| AgentId        | <b>Required.</b> A string indicating the GUID of the orchestrator being assigned.  |   |      |             |         |   |                |   |               |  |
| EnableDiscover | <b>Required*</b> . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> .  |   |      |             |         |   |                |   |               |  |
| EnableMonitor  | <b>Required*</b> . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is <b>required</b> . |   |      |             |         |   |                |   |               |  |

Table 36: POST AgentPools Response Data

| Name                | Description  |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
|---------------------|--|------|-------------|---------|---|----------------|--|---------------|---|---------|--|----------------|--|---------------|---|---------------|--|
| AgentPoolId         | A string indicating the GUID of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| Name                | A string indicating the name of the orchestrator pool.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |
| DiscoverAgentsCount | An integer specifying the number of orchestrators in the pool that can perform discovery jobs.   |      |             |         |   |                |  |               |   |         |  |                |  |               |   |               |  |

### 2.5.3.5 PUT Agent Pools

The PUT /AgentPools method is used to update an existing orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SslManagement: *Read*  
SslManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 37: PUT AgentPools Input Parameters

| Name           | In   | Description   |      |             |         |   |                |   |               |  |
|----------------|--|---|------|-------------|---------|---|----------------|---|---------------|--|
| AgentPoolId    | Body   | <b>Required.</b> A string indicating the GUID of the orchestrator pool that is to be updated.   |      |             |         |   |                |   |               |  |
| Name           | Body   | <b>Required.</b> A string indicating the name of the orchestrator pool.   |      |             |         |   |                |   |               |  |
| Agents         | Body   | <p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators <b>must not be</b> assigned to a different orchestrator pool (except the Default Agent Pool). ### 2.5.3.6 GET Agent Pools Agents

The GET /AgentPools/Agents method is used to retrieve the orchestrators (a.k.a. agents) associated with the Default Agent Pool. This method has no required input parameters. It returns HTTP 200 OK on a success with information about the Default Agent Pool orchestrators.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SslManagement: *Read*

Table 39: GET AgentPools Default Agent Pool Agents Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Collection Manager</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Id</i> (Orchestrator ID, AgentID)</li><li>• <i>ClientMachine</i></li><li>• <i>EnableDiscover</i> (true or false)</li><li>• <i>EnableMonitor</i> (true or false)</li><li>• <i>Version</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 40: GET AgentPools Default Agent Pool Agents Response Data

| Name           | Description   |
|----------------|---|
| AgentId        | A string indicating the GUID of the orchestrator.   |
| EnableDiscover | A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).  |
| EnableMonitor  | A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false). |
| Version        | A string indicating the version of the orchestrator.  |
| AllowsDiscover | A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).  |
| AllowsMonitor  | A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).   |
| ClientMachine  | A string indicating the client machine on which the orchestrator is installed.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.4 Alerts

The Alerts component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, test and delete alerts for denied certificate requests, expired certificates, issued certificate requests, pending certificate requests and SSH Key Rotations.

- [Alerts Denied below](#)
- [Alerts Expiration on page 74](#)
- [Alerts Issued on page 114](#)
- [Alerts Key Rotation on page 148](#)
- [Alerts Pending on page 182](#)

### 2.5.4.1 Alerts Denied

The Alerts Denied component of the Keyfactor API includes methods necessary to create, update, retrieve, and delete alerts for denied certificate requests.

Table 41: Alerts Denied

| Endpoint            | Method | Description  | Link  |
|---------------------|--------|--|---|
| /Alerts/Denied/{id} | DELETE | Deletes a denied certificate request alert for the specified ID.               | <a href="#">DELETE Alerts Denied ID below</a> |
| /Alerts/Denied/{id} | GET    | Retrieves details for a denied certificate request alert for the specified ID. | <a href="#">GET Alerts Denied ID below</a>    |
| /Alerts/Denied      | PUT    | Updates a denied certificate request alert for the specified ID.               | <a href="#">PUT Alerts Denied on page 65</a>  |
| /Alerts/Denied      | GET    | Retrieves details for all configured denied certificate request alerts.        | <a href="#">GET Alerts Denied on page 52</a>  |
| /Alerts/Denied      | POST   | Creates a new denied certificate request alert.                                | <a href="#">POST Alerts Denied on page 57</a> |

## DELETE Alerts Denied ID

The DELETE /Alerts/Denied/{id} method is used to delete the denied certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Modify*

Table 42: DELETE Alerts Denied {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert to be deleted.<br>Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 52</a> ) to retrieve a list of all the issued request alerts to determine the alert ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Denied ID

The GET /Alerts/Denied/{id} method is used to retrieve details for the denied certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 43: GET Alerts Denied {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the denied certificate request alert.<br>Use the <i>GET /Alerts/Denied</i> method (see <a href="#">GET Alerts Denied on page 52</a> ) to retrieve a list of all the issued request alerts to determine the alert ID. |

Table 44: GET Alerts Denied {id} Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the denied request alert.   |
| DisplayName | A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}</li> </ul> <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>  |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>   |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description  |       |             |    |  |             |   |            |   |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.   |       |             |    |  |             |   |            |   |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.  |       |             |    |  |             |   |            |   |                     |   |
| ForestRoot          | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |   |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.  |       |             |    |  |             |   |            |   |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>   | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> | ID  | Event Handler Type  | 6            | DeniedLogger   | 7             | DeniedPowershell  | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>  | ID    | Event Handler Type | 6  | DeniedLogger   | 7   | DeniedPowershell  |              |  |               |   |             |  |            |  |
| ID                     | Event Handler Type  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| 6                      | DeniedLogger  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| 7                      | DeniedPowershell  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DisplayName            | A string containing the name of the event handler.  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| UseHandler             | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| EventHandlerParameters | <p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain</li> </ul> </td></tr> </table> | Value | Description        | Id | An integer indicating the Keyfactor Command reference ID of the configured parameter.  | Key | A string indicating the reference name of the configured parameter. | DefaultValue | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ). | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain</li> </ul> |             |  |            |  |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| ParameterType          | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain</li> </ul>   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Denied

The GET /Alerts/Denied method is used to retrieve details of all denied certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 45: GET Alerts Denied Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DisplayName</i></li> <li>• <i>Message</i></li> <li>• <i>RegisteredEventHandlerId</i></li> <li>• <i>Subject</i></li> <li>• <i>Template_Id</i></li> <li>• <i>UseHandler</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 46: GET Alerts Denied Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the denied request alert.   |
| DisplayName | A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}</li> </ul> <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>  |

| Name                | Description   |       |             |    |  |             |   |            |  |                     |   |
|---------------------|---|-------|-------------|----|--|-------------|---|------------|--|---------------------|---|

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Denied

The POST /Alerts/Denied method is used to create a new denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 47: POST Alerts Denied Input Parameters

| Name  | In       | Description   |             |          |   |            |      |  |
|---|----------|---|-------------|----------|---|------------|------|--|
| DisplayName   | Body     | <b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.   |             |          |   |            |      |  |
| Subject   | Body     | <b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered. <div> <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</div>   |             |          |   |            |      |  |
| Message   | Body     | <b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. <p>For example:</p> <p>“Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n<table>\n<tr>\n<th>Certificate</th>\n<th>Metadata</th>\n</tr>\n<tr>\n<td>Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n<tr&gt;\n<td&gt;ca: address:="" certificate="" critical:="" email="" last="" management="" name:="" owner="" p="" system”<="" table&gt;\n\nthanks!\n\nyour="" td&gt;&lt;="" td&gt;&lt;td&gt;app="" td&gt;&lt;td&gt;business="" tr&gt;\n&lt;="" tr&gt;\n<tr&gt;\n<td&gt;dn:="" tr&gt;\n<tr&gt;\n<td&gt;sans:="" {careqid}&lt;="" {dn}&lt;="" {metadata:appowneremailaddress}&lt;="" {metadata:appownerlastname}&lt;="" {metadata:businesscritical}&lt;="" {san}&lt;=""><p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p></tr&gt;\n<td&gt;ca:></td></tr><tr><td>Recipients</td><td>Body</td><td>An array of strings containing the recipients for the alert. | Value         | Description  |   |       |             |  |                       |              |  |               |  |
|               | configured parameter.  |   |       |             |  |                       |              |  |               |  |
| DefaultValue  | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).   |   |       |             |  |                       |              |  |               |  |
| ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"><li>LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li><li>Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li><li>Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul> |   |       |             |  |                       |              |  |               |  |

For example, for a PowerShell handler:

| Name | In | Description   |
|------|----|---|
|      |    | <pre> "EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "rcn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",     "DefaultValue": "Denied Alert: Enterprise Web Server",     "ParameterType": "Value"   },   {     "Id": 31,     "Key": "DenialComment",     "DefaultValue": "cmnt",     "ParameterType": "Token"   },   {     "Id": 32,     "Key": "ScriptName",     "DefaultValue": "MyScript.ps1",     "ParameterType": "Script"   } ] </pre> |

Table 48: POST Alerts Denied Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the denied request alert.   |
| DisplayName | A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>  |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}</li> </ul> <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>  |

| Name                | Description   |       |             |    |  |             |   |            |  |                     |   |
|---------------------|---|-------|-------------|----|--|-------------|---|------------|--|---------------------|---|
|                     | <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |       |             |    |  |             |   |            |  |                     |   |
| Template            | <p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description   |       |             |    |  |             |   |            |  |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.  |       |             |    |  |             |   |            |  |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.   |       |             |    |  |             |   |            |  |                     |   |
| ForestRoot          | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div>  |       |             |    |  |             |   |            |  |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.   |       |             |    |  |             |   |            |  |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable.  **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT Alerts Denied

The PUT /Alerts/Denied method is used to update a denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected

data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 49: PUT Alerts Denied Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| id          | Path | An integer indicating the Keyfactor Command reference ID of the denied request alert.   |
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.   |
| Subject     | Body | <b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered. <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | Body | <b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. <p>For example:</p> <pre> “Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | Body | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual   |

| Name                   | In  | Description   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
|------------------------|---|---|--------------------|-------------|--------------|---|------------------|--------------------|---|--------------|---|------------------|------------|---|
|                        |   | <p>email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>  |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| TemplateId             | Body  | <p>An integer indicating the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Use the GET /Templates method (see <a href="#">GET Templates on page 1365</a>) to retrieve a list of all the templates to determine the template ID.</p>  |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| RegisteredEventHandler | Body  | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>6</td><td>DeniedLogger</td></tr><tr><td>7</td><td>DeniedPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value              | Description | Id           | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>6</td><td>DeniedLogger</td></tr><tr><td>7</td><td>DeniedPowershell</td></tr></table> | ID               | Event Handler Type | 6 | DeniedLogger | 7 | DeniedPowershell | UseHandler | <p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p> |
| Value                  | Description   |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| Id                     | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>6</td><td>DeniedLogger</td></tr><tr><td>7</td><td>DeniedPowershell</td></tr></table> | ID  | Event Handler Type | 6           | DeniedLogger | 7   | DeniedPowershell |                    |   |              |   |                  |            |   |
| ID                     | Event Handler Type  |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| 6                      | DeniedLogger  |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| 7                      | DeniedPowershell  |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| UseHandler             | <p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>   |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| EventHandlerParameters | Body  | <p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p>   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |

| Name | In | Description   |   |
|------|----|---------------|---|
|      |    | Value         | Description   |
|      |    | Id            | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |
|      |    | Key           | A string indicating the reference name of the configured parameter.   |
|      |    | DefaultValue  | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |
|      |    | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>• <b>LogTarget</b><br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• <b>Script</b><br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• <b>Token</b><br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• <b>Value</b><br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

| Name | In | Description   |
|------|----|---|
|      |    | <p>For example, for a PowerShell handler:</p> <pre> "EventHandlerParameters": [   {     "Id": 28,     "Key": "cn",     "DefaultValue": "rcn",     "ParameterType": "Token"   },   {     "Id": 29,     "Key": "AppOwnerFirstName",     "DefaultValue": "metadata:AppOwnerFirstName",     "ParameterType": "Token"   },   {     "Id": 30,     "Key": "Text",     "DefaultValue": "Denied Alert: Enterprise Web Server",     "ParameterType": "Value"   },   {     "Id": 31,     "Key": "DenialComment",     "DefaultValue": "cmnt",     "ParameterType": "Token"   },   {     "Id": 32,     "Key": "ScriptName",     "DefaultValue": "MyScript.ps1",     "ParameterType": "Script"   } ] </pre> |

Table 50: PUT Alerts Denied Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the denied request alert.   |
| DisplayName | A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Template: {template}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CA: {careqid}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}</li> </ul> <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>  |

| Name                | Description   |       |             |    |  |             |   |            |  |                     |   |
|---------------------|---|-------|-------------|----|--|-------------|---|------------|--|---------------------|---|
|                     | <ul style="list-style-type: none"> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |       |             |    |  |             |   |            |  |                     |   |
| Template            | <p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description   |       |             |    |  |             |   |            |  |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.  |       |             |    |  |             |   |            |  |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.   |       |             |    |  |             |   |            |  |                     |   |
| ForestRoot          | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.         </div>  |       |             |    |  |             |   |            |  |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.   |       |             |    |  |             |   |            |  |                     |   |

### 2.5.4.2 Alerts Expiration

The Alerts Expiration component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for expired certificates.

Table 51: Alerts Expiration

| Endpoint                | Method | Description  | Link   |
|-------------------------|--------|--|--|
| /Alerts/Expiration/{id} | DELETE | Deletes an expired certificate for the specified ID. | <a href="#">DELETE Alerts Expiration ID on the next page</a> |

| Endpoint                    | Method | Description   | Link  |
|-----------------------------|--------|---|---|
| /Alerts/Expiration/{id}     | GET    | Retrieves details for an expired certificate for the specified ID.            | <a href="#">GET Alerts Expiration ID on the next page</a>   |
| /Alerts/Expiration/Schedule | GET    | Retrieves details of the schedule for delivery of expired certificate alerts. | <a href="#">GET Alerts Expiration Schedule on page 80</a>   |
| /Alerts/Expiration/Schedule | PUT    | Updates the schedule for delivery of expired certificate alerts.              | <a href="#">PUT Alerts Expiration Schedule on page 81</a>   |
| /Alerts/Expiration          | GET    | Retrieves details for all configured expired certificate.                     | <a href="#">GET Alerts Expiration on page 83</a>            |
| /Alerts/Expiration          | POST   | Creates a new expired certificate alert.                                      | <a href="#">POST Alerts Expiration on page 88</a>           |
| /Alerts/Expiration          | PUT    | Updates an expired certificate for the specified ID.                          | <a href="#">PUT Alerts Expiration on page 98</a>            |
| /Alerts/Expiration/Test     | POST   | Test an Expiration Alert  | <a href="#">POST Alerts Expiration Test on page 108</a>     |
| /Alerts/Expiration/TestAll  | POST   | Test All Expiration Alerts  | <a href="#">POST Alerts Expiration Test All on page 112</a> |

## DELETE Alerts Expiration ID

The DELETE /Alerts/Expiration/{id} method is used to delete the expiration alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 52: DELETE Alerts Expiration {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert to be deleted.<br>Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 83</a> ) to retrieve a list of all the expiration alerts to determine the alert ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Expiration ID

The GET /Alerts/Expiration/{id} method is used to retrieve details for the expiration alert with the specified ID. This method returns HTTP 200 OK on a success with details about the specified alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 53: GET Alerts Expiration {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the expiration alert.<br>Use the <i>GET /Alerts/Expiration</i> method (see <a href="#">GET Alerts Expiration on page 83</a> ) to retrieve a list of all the expiration alerts to determine the alert ID. |

Table 54: GET Alerts Expiration {id} Response Data

| Name                  | Description  |
|-----------------------|--|
| Id                    | An integer indicating the Keyfactor Command reference ID of the expiration alert.  |
| DisplayName           | A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.   |
| Subject               | A string indicating the subject for the email message that will be delivered when the alert is triggered.  |
| Message               | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>   |
| ExpirationWarningDays | <p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p><b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div> |

| Name             | Description   |       |             |    |  |      |   |
|------------------|---|-------|-------------|----|--|------|---|
|                  |  2nd at 12:00 am UTC would be alerted on.  |       |             |    |  |      |   |
| Recipients       | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul> |       |             |    |  |      |   |
| CertificateQuery | <p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>  | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the certificate collection. | Name | A string containing the name of the certificate collection. |
| Value            | Description   |       |             |    |  |      |   |
| Id               | An integer indicating the Keyfactor Command reference ID for the certificate collection.  |       |             |    |  |      |   |
| Name             | A string containing the name of the certificate collection.   |       |             |    |  |      |   |

| Name                   | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
|------------------------|---|-------|--------------------|----|---|-----|---|--------------|--|---------------|--|---|-------------------|-------------|--|------------|--|
| RegisteredEventHandler | <p>An array containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> | ID  | Event Handler Type  | 1            | ExpirationLogger   | 2             | ExpirationPowershell   | 3 | ExpirationRenewal | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| Id                     | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>   | ID    | Event Handler Type | 1  | ExpirationLogger  | 2   | ExpirationPowershell  | 3            | ExpirationRenewal  |               |  |   |                   |             |  |            |  |
| ID                     | Event Handler Type  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| 1                      | ExpirationLogger  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| 2                      | ExpirationPowershell  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| 3                      | ExpirationRenewal   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| DisplayName            | A string containing the name of the event handler.  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| UseHandler             | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| EventHandlerParameters | <p>An object containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td>A string containing the parameter type. Supported types are:</td></tr> </table>   | Value | Description        | Id | An integer indicating the Keyfactor Command reference ID of the configured parameter.   | Key | A string indicating the reference name of the configured parameter. | DefaultValue | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ). | ParameterType | A string containing the parameter type. Supported types are: |   |                   |             |  |            |  |

## GET Alerts Expiration Schedule

The GET /Alerts/Expiration/Schedule method is used to retrieve the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for expiration alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 55: GET Alerts Expiration Schedule Response Data

| Name     | Description   |      |             |       |   |      |             |      |   |
|----------|---|------|-------------|-------|---|------|-------------|------|---|
| Schedule | <div>An array indicating the schedule for delivery of the expiration alerts. Possible values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Daily</td><td><div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. ## PUT Alerts Expiration Schedule

The PUT /Alerts/Expiration/Schedule method is used to create or update the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for the alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 56: PUT Alerts Expiration Schedule Input Parameters

| Name     | In  | Description   |             |             |  |   |      |             |      |  |

## GET Alerts Expiration

The GET /Alerts/Expiration method is used to retrieve details of all expiration alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Read*

Table 58: GET Alerts Expiration Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>CertificateQueryId</i></li> <li>• <i>Days</i></li> <li>• <i>DisplayName</i></li> <li>• <i>Message</i></li> <li>• <i>RegisteredEventHandlerId</i></li> <li>• <i>ScheduledTaskId</i></li> <li>• <i>Subject</i></li> <li>• <i>UseHandler</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 59: GET Alerts Expiration Response Data

| Name                  | Description  |
|-----------------------|--|
| Id                    | An integer indicating the Keyfactor Command reference ID of the expiration alert.  |
| DisplayName           | A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.   |
| Subject               | A string indicating the subject for the email message that will be delivered when the alert is triggered.  |
| Message               | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>   |
| ExpirationWarningDays | <p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p><b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div> |

| Name             | Description   |       |             |    |  |      |   |
|------------------|---|-------|-------------|----|--|------|---|
|                  |  2nd at 12:00 am UTC would be alerted on.  |       |             |    |  |      |   |
| Recipients       | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul> |       |             |    |  |      |   |
| CertificateQuery | <p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>  | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the certificate collection. | Name | A string containing the name of the certificate collection. |
| Value            | Description   |       |             |    |  |      |   |
| Id               | An integer indicating the Keyfactor Command reference ID for the certificate collection.  |       |             |    |  |      |   |
| Name             | A string containing the name of the certificate collection.   |       |             |    |  |      |   |

| Name                   | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
|------------------------|---|-------|--------------------|----|---|-----|---|--------------|--|---------------|--|---|-------------------|-------------|--|------------|--|
| RegisteredEventHandler | <p>An array containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> | ID  | Event Handler Type  | 1            | ExpirationLogger   | 2             | ExpirationPowershell   | 3 | ExpirationRenewal | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| Id                     | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>   | ID    | Event Handler Type | 1  | ExpirationLogger  | 2   | ExpirationPowershell  | 3            | ExpirationRenewal  |               |  |   |                   |             |  |            |  |
| ID                     | Event Handler Type  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| 1                      | ExpirationLogger  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |

| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| ParameterType          | A string containing the parameter type. Supported types are:  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <ul style="list-style-type: none"> <li>• <b>LogTarget</b><br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• <b>Script</b><br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• <b>Token</b><br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• <b>Value</b><br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Expiration

The POST /Alerts/Expiration method is used to create a new expiration alert. This method returns HTTP 200 OK on a success with details about the expiration alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

*Table 60: POST Alerts Expiration Input Parameters*

| Name                  | In   | Description  |
|-----------------------|------|--|
| DisplayName           | Body | <b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.  |
| Subject               | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="background-color: #e6ffe6; padding: 10px;">  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.         </div>   |
| Message               | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre>"Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System"</pre> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| ExpirationWarningDays | Body | <b>Required.</b> An integer indicating the number of days prior to expiration to send the warning.   |

| Name               | In   | Description   |
|--------------------|------|---|
|                    |      | <p> <b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.</p> |
| Recipients         | Body | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>   |
| CertificateQueryId | Body | <p><b>Required.</b> An integer indicating the certificate collection on which to base the alert.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate</a></p>  |

| Name                   | In  | Description   |                    |             |                  |   |                      |   |                   |   |   |                      |   |                   |            |  |
|------------------------|---|---|--------------------|-------------|------------------|---|----------------------|---|-------------------|---|---|----------------------|---|-------------------|------------|--|
|                        |   | <a href="#">Collections on page 405</a> ) to retrieve a list of all the certificate collections to determine the collection ID.   |                    |             |                  |   |                      |   |                   |   |   |                      |   |                   |            |  |
| RegisteredEventHandler | Body  | <p>An array containing the event handler configuration for the alert, if applicable. Table 61: POST Alerts Expiration Response Data

| Name                  | Description  |
|-----------------------|--|
| Id                    | An integer indicating the Keyfactor Command reference ID of the expiration alert.  |
| DisplayName           | A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.   |
| Subject               | A string indicating the subject for the email message that will be delivered when the alert is triggered.  |
| Message               | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>   |
| ExpirationWarningDays | <p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p><b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div> |

| Name             | Description   |       |             |    |  |      |   |
|------------------|---|-------|-------------|----|--|------|---|
|                  |  2nd at 12:00 am UTC would be alerted on.  |       |             |    |  |      |   |
| Recipients       | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul> |       |             |    |  |      |   |
| CertificateQuery | <p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>  | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the certificate collection. | Name | A string containing the name of the certificate collection. |
| Value            | Description   |       |             |    |  |      |   |
| Id               | An integer indicating the Keyfactor Command reference ID for the certificate collection.  |       |             |    |  |      |   |
| Name             | A string containing the name of the certificate collection.   |       |             |    |  |      |   |

| Name                   | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |

| Value                  | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
| ParameterType          | A string containing the parameter type. Supported types are:  |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <ul style="list-style-type: none"> <li>• <b>LogTarget</b><br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• <b>Script</b><br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• <b>Token</b><br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• <b>Value</b><br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT Alerts Expiration

The PUT /Alerts/Expiration method is used to update an expiration alert. This method returns HTTP 200 OK on a success with details about the alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 62: PUT Alerts Expiration Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| id          | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID of the expiration alert.   |
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.  |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>  |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate inform- ation includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:Ap- pOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thum- bprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/t- d&gt;&lt;td&gt;Business Critical: {metadata:Busi- nessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |

| Name                  | In   | Description  |
|-----------------------|------|--|
| ExpirationWarningDays | Body | <p><b>Required.</b> An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p><b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.</p> </div> |
| Recipients            | Body | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |
| CertificateQueryId    | Body | <p><b>Required.</b> An integer indicating the certificate collection on</p>  |

| Name                   | In  | Description   |                    |             |                  |   |                      |   |                   |                  |   |                      |   |                   |            |  |

|       | should be passed to the PowerShell script. |  |       |             |  |  |

Table 63: PUT Alerts Expiration Response Data

| Name                  | Description  |
|-----------------------|--|
| Id                    | An integer indicating the Keyfactor Command reference ID of the expiration alert.  |
| DisplayName           | A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.   |
| Subject               | A string indicating the subject for the email message that will be delivered when the alert is triggered.  |
| Message               | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>   |
| ExpirationWarningDays | <p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p><b>Example:</b> When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div> |

| Name             | Description   |       |             |    |  |      |   |
|------------------|---|-------|-------------|----|--|------|---|
|                  |  2nd at 12:00 am UTC would be alerted on.  |       |             |    |  |      |   |
| Recipients       | <p>An object containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul> |       |             |    |  |      |   |
| CertificateQuery | <p>An array indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>  | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the certificate collection. | Name | A string containing the name of the certificate collection. |
| Value            | Description   |       |             |    |  |      |   |
| Id               | An integer indicating the Keyfactor Command reference ID for the certificate collection.  |       |             |    |  |      |   |
| Name             | A string containing the name of the certificate collection.   |       |             |    |  |      |   |

| Name                   | Description   |       |                    |    |   |     |   |              |  |               |  |   |                   |             |  |            |  |
|------------------------|---|-------|--------------------|----|---|-----|---|--------------|--|---------------|--|---|-------------------|-------------|--|------------|--|

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Expiration Test

The POST /Alerts/Expiration/Test method is used to test individual certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of “NoActionTaken” if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowManagement: *Read*

WorkflowManagement: *Test*

Table 64: POST Alerts Expiration Test Input Parameters

| Name                       | In   | Description  |      |             |         |   |                |  |                        |   |            |  |
|----------------------------|--|--|------|-------------|---------|---|----------------|--|------------------------|---|------------|--|
| expirationAlertTestRequest | Body   | <p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AlertId</td><td><p><b>Required.</b> An integer indicating the reference ID of expiration alert to test.</p><p>Use the GET /Alerts/Expiration method (see <a href="#">GET Alerts Expiration on page 83</a>) to retrieve a list of all your expiration alerts to determine the alert Id.</p></td></tr><tr><td>EvaluationDate</td><td><p><b>Required.</b> A string indicating the start date/-time for the test, in UTC.</p><p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.</p></td></tr><tr><td>PreviousEvaluationDate</td><td><p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). | Recipients       | An object containing the recipients for the alert.  |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |
| SendDate         | A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).   |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |
| AlertBuildResult | A string indicating the outcome of the test (e.g. Success).   |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Expiration Test All

The POST /Alerts/Expiration/TestAll method is used to test all certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of "NoActionTaken" if no certificates match the test criteria entered.

**Tip:** Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 66: POST Alerts Expiration Test All Input Parameters

| Name                       | In  | Description   |      |             |                |   |                        |   |            |  |
|----------------------------|---|---|------|-------------|----------------|---|------------------------|---|------------|--|
| expirationAlertTestRequest | Body  | <p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>EvaluationDate</td><td><p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p><p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.</p></td></tr><tr><td>PreviousEvaluationDate</td><td><p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p></td></tr><tr><td>SendAlerts</td><td><p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p></td></tr></table> | Name | Description | EvaluationDate | <p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p> <p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.</p> | PreviousEvaluationDate | <p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p> | SendAlerts | <p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p> |
| Name                       | Description   |   |      |             |                |   |                        |   |            |  |
| EvaluationDate             | <p><b>Required.</b> A string indicating the start date/time for the test, in UTC.</p> <p>You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.</p> |   |      |             |                |   |                        |   |            |  |
| PreviousEvaluationDate     | <p><b>Required.</b> A string indicating the end date/time for the test, in UTC.</p>   |   |      |             |                |   |                        |   |            |  |

| Recipients       | An object containing the recipients for the alert.  |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |
| SendDate         | A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).   |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |
| AlertBuildResult | A string indicating the outcome of the test (e.g. Success).   |      |             |        |  |       |  |          |   |        |   |         |   |         |   |            |  |          |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.4.3 Alerts Issued

The Alerts Issued component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for issued certificate requests.

Table 68: Alerts Issued

| Endpoint                | Method | Description  | Link   |
|-------------------------|--------|--|--|
| /Alerts/Issued/{id}     | DELETE | Deletes an issued certificate request alert for the specified ID.                    | <a href="#">DELETE Alerts Issued ID below</a>          |
| /Alerts/Issued/{id}     | GET    | Retrieves details for an issued certificate request alert for the specified ID.      | <a href="#">GET Alerts Issued ID on the next page</a>  |
| /Alerts/Issued/Schedule | GET    | Retrieves details of the schedule for delivery of issued certificate request alerts. | <a href="#">GET Alerts Issued Schedule on page 120</a> |
| /Alerts/Issued/Schedule | PUT    | Updates the schedule for delivery of issued certificate request alerts.              | <a href="#">PUT Alerts Issued Schedule on page 122</a> |
| /Alerts/Issued          | GET    | Retrieves details for all configured issued certificate request alerts.              | <a href="#">GET Alerts Issued on page 125</a>          |
| /Alerts/Issued          | POST   | Creates a new issued certificate request alert.                                      | <a href="#">POST Alerts Issued on page 129</a>         |
| /Alerts/Issued          | PUT    | Updates an issued certificate request alert for the specified ID.                    | <a href="#">PUT Alerts Issued on page 138</a>          |

## DELETE Alerts Issued ID

The DELETE /Alerts/Issued/{id} method is used to delete the issued certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Modify*

Table 69: DELETE Alerts Issued {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert to be deleted.<br>Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 125</a> ) to retrieve a list of all the issued request alerts to determine the alert ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Issued ID

The GET /Alerts/Issued/{id} method is used to retrieve details for the issued certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Read*

Table 70: GET Alerts Issued {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the issued certificate request alert.<br>Use the <i>GET /Alerts/Issued</i> method (see <a href="#">GET Alerts Issued on page 125</a> ) to retrieve a list of all the issued request alerts to determine the alert ID. |

Table 71: GET Alerts Issued {id} Response Data

| Name        | Description  |
|-------------|--|
| Id          | An integer indicating the Keyfactor Command reference ID of the issued request alert.  |
| DisplayName | A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.   |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special  |

| Name                | Description  |       |             |    |  |             |   |            |  |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|--|---------------------|---|
|                     | <p>text strings include:</p> <ul style="list-style-type: none"> <li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |       |             |    |  |             |   |            |  |                     |   |
| Template            | <p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table data-bbox="581 705 1399 1444"> <tr> <th data-bbox="587 714 898 772">Value</th><th data-bbox="898 714 1393 772">Description</th></tr> <tr> <td data-bbox="587 772 898 900">Id</td><td data-bbox="898 772 1393 900">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td data-bbox="587 900 898 1062">DisplayName</td><td data-bbox="898 900 1393 1062">A string containing the name of the template. |------|-------------|---|
|      | Value       | Description   |
|      |             | <p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Issued Schedule

The GET /Alerts/Issued/Schedule method is used to retrieve the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for issued certificate request alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 72: GET Alerts Issued Schedule Response Data

| Name     | Description  |      |             |          |   |      |             |         |   |       |   |      |             |      |  |

| Time     | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |      |             |          |   |      |             |         |  |       |   |      |             |      |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Issued

The GET /Alerts/Issued method is used to retrieve details of all issued certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 75: GET Alerts Issued Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>Subject</i></li><li>• <i>Template_Id</i></li><li>• <i>UseHandler</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 76: GET Alerts Issued Response Data

| Name        | Description  |
|-------------|--|
| Id          | An integer indicating the Keyfactor Command reference ID of the issued request alert.  |
| DisplayName | A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.   |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special  |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <p>text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description  |       |             |    |  |             |   |            |   |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.   |       |             |    |  |             |   |            |   |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.  |       |             |    |  |             |   |            |   |                     |   |
| ForestRoot          | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |   |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.  |       |             |    |  |             |   |            |   |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> | ID  | Event Handler Type  | 4            | IssuedLogger   | 5             | IssuedPowershell  | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Issued

The POST /Alerts/Issued method is used to create a new issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 77: POST Alerts Issued Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.   |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | Body | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email  |

| Name                   | In   | Description   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
|------------------------|--|---|--------------------|-------------|--------------|--|------------------|--------------------|---|--------------|---|------------------|------------|--|
|                        |  | <p>addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| TemplateId             | Body   | <p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1365</a>) to retrieve a list of all the templates to determine the template ID.</p>   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| RegisteredEventHandler | Body   | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the event handler.<table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></tbody></table></td></tr><tr><td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr></tbody></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value              | Description | Id           | An integer indicating the Keyfactor Command reference ID for the event handler. <table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></tbody></table> | ID               | Event Handler Type | 4 | IssuedLogger | 5 | IssuedPowershell | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description  |   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID for the event handler. <table><thead><tr><th>ID</th><th>Event Handler Type</th></tr></thead><tbody><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></tbody></table> | ID  | Event Handler Type | 4           | IssuedLogger | 5  | IssuedPowershell |                    |   |              |   |                  |            |  |
| ID                     | Event Handler Type   |   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| 4                      | IssuedLogger   |   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| 5                      | IssuedPowershell   |   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| UseHandler             | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).   |   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |
| EventHandlerParameters | Body   | <p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p>   |                    |             |              |  |                  |                    |   |              |   |                  |            |  |

| Name | In | Description   |  |
|------|----|---------------|--|
|      |    | Value         | Description  |
|      |    | Id            | An integer indicating the Keyfactor Command reference ID of the configured parameter.  |
|      |    | Key           | A string indicating the reference name of the configured parameter.  |
|      |    | DefaultValue  | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).   |
|      |    | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>• <b>LogTarget</b><br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• <b>Script</b><br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• <b>Token</b><br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the</li> </ul> |

| Name  | In   | Description   |       |             |  |  |
|-------|--|---|-------|-------------|--|--|
|       |  | <table><tr><th>Value</th><th>Description</th></tr><tr><td></td><td><p><i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p><ul style="list-style-type: none"><li>Value</li></ul><p>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</p></td></tr></table> | Value | Description |  | <p><i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> <ul style="list-style-type: none"><li>Value</li></ul> <p>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</p> |

| DisplayName            | A string containing the name of the event handler.  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| UseHandler             | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| EventHandlerParameters | <p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget</li> </ul> </td></tr> </table>                     | Value | Description        | Id | An integer indicating the Keyfactor Command reference ID of the configured parameter.  | Key | A string indicating the reference name of the configured parameter. | DefaultValue | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ). | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget</li> </ul> |             |  |            |  |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| ParameterType          | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget</li> </ul>   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT Alerts Issued

The PUT /Alerts/Issued method is used to update an issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 79: PUT Alerts Issued Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| id          | Path | An integer indicating the Keyfactor Command reference ID of the issued request alert.   |
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.   |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>   |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate inform- ation includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:Ap- pOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thum- bprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/t- d&gt;&lt;td&gt;Business Critical: {metadata:Busi- nessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |

| Name                   | In  | Description   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
|------------------------|---|---|--------------------|-------------|--------------|---|------------------|--------------------|---|--------------|---|------------------|------------|---|
| Recipients             | Body  | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>  |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| TemplateId             | Body  | <p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1365</a>) to retrieve a list of all the templates to determine the template ID.</p>   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| RegisteredEventHandler | Body  | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value              | Description | Id           | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table> | ID               | Event Handler Type | 4 | IssuedLogger | 5 | IssuedPowershell | UseHandler | <p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p> |
| Value                  | Description   |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |
| Id                     | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>4</td><td>IssuedLogger</td></tr><tr><td>5</td><td>IssuedPowershell</td></tr></table> | ID  | Event Handler Type | 4           | IssuedLogger | 5   | IssuedPowershell |                    |   |              |   |                  |            |   |
| ID                     | Event Handler Type  |   |                    |             |              |   |                  |                    |   |              |   |                  |            |   |

Table 80: PUT Alerts Issued Response Data

| Name        | Description  |
|-------------|--|
| Id          | An integer indicating the Keyfactor Command reference ID of the issued request alert.  |
| DisplayName | A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.   |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Serial Number: {serial}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Thumbprint: {thumbprint}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {dn}&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special  |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <p>text strings include:</p> <ul style="list-style-type: none"> <li>{requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li> </ul>  |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description  |       |             |    |  |             |   |            |   |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.   |       |             |    |  |             |   |            |   |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.  |       |             |    |  |             |   |            |   |                     |   |
| ForestRoot          | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |   |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.  |       |             |    |  |             |   |            |   |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

#### 2.5.4.4 Alerts Key Rotation

The Alerts Key Rotation component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for SSH keys approaching the end of the key lifetime. The default key lifetime is 365 days, but this setting is configurable (see [Application Settings: SSH Tab](#) in the *Keyfactor Command Reference Guide*). Key rotation alerts apply to both user keys (see

[My SSH Key](#) in the *Keyfactor Command Reference Guide*) and service account keys (see [Service Account Keys](#) in the *Keyfactor Command Reference Guide*) generated within Keyfactor Command.

Table 81: Alerts Key Rotation

| Endpoint                     | Method | Description  | Link  |
|------------------------------|--------|--|---|
| /Alerts/KeyRotation/{id}     | DELETE | Deletes an SSH key rotation alert for the specified ID.                    | <a href="#">DELETE Alerts Key Rotation ID below</a>           |
| /Alerts/KeyRotation/{id}     | GET    | Retrieves details for the SSH key rotation alert for the specified ID.     | <a href="#">GET Alerts Key Rotation ID on the next page</a>   |
| /Alerts/KeyRotation/Schedule | GET    | Retrieves details of the schedule for delivery of SSH key rotation alerts. | <a href="#">GET Alerts Key Rotation Schedule on page 153</a>  |
| /Alerts/KeyRotation/Schedule | PUT    | Updates the schedule for delivery of SSH key rotation alerts.              | <a href="#">PUT Alerts Key Rotation Schedule on page 155</a>  |
| /Alerts/KeyRotation          | GET    | Retrieves details for all configured SSH key rotation alerts.              | <a href="#">GET Alerts Key Rotation on page 158</a>           |
| /Alerts/KeyRotation          | POST   | Creates a new SSH key rotation alert.                                      | <a href="#">POST Alerts Key Rotation on page 161</a>          |
| /Alerts/KeyRotation          | PUT    | Updates the SSH key rotation alert for a specified ID.                     | <a href="#">PUT Alerts Key Rotation on page 168</a>           |
| /Alerts/KeyRotation/Test     | POST   | Used to test specific SSH key rotation alerts.                             | <a href="#">POST Alerts Key Rotation Test on page 176</a>     |
| /Alerts/KeyRotation/TestAll  | POST   | Used to test all SSH key rotation alerts.                                  | <a href="#">POST Alerts Key Rotation Test All on page 179</a> |

## DELETE Alerts Key Rotation ID

The DELETE /Alerts/KeyRotation/{id} method is used to delete the SSH key rotation alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 82: DELETE Alerts Key Rotation {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert to be deleted.<br>Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 158</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Key Rotation ID

The GET /Alerts/KeyRotation/{id} method is used to retrieve details for the SSH key rotation alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 83: GET Alerts Key Rotation {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert.<br>Use the GET /Alerts/KeyRotation method (see <a href="#">GET Alerts Key Rotation on page 158</a> ) to retrieve a list of all the SSH key rotation alerts to determine the alert ID. |

Table 84: GET Alerts Key Rotation {id} Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.  |
| DisplayName         | A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject             | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>   |
| Message             | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| RotationWarningDays | An integer indicating the number of days prior to the end of an SSH key’s lifetime the alert should be triggered.  |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. ## GET Alerts Key Rotation Schedule

The GET /Alerts/KeyRotation/Schedule method is used to retrieve the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 85: GET Alerts Key Rotation Schedule Response Data

| Name     | Description   |      |             |          |   |      |             |         |  |       |   |      |             |      |   |

## GET Alerts Key Rotation

The GET /Alerts/KeyRotation method is used to retrieve details of all SSH key rotation alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 88: GET Alerts Key Rotation Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Days</i></li><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>ScheduledTaskId</i></li><li>• <i>Subject</i></li><li>• <i>UseHandler</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 89: GET Alerts Key Rotation Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.  |
| DisplayName         | A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject             | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>   |
| Message             | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| RotationWarningDays | An integer indicating the number of days prior to the end of an SSH key’s life-time the alert should be triggered.   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>               | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> | ID  | Event Handler Type  | 10           | SSHKeyRotationLogger   | 11            | SSHKeyRotationPowershell  | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

This value is related to the type of parameter (see <i>ParameterType</i> ). | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler</li> </ul> |             |  |            |  |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| ParameterType          | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler</li> </ul>   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Key Rotation

The POST /Alerts/KeyRotation method is used to create a new SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 90: POST Alerts Key Rotation Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>   |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Rota-       | Body | An integer indicating the number of days prior to the end of an SSH key's   |

| Name                        | In  | Description  |                    |             |                      |   |                          |   |              |  |               |  |            |  |

Table 91: POST Alerts Key Rotation Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.  |
| DisplayName         | A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject             | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>  |
| Message             | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=“https://[your_server_name]/KeyfactorPortal/SshMyKey”&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=“https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys”&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| RotationWarningDays | An integer indicating the number of days prior to the end of an SSH key’s life-time the alert should be triggered.   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT Alerts Key Rotation

The PUT /Alerts/KeyRotation method is used to update a SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should

first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 92: PUT Alerts Key Rotation Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| id          | Path | An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.   |
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>   |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available</p> |

| Name                   | In   | Description   |                    |             |                      |  |                          |   |              |   |    |                          |             |  |            |  |

| Value         | Description  |   |       |             |  |  |               |  |
|               | parameter (see <i>ParameterType</i> ).   |   |       |             |  |  |               |  |
| ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"><li>LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li><li>Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li><li>Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li><li>Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li></ul> |   |       |             |  |  |               |  |

For example, for a PowerShell handler:

```
"EventHandlerParameters": [  
  {
```

| Name | In | Description  |
|------|----|--|
|      |    | <pre>       "Id": 28,       "Key": "user",       "DefaultValue": "username",       "ParameterType": "Token"     },     {       "Id": 29,       "Key": "comment",       "DefaultValue": "comment",       "ParameterType": "Token"     },     {       "Id": 30,       "Key": "Text",       "DefaultValue": "Key Rotation Alert: 3 Days",       "ParameterType": "Value"     },     {       "Id": 32,       "Key": "ScriptName",       "DefaultValue": "MyScript.ps1",       "ParameterType": "Script"     }   ] </pre> |

Table 93: PUT Alerts Key Rotation Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.  |
| DisplayName         | A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.   |
| Subject             | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>   |
| Message             | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Field&lt;/th&gt;&lt;th&gt;Value&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Username&lt;/td&gt;&lt;td&gt;{username}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Fingerprint&lt;/td&gt;&lt;td&gt;{fingerprint}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Comment&lt;/td&gt;&lt;td&gt;{comment}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Length&lt;/td&gt;&lt;td&gt;{keylength}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Key Type&lt;/td&gt;&lt;td&gt;{keytype}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;Number of Server Logons for Key&lt;/td&gt;&lt;td&gt;{serverlogons}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nCorporate policy requires key rotation every year. Please visit the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshMyKey\"&gt;My SSH Key Portal&lt;/a&gt; for user keys or the &lt;a href=\"https://[your_server_name]/KeyfactorPortal/SshServiceAccountKeys\"&gt;Service Account Key Portal&lt;/a&gt; for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| RotationWarningDays | An integer indicating the number of days prior to the end of an SSH key’s lifetime the alert should be triggered.  |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. This value is related to the type of parameter (see <i>ParameterType</i> ). | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler</li> </ul> |             |  |            |  |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| ParameterType          | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler</li> </ul>   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

| Name | Description |   |
|------|-------------|---|
|      | Value       | Description   |
|      |             | <p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Key Rotation Test

The POST /Alerts/KeyRotation/Test method is used to test a specific SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of "NoActionTaken" if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting).

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 94: POST Alerts Key Rotation Test Input Parameters

| Name                        | In   | Description  |           |             |         |  |                |  |                        |   |            |  |
|-----------------------------|--|--|-----------|-------------|---------|--|----------------|--|------------------------|---|------------|--|
| keyRotationAlertTestRequest | Body   | <p><b>Required.</b> An array containing information for the alert test. | Name              | Description  |      |             |         |   |         |  |           |  |
| Subject           | A string indicating the subject for the email message, including any replaced substitutable special text.  |      |             |         |   |         |  |           |  |
| Message           | <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>   |      |             |         |   |         |  |           |  |
| Recipient         | A string indicating the recipient for the alert.   |      |             |         |   |         |  |           |  |
| AlertBuildResult  | A string indicating the outcome of the test (e.g. Success).  |      |             |         |   |         |  |           |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Key Rotation Test All

The POST /Alerts/KeyRotation/TestAll method is used to test all SSH key rotation alerts. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of "NoActionTaken" if no keys match the test criteria entered.

**Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting).

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

WorkflowManagement: *Read*

WorkflowManagement: *Test*

Table 96: POST Alerts Key Rotation Test All Input Parameters

| Name                        | In  | Description  |           |             |                |   |                        |   |            |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.4.5 Alerts Pending

The Alerts Pending component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for certificate requests that require approval based on policy on the CA.

**Important:** Pending alerts are **not** used to provide email alerts for certificate requests that require approval based on policies configured in Keyfactor Command workflows. These alerts are configured as steps within the workflow (see [Workflow Definitions on page 1426](#)). For more information about the difference between alerting for certificate requests that require manager approval at the CA level and alerting for certificate requests that require manager approval at the Keyfactor Command workflow level, see [Pending Certificate Request Alerts](#) in the *Keyfactor Command Reference Guide*.

Table 98: Alerts Pending

| Endpoint                  | Method | Description   | Link  |
|---------------------------|--------|---|---|
| /Alerts/Pending/{id}      | DELETE | Deletes a pending certificate request alert for the specified ID.                     | <a href="#">DELETE Alerts Pending ID below</a>          |
| /Alerts/Pending/{id}      | GET    | Retrieves details for a pending certificate request alert for the specified ID.       | <a href="#">GET Alerts Pending ID on the next page</a>  |
| /Alerts/Pending           | PUT    | Updates a pending certificate request alert for a specified ID.                       | <a href="#">PUT Alerts Pending on page 205</a>          |
| /Alerts/Pending/Schedule  | GET    | Retrieves details of the schedule for delivery of pending certificate request alerts. | <a href="#">GET Alerts Pending Schedule on page 188</a> |
| /Alerts/Pending/Schedule  | PUT    | Updates the schedule for delivery of pending certificate request alerts.              | <a href="#">PUT Alerts Pending Schedule on page 190</a> |
| /Alerts/Pending           | GET    | Retrieves details for all configured pending certificate request alerts.              | <a href="#">GET Alerts Pending on page 193</a>          |
| /Alerts/Pending           | POST   | Creates a new pending certificate request alert.                                      | <a href="#">POST Alerts Pending on page 197</a>         |
| /Alerts/Pending/Test      | POST   | Tests all alerts  | <a href="#">POST Alerts Pending TestAll on page 217</a> |
| /Alerts/Pending/Test/{id} | POST   | Tests specific alerts   | <a href="#">POST Alerts Pending Test on page 214</a>    |

### DELETE Alerts Pending ID

The DELETE /Alerts/Pending/{id} method is used to delete the pending certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 99: DELETE Alerts Pending {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert to be deleted.<br>Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 193</a> ) to retrieve a list of all the pending request alerts to determine the alert ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Pending ID

The GET /Alerts/Pending/{id} method is used to retrieve details for the pending certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 100: GET Alerts Pending {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the pending certificate request alert.<br>Use the GET /Alerts/Pending method (see <a href="#">GET Alerts Pending on page 193</a> ) to retrieve a list of all the pending request alerts to determine the alert ID. |

Table 101: GET Alerts Pending {id} Response Data

| Name        | Description  |
|-------------|--|
| Id          | An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.   |
| DisplayName | A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.   |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</table></p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:  |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <ul style="list-style-type: none"> <li><code>{requester:mail}</code><br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>   |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description  |       |             |    |  |             |   |            |   |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.   |       |             |    |  |             |   |            |   |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.  |       |             |    |  |             |   |            |   |                     |   |
| ForestRoot          | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |   |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.  |       |             |    |  |             |   |            |   |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>                               | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> | ID  | Event Handler Type  | 8            | PendingLogger  | 9             | PendingPowershell   | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |

## GET Alerts Pending Schedule

The GET /Alerts/Pending/Schedule method is used to retrieve the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Web API Common Features on page 3](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 102: GET Alerts Pending Schedule Response Data

| Name     | Description   |      |             |          |   |      |             |         |   |       |   |      |             |      |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET Alerts Pending

The GET /Alerts/Pending method is used to retrieve details of all pending certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alerts.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 105: GET Alerts Pending Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DisplayName</i></li><li>• <i>Message</i></li><li>• <i>RegisteredEventHandlerId</i></li><li>• <i>ScheduledTaskId</i></li><li>• <i>Subject</i></li><li>• <i>Template_Id</i></li><li>• <i>UseHandler</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

| Name                | Description   |       |             |    |  |             |   |            |  |                     |   |
|---------------------|---|-------|-------------|----|--|-------------|---|------------|--|---------------------|---|
|                     | <ul style="list-style-type: none"> <li><code>{requester:mail}</code><br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>  |       |             |    |  |             |   |            |  |                     |   |
| Template            | <p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td>           A string indicating the forest root of the template.           <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description   |       |             |    |  |             |   |            |  |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.  |       |             |    |  |             |   |            |  |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.   |       |             |    |  |             |   |            |  |                     |   |
| ForestRoot          | A string indicating the forest root of the template. <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |  |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.   |       |             |    |  |             |   |            |  |                     |   |

| Name                   | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
|------------------------|---|-------|--------------------|----|--|-----|---|--------------|--|---------------|---|-------------|--|------------|--|
| RegisteredEventHandler | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>                               | Value | Description        | Id | <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> | ID  | Event Handler Type  | 8            | PendingLogger  | 9             | PendingPowershell   | DisplayName | A string containing the name of the event handler. | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

## POST Alerts Pending

The POST /Alerts/Pending method is used to create a new pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 107: POST Alerts Pending Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.  |
| Subject     | Body | <b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered. <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>  |
| Message     | Body | <b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | Body | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address vari-   |

| Name                   | In   | Description   |                    |             |               |  |                   |                    |   |               |   |                   |            |  |
|------------------------|--|---|--------------------|-------------|---------------|--|-------------------|--------------------|---|---------------|---|-------------------|------------|--|
|                        |  | <p>able with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>   |                    |             |               |  |                   |                    |   |               |   |                   |            |  |
| TemplateId             | Body   | <p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1365</a>) to retrieve a list of all the templates to determine the template ID.</p>   |                    |             |               |  |                   |                    |   |               |   |                   |            |  |
| RegisteredEventHandler | Body   | <p>An object containing the event handler configuration for the alert, if applicable. | Value       | Description  |   |       |             |  |  |
|             | This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script. |   |       |             |  |  |
| CARquestId  |  | A string containing the CA's reference ID for the certificate request.  |       |             |  |  |
| CommonName  |  | A string indicating the common name of the certificate.   |       |             |  |  |
| LogicalName |  | A string indicating the logical name of the certificate authority.  |       |             |  |  |

Table 108: POST Alerts Pending Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.  |
| DisplayName | A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/t- d&gt;&lt;td&gt;App Owner Last Name: {metadata:Ap- pOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:   |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <ul style="list-style-type: none"> <li><code>{requester:mail}</code><br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>   |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. | Value                  | Description   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Id                     | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| Key                    | A string indicating the reference name of the configured parameter.   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| DefaultValue           | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |
| ParameterType          | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>LogTarget<br/>This type is used for the event logging handler</li> </ul>   |       |                    |    |  |     |   |              |  |               |   |             |  |            |  |

| Name | Description |  |
|------|-------------|--|
|      | Value       | Description  |
|      |             | <p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the filename and optional relative path to the PowerShell script, located in the extensions directory on the Keyfactor Command server.</li> <li>• Token<br/>This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</li> <li>• Value<br/>This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.</li> </ul> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 109: PUT Alerts Pending Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| id          | Path | An integer indicating the Keyfactor Command reference ID of the pending request alert. Run the  |
| DisplayName | Body | <b>Required.</b> A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.   |
| Subject     | Body | <p><b>Required.</b> A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p><b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>   |
| Message     | Body | <p><b>Required.</b> A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/td&gt;&lt;td&gt;App Owner Last Name: {metadata:AppOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:AppOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n&lt;/table&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</table></p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |

| Name   | In   | Description   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
|--|--|---|--------------------|-------------|---------------|---|--|--|----|--------------------|---|---------------|---|-------------------|------------|--|
| Recipients   | Body   | <p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><li>• {requester:mail}<br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li><li>• Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.</li></ul>  |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| TemplateId   | Body   | <p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET /Templates method (see <a href="#">GET Templates on page 1365</a>) to retrieve a list of all the templates to determine the template ID.</p>   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| RegisteredEventHandler   | Body   | <p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the event handler.</td></tr><tr><td colspan="2"><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>8</td><td>PendingLogger</td></tr><tr><td>9</td><td>PendingPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p> | Value              | Description | Id            | An integer indicating the Keyfactor Command reference ID for the event handler. | <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>8</td><td>PendingLogger</td></tr><tr><td>9</td><td>PendingPowershell</td></tr></table> |  | ID | Event Handler Type | 8 | PendingLogger | 9 | PendingPowershell | UseHandler | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |
| Value  | Description  |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| Id   | An integer indicating the Keyfactor Command reference ID for the event handler.                |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>8</td><td>PendingLogger</td></tr><tr><td>9</td><td>PendingPowershell</td></tr></table> |  | ID  | Event Handler Type | 8           | PendingLogger | 9   | PendingPowershell  |  |    |                    |   |               |   |                   |            |  |
| ID   | Event Handler Type   |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| 8  | PendingLogger  |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| 9  | PendingPowershell  |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| UseHandler   | A Boolean indicating whether event handler use is enabled for the alert (true) or not (false). |   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |
| EventHandlerParameters   | Body   | <p>An array containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p>   |                    |             |               |   |  |  |    |                    |   |               |   |                   |            |  |

| Name | In | Description   |   |
|------|----|---------------|---|
|      |    | Value         | Description   |
|      |    | Id            | An integer indicating the Keyfactor Command reference ID of the configured parameter.   |
|      |    | Key           | A string indicating the reference name of the configured parameter.   |
|      |    | DefaultValue  | A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i> ).  |
|      |    | ParameterType | <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> <li>• LogTarget<br/>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</li> <li>• Script<br/>This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. |       | This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script. |   |       |             |  |  |

Table 110: PUT Alerts Pending Response Data

| Name        | Description   |
|-------------|---|
| Id          | An integer indicating the Keyfactor Command reference ID of the pending request alert. Run GET /Alerts/Pending to find the pending request alert ID.  |
| DisplayName | A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.  |
| Subject     | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>   |
| Message     | <p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n&lt;table&gt;\n&lt;tr&gt;&lt;th&gt;Certificate Details&lt;/th&gt;&lt;th&gt;Metadata&lt;/th&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;CN: {rcn}&lt;/td&gt;&lt;td&gt;App Owner First Name: {metadata:AppOwnerFirstName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;DN: {rdn}&lt;/t- d&gt;&lt;td&gt;App Owner Last Name: {metadata:Ap- pOwnerLastName}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;SANs: {san}&lt;/td&gt;&lt;td&gt;App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}&lt;/td&gt;&lt;/tr&gt;\n&lt;tr&gt;&lt;td&gt;&amp;nbsp;&lt;/td&gt;&lt;td&gt;Business Critical: {metadata:BusinessCritical}&lt;/td&gt;&lt;/tr&gt;\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> |
| Recipients  | An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:   |

| Name                | Description  |       |             |    |  |             |   |            |   |                     |   |
|---------------------|--|-------|-------------|----|--|-------------|---|------------|---|---------------------|---|
|                     | <ul style="list-style-type: none"> <li><code>{requester:mail}</code><br/>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</li> <li>Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.</li> </ul>   |       |             |    |  |             |   |            |   |                     |   |
| Template            | <p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates. | DisplayName | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. | ForestRoot | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> | ConfigurationTenant | A string indicating the configuration tenant of the template. |
| Value               | Description  |       |             |    |  |             |   |            |   |                     |   |
| Id                  | An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.   |       |             |    |  |             |   |            |   |                     |   |
| DisplayName         | A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.  |       |             |    |  |             |   |            |   |                     |   |
| ForestRoot          | <p>A string indicating the forest root of the template.</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>  |       |             |    |  |             |   |            |   |                     |   |
| ConfigurationTenant | A string indicating the configuration tenant of the template.  |       |             |    |  |             |   |            |   |                     |   |

| CARquestId  | A string containing the CA's reference ID for the certificate request.   |       |             |  |  |
| CommonName  | A string indicating the common name of the certificate.  |       |             |  |  |
| LogicalName | A string indicating the logical name of the certificate authority.   |       |             |  |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Pending Test

The POST /Alerts/Pending/Test method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

**Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 111: POST Alerts Pending Test Input Parameters

| Parameter  | In  | Description   |       |             |         |   |            |   |
|------------|---|---|-------|-------------|---------|---|------------|---|
| req        | Body  | <p><b>Required.</b> An array containing information for the alert test. Alert test detail values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>AlertId</td><td>An integer indicating the Keyfactor Command reference ID for the pending alert.</td></tr><tr><td>SendAlerts</td><td>A Boolean indicating whether to send alert emails with the test (true), or not (false).</td></tr></table> <p>For example:</p> <pre>{<br/>  "AlertId": 1,<br/>  "SendAlertEmails": false<br/>}</pre> | Value | Description | AlertId | An integer indicating the Keyfactor Command reference ID for the pending alert. | SendAlerts | A Boolean indicating whether to send alert emails with the test (true), or not (false). |
| Value      | Description   |   |       |             |         |   |            |   |
| AlertId    | An integer indicating the Keyfactor Command reference ID for the pending alert.         |   |       |             |         |   |            |   |
| SendAlerts | A Boolean indicating whether to send alert emails with the test (true), or not (false). |   |       |             |         |   |            |   |

Table 112: POST Alerts Pending Test Response Data

| Parameter     | Description   |      |             |         |   |
|---------------|---|------|-------------|---------|---|
| PendingAlerts | <p>An object containing alert details resulting from the test. Pending alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td> <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div> </td></tr> </table> | Name | Description | Subject | <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <b>Tip:</b> Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div> |

| Parameter        | Description   |  |
|------------------|---|--|
|                  | Name  | Description  |
|                  | Message   | A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.   |
|                  | Recipients  | An object containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. |
|                  | CARequestId   | An string containing the CA's reference ID for the certificate request.  |
|                  | CommonName  | A string indicating the common name of the certificate request.  |
|                  | LogicalName   | A string indicating the logical name of the certificate authority from which the certificate was requested.  |
| AlertBuildResult | A string indicating the result of pending alerts test (e.g. Success). |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST Alerts Pending TestAll

The POST /Alerts/Pending/TestAll method is used to test all pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting number of alerts generated.

**Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab](#) in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 113: POST Alerts Pending Test All Input Parameters

| Name       | In  | Description  |       |             |            |   |

## 2.5.5 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 115: Audit Endpoints

| Endpoint         | Method | Description   | Links  |
|------------------|--------|---|--|
| / {id}           | GET    | Returns information about the specified audit log entry.  | <a href="#">GET Audit ID below</a>                     |
| / {id}/Validate  | GET    | Validates the specified audit log entry.  | <a href="#">GET Audit ID Validate on page 226</a>      |
| /                | GET    | Returns a list of all audit log entries according to the provided filters and input parameters.                                   | <a href="#">GET Audit on page 227</a>                  |
| /Download        | GET    | Returns a comma separated list of audit log entries according to the provided filters and input parameters.                       | <a href="#">GET Audit Download on page 233</a>         |
| /RelatedEntities | GET    | Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters. | <a href="#">GET Audit Related Entities on page 237</a> |

### 2.5.5.1 GET Audit ID

The GET /Audit/{id} method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: *Read*

Table 116: *GET Audit {id}* Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The ID of the audit log entry to retrieve.<br>Use the <i>GET /Audit</i> method (see <a href="#">GET Audit on page 227</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID. |

Table 117: GET Audit {id} Response Data

| Name      | Description   |  |                  |             |      |             |             |      |  |  |      |                            |                     |      |                |                 |      |          |          |      |                  |                              |      |                 |                  |      |                                       |                  |      |              |               |      |                                    |               |      |                    |                     |      |             |              |      |                                   |              |

| User  | The user who performed the audit event in DOMAIN\username format.   |       |             |    |             |    |                       |    |           |    |          |    |                   |    |               |    |                   |    |                           |    |           |    |       |    |             |    |           |    |      |    |        |    |           |    |          |

| Name                | Description   |
|---------------------|---|
| EntityType          | The category of the object being audited (e.g. Template, Certificate).  |
| AuditIdentifier     | An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. |
| ImmutableIdentifier | The fixed ID of the auditable event in the Keyfactor database.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.5.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: *Read*

Table 118: GET Audit {id} Validate Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The ID of the audit log entry to validate.<br>Use the <i>GET /Audit</i> method (see <a href="#">GET Audit on the next page</a> ) to retrieve a list of all the audit log entries to determine the audit log entry ID. |

Table 119: GET Audit {id} Validate Response Data

| Name | Description   |
|------|---|
|      | A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name. |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.5.3 GET Audit

The GET /Audit method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: *Read*

Table 120: GET Audit Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i> (EntityIdentifier)</li> <li>• <i>Category</i> (EntityType) (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>ImmutableIdentifier</i></li> <li>• <i>Level</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>Operation</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>PropertyChanged</i></li> <li>• <i>Timestamp</i></li> <li>• <i>ActingUser</i></li> </ul> <div>  <p><b>Tip:</b> To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example:</p> <p style="text-align: center;">category -contains "Agent"</p> </div> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

| User  | The user who performed the audit event in DOMAIN\username format.   |       |             |    |             |    |                       |    |           |    |          |    |                   |    |               |    |                   |    |                           |    |           |    |       |    |             |    |           |    |      |    |        |    |           |    |          |

| Name                | Description   |
|---------------------|---|
| EntityType          | The category of the object being audited (e.g. Template, Certificate).  |
| AuditIdentifier     | An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. |
| ImmutableIdentifier | The fixed ID of the auditable event in the Keyfactor database.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.5.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information requested in comma-delimited form with the property names at the start of the list and then the values.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: *Read*

Table 122: GET Audit Download Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i> (EntityIdentifier)</li> <li>• <i>Category</i> (EntityType) (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>ImmutableIdentifier</i></li> <li>• <i>Level</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>Operation</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>PropertyChanged</i></li> <li>• <i>Timestamp</i></li> <li>• <i>ActingUser</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 123: GET Audit Download Response Data

| Name       | Description   |       |             |   |         |   |         |   |         |   |          |   |        |   |         |   |            |   |                     |   |         |    |             |    |                       |    |           |    |          |    |                   |    |               |    |                   |

| 2               | Failure  |       |             |    |                           |    |           |    |         |    |             |    |           |    |      |    |        |    |           |    |          |
| User            | The user who performed the audit event in DOMAIN\username format.  |       |             |    |                           |    |           |    |         |    |             |    |           |    |      |    |        |    |           |    |          |
| EntityType      | The category of the object being audited (e.g. Template, Certificate). Also known as the <i>Category</i> in some interfaces.   |       |             |    |                           |    |           |    |         |    |             |    |           |    |      |    |        |    |           |    |          |
| AuditIdentifier | An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. Also known as the <i>Name</i> in some interfaces.  |       |             |    |                           |    |           |    |         |    |             |    |           |    |      |    |        |    |           |    |          |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.5.5 GET Audit Related Entities

The GET /Audit/RelatedEntities method returns a list of all audit entries and all audit entries related to those audit entries. This method returns HTTP 200 OK on a success with the information requested.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Auditing: *Read*

Table 124: GET Audit Related Entities Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Audit Log Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Name</i> (EntityIdentifier)</li> <li>• <i>Category</i> (EntityType) (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>ImmutableIdentifier</i></li> <li>• <i>Level</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>Operation</i> (see <a href="#">Table 121: GET Audit Response Data</a> for codes)</li> <li>• <i>PropertyChanged</i></li> <li>• <i>Timestamp</i></li> <li>• <i>ActingUser</i></li> </ul> <div>  <p><b>Tip:</b> In order to return related entries, your queryString needs to query for the specific immutable identifier of the audit record for which you wish to see related entries. For example:</p> <p style="text-align: center;"><code>ImmutableIdentifier -eq 707662</code></p> </div> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 125: GET Audit Related Entities Response Data

| Name      | Description   |  |                  |             |      |             |             |      |  |  |      |                            |                        |      |                |                 |      |          |          |      |                  |                                   |      |                 |                  |      |                                       |                  |      |              |               |      |                                    |               |      |                    |                        |      |             |              |      |                                   |              |

| 2     | Failure   |       |             |    |             |    |                       |    |           |    |          |    |                   |    |               |    |                   |    |                           |    |           |    |       |    |             |    |           |    |      |    |        |    |           |    |          |
| User  | The user who performed the audit event in DOMAIN\username format.   |       |             |    |             |    |                       |    |           |    |          |    |                   |    |               |    |                   |    |                           |    |           |    |       |    |             |    |           |    |      |    |        |    |           |    |          |

| Name                | Description   |
|---------------------|---|
| EntityType          | The category of the object being audited (e.g. Template, Certificate).  |
| AuditIdentifier     | An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change. |
| ImmutableIdentifier | The fixed ID of the auditable event in the Keyfactor database.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.6 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 126: Certificates Endpoints

| Endpoint            | Method | Description   | Link   |
|---------------------|--------|---|--|
| /id/Security        | GET    | Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are. | <a href="#">GET Certificates ID Security on page 245</a>       |
| /id/Validate        | GET    | Validates that a certificate chain can be built for the specified certificate.  | <a href="#">GET Certificates ID Validate on page 246</a>       |
| /Locations/{id}     | GET    | Returns details about the certificates stores in which the certificate is located.  | <a href="#">GET Certificates Locations ID on page 253</a>      |
| /IdentityAudit/{id} | GET    | Returns audit identity permissions for certificate.   | <a href="#">GET Certificates Identity Audit ID on page 256</a> |
| /id}                | DELETE | Deletes a certificate from the Keyfactor Command database by its ID.  | <a href="#">DELETE Certificates ID on page 258</a>             |

| Endpoint          | Method | Description   | Link  |
|-------------------|--------|---|---|
| / {id}            | GET    | Returns certificate details for a specified certificate.  | <a href="#">GET Certificates ID on page 259</a>               |
| /Metadata/Compare | GET    | Compares the metadata value provided with the metadata value associated with the specified certificate.                                       | <a href="#">GET Certificates Metadata Compare on page 271</a> |
| / {id}/History    | GET    | Returns the certificate operations history for a specified certificate.   | <a href="#">GET Certificates ID History on page 272</a>       |
| /                 | DELETE | Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.                               | <a href="#">DELETE Certificates on page 274</a>               |
| /                 | GET    | Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level. | <a href="#">GET Certificates on page 275</a>                  |
| /Metadata         | PUT    | Updates the metadata for a specified certificate.   | <a href="#">PUT Certificates Metadata on page 289</a>         |
| /Metadata/All     | PUT    | Updates the metadata for an array of certificate IDs.   | <a href="#">PUT Certificates Metadata All on page 291</a>     |
| /Import           | POST   | Imports a certificate into Keyfactor Command.   | <a href="#">POST Certificates Import on page 294</a>          |
| /Revoke           | POST   | Revokes a certificate.  | <a href="#">POST Certificates Revoke on page 297</a>          |
| /Analyze          | POST   | Reads a base-64 encoded PEM certificates and returns it in human-readable form.   | <a href="#">POST Certificates Analyze on page 299</a>         |
| /Recover          | POST   | Returns a recovered certificate as a PFX.   | <a href="#">POST Certificates Recover on page 300</a>         |
| /Download         | POST   | Downloads a certificate.  | <a href="#">POST Certificates Download on page 303</a>        |
| /RevokeAll        | POST   | Revokes all the certificates in the   | <a href="#">POST Certificates</a>                             |

| Endpoint         | Method | Description   | Link   |
|------------------|--------|---|--|
|                  |        | provided query.   | <a href="#">Revoke All on page 306</a>                         |
| /Query           | DELETE | Deletes multiple certificates from the Keyfactor Command database based on search query.        | <a href="#">DELETE Certificates Query on page 308</a>          |
| /PrivateKey      | DELETE | Deletes the stored private keys of multiple certificates within the Keyfactor Command database. | <a href="#">DELETE Certificates Private Key on page 309</a>    |
| /PrivateKey/{id} | DELETE | Deletes the stored private key(s) of a certificate within the Keyfactor Command database.       | <a href="#">DELETE Certificates Private Key ID on page 310</a> |

### 2.5.6.1 GET Certificates ID Security

The GET /Certificates/{id}/Security method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 Certificates: *Read*  
 SecuritySettings: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 127: GET Certificates {id} Security Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> The Keyfactor Command reference ID of the certificate for which to check security permissions.  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 128: GET Certificates {id} Security Response Data

| Name        | Description  |      |             |      |   |             |  |
|-------------|--|------|-------------|------|---|-------------|--|
| Roles       | <p>An array containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string containing the short reference name for the security role.</td></tr><tr><td>Permissions</td><td>An array of strings containing the permissions assigned to the role.</td></tr></table> <p>For example, the following return snippet shows the response for the “Power Users” security role:</p> <pre>{   "Name": "Power Users",   "Permissions": [     "Read",     "EditMetadata",     "Recover"   ] }</pre> | Name | Description | Name | A string containing the short reference name for the security role. | Permissions | An array of strings containing the permissions assigned to the role. |
| Name        | Description  |      |             |      |   |             |  |
| Name        | A string containing the short reference name for the security role.  |      |             |      |   |             |  |
| Permissions | An array of strings containing the permissions assigned to the role.   |      |             |      |   |             |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.6.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 129: GET Certificates {id} Validate Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> The Keyfactor Command reference ID of the certificate to be validated.  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 130: GET Certificates {id} Validate Response Data

| Name    | Description   |  |   |
|---------|---|--|---|
| Valid   | A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false). |  |   |
| Results | An array containing the X509 certificate chain validity fields. The included validity fields are:     |  |   |
|         | Name  | Keyfactor Command Management Portal Equivalent | Description   |
|         | NotTimeValid  | Time Valid                                     | A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid ( <i>Fail</i> ) for a certificate that has expired.  |
|         | NotTimeNested   | n/a  | A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release. |
|         | Revoked   | Active   | A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates  |

| Name | Description             |  |  |
|------|-------------------------|--|--|
|      | Name                    | Keyfactor Command Management Portal Equivalent | Description  |
|      |                         |  | or errors.   |
|      | NotSignatureValid       | Signature                                      | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid certificate signature.   |
|      | NotValidForUsage        | Usage  | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid key usage.   |
|      | UntrustedRoot           | Trusted Root                                   | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an untrusted root certificate.  |
|      | RevocationStatusUnknown | Revocation Status                              | A value of <i>Pass</i> indicates that the revocation status can successfully be determined for the certificate. This may be the result of successful access to online certificate revocation lists (CRLs). |
|      | Cyclic                  | Chain Built                                    | A value of <i>Pass</i> indicates that the certificate chain for the  |

| Name | Description                   |  |  |
|------|-------------------------------|--|--|
|      | Name                          | Keyfactor Command Management Portal Equivalent | Description  |
|      |                               |  | certificate could successfully be built.   |
|      | InvalidExtension              | Extensions                                     | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid extension.                         |
|      | InvalidPolicyConstraints      | Policy Constraints                             | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid policy constraint.                 |
|      | InvalidBasicConstraints       | Basic Constraints                              | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.                  |
|      | InvalidNameConstraints        | Valid Name Constraints                         | A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.                   |
|      | HasNotSupportedNameConstraint | Supported Name Constraints                     | A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name |

| Name | Description                   |  |  |
|------|-------------------------------|--|--|
|      | Name                          | Keyfactor Command Management Portal Equivalent | Description  |
|      |                               |  | constraints.   |
|      | HasNotDefinedNameConstraint   | Defined Name Constraints                       | A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.  |
|      | HasNotPermittedNameConstraint | Permitted Name Constraints                     | A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.  |
|      | HasExcludedNameConstraint     | Excluded Name Constraints                      | A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.   |
|      | PartialChain                  | Full Chain                                     | A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.        |
|      | CtlNotTimeValid               | CTL Time Valid                                 | A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired). |
|      | CtlNotSignatureValid          | CTL Signature                                  | A value of <i>Fail</i> indic-  |

| Name | Description           |  |   |
|------|-----------------------|--|---|
|      | Name                  | Keyfactor Command Management Portal Equivalent | Description   |
|      |                       | Valid  | ates that the certificate trust list (CTL) contains an invalid signature.   |
|      | CtlInvalidForUsage    | CTL Usage Valid                                | A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.   |
|      | HasWeakSignature      | Strong Signature                               | A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate. |
|      | OfflineRevocation     | CRL online                                     | A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.  |
|      | NoIssuanceChainPolicy | Chain Policy                                   | A value of <i>Pass</i> indicates that there is either no certificate policy by design in the certificate or that if a group policy has specified that all certificates must have a                              |

| Name | Description                      |  |   |
|------|----------------------------------|--|---|
|      | Name                             | Keyfactor Command Management Portal Equivalent | Description   |
|      |                                  |  | certificate policy, the certificate policy exists in the certificate.   |
|      | ExplicitDistrust                 | No Explicit Distrust                           | A value of <i>Pass</i> indicates that the certificate is not explicitly distrusted.   |
|      | HasNotSupportedCriticalExtension | Critical Extensions                            | A value of <i>Pass</i> indicates that the certificate has a critical extension that is supported or has no critical extensions. |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.3 GET Certificates Locations ID

The GET /Certificates/Locations/{id} method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 131: GET Certificates Locations {id} Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.   |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 132: GET Certificates Locations {id} Response Data

| Name          | Description   |      |             |           |   |             |   |               |  |           |   |      |             |         |   |             |   |               |  |

#### 2.5.6.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 133: GET Certificates {id} History Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 134: GET Certificates {id} History Response Data

| Permissions  | An array of the permissions for the certificate. <table> <tr> <th>Parameter</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td></tr> <tr> <td>GrantedBy</td><td>A string containing the list of roles or collections that grant the given permission to the user-/group.</td></tr> <tr> <td></td><td></td></tr> </table> | Parameter | Description | Name | A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...) | GrantedBy | A string containing the list of roles or collections that grant the given permission to the user-/group. |  |  |
| Parameter    | Description   |           |             |      |   |           |  |  |  |
| Name         | A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)   |           |             |      |   |           |  |  |  |
| GrantedBy    | A string containing the list of roles or collections that grant the given permission to the user-/group.  |           |             |      |   |           |  |  |  |
|              |   |           |             |      |   |           |  |  |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.5 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this private key is also removed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 135: DELETE Certificates {id} Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> The Keyfactor Command reference ID of the certificate to delete.<br>Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 275</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.6 GET Certificates ID

The *GET /Certificates/{id}* method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under *CollectionId*, below.

Table 136: GET Certificates {id} Input Parameters

| Name             | In    | Description  |
|------------------|-------|--|
| id               | Path  | <b>Required.</b> An integer indicating the Keyfactor Command reference ID of the certificate.<br>Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 275</a> ) to retrieve a list of multiple certificates to determine the desired certificate's ID.  |
| includeLocations | Query | A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .  |
| includeMetadata  | Query | A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .   |
| CollectionId     | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 137: GET Certificates {id} Response Data

| Name         | Description  |
|--------------|--|
| Id           | An integer indicating the Keyfactor Command reference ID of the certificate.   |
| Thumbprint   | A string indicating the thumbprint of the certificate.   |
| SerialNumber | A string indicating the serial number of the certificate.  |
| IssuedDN     | A string indicating the distinguished name of the certificate.   |
| IssuedCN     | A string indicating the common name of the certificate.  |
| ImportDate   | The date, in UTC, on which the certificate was imported into Keyfactor Command.  |
| NotBefore    | The date, in UTC, on which the certificate was issued by the certificate authority.  |
| NotAfter     | The date, in UTC, on which the certificate expires.  |
| IssuerDN     | A string indicating the distinguished name of the issuer.  |
| PrincipalId  | An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> . |
| TemplateId   | An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.  |

| Name          | Description   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
|---------------|---|-------|-------------|---|---------|---|--------|---|---------|---|--------|---|--------|---|---------|---|-----------------------|---|------------------------------|
| CertState     | <p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table> | Value | Description | 0 | Unknown | 1 | Active | 2 | Revoked | 3 | Denied | 4 | Failed | 5 | Pending | 6 | Certificate Authority | 7 | Parent Certificate Authority |
| Value         | Description   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 0             | Unknown   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 1             | Active  |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 2             | Revoked   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 3             | Denied  |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 4             | Failed  |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 5             | Pending   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 6             | Certificate Authority   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 7             | Parent Certificate Authority  |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| KeySizeInBits | An integer specifying the key size in bits.   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| KeyType       | <p>An integer specifying the key type of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>  | Value | Description | 0 | Unknown | 1 | RSA    | 2 | DSA     | 3 | ECC    | 4 | DH     |   |         |   |                       |   |                              |

| 1                | Encipherment Only  | The key can be used for encryption only.  |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 2                | CRL Signing  | The key can be used to sign a certificate revocation list (CRL).  |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 4                | Key Certificate Signing  | The key can be used to sign certificates.   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 8                | Key Agreement  | The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm. |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 16               | Data Encipherment  | The key can be used for data encryption.  |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 32               | Key Encipherment   | The key can be used for key encryption.   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 64               | Nonrepudiation   | The key can be used for authentication.   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 128              | Digital Signature  | The key can be used as a digital signature.   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| 32768            | Decipherment Only  | The key can be used for decryption only.  |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| SigningAlgorithm | A string indicating the algorithm used to sign the certificate.  |   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |
| CertStateString  | A string containing the certificate state. The possible values are: <ul style="list-style-type: none"><li>Unknown (0)</li></ul>  |   |          |             |   |      |                          |   |                   |  |   |             |  |   |                         |   |   |               |   |    |                   |  |    |                  |   |    |                |   |     |                   |   |       |                   |  |

| Name                     | Description   |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
|--------------------------|---|-------|-------------|---|-------------|---|-----------------|---|----------------|---|---------------------|---|------------|---|------------------------|---|------------------|-----|---------|
|                          | <ul style="list-style-type: none"> <li>• Active (1)</li> <li>• Revoked (2)</li> <li>• Denied (3)</li> <li>• Failed (4)</li> <li>• Pending (5)</li> <li>• Certificate Authority (6)</li> <li>• Parent Certificate Authority (7)</li> <li>• External Validation (8)</li> </ul>  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| KeyTypeString            | A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| RevocationEffDate        | The date, in UTC, on which the certificate was revoked, if applicable.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| RevocationReason         | <p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation Of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table> | Value | Description | 0 | Unspecified | 1 | Key Compromised | 2 | CA Compromised | 3 | Affiliation Changed | 4 | Superseded | 5 | Cessation Of Operation | 6 | Certificate Hold | 999 | Unknown |
| Value                    | Description   |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |

| 5                        | Cessation Of Operation  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| 6                        | Certificate Hold  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| 999                      | Unknown   |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| RevocationComment        | An internally used Keyfactor Command field.   |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| CertificateAuthorityId   | An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| CertificateAuthorityName | A string indicating the certificate authority that issued the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| TemplateName             | A string indicating the name of the template that was used when issuing the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |

| Name              | Description   |      |             |    |   |     |  |             |   |
|-------------------|---|------|-------------|----|---|-----|--|-------------|---|
| ArchivedKey       | A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).  |      |             |    |   |     |  |             |   |
| HasPrivateKey     | A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)  |      |             |    |   |     |  |             |   |
| PrincipalName     | A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).  |      |             |    |   |     |  |             |   |
| CertRequestId     | An integer containing the Keyfactor Command reference ID of the certificate request.  |      |             |    |   |     |  |             |   |
| RequesterName     | A string containing the name of the identity that requested the certificate.  |      |             |    |   |     |  |             |   |
| ContentBytes      | A string containing the certificate as bytes.   |      |             |    |   |     |  |             |   |
| ExtendedKeyUsages | <p>An array containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr> <tr> <td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command reference ID of the extended key usage. | Oid | A string indicating the OID of the extended key usage. | DisplayName | A string indicating the name of the extended key usage. |

| 1xx          | User-defined certificate stores will be given a type ID over 101.   |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| Alias        | A string indicating the alias of the certificate in the certificate store.  |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| ChainLevel   | An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.  |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| CertStoreId  | A string indicating the GUID of the certificate   |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |

| Name             | Description  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
|------------------|--|------|-------------|---------|--|------------------|--|--------------|--|------------------|--|--------------|--|--------------|---|
| Metadata         | An array containing the metadata fields populated for the certificate.   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CertificateKeyId | An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CARowIndex       | <p>An integer containing the CA's reference ID for certificate.</p> <div>  <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CARecordId       | A string containing the CA's reference ID for certificate.   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DetailedKeyUsage | <p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CrlSign</td><td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DataEncipherment</td><td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DecipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td></tr> <tr> <td>DigitalSignature</td><td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>EncipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td></tr> <tr> <td>KeyAgreement</td><td>A Boolean that indicates whether the certificate is configured for key agreement.</td></tr> </table> | Name | Description | CrlSign | A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false). | DataEncipherment | A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false). | DecipherOnly | A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false). | DigitalSignature | A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false). | EncipherOnly | A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false). | KeyAgreement | A Boolean that indicates whether the certificate is configured for key agreement. |
| Name             | Description  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CrlSign          | A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DataEncipherment | A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DecipherOnly     | A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DigitalSignature | A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| EncipherOnly     | A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| KeyAgreement     | A Boolean that indicates whether the certificate is configured for key agreement.  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |

| Name            | Description   |      |             |             |   |                 |  |                |   |         |   |
|-----------------|---|------|-------------|-------------|---|-----------------|--|----------------|---|---------|---|
|                 | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>KeyCertSign</td><td>A Boolean that indicates whether the certificate is configured for certificate signing.</td></tr> <tr> <td>KeyEncipherment</td><td>A Boolean that indicates whether the certificate is configured for key encipherment.</td></tr> <tr> <td>NonRepudiation</td><td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td></tr> <tr> <td>HexCode</td><td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td></tr> </table> | Name | Description | KeyCertSign | A Boolean that indicates whether the certificate is configured for certificate signing. | KeyEncipherment | A Boolean that indicates whether the certificate is configured for key encipherment. | NonRepudiation | A Boolean that indicates whether the certificate is configured for non-repudiation. | HexCode | A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> . |
| Name            | Description   |      |             |             |   |                 |  |                |   |         |   |
| KeyCertSign     | A Boolean that indicates whether the certificate is configured for certificate signing.   |      |             |             |   |                 |  |                |   |         |   |
| KeyEncipherment | A Boolean that indicates whether the certificate is configured for key encipherment.  |      |             |             |   |                 |  |                |   |         |   |
| NonRepudiation  | A Boolean that indicates whether the certificate is configured for non-repudiation.   |      |             |             |   |                 |  |                |   |         |   |
| HexCode         | A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .   |      |             |             |   |                 |  |                |   |         |   |
| KeyRecoverable  | A Boolean that indicates whether the certificate key is recoverable (true) or not (false).  |      |             |             |   |                 |  |                |   |         |   |
| Curve           | A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>  |      |             |             |   |                 |  |                |   |         |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.7 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 138: GET Certificates Metadata Compare Input Parameters

| Name              | In    | Description  |
|-------------------|-------|--|
| certificateId     | Query | <b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.   |
| metadataFieldName | Query | <b>Required.</b> A string containing the name of the metadata field whose value should be compared.  |
| value             | Query | <b>Required.</b> A string containing the value for comparison.   |
| collectionId      | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.8 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see *Certificate Details* in the *Keyfactor Command Reference Guide*. This method returns HTTP 200 OK on a success with certificate history details in the message body.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 139: GET Certificates {id} History Input Parameters

| Name                | In    | Description  |
|---------------------|-------|--|
| id                  | Path  | <b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate.  |
| CollectionId        | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |
| query.pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| query.returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| query.sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .   |
| query.sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 140: GET Certificates {id} History Response Data

| Name           | Description   |
|----------------|---|
| Id             | An integer containing the Keyfactor Command reference ID of the certificate.  |
| OperationStart | The date, in UTC, on which the operation begin.   |
| OperationEnd   | The date, in UTC, on which the operation completed.   |
| Username       | The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.   |
| Comment        | A string containing a comment that provides more information about the history record. For example (for a metadata field):<br><div>“AppOwnerEmailAddress has been updated from ‘john.-smith@keyexample.com’ to ‘martha.jones@keyexample.com’”</div> |
| Action         | A string naming the action that was taken. For example:<br><div>Metadata Updated</div>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.9 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

 **Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full

synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 141: DELETE Certificates Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| ids          | Body  | <b>Required.</b> Array of Keyfactor Command certificate IDs for certificates that should be deleted in the form: <div>[123, 789, 567]</div>  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.6.10 GET Certificates

The GET /Certificates method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: Global *Read*, or Collection ID *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 142: GET Certificates Input Parameters

| Name                 | In    | Description  |
|----------------------|-------|--|
| includeLocations     | Query | A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .  |
| includeMetadata      | Query | A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .   |
| includeHasPrivateKey | Query | A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .   |
| CollectionId         | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |
| includeRevoked       | Query | A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .  |
| includeExpired       | Query | A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .  |

| Name        | In    | Description  |
|-------------|-------|--|
| queryString | Query | <ul style="list-style-type: none"> <li>• <i>ArchivedKey</i></li> <li>• <i>CertId</i></li> <li>• <i>CA</i></li> <li>• <i>CertState</i></li> <li>• <i>CertStoreContainer</i></li> <li>• <i>CertStoreFQDN</i> (alias: <i>JavaKey-storeFQDN</i>)</li> <li>• <i>CertStorePath</i> (alias: <i>JavaKey-storePath</i>)</li> <li>• <i>CN</i> (alias: <i>IssuedCN</i>)</li> <li>• <i>DN</i> (alias: <i>IssuedDN</i>)</li> <li>• <i>ExpirationDate</i> (alias: <i>NotAfter</i>)</li> </ul> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <li>• <i>CARquestId</i></li> <li>• <i>CertRequestId</i></li> </ul>   |
|             |       | <ul style="list-style-type: none"> <li>• <i>EKU</i></li> <li>• <i>EKUName</i></li> <li>• <i>HasPrivateKey</i></li> <li>• <i>ImportDate</i></li> <li>• <i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>)</li> <li>• <i>IssuerDN</i></li> <li>• <i>KeySize</i> (alias: <i>KeySizeInBits</i>)</li> <li>• <i>KeyType</i></li> <li>• <i>KeyUsage</i></li> <li>• <i>OU</i></li> <li>• <i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>)</li> <li>• <i>PublicKey</i></li> <li>• <i>NetBIOSRequester</i> (alias: <i>RequesterName</i>)</li> <li>• <i>RevocationDate</i> (alias: <i>RevocationEffDate</i>)</li> <li>• <i>Revoker</i></li> <li>• <i>RFC2818Compliant</i></li> <li>• <i>SelfSigned</i></li> <li>• <i>SerialNumber</i></li> <li>• <i>SigningAlgorithm</i></li> <li>• <i>SSLDNSName</i></li> <li>• <i>SSLIPAddress</i> (alias: <i>SslHostName</i>)</li> <li>• <i>SSLNetworkName</i></li> <li>• <i>SSLPort</i></li> <li>• <i>SAN</i></li> <li>• <i>TemplateDisplayName</i> (alias: <i>TemplateName</i>)</li> <li>• <i>TemplateShortName</i></li> <li>• <i>Thumbprint</i></li> </ul> |

| Name          | In    | Description  |
|---------------|-------|--|
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 143: GET Certificates Response Data

| Name         | Description  |
|--------------|--|
| Id           | An integer indicating the Keyfactor Command reference ID of the certificate.   |
| Thumbprint   | A string indicating the thumbprint of the certificate.   |
| SerialNumber | A string indicating the serial number of the certificate.  |
| IssuedDN     | A string indicating the distinguished name of the certificate.   |
| IssuedCN     | A string indicating the common name of the certificate.  |
| ImportDate   | The date, in UTC, on which the certificate was imported into Keyfactor Command.  |
| NotBefore    | The date, in UTC, on which the certificate was issued by the certificate authority.  |
| NotAfter     | The date, in UTC, on which the certificate expires.  |
| IssuerDN     | A string indicating the distinguished name of the issuer.  |
| PrincipalId  | An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> . |
| TemplateId   | An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.  |

| Name          | Description   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
|---------------|---|-------|-------------|---|---------|---|--------|---|---------|---|--------|---|--------|---|---------|---|-----------------------|---|------------------------------|
| CertState     | <p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table> | Value | Description | 0 | Unknown | 1 | Active | 2 | Revoked | 3 | Denied | 4 | Failed | 5 | Pending | 6 | Certificate Authority | 7 | Parent Certificate Authority |
| Value         | Description   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 0             | Unknown   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 1             | Active  |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |
| 2             | Revoked   |       |             |   |         |   |        |   |         |   |        |   |        |   |         |   |                       |   |                              |

| RevocationComment        | An internally used Keyfactor Command field.   |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| CertificateAuthorityId   | An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| CertificateAuthorityName | A string indicating the certificate authority that issued the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |
| TemplateName             | A string indicating the name of the template that was used when issuing the certificate.  |       |             |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |     |         |

| Name              | Description   |      |             |    |   |     |  |             |   |
|-------------------|---|------|-------------|----|---|-----|--|-------------|---|
| ArchivedKey       | A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).  |      |             |    |   |     |  |             |   |
| HasPrivateKey     | A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)  |      |             |    |   |     |  |             |   |
| PrincipalName     | A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).  |      |             |    |   |     |  |             |   |
| CertRequestId     | An integer containing the Keyfactor Command reference ID of the certificate request.  |      |             |    |   |     |  |             |   |
| RequesterName     | A string containing the name of the identity that requested the certificate.  |      |             |    |   |     |  |             |   |
| ContentBytes      | A string containing the certificate as bytes.   |      |             |    |   |     |  |             |   |
| ExtendedKeyUsages | <p>An array containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr> <tr> <td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command reference ID of the extended key usage. | Oid | A string indicating the OID of the extended key usage. | DisplayName | A string indicating the name of the extended key usage. |
| Name              | Description   |      |             |    |   |     |  |             |   |
| Id                | An integer containing the Keyfactor Command reference ID of the extended key usage.   |      |             |    |   |     |  |             |   |
| Oid               | A string indicating the OID of the extended key usage.  |      |             |    |   |     |  |             |   |
| DisplayName       | A string indicating the name of the extended key usage.   |      |             |    |   |     |  |             |   |

| Name                   | Description   |       |             |    |  |       |   |      |  |       |              |   |                |   |               |   |                             |   |              |   |                |     |                    |     |                             |     |            |   |               |     |                    |     |                    |     |         |           |  |
|------------------------|---|-------|-------------|----|--|-------|---|------|--|-------|--------------|---|----------------|---|---------------|---|-----------------------------|---|--------------|---|----------------|-----|--------------------|-----|-----------------------------|-----|------------|---|---------------|-----|--------------------|-----|--------------------|-----|---------|-----------|--|
| SubjectAltNameElements | <p>An array containing the subject alternative name elements of the certificate. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the SAN Element.</td></tr> <tr> <td>Type</td><td> <p>An integer containing the type of SAN element. | 101          | File Transfer Protocol  |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| 1xx          | User-defined certificate stores will be given a type ID over 101.   |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| Alias        | A string indicating the alias of the certificate in the certificate store.  |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| ChainLevel   | An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.  |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |
| CertStoreId  | A string indicating the GUID of the certificate   |       |             |              |  |           |  |           |  |       |             |   |               |   |              |   |                 |   |             |   |                    |    |                      |    |                    |     |                     |     |                        |     |   |    |                    |     |                     |     |                        |     |   |       |  |            |  |             |   |

| Name             | Description  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
|------------------|--|------|-------------|---------|--|------------------|--|--------------|--|------------------|--|--------------|--|--------------|---|
| Metadata         | An array containing the metadata fields populated for the certificate.   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CertificateKeyId | An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CARowIndex       | <p>An integer containing the CA's reference ID for certificate.</p> <div>  <b>Note:</b> The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CARecordId       | A string containing the CA's reference ID for certificate.   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DetailedKeyUsage | <p>An array containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CrlSign</td><td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DataEncipherment</td><td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DecipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td></tr> <tr> <td>DigitalSignature</td><td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>EncipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td></tr> <tr> <td>KeyAgreement</td><td>A Boolean that indicates whether the certificate is configured for key agreement.</td></tr> </table> | Name | Description | CrlSign | A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false). | DataEncipherment | A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false). | DecipherOnly | A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false). | DigitalSignature | A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false). | EncipherOnly | A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false). | KeyAgreement | A Boolean that indicates whether the certificate is configured for key agreement. |
| Name             | Description  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| CrlSign          | A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DataEncipherment | A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DecipherOnly     | A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| DigitalSignature | A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| EncipherOnly     | A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).   |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |
| KeyAgreement     | A Boolean that indicates whether the certificate is configured for key agreement.  |      |             |         |  |                  |  |              |  |                  |  |              |  |              |   |

| Name            | Description   |      |             |             |   |                 |  |                |   |         |   |
|-----------------|---|------|-------------|-------------|---|-----------------|--|----------------|---|---------|---|
|                 | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>KeyCertSign</td><td>A Boolean that indicates whether the certificate is configured for certificate signing.</td></tr> <tr> <td>KeyEncipherment</td><td>A Boolean that indicates whether the certificate is configured for key encipherment.</td></tr> <tr> <td>NonRepudiation</td><td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td></tr> <tr> <td>HexCode</td><td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td></tr> </table> | Name | Description | KeyCertSign | A Boolean that indicates whether the certificate is configured for certificate signing. | KeyEncipherment | A Boolean that indicates whether the certificate is configured for key encipherment. | NonRepudiation | A Boolean that indicates whether the certificate is configured for non-repudiation. | HexCode | A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> . |
| Name            | Description   |      |             |             |   |                 |  |                |   |         |   |
| KeyCertSign     | A Boolean that indicates whether the certificate is configured for certificate signing.   |      |             |             |   |                 |  |                |   |         |   |
| KeyEncipherment | A Boolean that indicates whether the certificate is configured for key encipherment.  |      |             |             |   |                 |  |                |   |         |   |
| NonRepudiation  | A Boolean that indicates whether the certificate is configured for non-repudiation.   |      |             |             |   |                 |  |                |   |         |   |
| HexCode         | A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .   |      |             |             |   |                 |  |                |   |         |   |
| KeyRecoverable  | A Boolean that indicates whether the certificate key is recoverable (true) or not (false).  |      |             |             |   |                 |  |                |   |         |   |
| Curve           | A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> <li>• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1</li> <li>• 1.3.132.0.34 = P-384/secp384r1</li> <li>• 1.3.132.0.35 = P-521/secp521r1</li> </ul>  |      |             |             |   |                 |  |                |   |         |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.11 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the *PUT /Certificates/Metadata/All* method (see [PUT Certificates Metadata All on page 291](#)). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 144: PUT Certificates Metadata Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| Id           | Body  | <b>Required.</b> An integer specifying the Keyfactor Command reference ID for the certificate to update.   |
| Metadata     | Body  | <p><b>Required.</b> An array containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example:</p> <pre> "Metadata": {   "AppOwnerEmailAddress": "john.smith@keyexample.com", // String field    "SiteCode": 23, // Integer field    "BusinessCritical": true, // Boolean field    "Notes": "Here are some notes about this certificate.", // BigText field    "BusinessUnit": "E-Business", // Multiple Choice field pre-defined value    "TicketResolutionDate": "2021-07-23" // Date field in yyyy-mm-dd format }</pre> |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.                                       |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.12 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of active certificates. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *EditMetadata*

Certificate permission can be granted at either the global or collection level. See note under *CollectionId*, below.

Table 145: PUT Certificates Metadata All Input Parameters

| Name  | In   | Description  |
|-------|------|--|
| Query | Body | <p><b>Required*</b>. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Certificate Search Page</a> section. A value for one of <i>CertificateId</i>s, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"><li>• <i>ArchivedKey</i></li><li>• <i>CertId</i></li><li>• <i>CA</i></li><li>• <i>CertState</i></li><li>• <i>CertStoreContainer</i></li><li>• <i>CertStoreFQDN</i> (alias: <i>JavaKey-storeFQDN</i>)</li><li>• <i>CertStorePath</i> (alias: <i>JavaKey-storePath</i>)</li><li>• <i>CN</i> (alias: <i>IssuedCN</i>)</li><li>• <i> EKU</i></li><li>• <i>EKUName</i></li><li>• <i>HasPrivateKey</i></li><li>• <i>ImportDate</i></li><li>• <i>IssuedDate</i> (aliases: <i>NotBefore</i> and <i>EffectiveDate</i>)</li><li>• <i>IssuerDN</i></li><li>• <i>KeySize</i> (alias: <i>KeySizeInBits</i>)</li><li>• <i>KeyType</i></li><li>• <i>OU</i></li><li>• <i>NetBIOSPrincipal</i> (alias: <i>PrincipalName</i>)</li><li>• <i>PublicKey</i></li><li>• <i>NetBIOSRequester</i> (alias: <i>RequesterName</i>)</li><li>• <i>RevocationDate</i> (alias: <i>RevocationEffDate</i>)</li><li>• <i>Revoker</i></li><li>• <i>RFC2818Compliant</i></li><li>• <i>SelfSigned</i></li><li>• <i>SigningAlgorithm</i></li><li>• <i>SSLDNSName</i></li><li>• <i>SSLIPAddress</i> (alias: <i>SslHostName</i>)</li><li>• <i>SSLNetworkName</i></li><li>• <i>SSLPort</i></li><li>• <i>SAN</i></li><li>• <i>TemplateDisplayName</i> (alias: <i>TemplateName</i>)</li><li>• <i>TemplateShortName</i></li></ul> |

| Name                | In  | Description  |      |             |       |  |              |   |                   |   |
|---------------------|---|--|------|-------------|-------|--|--------------|---|-------------------|---|
|                     |   | <div><ul style="list-style-type: none"><li>• <i>DN</i> (alias: <i>IssuedDN</i>)</li><li>• <i>ExpirationDate</i> (alias: <i>NotAfter</i>)</li><li>• <i>KeyUsage</i></li><li>• <i>SerialNumber</i></li><li>• <i>Thumbprint</i></li></ul></div> <p>The following fields have been deprecated and will be ignored if included in a request:</p> <div><ul style="list-style-type: none"><li>• <i>CARequestID</i></li><li>• <i>CertRequestId</i></li><li>• <i>IsPfx</i></li><li>• <i>RequestResolutionDate</i></li></ul></div> <div><div></div><div><b>Note:</b> Queries may be done using either the primary field name or the field alias(es).</div></div> <div><div></div><div><b>Tip:</b> To exclude revoked certificates from the update, include a query of:<br/><code>CertState -ne \"2\"</code></div><div>To exclude expired certificates from the update, include a query of:<br/><code>ExpirationDate -ge \"%TODAY%\"</code></div></div> |      |             |       |  |              |   |                   |   |
| Certi-<br>ficatelds | Body  | <b>Required*</b> . An array of Keyfactor Command certificate IDs to update. A value for one of <i>CertificateIds</i> , <i>Query</i> , or <i>CollectionId</i> is <b>required</b> .  |      |             |       |  |              |   |                   |   |
| Metadata            | Body  | <b>Required</b> . An array containing information about the metadata field(s) to update. The parameters are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><b>Required</b>. The value that should be set for the metadata field.</td></tr><tr><td>MetadataName</td><td><b>Required</b>. The name of the metadata field that should be updated for the certificates.</td></tr><tr><td>OverwriteExisting</td><td>A Boolean that sets whether all the certificates being updated will have their metadata field over-written to the value being provided, including those that already have a value in the given metadata field</td></tr></table>  | Name | Description | Value | <b>Required</b> . The value that should be set for the metadata field. | MetadataName | <b>Required</b> . The name of the metadata field that should be updated for the certificates. | OverwriteExisting | A Boolean that sets whether all the certificates being updated will have their metadata field over-written to the value being provided, including those that already have a value in the given metadata field |
| Name                | Description   |  |      |             |       |  |              |   |                   |   |
| Value               | <b>Required</b> . The value that should be set for the metadata field.  |  |      |             |       |  |              |   |                   |   |
| MetadataName        | <b>Required</b> . The name of the metadata field that should be updated for the certificates.   |  |      |             |       |  |              |   |                   |   |
| OverwriteExisting   | A Boolean that sets whether all the certificates being updated will have their metadata field over-written to the value being provided, including those that already have a value in the given metadata field |  |      |             |       |  |              |   |                   |   |

| Name         | In   | Description   |      |             |  |  |
|--------------|--|---|------|-------------|--|--|
|              |  | <table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>(true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>"Metadata": [<br/>  {<br/>    "MetadataName": "AppOwnerEmailAddress", // This is a String field.<br/>    "Value": "john.smith@keyexample.com",<br/>    "OverwriteExisting": true<br/>  },<br/>  {<br/>    "MetadataName": "SiteCode", // This is an Integer field.<br/>    "Value": 5,<br/>    "OverwriteExisting": true<br/>  },<br/>  {<br/>    "MetadataName": "BusinessCritical", // This is a Boolean field.<br/>    "Value": true,<br/>    "OverwriteExisting": true<br/>  },<br/>  {<br/>    "MetadataName": "Notes", // This is a BigText field.<br/>    "Value": "Here are some notes about this certificate.",<br/>    "OverwriteExisting": true<br/>  },<br/>  {<br/>    "MetadataName": "BusinessUnit", // This is a Multiple Choice field.<br/>    "Value": "E-Business", // This is a value pre-defined for the<br/>field.<br/>    "OverwriteExisting": true<br/>  },<br/>  {<br/>    "MetadataName": "TicketResolutionDate", // This is a Date field in<br/>yyyy-mm-dd format.<br/>    "Value": "2021-07-23",<br/>    "OverwriteExisting": true<br/>  }<br/>]</pre> | Name | Description |  | (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> . |
| Name         | Description  |   |      |             |  |  |
|              | (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> . |   |      |             |  |  |
| CollectionId | Query  | <b>Required*</b> . An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to  |      |             |  |  |

| Name | In | Description   |
|------|----|---|
|      |    | <p>complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>Certificatelds</i>, <i>Query</i>, or <i>CollectionId</i> is <b>required</b>.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.13 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Import*

Table 146: POST Certificates Import Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| Certificate | Body | <b>Required.</b> The base-64 encoded contents of the certificate that is to be imported into Keyfactor Command.   |
| Password    | Body | <b>Required*</b> . The password used to decrypt the imported PFX. This field is <b>required</b> if a PFX certificate is provided in the <i>Certificate</i> field.   |
| Metadata    | Body | <p>A list of certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example:</p> <pre>"Metadata": {   "AppOwnerFirstName": "John",   "AppOwnerLastName": "Smith" }</pre> |
| Storeids    | Body | A list of the certificate store GUIDs that the imported certificate will be installed into.   |

| Name       | In  | Description  |   |             |             |   |               |             |          |               |                 |          |           |                 |           |           |              |           |               |              |             |               |                    |             |                      |                    |                    |                      |                     |                    |                        |                     |   |                        |     |   |       |   |
|------------|---|--|---|-------------|-------------|---|---------------|-------------|----------|---------------|-----------------|----------|-----------|-----------------|-----------|-----------|--------------|-----------|---------------|--------------|-------------|---------------|--------------------|-------------|----------------------|--------------------|--------------------|----------------------|---------------------|--------------------|------------------------|---------------------|---|------------------------|-----|---|-------|---|
| StoreTypes | Body  | <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeId</td><td><p>The ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Java Keystore</td></tr><tr><td>2</td><td>PEM File</td></tr><tr><td>3</td><td>F5 SSL Profiles</td></tr><tr><td>4</td><td>IIS Roots</td></tr><tr><td>5</td><td>NetScaler</td></tr><tr><td>6</td><td>IIS Personal</td></tr><tr><td>7</td><td>F5 Web Server</td></tr><tr><td>8</td><td>IIS Revoked</td></tr><tr><td>9</td><td>F5 Web Server REST</td></tr><tr><td>10</td><td>F5 SSL Profiles REST</td></tr><tr><td>11</td><td>F5 CA Bundles REST</td></tr><tr><td>100</td><td>Amazon Web Services</td></tr><tr><td>101</td><td>File Transfer Protocol</td></tr><tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr></table></td></tr><tr><td>Alias</td><td><p><b>Required*</b>. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</p></td></tr></table> | Name  | Description | StoreTypeId | <p>The ID of the store type being used. | Alias      | <p><b>Required*</b>. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</p> |  |   |             |             |   |               |             |          |               |                 |          |           |                 |           |           |              |           |               |              |             |               |                    |             |                      |                    |                    |                      |                     |                    |                        |                     |   |                        |     |   |       |   |
| KEYFACTOR  |   | 10.5 Keyfactor Web APIs Reference Guide296   |   |             |             |   |               |             |          |               |                 |          |           |                 |           |           |              |           |               |              |             |               |                    |             |                      |                    |                    |                      |                     |                    |                        |                     |   |                        |     |   |       |   |
|            | Overwrite   | <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false). | Name     | In   | Description  |
|----------|------|--|
| Schedule | Body | The time the imported certificate should be scheduled to be installed into the certificate store. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). |

Table 147: POST Certificates Import Response Data

| Name             | Description   |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
|------------------|---|------|-------------|------------|----------------------------------|---------------|--|-----------|--|-------|---|--------|----------------------------------|-------------|---|
| ImportStatus     | The status of the import job indicating, for example, whether the certificate was newly created in Keyfactor Command or already existed in Keyfactor Command and was just updated based on provided private key, metadata, or location information.   |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| InvalldKeyStores | Which key store items failed with some information. Included parameters are: <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>KeystoreId</td><td>The ID of the store that failed.</td></tr> <tr> <td>ClientMachine</td><td>The client machine of the store that failed.</td></tr> <tr> <td>StorePath</td><td>The path to the location of the certificate store that failed.</td></tr> <tr> <td>Alias</td><td>The alias for the certificate in the store that failed.</td></tr> <tr> <td>Reason</td><td>The simple reason why it failed.</td></tr> <tr> <td>Explanation</td><td>A more specific reason for the failure.</td></tr> </table> | Name | Description | KeystoreId | The ID of the store that failed. | ClientMachine | The client machine of the store that failed. | StorePath | The path to the location of the certificate store that failed. | Alias | The alias for the certificate in the store that failed. | Reason | The simple reason why it failed. | Explanation | A more specific reason for the failure. |
| Name             | Description   |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| KeystoreId       | The ID of the store that failed.  |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| ClientMachine    | The client machine of the store that failed.  |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| StorePath        | The path to the location of the certificate store that failed.  |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| Alias            | The alias for the certificate in the store that failed.   |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| Reason           | The simple reason why it failed.  |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| Explanation      | A more specific reason for the failure.   |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |
| JobStatus        | The state of all certificate store jobs.  |      |             |            |                                  |               |  |           |  |       |   |        |                                  |             |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.6.14 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 148: POST Certificates Revoke Input Parameters

| Name           | In   | Description  |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |  |

| 5              | Cessation of Operation   |  |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |  |
| 6              | Certificate Hold   |  |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |  |
| 7              | Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold |  |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |  |
| Comment        | Body   | <b>Required.</b> A string containing a freeform reason or comment on why the certificate is being revoked.   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |  |

| Name          | In   | Description  |
|---------------|------|--|
| EffectiveDate | Body | The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.  |
| CollectionId  | Body | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.15 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. This method returns HTTP 200 OK on a success with a list of the contents of the certificate.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*  
OR  
Certificates: *Import*

Table 149: POST Certificates Analyze Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| Certificate | Body | <b>Required.</b> The base-64 encoded PEM string of the certificate, <b>not</b> including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----). |
| Password    | Body | The password used to encrypt the private key of the certificate for a base-64 encoded PEM containing the certificate's private key (-----BEGIN ENCRYPTED PRIVATE KEY-----).      |

Table 150: POST Certificates Analyze Response Data

| Name        | Description  |
|-------------|--|
| IssuedDN    | A string containing the distinguished name of the certificate.   |
| IssuerDN    | A string containing the distinguished name of the issuer.  |
| Thumbprint  | A string containing the thumbprint of the certificate.   |
| NotAfter    | The date/time, in UTC, on which the certificate expires.   |
| NotBefore   | The date/time, in UTC, on which the certificate was issued by the certificate authority.                             |
| Metadata    | An array containing the metadata fields populated for the certificate.   |
| IsEndEntity | A Boolean indicating whether the certificate is the end entity of the chain ( <i>true</i> ) or not ( <i>false</i> ). |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.16 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in JKS, PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 303](#)).

**Tip:** CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see [Details Tab](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 151: POST Certificates Recover Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| Password     | Body  | <b>Required</b> . The password to set on the certificate.  |
| CertID       | Body  | <b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the certificate to retrieve.<br>One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul> |
| SerialNumber | Body  | <b>Required*</b> . A string indicating the serial number of the certificate to retrieve.<br>One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>                    |
| IssuerDN     | Body  | <b>Required*</b> . A string indicating the distinguished name of the issuer of the certificate to retrieve.<br>One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul> |
| Thumbprint   | Body  | <b>Required*</b> . A string indicating the thumbprint of the certificate to retrieve.<br>One of the following is <b>required</b> : <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>                       |
| IncludeChain | Body  | A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.  |
| ChainOrder   | Body  | A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user  |

| Name                | In     | Description   |
|---------------------|--------|---|
|                     |        | must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| x-certificateformat | Header | <p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> <li>• JKS<br/>Selecting the JKS option allows you to create a Java keystore with the returned PFX value.</li> <li>• PEM<br/>Output the certificate in base-64 encoded PEM format along with the private key and any optional chain certificates in a single file.</li> <li>• PFX<br/>Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PFX value.</li> </ul> |

Table 152: POST Certificates Recover Response Data

| Name     | Description   |
|----------|---|
| PFX      | <p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content   ConvertFrom-Json  \$targetFile = 'C:\path_to_target_file\' + \$ResponseContent.FileName  \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p> |
| FileName | The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.17 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the *POST /Certificates/Recover* method (see [POST Certificates Recover on page 300](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 153: POST Certificates Download Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| CertID       | Body  | <p><b>Required</b>*. An integer indicating the Keyfactor Command reference ID of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>                                       |
| SerialNumber | Body  | <p><b>Required</b>*. A string indicating the serial number of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>  |
| IssuerDN     | Body  | <p><b>Required</b>*. A string indicating the distinguished name of the issuer of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>                                       |
| Thumbprint   | Body  | <p><b>Required</b>*. A string indicating the thumbprint of the certificate to retrieve.</p> <p>One of the following is <b>required</b>:</p> <ul style="list-style-type: none"> <li>• <i>CertID</i></li> <li>• <i>Thumbprint</i></li> <li>• <i>SerialNumber</i> and <i>IssuerDN</i></li> </ul>   |
| IncludeChain | Body  | A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.   |
| ChainOrder   | Body  | A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .   |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate |

| Name                | In     | Description  |
|---------------------|--------|--|
|                     |        | collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| x-certificateformat | Header | <p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> <li>DER<br/>DER is not supported if IncludeChain is set to <i>true</i>.</li> <li>PEM<br/>Output the certificate in base-64 encoded PEM format along with any optional chain certificates in a single file.</li> <li>P7B<br/>This option is only supported if IncludeChain is set to <i>true</i></li> </ul> |

Table 154: POST Certificates Download Response Data

| Name    | Description  |
|---------|--|
| Content | The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.18 POST Certificates Revoke All

The POST /Certificates/RevokeAll method is used to revoke all the certificates in the specified query and/or collection ID. The endpoint makes use of the *Revoke All Enabled* application setting (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If *Revoke All Enabled* is set to *False*, the endpoint will return an error indicating revoke all is not allowed and not complete the request. This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Revoke*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 155: POST Certificates Revoke All Input Parameters

| Name          | In                     | Description   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
|---------------|------------------------|---|-------|-------------|----|------------------|---|-------------|---|-----------------|---|----------------|---|---------------------|---|------------|---|------------------------|---|------------------|---|-----------------|
| Query         | Body                   | <b>Required*</b> . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Certificate Search Page</a> section. A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b> . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.             |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| Reason        | Body                   | <p>An integer containing the specific reason that the certificates are being revoked. Available values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-1</td><td>Remove from Hold</td></tr><tr><td>0</td><td>Unspecified</td></tr><tr><td>1</td><td>Key Compromised</td></tr><tr><td>2</td><td>CA Compromised</td></tr><tr><td>3</td><td>Affiliation Changed</td></tr><tr><td>4</td><td>Superseded</td></tr><tr><td>5</td><td>Cessation of Operation</td></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL</td></tr></table> <p>The default is <i>Unspecified</i>.</p> | Value | Description | -1 | Remove from Hold | 0 | Unspecified | 1 | Key Compromised | 2 | CA Compromised | 3 | Affiliation Changed | 4 | Superseded | 5 | Cessation of Operation | 6 | Certificate Hold | 7 | Remove from CRL |
| Value         | Description            |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| -1            | Remove from Hold       |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 0             | Unspecified            |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 1             | Key Compromised        |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 2             | CA Compromised         |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 3             | Affiliation Changed    |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 4             | Superseded             |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 5             | Cessation of Operation |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 6             | Certificate Hold       |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| 7             | Remove from CRL        |   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| Comment       | Body                   | <b>Required</b> . A string containing a freeform reason or comment indicating why the certificates are being revoked.   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |
| EffectiveDate | Body                   | The date and time when the certificate will be revoked. The date and time   |       |             |    |                  |   |             |   |                 |   |                |   |                     |   |            |   |                        |   |                  |   |                 |

| Name            | In    | Description  |
|-----------------|-------|--|
|                 |       | should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z). The default is the current date and time.  |
| IncludeRe-voked | Body  | A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .  |
| IncludeExpired  | Body  | A Boolean that indicates whether expired certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .  |
| CollectionId    | Query | <p><b>Required*</b>. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is <b>required</b>. If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.</p> <p>For example:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/RevokeAll?CollectionId=14</pre> |

**Note:** This endpoint is not exposed in the Keyfactor API Endpoint Utility to reduce accidental usage. You may still make use of it by calling it from your own tool.

### 2.5.6.19 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of active certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 156: DELETE Certificates Query Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| sq           | Body  | <p><b>Required.</b> Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>"CN -contains \"mycertificate.keyexample.com\""</pre> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.</p> <p> <b>Tip:</b> Revoked and expired certificates are excluded from the selection regardless of the query you enter.</p>   |
| CollectionId | Query | <p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.6.20 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 157: DELETE Certificates Private Key Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| ids          | Body  | <b>Required.</b> An array of Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form:<br><div>[123, 789, 567]</div>   |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.6.21 DELETE Certificates Private Key ID

The DELETE /Certificates/PrivateKey/{id} method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Delete*

Certificate permission can be granted at either the global or collection level. See note under CollectionId, below.

Table 158: DELETE Certificates Private Key {id} Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| id           | Path  | <b>Required.</b> The Keyfactor Command reference ID of the certificate whose private key should be deleted.<br>Use the <i>GET /Certificates</i> method (see <a href="#">GET Certificates on page 275</a> ) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.  |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.7 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 159: Certificate Authority Endpoints

| Endpoint | Method | Description   | Link   |
|----------|--------|---|--|
| / {id}   | DELETE | Deletes the certificate authority record for the specified ID.                | <a href="#">DELETE Certificate Authority ID on the next page</a> |
| / {id}   | GET    | Returns details for the certificate authority identified by the specified ID. | <a href="#">GET Certificate Authority ID on the next page</a>    |
| /        | GET    | Returns a list of all certificate authorities.                                | <a href="#">GET Certificate Authority on page 326</a>            |
| /        | POST   | Creates a new certificate authority   | <a href="#">POST Certificate</a>                                 |

| Endpoint    | Method | Description  | Link  |
|-------------|--------|--|---|
|             |        | record.  | <a href="#">Authority on page 340</a>                             |
| /           | PUT    | Updates an existing certificate authority record.                                      | <a href="#">PUT Certificate Authority on page 368</a>             |
| /Test       | POST   | Validates that the certificate authority with the provided information can be reached. | <a href="#">POST Certificate Authority Test on page 397</a>       |
| /PublishCRL | POST   | Publishes the Certificate Revocation List of the given certificate authority.          | <a href="#">POST Certificate Authority PublishCRL on page 399</a> |

### 2.5.7.1 DELETE Certificate Authority ID

The DELETE /CertificateAuthority/{id} endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: PkiManagement: *Modify*

**Note:** You can't delete a CA from Keyfactor Command that has active records associated with it (e.g. certificates, certificate requests).

Table 160: DELETE Certificate Authority {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.7.2 GET Certificate Authority ID

The POST /CertificateAuthority method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 161: GET Certificate Authority {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve. |

Table 162: GET Certificate Authority {id} Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.   |
| LogicalName         | A string indicating the logical name of the certificate authority.   |
| HostName            | A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).   |
| Delegate            | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div> |
| DelegateEnrollment  | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div>                       |
| ForestRoot          | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.         </div>   |
| ConfigurationTenant | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>   |

| Name              | Description  |
|-------------------|--|
|                   |  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.   |
| Remote            | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .   |
| Agent             | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).  |
| Standalone        | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .  |
| MonitorThresholds | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div> |
| IssuanceMax       | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| IssuanceMin       | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is   |

| Name                   | Description  |       |             |   |                |   |                |   |                        |
|------------------------|--|-------|-------------|---|----------------|---|----------------|---|------------------------|
|                        | triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |       |             |   |                |   |                |   |                        |
| FailureMax             | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |       |             |   |                |   |                |   |                        |
| RFCEnforcement         | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). </div> |       |             |   |                |   |                |   |                        |
| Properties             | <p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>   |       |             |   |                |   |                |   |                        |
| AllowedEnrollmentTypes | <p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |
| Value                  | Description  |       |             |   |                |   |                |   |                        |
| 1                      | PFX Enrollment   |       |             |   |                |   |                |   |                        |
| 2                      | CSR Enrollment   |       |             |   |                |   |                |   |                        |
| 3                      | PFX and CSR Enrollment   |       |             |   |                |   |                |   |                        |
| KeyRetention           | An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:   |       |             |   |                |   |                |   |                        |

| Name                | Description  |       |             |   |                        |   |            |   |                  |   |               |
|---------------------|--|-------|-------------|---|------------------------|---|------------|---|------------------|---|---------------|
|                     | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <div>  <p><b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).<br/><i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite | 2 | After Expiration | 3 | From Issuance |
| Value               | Description  |       |             |   |                        |   |            |   |                  |   |               |
| 0                   | Key Retention Disabled   |       |             |   |                        |   |            |   |                  |   |               |
| 1                   | Indefinite   |       |             |   |                        |   |            |   |                  |   |               |
| 2                   | After Expiration   |       |             |   |                        |   |            |   |                  |   |               |
| 3                   | From Issuance  |       |             |   |                        |   |            |   |                  |   |               |
| KeyRetentionDays    | An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.   |       |             |   |                        |   |            |   |                  |   |               |
| ExplicitCredentials | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <p><b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>   |       |             |   |                        |   |            |   |                  |   |               |
| SubscriberTerms     | A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |       |             |   |                        |   |            |   |                  |   |               |

| Name                 | Description  |
|----------------------|--|
|                      |  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| ExplicitUser         | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command. |
| ExplicitPassword     | A string containing the password for the <i>ExplicitUser</i> .   |
| UseAllowedRequesters | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is   |

| Name              | Description  |
|-------------------|--|
|                   | <div data-bbox="508 285 1406 369">  similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="508 411 1406 653">  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>). </div>   |
| AllowedRequesters | <p data-bbox="496 695 1406 758">An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="508 789 1406 947"> <pre data-bbox="524 810 781 926">"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> </div> <p data-bbox="496 978 1406 1073">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1083 1406 1419">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p data-bbox="496 1430 1406 1524">In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p data-bbox="496 1535 1406 1566">The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |

You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor </div> | Name | Description |      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. |-----------------|---|------|-------------|---------|--|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|--|
|                 |  Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |

These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday"). |

|-----------------|--|-------|-------------|--|--|----------|---|------------|--|----------------|---|
|                 | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>"IssuedDN" :<br/>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>   | Value | Description |  | "IssuedDN" :<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US" | IssuerDN | A string indicating the distinguished name of the EJBCA CA in X.500 format. | Thumbprint | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA. | ExpirationDate | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA. |
| Value           | Description  |       |             |  |  |          |   |            |  |                |   |
|                 | "IssuedDN" :<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"   |       |             |  |  |          |   |            |  |                |   |
| IssuerDN        | A string indicating the distinguished name of the EJBCA CA in X.500 format.  |       |             |  |  |          |   |            |  |                |   |
| Thumbprint      | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.   |       |             |  |  |          |   |            |  |                |   |
| ExpirationDate  | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.  |       |             |  |  |          |   |            |  |                |   |
| EnforceUniqueDN | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |       |             |  |  |          |   |            |  |                |   |
| LastScan        | A string indicating the date, in UTC, on which a synchronization was last performed for the CA.  |       |             |  |  |          |   |            |  |                |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.7.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 163: GET Certificate Authority Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 164: GET Certificate Authority Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.   |
| LogicalName         | A string indicating the logical name of the certificate authority.   |
| HostName            | A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).   |
| Delegate            | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div> |
| DelegateEnrollment  | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div>                       |
| ForestRoot          | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.         </div>   |
| ConfigurationTenant | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>   |

| Name              | Description  |
|-------------------|--|
|                   |  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.   |
| Remote            | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .   |
| Agent             | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).  |
| Standalone        | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .  |
| MonitorThresholds | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div> |
| IssuanceMax       | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| IssuanceMin       | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is   |

| Name                   | Description  |       |             |   |                |   |                |   |                        |
|------------------------|--|-------|-------------|---|----------------|---|----------------|---|------------------------|
|                        | triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |       |             |   |                |   |                |   |                        |
| FailureMax             | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |       |             |   |                |   |                |   |                        |
| RFCEnforcement         | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). </div> |       |             |   |                |   |                |   |                        |
| Properties             | <p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>   |       |             |   |                |   |                |   |                        |
| AllowedEnrollmentTypes | <p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |
| Value                  | Description  |       |             |   |                |   |                |   |                        |
| 1                      | PFX Enrollment   |       |             |   |                |   |                |   |                        |
| 2                      | CSR Enrollment   |       |             |   |                |   |                |   |                        |
| 3                      | PFX and CSR Enrollment   |       |             |   |                |   |                |   |                        |
| KeyRetention           | An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:   |       |             |   |                |   |                |   |                        |

| Name                | Description  |       |             |   |                        |   |            |   |                  |   |               |
|---------------------|--|-------|-------------|---|------------------------|---|------------|---|------------------|---|---------------|
|                     | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <div>  <p><b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).<br/><i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite | 2 | After Expiration | 3 | From Issuance |
| Value               | Description  |       |             |   |                        |   |            |   |                  |   |               |
| 0                   | Key Retention Disabled   |       |             |   |                        |   |            |   |                  |   |               |
| 1                   | Indefinite   |       |             |   |                        |   |            |   |                  |   |               |
| 2                   | After Expiration   |       |             |   |                        |   |            |   |                  |   |               |
| 3                   | From Issuance  |       |             |   |                        |   |            |   |                  |   |               |
| KeyRetentionDays    | An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.   |       |             |   |                        |   |            |   |                  |   |               |
| ExplicitCredentials | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <p><b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>   |       |             |   |                        |   |            |   |                  |   |               |
| SubscriberTerms     | A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |       |             |   |                        |   |            |   |                  |   |               |

| Name                 | Description   |
|----------------------|---|
|                      |  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| ExplicitUser         | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul>           These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.         </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div> |
| ExplicitPassword     | A string containing the password for the <i>ExplicitUser</i> .  |
| UseAllowedRequesters | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is           </div>   |

| Name              | Description  |
|-------------------|--|
|                   | <p> similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>).</p>   |
| AllowedRequesters | <p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |
| FullScan          | <p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p>  |

| Name     | Description  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |
|----------|--|------|-------------|---------|--|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|--|--------|---|
|          | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. | Time     | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |
| Weekly   | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |

| Name | Description   |      |             |      |  |      |  |      |  |      |  |
|------|---|------|-------------|------|--|------|--|------|--|------|--|
|      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre> "Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" } </pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p> <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor</p> | Name | Description |      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. |                 |  Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |

| Name     | Description  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |
| Time     | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |

| Name                    | Description   |       |             |             |   |            |   |          |  |
|-------------------------|---|-------|-------------|-------------|---|------------|---|----------|--|
| CAType                  | <p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> <li>• 0—DCOM</li> <li>• 1—HTTPS</li> </ul>  |       |             |             |   |            |   |          |  |
| AuthCertificatePassword | <p>An array indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> <li>• Store the credential information in the Keyfactor secrets table.<br/>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</li> <li>• Load the credential information from a PAM provider.<br/>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 817</a> for more information.</li> </ul> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> <tr> <td>Provider</td><td> <p>A string indicating the ID of the PAM provider.</p> <p>Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of all the PAM providers to determine the ID.</p> </td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p> | Value | Description | SecretValue | A string containing the password used to security the EJBCA CA client authentication certificate.                                       | Parameters | An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider. | Provider | <p>A string indicating the ID of the PAM provider.</p> <p>Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of all the PAM providers to determine the ID.</p> |
| Value                   | Description   |       |             |             |   |            |   |          |  |
| SecretValue             | A string containing the password used to security the EJBCA CA client authentication certificate.   |       |             |             |   |            |   |          |  |
| Parameters              | An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.   |       |             |             |   |            |   |          |  |
| Provider                | <p>A string indicating the ID of the PAM provider.</p> <p>Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of all the PAM providers to determine the ID.</p>  |       |             |             |   |            |   |          |  |
| AuthCertificate         | <p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:</td></tr> </table>  | Value | Description | IssuedDN    | A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: |            |   |          |  |
| Value                   | Description   |       |             |             |   |            |   |          |  |
| IssuedDN                | A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:   |       |             |             |   |            |   |          |  |

| Name            | Description   |       |             |  |  |          |   |            |  |                |   |
|-----------------|---|-------|-------------|--|--|----------|---|------------|--|----------------|---|
|                 | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>"IssuedDN" :<br/>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>  | Value | Description |  | "IssuedDN" :<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US" | IssuerDN | A string indicating the distinguished name of the EJBCA CA in X.500 format. | Thumbprint | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA. | ExpirationDate | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA. |
| Value           | Description   |       |             |  |  |          |   |            |  |                |   |
|                 | "IssuedDN" :<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"  |       |             |  |  |          |   |            |  |                |   |
| IssuerDN        | A string indicating the distinguished name of the EJBCA CA in X.500 format.   |       |             |  |  |          |   |            |  |                |   |
| Thumbprint      | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.  |       |             |  |  |          |   |            |  |                |   |
| ExpirationDate  | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.   |       |             |  |  |          |   |            |  |                |   |
| EnforceUniqueDN | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |       |             |  |  |          |   |            |  |                |   |
| LastScan        | A string indicating the date, in UTC, on which a synchronization was last performed for the CA.   |       |             |  |  |          |   |            |  |                |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.7.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

Table 165: POST Certificate Authority Input Parameters

| Name                | In   | Description  |
|---------------------|------|--|
| LogicalName         | Body | <b>Required.</b> A string indicating the logical name of the certificate authority.  |
| HostName            | Body | <b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).  |
| Delegate            | Body | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div> |
| DelegateEnrollment  | Body | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div>                       |
| ForestRoot          | Body | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.         </div>   |
| ConfigurationTenant | Body | <p><b>Required.</b> A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>  |

| Name              | In   | Description   |
|-------------------|------|---|
|                   |      |  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.  |
| Remote            | Body | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .  |
| Agent             | Body | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).   |
| Standalone        | Body | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .   |
| MonitorThresholds | Body | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div> |
| IssuanceMax       | Body | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period,   |

| Name                   | In   | Description   |
|------------------------|------|---|
|                        |      | a notification will be included in the threshold monitoring email. This value is unset by default.  |
| IssuanceMin            | Body | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |
| FailureMax             | Body | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |
| RFCEnforcement         | Body | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). </div> |
| Properties             | Body | <p><b>Required.</b> Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal\":"true"} OR {"syncExternal\":"false"}</pre>   |
| AllowedEnrollmentTypes | Body | An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:   |

| Name                | In                     | Description  |       |             |   |                        |   |                |   |                        |   |               |
|---------------------|------------------------|--|-------|-------------|---|------------------------|---|----------------|---|------------------------|---|---------------|
|                     |                        | <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment         | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |   |               |
| Value               | Description            |  |       |             |   |                        |   |                |   |                        |   |               |
| 1                   | PFX Enrollment         |  |       |             |   |                        |   |                |   |                        |   |               |
| 2                   | CSR Enrollment         |  |       |             |   |                        |   |                |   |                        |   |               |
| 3                   | PFX and CSR Enrollment |  |       |             |   |                        |   |                |   |                        |   |               |
| KeyRetention        | Body                   | <p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Key Retention Disabled</td></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <div> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite     | 2 | After Expiration       | 3 | From Issuance |
| Value               | Description            |  |       |             |   |                        |   |                |   |                        |   |               |
| 0                   | Key Retention Disabled |  |       |             |   |                        |   |                |   |                        |   |               |
| 1                   | Indefinite             |  |       |             |   |                        |   |                |   |                        |   |               |
| 2                   | After Expiration       |  |       |             |   |                        |   |                |   |                        |   |               |
| 3                   | From Issuance          |  |       |             |   |                        |   |                |   |                        |   |               |
| KeyRetentionDays    | Body                   | <p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>  |       |             |   |                        |   |                |   |                        |   |               |
| ExplicitCredentials | Body                   | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>Expli-</i></p>   |       |             |   |                        |   |                |   |                        |   |               |

| Name            | In   | Description  |
|-----------------|------|--|
|                 |      | <p><i>citPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>   |
| SubscriberTerms | Body | <p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>   |
| ExplicitUser    | Body | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor </div> |

| Name                 | In   | Description   |
|----------------------|------|---|
|                      |      |  Command. This overrides the existing AD security policy used by Keyfactor Command.  |
| ExplicitPassword     | Body | A string containing the password for the <i>ExplicitUser</i> .  |
| UseAllowedRequesters | Body | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.           </div> <div>  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>).           </div> |
| AllowedRequesters    | Body | <p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p>  |

| Name     | In   | Description   |             |             |  |  |          |  |      |             |         |  |       |  |
|----------|--|---|-------------|-------------|--|--|----------|--|------|-------------|---------|--|-------|--|
|          |  | <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |             |             |  |  |          |  |      |             |         |  |       |  |
| FullScan | Body   | <p>The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p> <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. | Name            | In  | Description  |             |             |  |  |          |   |      |             |         |  |       |   |
|-----------------|---|--|-------------|-------------|--|--|----------|---|------|-------------|---------|--|-------|---|
|                 |   | <div> ficate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</div>  |             |             |  |  |          |   |      |             |         |  |       |   |

These will vary depending on the PAM provider. | Provider | A string indicating the ID of the PAM provider.<br>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a> ) to retrieve a list of all the PAM providers to determine the ID. |
| Value       | Description  |  |       |             |             |   |            |   |          |  |
| SecretValue | A string containing the password used to security the EJBCA CA client authentication certificate.  |  |       |             |             |   |            |   |          |  |
| Parameters  | An array indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.  |  |       |             |             |   |            |   |          |  |
| Provider    | A string indicating the ID of the PAM provider.<br>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a> ) to retrieve a list of all the PAM providers to determine the ID. |  |       |             |             |   |            |   |          |  |

| Name            | In   | Description  |
|-----------------|------|--|
|                 |      | <pre>}</pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>  |
| AuthCertificate | Body | <p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>  |
| EnforceUniqueDN | Body | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |
| LastScan        | Body | <p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>   |

Table 166: POST Certificate Authority Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.   |
| LogicalName         | A string indicating the logical name of the certificate authority.   |
| HostName            | A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).   |
| Delegate            | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div> |
| DelegateEnrollment  | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div>                       |
| ForestRoot          | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.         </div>   |
| ConfigurationTenant | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>   |

| Name              | Description  |
|-------------------|--|
|                   |  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.   |
| Remote            | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .   |
| Agent             | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).  |
| Standalone        | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .  |
| MonitorThresholds | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div> |
| IssuanceMax       | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| IssuanceMin       | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is   |

| Name                   | Description  |       |             |   |                |   |                |   |                        |
|------------------------|--|-------|-------------|---|----------------|---|----------------|---|------------------------|
|                        | triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |       |             |   |                |   |                |   |                        |
| FailureMax             | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |       |             |   |                |   |                |   |                        |
| RFCEnforcement         | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). </div> |       |             |   |                |   |                |   |                        |
| Properties             | <p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>   |       |             |   |                |   |                |   |                        |
| AllowedEnrollmentTypes | <p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |
| Value                  | Description  |       |             |   |                |   |                |   |                        |
| 1                      | PFX Enrollment   |       |             |   |                |   |                |   |                        |
| 2                      | CSR Enrollment   |       |             |   |                |   |                |   |                        |
| 3                      | PFX and CSR Enrollment   |       |             |   |                |   |                |   |                        |
| KeyRetention           | An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:   |       |             |   |                |   |                |   |                        |

| Name                | Description   |       |             |   |                        |   |            |   |                  |   |               |
|---------------------|---|-------|-------------|---|------------------------|---|------------|---|------------------|---|---------------|
|                     | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite | 2 | After Expiration | 3 | From Issuance |
| Value               | Description   |       |             |   |                        |   |            |   |                  |   |               |
| 0                   | Key Retention Disabled  |       |             |   |                        |   |            |   |                  |   |               |
| 1                   | Indefinite  |       |             |   |                        |   |            |   |                  |   |               |
| 2                   | After Expiration  |       |             |   |                        |   |            |   |                  |   |               |
| 3                   | From Issuance   |       |             |   |                        |   |            |   |                  |   |               |
| KeyRetentionDays    | An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.  |       |             |   |                        |   |            |   |                  |   |               |
| ExplicitCredentials | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>   |       |             |   |                        |   |            |   |                  |   |               |
| SubscriberTerms     | A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .  |       |             |   |                        |   |            |   |                  |   |               |

| Name                 | Description   |
|----------------------|---|
|                      |  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| ExplicitUser         | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul>           These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.         </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div> |
| ExplicitPassword     | A string containing the password for the <i>ExplicitUser</i> .  |
| UseAllowedRequesters | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is           </div>   |

| Name              | Description  |
|-------------------|--|
|                   | <div data-bbox="508 285 1406 369">  similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="508 411 1406 653">  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>). </div>   |
| AllowedRequesters | <p data-bbox="496 695 1406 758">An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="508 789 1406 947"> <pre data-bbox="524 810 781 926">"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> </div> <p data-bbox="496 978 1406 1073">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1083 1406 1419">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p data-bbox="496 1430 1406 1524">In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p data-bbox="496 1535 1406 1566">The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |
| FullScan          | <p data-bbox="496 1598 1406 1661">The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p>   |

| Name     | Description  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |
| Weekly   | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |

| Name | Description   |      |             |      |  |      |  |      |  |      |  |
|------|---|------|-------------|------|--|------|--|------|--|------|--|
|      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre> "Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" } </pre> </td></tr> </table> <div>  <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <div>  <b>Tip:</b> There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor </div> | Name | Description |      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. |-----------------|---|------|-------------|---------|--|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|--|
|                 |  Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |
| IncrementalScan | <p>The schedule for the incremental synchronization of this certificate authority. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. | Value           | Description   |       |             |  |   |          |   |            |  |                |   |
|                 | "IssuedDN":<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"   |       |             |  |   |          |   |            |  |                |   |
| IssuerDN        | A string indicating the distinguished name of the EJBCA CA in X.500 format.   |       |             |  |   |          |   |            |  |                |   |
| Thumbprint      | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.  |       |             |  |   |          |   |            |  |                |   |
| ExpirationDate  | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.   |       |             |  |   |          |   |            |  |                |   |
| EnforceUniqueDN | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |       |             |  |   |          |   |            |  |                |   |
| LastScan        | A string indicating the date, in UTC, on which a synchronization was last performed for the CA.   |       |             |  |   |          |   |            |  |                |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.7.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 167: PUT Certificate Authority Input Parameters

| Name                | In   | Description  |
|---------------------|------|--|
| Id                  | Body | <b>Required.</b> An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.  |
| LogicalName         | Body | <b>Required.</b> A string indicating the logical name of the certificate authority.  |
| HostName            | Body | <b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).  |
| Delegate            | Body | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div> |
| DelegateEnrollment  | Body | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>                       |
| ForestRoot          | Body | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>   |
| ConfigurationTenant | Body | <b>Required.</b> A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).  |

| Name              | In   | Description  |
|-------------------|------|--|
|                   |      | <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div>  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>  |
| Remote            | Body | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .   |
| Agent             | Body | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).  |
| Standalone        | Body | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .  |
| MonitorThresholds | Body | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div> |

| Name                   | In   | Description  |
|------------------------|------|--|
| IssuanceMax            | Body | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| IssuanceMin            | Body | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| FailureMax             | Body | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| RFCEnforcement         | Body | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div>  <p><b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> </div> |
| Properties             | Body | <p><b>Required.</b> Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>  |
| AllowedEnrollmentTypes | Body | An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:  |

| Name                | In                     | Description  |       |             |   |                        |   |                |   |                        |   |               |
|---------------------|------------------------|--|-------|-------------|---|------------------------|---|----------------|---|------------------------|---|---------------|
|                     |                        | <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment         | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |   |               |
| Value               | Description            |  |       |             |   |                        |   |                |   |                        |   |               |
| 1                   | PFX Enrollment         |  |       |             |   |                        |   |                |   |                        |   |               |
| 2                   | CSR Enrollment         |  |       |             |   |                        |   |                |   |                        |   |               |
| 3                   | PFX and CSR Enrollment |  |       |             |   |                        |   |                |   |                        |   |               |
| KeyRetention        | Body                   | <p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Key Retention Disabled</td></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <div> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite     | 2 | After Expiration       | 3 | From Issuance |
| Value               | Description            |  |       |             |   |                        |   |                |   |                        |   |               |
| 0                   | Key Retention Disabled |  |       |             |   |                        |   |                |   |                        |   |               |
| 1                   | Indefinite             |  |       |             |   |                        |   |                |   |                        |   |               |
| 2                   | After Expiration       |  |       |             |   |                        |   |                |   |                        |   |               |
| 3                   | From Issuance          |  |       |             |   |                        |   |                |   |                        |   |               |
| KeyRetentionDays    | Body                   | <p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>  |       |             |   |                        |   |                |   |                        |   |               |
| ExplicitCredentials | Body                   | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>Expli-</i></p>   |       |             |   |                        |   |                |   |                        |   |               |

| Name            | In   | Description  |
|-----------------|------|--|
|                 |      | <p><i>citPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>   |
| SubscriberTerms | Body | <p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>   |
| ExplicitUser    | Body | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul> These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor </div> |

| Name                 | In   | Description   |
|----------------------|------|---|
|                      |      |  Command. This overrides the existing AD security policy used by Keyfactor Command.  |
| ExplicitPassword     | Body | A string containing the password for the <i>ExplicitUser</i> .  |
| UseAllowedRequesters | Body | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.           </div> <div>  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>).           </div> |
| AllowedRequesters    | Body | <p>An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p>  |

| Name     | In   | Description   |             |             |  |  |          |  |      |             |         |  |       |  |
|----------|--|---|-------------|-------------|--|--|----------|--|------|-------------|---------|--|-------|--|
|          |  | <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |             |             |  |  |          |  |      |             |         |  |       |  |

| Name            | In  | Description  |             |             |  |  |          |   |      |             |         |  |       |   |
|-----------------|---|--|-------------|-------------|--|--|----------|---|------|-------------|---------|--|-------|---|
|                 |   | <div> ficate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</div>  |             |             |  |  |          |   |      |             |         |  |       |   |

| Provider    | A string indicating the ID of the PAM provider.<br>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a> ) to retrieve a list of all the PAM providers to determine the ID. |   |       |             |             |   |            |   |          |  |

| Name            | In   | Description  |
|-----------------|------|--|
|                 |      | <div> }</div> <p>Due to its sensitive nature, this value is not returned in responses.</p>   |
| AuthCertificate | Body | <p>An array containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>  |
| EnforceUniqueDN | Body | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |
| LastScan        | Body | <p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>   |

Table 168: PUT Certificate Authority Response Data

| Name                | Description  |
|---------------------|--|
| Id                  | An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.   |
| LogicalName         | A string indicating the logical name of the certificate authority.   |
| HostName            | A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).   |
| Delegate            | <p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div> |
| DelegateEnrollment  | <p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  <b>Important:</b> Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true.         </div>                       |
| ForestRoot          | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  <b>Note:</b> This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.         </div>   |
| ConfigurationTenant | <p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>   |

| Name              | Description  |
|-------------------|--|
|                   |  <b>Important:</b> EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.   |
| Remote            | A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Windows Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .   |
| Agent             | A string indicating the GUID of the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i> ).  |
| Standalone        | A Boolean that sets whether the certificate authority is a standalone CA ( <i>true</i> ) or not ( <i>false</i> ). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .  |
| MonitorThresholds | <p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> <li>• IssuanceMax</li> <li>• IssuanceMin</li> <li>• FailureMax</li> </ul> <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Windows Orchestrator or Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  <b>Note:</b> For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information.         </div> |
| IssuanceMax       | An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |
| IssuanceMin       | An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is   |

| Name                   | Description  |       |             |   |                |   |                |   |                        |
|------------------------|--|-------|-------------|---|----------------|---|----------------|---|------------------------|
|                        | triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.  |       |             |   |                |   |                |   |                        |
| FailureMax             | An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.   |       |             |   |                |   |                |   |                        |
| RFCEnforcement         | <p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  <b>Tip:</b> The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). </div> |       |             |   |                |   |                |   |                        |
| Properties             | <p>Additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre>   |       |             |   |                |   |                |   |                        |
| AllowedEnrollmentTypes | <p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>  | Value | Description | 1 | PFX Enrollment | 2 | CSR Enrollment | 3 | PFX and CSR Enrollment |
| Value                  | Description  |       |             |   |                |   |                |   |                        |
| 1                      | PFX Enrollment   |       |             |   |                |   |                |   |                        |
| 2                      | CSR Enrollment   |       |             |   |                |   |                |   |                        |
| 3                      | PFX and CSR Enrollment   |       |             |   |                |   |                |   |                        |
| KeyRetention           | An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:   |       |             |   |                |   |                |   |                        |

| Name                | Description   |       |             |   |                        |   |            |   |                  |   |               |
|---------------------|---|-------|-------------|---|------------------------|---|------------|---|------------------|---|---------------|
|                     | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>.<br/>This value is unset by default.</p> <p> <b>Tip:</b> The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> | Value | Description | 0 | Key Retention Disabled | 1 | Indefinite | 2 | After Expiration | 3 | From Issuance |
| Value               | Description   |       |             |   |                        |   |            |   |                  |   |               |
| 0                   | Key Retention Disabled  |       |             |   |                        |   |            |   |                  |   |               |
| 1                   | Indefinite  |       |             |   |                        |   |            |   |                  |   |               |
| 2                   | After Expiration  |       |             |   |                        |   |            |   |                  |   |               |
| 3                   | From Issuance   |       |             |   |                        |   |            |   |                  |   |               |
| KeyRetentionDays    | An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.  |       |             |   |                        |   |            |   |                  |   |               |
| ExplicitCredentials | <p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> <b>Tip:</b> This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>   |       |             |   |                        |   |            |   |                  |   |               |
| SubscriberTerms     | A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .  |       |             |   |                        |   |            |   |                  |   |               |

| Name                 | Description   |
|----------------------|---|
|                      |  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| ExplicitUser         | <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <b>Tip:</b> This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:           <ul style="list-style-type: none"> <li>• Certificate enrollment</li> <li>• Certificate revocation</li> <li>• Certificate key recovery</li> <li>• Certificate request approval and denial</li> </ul>           These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Identities</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.         </div> <div>  <b>Note:</b> When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.         </div> |
| ExplicitPassword     | A string containing the password for the <i>ExplicitUser</i> .  |
| UseAllowedRequesters | <p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  <b>Tip:</b> This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is           </div>   |

| Name              | Description  |
|-------------------|--|
|                   | <div data-bbox="508 285 1406 369">  similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="508 411 1406 653">  <b>Tip:</b> For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see <a href="#">PUT Templates on page 1378</a>). </div>   |
| AllowedRequesters | <p data-bbox="496 695 1406 758">An array of Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="508 789 1406 947"> <pre data-bbox="524 810 781 926">"AllowedRequesters": [   "Power Users",   "Read Only" ]</pre> </div> <p data-bbox="496 978 1406 1073">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1083 1406 1419">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p data-bbox="496 1430 1406 1524">In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see <a href="#">PUT Templates on page 1378</a>).</p> <p data-bbox="496 1535 1406 1566">The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p> |
| FullScan          | <p data-bbox="496 1602 1406 1665">The schedule for the full synchronization of this certificate authority. The following schedule types are supported:</p>   |

| Name     | Description  |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |        |   |

You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor</p> | Name | Description |      | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. |-----------------|---|------|-------------|---------|--|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|--|
|                 |  Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.   |      |             |         |  |          |   |      |             |         |  |       |  |      |             |      |  |

| Value           | Description  |       |             |  |  |          |   |            |  |                |   |
|                 | "IssuedDN" :<br>"CN=SuperAdmin,OU=IT,O=\"\Key Example, Inc.\",L=Independence,ST=OH,C=US"   |       |             |  |  |          |   |            |  |                |   |
| IssuerDN        | A string indicating the distinguished name of the EJBCA CA in X.500 format.  |       |             |  |  |          |   |            |  |                |   |
| Thumbprint      | A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.   |       |             |  |  |          |   |            |  |                |   |
| ExpirationDate  | A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.  |       |             |  |  |          |   |            |  |                |   |
| EnforceUniqueDN | <p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p> |       |             |  |  |          |   |            |  |                |   |
| LastScan        | A string indicating the date, in UTC, on which a synchronization was last performed for the CA.  |       |             |  |  |          |   |            |  |                |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.7.6 POST Certificate Authority Test

The POST /CertificateAuthority/Test method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PkiManagement: *Read*

Table 169: POST Certificate Authority Test Input Parameters

| Name                    | In   | Description  |
|-------------------------|------|--|
| LogicalName             | Body | <b>Required.</b> A string indicating the logical name of the certificate authority.  |
| HostName                | Body | <b>Required.</b> A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).   |
| ConfigurationTenant     | Body | <b>Required*</b> . A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).<br>This parameter is required for Microsoft CAs.   |
| AuthCertificatePassword | Body | <b>Required*</b> . An array indicating the password for the PKCS#12 client certificate to use to authenticate to the EJBCA CA.<br>The password is provided in the following format: <div> <pre>{   "SecretValue": "MySuperSecretPassword" }</pre> </div> This parameter is required for EJBCA CAs.   |
| AuthCertificate         | Body | <b>Required*</b> . An array containing the base-64 encoded PKCS#12 client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format: <div> <pre>{   "SecretValue": "MIACAQMwgAY ... CAwGQAAAA" }</pre> </div> This parameter is required for EJBCA CAs. |
| CAType                  | Body | An integer indicating the type of CA: <ul style="list-style-type: none"> <li>0—DCOM<br/>Use this option for Microsoft CAs and CA gateways.</li> <li>1—HTTPS<br/>Use this option for EJBCA CAs.</li> </ul> The default is 0.  |

Table 170: POST Certificate Authority Test Response Data

| Name    | Description  |
|---------|--|
| Success | A Boolean that indicates whether the CA could successfully be reached (True) or not (False). |
| Message | A string indicating a message about the validation test of the certificate authority.        |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.7.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Revoke*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 171: POST Certificate Authority PublishCRL Input Parameters

| Name                            | In   | Description  |
|---------------------------------|------|--|
| CertificateAuthorityHostName    | Body | The host name of the machine hosting the CA. This field is optional, but is recommended. |
| CertificateAuthorityLogicalName | Body | <b>Required.</b> The logical name of the CA.   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.8 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, list and set permissions on certificate collections.

Table 172: Certificate Collections Endpoints

| Endpoint  | Method | Description   | Link  |
|---|--------|---|---|
| / {id}  | GET    | Returns the certificate collection with the specified ID.   | <a href="#">GET Certificate Collections ID below</a>                    |
| / {name}  | GET    | Returns the certificate collection with the specified name.   | <a href="#">GET Certificate Collections Name on page 403</a>            |
| /   | GET    | Returns all certificate collections with details about the collection configuration.                        | <a href="#">GET Certificate Collections on page 405</a>                 |
| /   | POST   | Creates a new certificate collection.   | <a href="#">POST Certificate Collections on page 407</a>                |
| /   | PUT    | Updates an existing certificate collection.   | <a href="#">PUT Certificate Collections on page 413</a>                 |
| /Copy   | POST   | Creates a new certificate collection based on an existing collection.                                       | <a href="#">POST Certificate Collections Copy on page 417</a>           |
| / {id} /Permissions   | POST   | Grants the specified collection permissions for the specified role to the specified certificate collection. | <a href="#">POST Certificate Collections ID Permissions on page 423</a> |
|  <b>Note:</b> This endpoint will be removed in version 11. |        |   |   |

### 2.5.8.1 GET Certificate Collections ID

The GET /CertificateCollections/{id} method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: Read

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 173: GET CertificateCollections {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the ID of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificates on page 275</a> ) to retrieve a list of all the certificate collections to determine the certificate collection ID. |

Table 174: GET CertificateCollections {id} Response Data

| Name             | Description   |       |             |   |      |   |             |   |                    |   |                |
|------------------|---|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| ID               | The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.   |       |             |   |      |   |             |   |                    |   |                |
| Name             | The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |   |             |   |                    |   |                |
| Automated        | An internally used Keyfactor Command field.   |       |             |   |      |   |             |   |                    |   |                |
| Content          | A string containing the search criteria for the collection.   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | <p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description   |       |             |   |      |   |             |   |                    |   |                |
| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.8.2 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 175: GET CertificateCollections Name Input Parameters

| Name | In   | Description   |
|------|------|---|
| name | Path | <b>Required.</b> A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificates on page 275</a> ) to retrieve a list of all the certificate collections to determine the certificate collection name. <div> <b>Tip:</b> When using the Keyfactor API Endpoint Utility, provide this name without quotation marks.</div> |

Table 176: GET CertificateCollections ID Response Data

| Name             | Description   |       |             |   |      |   |             |   |                    |   |                |
|------------------|---|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| ID               | The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.   |       |             |   |      |   |             |   |                    |   |                |
| Name             | The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |   |             |   |                    |   |                |
| Automated        | An internally used Keyfactor Command field.   |       |             |   |      |   |             |   |                    |   |                |
| Content          | A string containing the search criteria for the collection.   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | <div>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table></div> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description   |       |             |   |      |   |             |   |                    |   |                |
| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.8.3 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 177: GET Certificate Collections Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>Name</i></li><li>• <i>Query</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 178: GET CertificateCollections Response Data

| Name             | Description   |       |             |   |      |   |             |   |                    |   |                |
|------------------|---|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| ID               | The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.   |       |             |   |      |   |             |   |                    |   |                |
| Name             | The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |   |             |   |                    |   |                |
| Automated        | An internally used Keyfactor Command field.   |       |             |   |      |   |             |   |                    |   |                |
| Content          | A string containing the search criteria for the collection.   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | <p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description   |       |             |   |      |   |             |   |                    |   |                |
| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.8.4 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*  
Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 179: POST Certificate Collections Input Parameters

| Name             | In                 | Description  |       |             |   |      |   |             |   |                    |   |                |
|------------------|--------------------|--|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| Name             | Body               | <b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | Body               | <b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .  |       |             |   |      |   |             |   |                    |   |                |
| Query            | Body               | <b>Required.</b> A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p> <p>See also <i>CopyFromId</i>.</p>   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | Body               | <p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. The default is 0. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description        |  |       |             |   |      |   |             |   |                    |   |                |
| 0                | None               |  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name        |  |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name |  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name     |  |       |             |   |      |   |             |   |                    |   |                |

| Name            | In   | Description   |
|-----------------|------|---|
| ShowOnDashboard | Body | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |
| Favorite        | Body | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |
| CopyFromId      | Body | <p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 405</a>) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div> <p><b>Q Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre> {   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true } </pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p> </div> |

| Name | In | Description   |
|------|----|---|
|      |    | <p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The</p> |

| Name | In | Description   |
|------|----|---|
|      |    | <p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{   "Id": 16,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p> |

Table 180: POST Certificate Collections Response Data

| Name             | Description   |       |             |   |      |   |             |   |                    |   |                |
|------------------|---|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| ID               | The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.   |       |             |   |      |   |             |   |                    |   |                |
| Name             | The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |   |             |   |                    |   |                |
| Content          | A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.   |       |             |   |      |   |             |   |                    |   |                |
| Query            | A string containing the search criteria for the collection.   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | <p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description   |       |             |   |      |   |             |   |                    |   |                |
| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.8.5 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

**Note:** Certificate collections that are configured for *Certificate Entered Collection* or *Certificate Left Collection* workflows (see Workflow Definition Operations in the *Keyfactor Command Reference Guide*) cannot be edited to prevent triggering a large number of entered/left workflows.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*  
Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 181: PUT CertificateCollections Input Parameters

| Name             | In          | Description  |       |             |   |      |
|------------------|-------------|--|-------|-------------|---|------|
| ID               | Body        | <b>Required.</b> The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 405</a> ) to locate the ID of the collection you wish to update.   |       |             |   |      |
| Name             | Body        | <b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short. |       |             |   |      |
| Description      | Body        | <b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |
| Query            | Body        | <b>Required.</b> A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p>  |       |             |   |      |
| DuplicationField | Body        | An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr></table>                            | Value | Description | 0 | None |
| Value            | Description |  |       |             |   |      |
| 0                | None        |  |       |             |   |      |

| Name            | In                 | Description   |       |             |   |             |   |                    |   |                |  |
|-----------------|--------------------|---|-------|-------------|---|-------------|---|--------------------|---|----------------|--|
|                 |                    | <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table>   | Value | Description | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |  |
| Value           | Description        |   |       |             |   |             |   |                    |   |                |  |
| 1               | Common Name        |   |       |             |   |             |   |                    |   |                |  |
| 2               | Distinguished Name |   |       |             |   |             |   |                    |   |                |  |
| 3               | Principal Name     |   |       |             |   |             |   |                    |   |                |  |
| ShowOnDashboard | Body               | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> . |       |             |   |             |   |                    |   |                |  |
| Favorite        | Body               | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .                                     |       |             |   |             |   |                    |   |                |  |

Table 182: PUT CertificateCollections Response Data

| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.8.6 POST Certificate Collections Copy

The POST /CertificateCollections/Copy method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*  
Certificate Collections: *Modify*

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 183: POST Certificate Collections Copy Input Parameters

| Name             | In                 | Description  |       |             |   |      |   |             |   |                    |   |                |
|------------------|--------------------|--|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| Name             | Body               | <b>Required.</b> The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | Body               | <b>Required.</b> The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .  |       |             |   |      |   |             |   |                    |   |                |
| Query            | Body               | <b>Required.</b> A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p> <p>See also <i>CopyFromId</i>.</p>   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | Body               | An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr></table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description        |  |       |             |   |      |   |             |   |                    |   |                |
| 0                | None               |  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name        |  |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name |  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name     |  |       |             |   |      |   |             |   |                    |   |                |

| Name            | In   | Description   |
|-----------------|------|---|
| ShowOnDashboard | Body | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |
| Favorite        | Body | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ). The default is <i>false</i> .   |
| CopyFromId      | Body | <p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see <a href="#">GET Certificate Collections on page 405</a>) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div> <p><b>Q Example:</b> Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre>{   "Id": 10,   "Name": "Keyexample Collection",   "Description": "Certificates in the Keyexample Domain",   "Automated": false,   "Content": "CN -contains \"keyexample.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p> </div> |

| Name | In | Description   |
|------|----|---|
|      |    | <p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{   "CopyFromId": 10,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Query": "CN -contains \"keyother.com\"",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{   "Id": 15,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The</p> |

| Name | In | Description   |
|------|----|---|
|      |    | <p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{   "Id": 16,   "Name": "Keyother Collection",   "Description": "Certificates in the Keyother Domain",   "Automated": false,   "Content": "(CN -contains \"keyother.com\")",   "Query": "(CN -contains \"keyother.com\")",   "DuplicationField": 2,   "ShowOnDashboard": false,   "Favorite": true }</pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p> |

Table 184: POST Certificate Collections Copy Response Data

| Name             | Description   |       |             |   |      |   |             |   |                    |   |                |
|------------------|---|-------|-------------|---|------|---|-------------|---|--------------------|---|----------------|
| ID               | The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.   |       |             |   |      |   |             |   |                    |   |                |
| Name             | The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.   |       |             |   |      |   |             |   |                    |   |                |
| Description      | The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.   |       |             |   |      |   |             |   |                    |   |                |
| Content          | A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.   |       |             |   |      |   |             |   |                    |   |                |
| Query            | A string containing the search criteria for the collection.   |       |             |   |      |   |             |   |                    |   |                |
| DuplicationField | <p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> </table> | Value | Description | 0 | None | 1 | Common Name | 2 | Distinguished Name | 3 | Principal Name |
| Value            | Description   |       |             |   |      |   |             |   |                    |   |                |
| 0                | None  |       |             |   |      |   |             |   |                    |   |                |
| 1                | Common Name   |       |             |   |      |   |             |   |                    |   |                |
| 2                | Distinguished Name  |       |             |   |      |   |             |   |                    |   |                |
| 3                | Principal Name  |       |             |   |      |   |             |   |                    |   |                |
| ShowOnDashboard  | A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph ( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |
| Favorite         | A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—( <i>true</i> ) or not ( <i>false</i> ).   |       |             |   |      |   |             |   |                    |   |                |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.8.7 POST Certificate Collections ID Permissions

The POST /CertificateCollections/{id}/Permissions method is used to set permissions on a certificate collection. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Security Settings: *Modify*

**Important:** When using this method to update an existing certificate collection, all existing RoleId and Permission information must be submitted along with any updates. Any existing permissions that are not included with their full existing data (RoleId and Permission mappings) on an update using this method will be removed from the permissions for the certificate collection. There is not presently a GET method to retrieve the current state of the permissions for certificate collections.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in release 11. It has been replaced by the endpoint: PUT /Security/Roles/{id}/Permissions/Collection.

Table 185: POST CertificateCollections {id} Permissions Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| id          | Path | <p><b>Required.</b> An integer indicating the ID of the certificate collection to update.</p> <p>Use the <a href="#">GET /CertificateCollections</a> method (see <a href="#">GET Certificate Collections on page 405</a>) to retrieve a list of all the certificate collections to determine the certificate collection ID.</p>  |
| RoleId      | Body | <p>An integer identifying the Keyfactor Command security role that you wish to grant collection security permissions to.</p> <p>Use the <a href="#">GET /Security/Roles</a> method (see <a href="#">GET Security Roles on page 1039</a>) to retrieve a list of your defined security roles to determine the security role ID to use.</p>   |
| Permissions | Body | <p>An array of the collection permissions that can be granted to the role. Possible values are:</p> <ul style="list-style-type: none"> <li>• Read</li> <li>• EditMetadata</li> <li>• Recover</li> <li>• Revoke</li> <li>• Delete</li> </ul> <p>For example:</p> <pre>"Permissions": [   "Read",   "Recover",   "Revoke" ]</pre> <p>Permissions for certificates can be set at either the global or certificate collection level. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information about global vs collection permissions.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.9 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the *Keyfactor Command Reference Guide* and *Keyfactor Command Orchestrator Installation and Configuration Guide*, or contact your Keyfactor representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 186: Certificate Stores Endpoints](#).

Table 186: Certificate Stores Endpoints

| Endpoint              | Method | Description  |   |
|-----------------------|--------|--|---|
| /                     | DELETE | Deletes multiple certificate stores specified in the request body.             | <a href="#">DELETE Certificate Stores on the next page</a>      |
| /                     | GET    | Returns all certificate stores with paging and option to specify detail level. | <a href="#">GET Certificate Stores on page 427</a>              |
| /                     | POST   | Creates a new certificate store if valid parameters are supplied.              | <a href="#">POST Certificate Stores on page 436</a>             |
| /                     | PUT    | Updates an existing certificate store.   | <a href="#">PUT Certificate Stores on page 458</a>              |
| / {id}                | DELETE | Deletes a certificate store by its GUID.                                       | <a href="#">DELETE Certificate Stores ID on page 482</a>        |
| / {id}                | GET    | Returns certificate store details for the specified certificate store.         | <a href="#">GET Certificate Stores ID on page 483</a>           |
| / {id}/Inventory      | GET    | Returns certificate inventory for the specified certificate store.             | <a href="#">GET Certificate Stores ID Inventory on page 498</a> |
| /Server (*deprecated) | GET    | Returns a list of certificate store servers.                                   | <a href="#">GET Certificate Stores Server on page 501</a>       |
| /Server (*deprecated) | POST   | Creates a new certificate store server.  | <a href="#">POST Certificate Stores Server on page 504</a>      |
| /Server (*deprecated) | PUT    | Updates an existing certificate store server.                                  | <a href="#">PUT Certificate Stores Server on</a>                |

| Endpoint             | Method | Description   |   |
|----------------------|--------|---|---|
|                      |        |   | <a href="#">page 509</a>  |
| /Password            | PUT    | Updates the password for a certificate store.   | <a href="#">PUT Certificate Stores Password on page 514</a>             |
| /DiscoveryJob        | PUT    | Creates a job to find certificate stores.   | <a href="#">PUT Certificate Stores Discovery Job on page 517</a>        |
| /AssignContainer     | PUT    | Assigns a certificate store to a container.   | <a href="#">PUT Certificate Stores Assign Container on page 523</a>     |
| /Approve             | POST   | Approves an array of pending certificate stores.  | <a href="#">POST Certificate Stores Approve on page 531</a>             |
| /Schedule            | POST   | Creates an inventory schedule for a certificate store.  | <a href="#">POST Certificate Stores Schedule on page 543</a>            |
| /Reenrollment        | POST   | Schedules a reenrollment of a certificate into a certificate store.                                     | <a href="#">POST Certificate Stores Reenrollment on page 546</a>        |
| /Certificates/Add    | POST   | Configures a management job to add a certificate to one or more stores with the provided schedule.      | <a href="#">POST Certificate Stores Certificates Add on page 548</a>    |
| /Certificates/Remove | POST   | Configures a management job to remove a certificate from one or more stores with the provided schedule. | <a href="#">POST Certificate Stores Certificates Remove on page 554</a> |

### 2.5.9.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 187: DELETE Certificate Stores Input Parameters

| Name | In   | Description  |
|------|------|--|
| IDs  | Body | <p><b>Required.</b> An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <pre>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</pre> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores below</a>) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 188: GET Certificate Stores Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| queryString  | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AddSupported</i> (True, False)</li> <li>• <i>AgentAvailable</i> (True, False)</li> <li>• <i>AgentId</i></li> <li>• <i>Approved</i> (True, False)</li> <li>• <i>Category</i> (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</li> <li>• <i>CertificateId</i></li> <li>• <i>ClientMachine</i></li> <li>• <i>Container</i> (ContainerName)</li> <li>• <i>ContainerId</i></li> <li>• <i>HasInventoryScheduled</i> (True, False)</li> <li>• <i>PrivateKeyAllowed</i> (0-Forbidden, 1-Optional, 2-Required)</li> <li>• <i>RemoveSupported</i> (True, False)</li> <li>• <i>StorePath</i></li> </ul> <div>  <p><b>Tip:</b> Use the following query to limit the results to only active certificate stores and not include discovery results:</p> <p>approved -eq true</p> </div> |
| pageReturned | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit  | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField    | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .  |

| Name          | In    | Description  |
|---------------|-------|--|
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. |

Table 189: GET Certificate Stores Response Data

| Name                    | Description   |
|-------------------------|---|
| Id                      | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.  |
| ContainerId             | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| ClientMachine           | The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.  |
| CertStoreType           | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing         | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties              | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for   |

| Name | Description   |
|------|---|
|      | <p>more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 783 1052 888"> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 1134 1190 1239"> {   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="516 1415 1287 1551"> {   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> |

| SetNewPasswordAllowed | A Boolean that indicates whether the store password can be changed (true) or not (false).  |      |             |  |  |                    |  |
| Password              | <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>   |      |             |  |  |                    |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 190: POST Certificate Stores Input Parameters

| Name                    | In   | Description  |
|-------------------------|------|--|
| ContainerId             | Body | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).   |
| ClientMachine           | Body | <b>Required.</b> The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | Body | <b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | Body | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.   |
| CertStoreType           | Body | <b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | Body | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .  |
| CreateIfMissing         | Body | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .  |
| Properties              | Body | <b>Required.</b> Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for more information).  |

| Name | In | Description   |
|------|----|---|
|      |    | <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre>{   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> |

| Name | In | Description   |
|------|----|---|
|      |    | <pre>"{   \"ServerUsername\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":{\"User_Name\"}}},   \"ServerPassword\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":{\"Password\"}}},   \"ServerUseSsl\":{\"value\":\"true\"} }"</pre> <p> <b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <p> <b>Tip:</b> Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for SMB communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if</li> </ul> |

| Name              | In  | Description  |             |             |  |  |           |  |          |   |      |             |         |  |
|-------------------|---|--|-------------|-------------|--|--|-----------|--|----------|---|------|-------------|---------|--|
|                   |   | <div> defined, and the Boolean value indicating whether a separate private key path is defined.</div>   |             |             |  |  |           |  |          |   |      |             |         |  |
| AgentId           | Body  | <b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.  |             |             |  |  |           |  |          |   |      |             |         |  |
| AgentAssigned     | Body  | A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .   |             |             |  |  |           |  |          |   |      |             |         |  |
| ContainerName     | Body  | A string indicating the name of the certificate store's associated container, if applicable.   |             |             |  |  |           |  |          |   |      |             |         |  |
| InventorySchedule | Body  | <div>The inventory schedule for this certificate store. The following schedule types are supported:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. | Message             | A string indicating the reason the certificate store cannot re-enroll, if applicable.  |  |      |             |      |  |         |  |         |   |               |  |
| JobProperties       | <p>An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <div>"JobProperties": [ "NetscalerVserver" ]</div> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>. The setting is referenced using the following format:</p> <div>"JobProperties": [ { "NetscalerVserver": "MyVirtualServerNa</div> |  |      |             |      |  |         |  |         |   |               |  |

For parameters with an InstanceLevel of <i>true</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider. | Data-Type  | An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"><li>1 = String</li></ul> |              |  |   |  |  |              |  |           |  |
| Name         | Description  |  |             |             |  |  |  |              |  |  |  |              |  |   |  |  |              |  |           |  |
| Id           | An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.  |  |             |             |  |  |  |              |  |  |  |              |  |   |  |  |              |  |           |  |
| Name         | A string indicating the internal name for the PAM provider type parameter.   |  |             |             |  |  |  |              |  |  |  |              |  |   |  |  |              |  |           |  |
| Display-Name | A string indicating the display name for the PAM provider type parameter. For parameters with an InstanceLevel of <i>false</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an InstanceLevel of <i>true</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.   |  |             |             |  |  |  |              |  |  |  |              |  |   |  |  |              |  |           |  |
| Data-Type    | An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"><li>1 = String</li></ul>   |  |             |             |  |  |  |              |  |  |  |              |  |   |  |  |              |  |           |  |

| IsManaged           |   | A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.   |             |             |   |   |   |                     |                           |   |   |                     |              |                           |      |   |                     |              |            |  |  |           |  |   |

Table 191: POST Certificate Stores Response Data

| Name                    | Description   |
|-------------------------|---|
| Id                      | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.  |
| ContainerId             | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| ClientMachine           | The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.  |
| CertStoreType           | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing         | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties              | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for   |

| Name | Description   |
|------|---|
|      | <p>more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 779 1052 888"> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 1129 1192 1239"> {   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="516 1413 1286 1549"> {   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.9.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 192: PUT Certificate Stores Input Parameters

| Name                    | In   | Description  |
|-------------------------|------|--|
| Id                      | Body | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.   |
| ContainerId             | Body | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).   |
| ClientMachine           | Body | <b>Required.</b> The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | Body | <b>Required.</b> A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | Body | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.   |
| CertStoreType           | Body | <b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | Body | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .  |
| CreateIfMissing         | Body | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .  |
| Properties              | Body | <b>Required.</b> Some types of certificate stores have additional properties that are  |

| Name | In | Description   |
|------|----|---|
|      | dy | <p>stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre>"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on</a></p> |

| Name | In | Description  |
|------|----|--|
|      |    | <p><a href="#">page 833</a>):</p> <pre> {   \"ServerUsername\":{\"value\":{\"Provider\":\"1\", \"Parameters\":   {\"SecretId\":\"User_Name\"}}},   \"ServerPassword\":{\"value\":{\"Provider\":\"1\", \"Parameters\":   {\"SecretId\":\"Password\"}}},   \"ServerUseSsl\":{\"value\":\"true\"} }</pre> <div>  <p><b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <div>  <p><b>Tip:</b> Built-in stores that make use of this field include:</p> <ul style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for SMB communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword,</li> </ul> </div> |

| Name              | In   | Description   |             |             |  |  |           |   |          |  |      |             |         |  |
|-------------------|--|---|-------------|-------------|--|--|-----------|---|----------|--|------|-------------|---------|--|
|                   |  | <div> ServerUseSsl).<ul style="list-style-type: none"><li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li></ul></div>  |             |             |  |  |           |   |          |  |      |             |         |  |
| AgentId           | Body   | <b>Required.</b> A string indicating the Keyfactor Command GUID of the orchestrator for this store.   |             |             |  |  |           |   |          |  |      |             |         |  |
| AgentAssigned     | Body   | A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .  |             |             |  |  |           |   |          |  |      |             |         |  |
| ContainerName     | Body   | A string indicating the name of the certificate store’s associated container, if applicable.  |             |             |  |  |           |   |          |  |      |             |         |  |
| InventorySchedule | Body   | <p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Table 193: PUT Certificate Stores Response Data

| Name                    | Description   |
|-------------------------|---|
| Id                      | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.  |
| ContainerId             | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| ClientMachine           | The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.  |
| CertStoreType           | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing         | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties              | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for   |

| Name | Description   |
|------|---|
|      | <p>more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 783 1052 888"> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 1134 1190 1239"> {   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="516 1417 1287 1549"> {   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> |

|                       | <p> <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p> <p>This field is optional.</p>   |      |             |  |  |                    |  |
| CustomAliasAllowed    | <p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> <li>• 0—forbidden</li> <li>• 1—optional</li> <li>• 2—required</li> </ul>   |      |             |  |  |                    |  |
| SetNewPasswordAllowed | A Boolean that indicates whether the store password can be changed (true) or not (false).  |      |             |  |  |                    |  |
| Password              | <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>   |      |             |  |  |                    |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.5 DELETE Certificate Stores ID

The DELETE /CertificateStores/{id} method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 194: DELETE Certificate Stores Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> A string indicating the GUID of the certificate store to delete. Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a> ) to retrieve a list of all the certificate stores to determine the certificate store GUID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.6 GET Certificate Stores ID

The *GET /CertificateStores/{id}* method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 195: GET Certificate Stores {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command. |

Table 196: GET Certificate Stores {id} Response Data

| Name                    | Description   |
|-------------------------|---|
| Id                      | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.  |
| ContainerId             | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| ClientMachine           | The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the host-name of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| Storepath               | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.  |
| CertStoreType           | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing         | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties              | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for more information).  |

| Name | Description   |
|------|---|
|      | <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 709 1003 819">"{   \"privateKeyPath\": \" /opt/app/mystore.key\",   \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 1024 1141 1134">"{   \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"},   \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="467 1308 1235 1444">"{   \"ServerUsername\": {\"value\": {\"SecretValue\": \"User_Name\"}},   \"ServerPassword\": {\"value\": {\"SecretValue\": \"Password\"}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> <pre data-bbox="467 1654 1260 1732">"{   \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"User_Name\"}}},   \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"Password\"}}},   \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> |

| Name    | Description  |
|---------|--|
|         | <pre data-bbox="467 300 1260 411"> {"ServerPassword\":{"value\":{"Provider\":"1","Parameters\": {"SecretId\":"Password\}}}}, {"ServerUseSsl\":{"value\":"true\"} } </pre> <div data-bbox="456 478 493 527"></div> <p data-bbox="516 478 1385 541"><b>Note:</b> There are three standard properties that are used for any built-in certificate store types that require server credentials (e.g. F5):</p> <ul data-bbox="527 548 743 653" style="list-style-type: none"> <li>• ServerUsername</li> <li>• ServerPassword</li> <li>• ServerUseSsl</li> </ul> <p data-bbox="516 674 1398 835">These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> <div data-bbox="456 898 493 947"></div> <p data-bbox="516 898 1110 926"><b>Tip:</b> Built-in stores that make use of this field include:</p> <ul data-bbox="527 932 1385 1675" style="list-style-type: none"> <li>• AWS stores use this field to store secured versions of the access key and secret.</li> <li>• F5 REST stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl) and primary node information (PrimaryNode, PrimaryNodeCheckRetryWaitSecs, PrimaryNodeCheckRetryMax) and F5 version (F5Version).</li> <li>• F5 SOAP stores (all types) use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• FTP stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• IIS stores (all types) use this field to store the UseSSL flag and the port for SMB communications.</li> <li>• Java keystores use this field to store type (ProviderType).</li> <li>• NetScaler stores use this field to store secured versions of the server authentication information (ServerUsername, ServerPassword, ServerUseSsl).</li> <li>• PEM stores use this field to store the path to the private key file, if defined, and the Boolean value indicating whether a separate private key path is defined.</li> </ul> |
| AgentId | A string indicating the Keyfactor Command GUID of the orchestrator for this store.   |

| Name              | Description  |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
|-------------------|--|------|-------------|---------|--|-----------|--|----------|--|------|-------------|---------|--|-------|---|
| AgentAssigned     | A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).  |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| ContainerName     | A string indicating the name of the certificate store's associated container, if applicable.   |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| InventorySchedule | <p>The inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td>           A Boolean that indicates a job scheduled to run immediately (true) or not (false).           <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div> </td></tr> <tr> <td>Interval</td><td>           A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.           <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table> | Name | Description | Off     | Turn off a previously configured schedule.                         | Immediate | A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div> | Interval | A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> | Name | Description | Minutes | An integer indicating the number of minutes between each interval. | Daily | A dictionary that indicates a job scheduled to run every day at the same time with the parameter: |
| Name              | Description  |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| Off               | Turn off a previously configured schedule.   |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| Immediate         | A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div>  <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.           </div>   |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| Interval          | A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>   | Name | Description | Minutes | An integer indicating the number of minutes between each interval. |           |  |          |  |      |             |         |  |       |   |
| Name              | Description  |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| Minutes           | An integer indicating the number of minutes between each interval.   |      |             |         |  |           |  |          |  |      |             |         |  |       |   |
| Daily             | A dictionary that indicates a job scheduled to run every day at the same time with the parameter:  |      |             |         |  |           |  |          |  |      |             |         |  |       |   |

| Name                | Description   |      |             |      |   |      |             |      |  |             |   |      |             |      |  |
|---------------------|---|------|-------------|------|---|------|-------------|------|--|-------------|---|------|-------------|------|--|

### 2.5.9.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 197: GET Certificate Stores {id} Inventory Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| id            | Path  | <b>Required.</b> A string indicating the GUID of the certificate store within Keyfactor Command.   |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> . |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 198: GET Certificate Stores {id} Inventory Response Data

| Name                     | Description   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
|--------------------------|---|------|-------------|----|--|----------|--|--------------|---|-----------|---|----------|---|------------------|---|----------|---|------------|--|--------------------------|--|
| Name                     | A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| Certificates             | <p>An array of certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>The date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>The date, in UTC, on which the certificate expires.</td></tr> <tr> <td>SigningAlgorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the issuer.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>CertStoreInventoryItemId</td><td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td></tr> </table> | Name | Description | Id | An integer indicating the Keyfactor Command reference ID of the certificate. | IssuedDN | A string indicating the distinguished name of the certificate. | SerialNumber | A string indicating the serial number of the certificate. | NotBefore | The date, in UTC, on which the certificate was issued by the certificate authority. | NotAfter | The date, in UTC, on which the certificate expires. | SigningAlgorithm | A string indicating the algorithm used to sign the certificate. | IssuerDN | A string indicating the distinguished name of the issuer. | Thumbprint | A string indicating the thumbprint of the certificate. | CertStoreInventoryItemId | An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store. |
| Name                     | Description   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| Id                       | An integer indicating the Keyfactor Command reference ID of the certificate.  |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| IssuedDN                 | A string indicating the distinguished name of the certificate.  |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| SerialNumber             | A string indicating the serial number of the certificate.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| NotBefore                | The date, in UTC, on which the certificate was issued by the certificate authority.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| NotAfter                 | The date, in UTC, on which the certificate expires.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| SigningAlgorithm         | A string indicating the algorithm used to sign the certificate.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| IssuerDN                 | A string indicating the distinguished name of the issuer.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| Thumbprint               | A string indicating the thumbprint of the certificate.  |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| CertStoreInventoryItemId | An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.  |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| CertStoreInventoryItemId | An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.   |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |
| Parameters               | An array of entry parameters associated with the certificate in the certi-  |      |             |    |  |          |  |              |   |           |   |          |   |                  |   |          |   |            |  |                          |  |

| Name | Description  |
|------|--|
|      | ificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See <a href="#">POST Certificate Store Types on page 595</a> for more information about entry parameters. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.8 GET Certificate Stores Server

The GET /CertificateStores/Server method is used to retrieve all servers for certificate stores. Only select types of certificate stores have an associated server. These include F5, FTP, NetScaler, and any custom method you've defined to support this. This method returns HTTP 200 OK on a success with details for each server.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in release 12. Certificate store server information is now found in the certificate store (see [GET Certificate Stores on page 427](#)).

Table 199: GET Certificate Stores Server Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Certificate Store Search Feature</i> section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Id</i></li> <li>• <i>Name</i></li> <li>• <i>ServerType</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 200: GET Certificate Stores Server Response Data

| Name       | Description   |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
|------------|---|-------|-------------|---|---------------------------------|---|-----------|---|-----|---|--------------------|---|----------------------|---|--------------------|
| Id         | The ID of the server.   |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| Username   | <p>The username used to connect to the certificate store.</p> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| Password   | <p>The password used to connect to the certificate store.</p> <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| UseSSL     | A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).   |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| ServerType | <p>An integer indicating the type of server. Possible values include (plus any custom values):</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>F5 Web Server &amp; F5 SSL Profiles</td></tr> <tr> <td>1</td><td>NetScaler</td></tr> <tr> <td>2</td><td>FTP</td></tr> <tr> <td>3</td><td>F5 Web Server REST</td></tr> <tr> <td>4</td><td>F5 SSL Profiles REST</td></tr> <tr> <td>5</td><td>F5 CA Bundles REST</td></tr> </table> | Value | Description | 0 | F5 Web Server & F5 SSL Profiles | 1 | NetScaler | 2 | FTP | 3 | F5 Web Server REST | 4 | F5 SSL Profiles REST | 5 | F5 CA Bundles REST |
| Value      | Description   |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |

| Name       | The host name of the server.  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.9 POST Certificate Stores Server

The POST /CertificateStores/Server method is used to create a new server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the newly created server record.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Creating new certificate store server records requires permissions at the global level. See [Container Permissions](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. Certificate store server information is now found in the certificate store (see [POST Certificate Stores on page 436](#)). The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new API endpoint.

**Tip:** If a certificate store that requires a server is missing a server definition within the store record, the certificate store server created with this method will be used. If no credentials are supplied in the request and no certificate store server exists, an error is returned and the request fails.

Table 201: POST Certificate Stores Server Input Parameters

| Name        | In  | Description  |      |             |             |   |          |   |            |   |

| 5          | F5 CA Bundles REST  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| Name       | The host name of the server.  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.9.10 PUT Certificate Stores Server

The PUT /CertificateStores/Server method is used to update the server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the server record.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. Updating certificate store server records requires permissions at the global level. See [Container Permissions](#) in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Note:** This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. The Management Portal has additional functionality, such as being able to set different credentials for different stores on the same server, which use the new [PUT Certificate Stores on page 458](#) API endpoint. Using this deprecated API endpoint could potentially, for instance, overwrite all cert stores on the server.

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 203: PUT Certificate Stores Server Input Parameters

| Name | In   | Description           |
|------|------|-----------------------|
| Id   | Body | The ID of the server. |

| Name        | In  | Description   |      |             |             |  |          |   |            |   |
|-------------|---|---|------|-------------|-------------|--|----------|---|------------|---|
| Username    | Body  | <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your username in the Keyfactor Command data-base.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the username. Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p><p>This value only needs to be supplied if you're storing your username using a PAM provider.</p></td></tr><tr><td>Parameters</td><td><p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p><p>For example, for Delinea (formerly Thycotic), this might be:</p><pre>"Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } },</pre><p>For CyberArk, this might be:</p><pre>"Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } },</pre></td></tr></table> | Name | Description | SecretValue | <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command data-base.</p> | Provider | <p>An integer that identifies the PAM provider used to store the username. Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p> | Parameters | <p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea (formerly Thycotic), this might be:</p> <pre>"Username": {   "Provider": 2,   "Parameters": {     "SecretId": 4   } },</pre> <p>For CyberArk, this might be:</p> <pre>"Username": {   "Provider": 5,   "Parameters": {     "Folder": "Root",     "Object": "F5Username"   } },</pre> |
| Name        | Description   |   |      |             |             |  |          |   |            |   |
| SecretValue | <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command data-base.</p>  |   |      |             |             |  |          |   |            |   |
| Provider    | <p>An integer that identifies the PAM provider used to store the username. Use the <code>GET /PamProviders</code> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. | 4          | F5 SSL Profiles REST  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| 5          | F5 CA Bundles REST  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |
| Name       | The host name of the server.  |       |             |   |                                 |   |           |   |     |   |                    |   |                      |   |                    |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.11 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the

certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 205: PUT Certificate Stores Password Input Parameters

| Name        | Type  | Description   |      |             |             |  |          |  |            |   |
|-------------|---|---|------|-------------|-------------|--|----------|--|------------|---|
| CertStoreID | Body  | <b>Required.</b> A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a> ) to retrieve a list of all your certificate stores to determine the GUID of the store.   |      |             |             |  |          |  |            |   |
| NewPassword | Body  | <b>Required.</b> A array that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command’s definition of it. Password settings include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.</td></tr><tr><td>Provider</td><td>An integer that identifies the PAM provider used to store the password.  **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.12 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.
- F5 bundle and SSL certificates discovered by the Keyfactor Windows Orchestrator on F5 devices using the F5 REST API (v14 and up).

- F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with a custom extension to support F5. For more information about the Keyfactor Universal Orchestrator and custom extensions, see *Universal Orchestrator* in the [Keyfactor Orchestrators Installation and Configuration Guide](#).
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 531](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 206: PUT Certificate Stores Discovery Job Input Parameters

| Name                  | In   | Description   |
|-----------------------|------|---|
| ClientMachine         | Body | <b>Required.</b> A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.  |
| AgentId               | Body | <b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.   |
| Type                  | Body | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) The default is 0 for a JKS discovery.  |
| JobExecutionTimestamp | Body | The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |
| Dirs                  | Body | <p><b>Required.</b> A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas.</p> <p><b>Java</b></p> <p>For Java discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server.</p> <p><b>PEM</b></p> <p>For PEM discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server.</p> <p><b>F5</b></p> <p>For F5 discovery, enter “/”.</p> |
| IgnoredDirs           | Body | A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.  |

| Name          | In   | Description  |
|---------------|------|--|
| Extensions    | Body | A string containing the file extensions for which to search. For example, search for files with the extension “jks” in order to exclude files with other extensions such as “txt”. The dot should not be included when specifying extensions.                        |
| NamePatterns  | Body | A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. “myjks”).  |
| SymLinks      | Body | A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows. |
| Compatibility | Body | A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.                                    |

| Name           | In   | Description   |      |             |             |   |          |   |            |  |
|----------------|--|---|------|-------------|-------------|---|----------|---|------------|--|
| ServerUsername | Body   | <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p><p>This value only needs to be supplied if you're storing your username using a PAM provider.</p></td></tr><tr><td>Parameters</td><td><p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p><p>For example, for Delinea (formerly Thycotic), this might be:</p><pre>"ServerUsername": {  "Provider": 2,  "Parameters": {    "SecretId": 4  } },</pre><p>For CyberArk, this might be:</p><pre>"ServerUsername": {  "Provider": 5,  "Parameters": {    "Folder": "Root",    "Object": "F5Username"  } },</pre></td></tr></table> | Name | Description | SecretValue | <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> | Provider | <p>An integer that identifies the PAM provider used to store the username. Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a>) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. See <i>PAM Provider Configuration in Keyfactor Command</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This value only needs to be supplied if you're storing your username using a PAM provider.</p> | Parameters | <p>The parameters required by your PAM provider, containing the information that identifies the location of the username in the PAM solution. These include F5, FTP, NetScaler, and any custom method you’ve defined to support this.</p> | Name | Description |  | <pre>"Parameters": {<br/>  "Folder": "Root",<br/>  "Object": "F5Password"<br/>}<br/>},</pre> |
| Name         | Description  |   |      |             |  |  |
|              | <pre>"Parameters": {<br/>  "Folder": "Root",<br/>  "Object": "F5Password"<br/>}<br/>},</pre> |   |      |             |  |  |
| ServerUseSsl | Body   | A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .   |      |             |  |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.13 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 207: PUT Certificate Stores Assign Container Input Parameters

| Name                 | In   | Description   |
|----------------------|------|---|
| CertStoreContainerId | Body | <b>Required</b> <sup>*</sup> . An integer that identifies the container into which you want to place the certificate store or stores.<br><br>One of the following is <b>required</b> : <ul style="list-style-type: none"><li>• <i>CertStoreContainerId</i></li><li>• <i>NewContainerName</i> and <i>NewContainerType</i></li></ul>  |
| KeystoreIds          | Body | <b>Required</b> . An array of certificate store GUIDs for the stores you want to place into the container.  |
| NewContainerName     | Body | <b>Required</b> <sup>*</sup> . A string that sets the name of the container if you would like to create a new container while assigning store(s) to it.<br><br>One of the following is <b>required</b> : <ul style="list-style-type: none"><li>• <i>CertStoreContainerId</i></li><li>• <i>NewContainerName</i> and <i>NewContainerType</i></li></ul>  |
| NewContainerType     | Body | <b>Required</b> <sup>*</sup> . An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types.<br><br>Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype -eq 7</i> ) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i> .<br><br>One of the following is <b>required</b> : <ul style="list-style-type: none"><li>• <i>CertStoreContainerId</i></li><li>• <i>NewContainerName</i> and <i>NewContainerType</i></li></ul> |

Table 208: PUT Certificate Stores Assign Container Response Data

| Name                    | Description   |
|-------------------------|---|
| Id                      | A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.  |
| ContainerId             | An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see <a href="#">GET Certificate Store Containers on page 558</a> ).  |
| ClientMachine           | The string value of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Storepath               | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722. |
| CertStoreInventoryJobId | A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.  |
| CertStoreType           | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |
| Approved                | A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.  |
| CreateIfMissing         | A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.   |
| Properties              | Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for   |

| Name | Description   |
|------|---|
|      | <p>more information).</p> <p>As of Keyfactor Command v10, this parameter is used to store certificate store server usernames, server passwords, and the UseSSL flag. Built-in certificate stores that typically require configuration of certificate store server parameters include NetScaler and F5 stores. The legacy methods for managing certificate store server credentials have been deprecated but are retained for backwards compatibility. For more information, see <a href="#">POST Certificate Stores Server on page 504</a>.</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 779 1052 888"> {   "privateKeyPath": "/opt/app/mystore.key",   "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="516 1129 1192 1239"> {   "privateKeyPath": {"value": "/opt/app/mystore.key"},   "separatePrivateKey": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store would contain:</p> <pre data-bbox="516 1413 1286 1549"> {   "ServerUsername": {"value": {"SecretValue": "User_Name"}},   "ServerPassword": {"value": {"SecretValue": "Password"}},   "ServerUseSsl": {"value": "true"} }</pre> <p>An example server properties parameter POST for an FTP or NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from <a href="#">GET PAM Providers on page 833</a>):</p> |

| Name | Description  |

| CustomAliasAllowed    | <p>An integer indicating the option for a custom alias for this certificate store.</p> <ul style="list-style-type: none"> <li>• 0—forbidden</li> <li>• 1—optional</li> <li>• 2—required</li> </ul>   |      |             |  |  |                    |  |
| SetNewPasswordAllowed | A Boolean that indicates whether the store password can be changed (true) or not (false).  |      |             |  |  |                    |  |
| Password              | <p> <b>Note:</b> Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>   |      |             |  |  |                    |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.9.14 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores Discovery Job on page 517](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 209: POST Certificate Stores Approve Input Parameters

| Name          | In   | Description  |
|---------------|------|--|
| Id            | Body | <p><b>Required.</b> The GUID of the pending certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) with a query of “Approved -eq false” to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.</p>  |
| ContainerId   | Body | <p>An integer that identifies the container in which the certificate store should be placed on approval. Use the <i>GET /CertificateStores/Containers</i> method (see <a href="#">GET Certificate Store Containers on page 558</a>) to retrieve a list of your defined certificate store containers to determine the container ID to use.</p>  |
| CertStoreType | Body | <p><b>Required.</b> An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)</p>   |
| Properties    | Body | <p><b>Required*</b>. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see <a href="#">GET Certificate Store Types on page 589</a> for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   "privateKeyPath":"/opt/app/mystore.key",   "separatePrivateKey":"true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{   "privateKeyPath":{"value":"/opt/app/mystore.key"},   "separatePrivateKey":{"value":"true"} }</pre> <p>This field is <b>required</b> for certificate store types that store additional properties in this parameter.</p> |
| Pass-         | Body | <p><b>Required.</b> An array indicating the source for and details of the credential information</p>   |

| Name           | In  | Description   |      |             |       |   |                |  |
|----------------|---|---|------|-------------|-------|---|----------------|--|
| word           | dy  | <p>Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see <a href="#">POST Certificate Stores Server on page 504</a>).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"><li>• Use no store password.<br/>This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</li><li>• Store the credential information in the Keyfactor secrets table.<br/>A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.</li><li>• Load the credential information from a PAM provider.<br/>See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and <a href="#">PAM Providers on page 817</a> for more information.</li></ul> <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div><pre>"Password": {<br/>  "Value": {null}<br/>}</pre><p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p><pre>"Password": {<br/>  "Value": "MyVerySecurePassword"<br/>}</pre></td></tr><tr><td>SecretTypeGuid</td><td>A string indicating the Keyfactor Command reference GUID for the type of credentials. This value is automatically set by</td></tr></table> | Name | Description | Value | <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div> <b>Tip:</b> To set the no password option on a store, submit the password with a null value. For example:</div> <pre>"Password": {<br/>  "Value": {null}<br/>}</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes.
