**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.15 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Schedule*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 210: POST Certificate Stores Schedule Input Parameters

| Name      | In  | Description   |             |             |  |  |           |  |          |   |      |             |         |  |       |   |      |             |      |  |
|-----------|---|---|-------------|-------------|--|--|-----------|--|----------|---|------|-------------|---------|--|-------|---|------|-------------|------|--|
| Storelds  | Body  | <b>Required.</b> An array of strings providing the certificate store GUIDs to schedule.   |             |             |  |  |           |  |          |   |      |             |         |  |       |   |      |             |      |  |
| Schedule  | Body  | <b>Required.</b> The inventory schedule for the certificate store(s). Supported schedules are: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": {  "Minutes": 60 }</pre></div></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO</td></tr></table></div></td></tr></table></div> | Name        | Description | Off  | Turn off a previously configured schedule. | Immediate | A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div> | Interval | A dictionary that indicates a job scheduled to run every x minutes with the specified parameter.  **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.16 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.
- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 792](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

CertificateEnrollment: *EnrollCSR*

CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

In addition, the either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see [Authorization Methods Tab](#) in the *Keyfactor Command Reference Guide*) must have enrollment permissions configured on the CA and template.

Table 211: POST Certificates Stores Reenrollment Input Parameters

| Name          | In   | Description   |
|---------------|------|---|
| KeystoreId    | Body | <p><b>Required.</b> The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) to retrieve a list of your certificate stores to determine the GUID of the store.</p>  |
| SubjectName   | Body | <p><b>Required.</b> A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>  |
| AgentGuid     | Body | <p><b>Required.</b> The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>   |
| Alias         | Body | <p><b>Required.</b> The alias of the certificate in the certificate store.</p>  |
| JobProperties | Body | <p>An array of key/value pairs for the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": [ "NetscalerVserver" ]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [ {"NetscalerVserver": "MyVirtualServerName"} ]</pre> <p> <b>Note:</b> The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-</p> |

| Name                 | In   | Description  |
|----------------------|------|--|
|                      |      |  certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.   |
| CertificateAuthority | Body | A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see <a href="#">Application Settings: Agents Tab</a> in the <i>Keyfactor Command Reference Guide</i> ). |
| CertificateTemplate  | Body | A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i> application setting will be used (see <a href="#">Application Settings: Agents Tab</a> in the <i>Keyfactor Command Reference Guide</i> ).                       |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.17 POST Certificate Stores Certificates Add

The POST `/CertificateStores/Certificates/Add` method is used to add a certificate to one or more certificate stores. The POST request must contain a certificate ID and an array of certificate store GUIDs that identify the stores to which the certificate should be added. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 792](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 Certificates: *Read*  
 CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 212: POST Certificate Stores Certificates Add Input Parameters

| Name                | In  | Description   |      |             |                     |   |       |   |           |  |           |   |
|---------------------|---|---|------|-------------|---------------------|---|-------|---|-----------|--|-----------|---|
| CertificateId       | Body  | <b>Required.</b> An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).   |      |             |                     |   |       |   |           |  |           |   |
| CertificateStores   | Body  | <b>Required.</b> An array of certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CertificateStoreIds</td><td><b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added.</td></tr><tr><td>Alias</td><td><b>Required*</b>. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected.</td></tr><tr><td>JobFields</td><td>An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td></tr><tr><td>Overwrite</td><td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>.<br/>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 253</a>) to retrieve a list of the locations an existing certificate is in to determine the alias</td></tr></table> | Name | Description | CertificateStoreIds | <b>Required.</b> A string containing the GUID for the certificate store to which the certificate should be added. | Alias | <b>Required*</b> . A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be <b>required</b> depending on the store type selected. | JobFields | An array of key/value pairs that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations. | Overwrite | A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). | Time         | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |   |             |             |   |  |      |             |      |   |
| CollectionId | Body   | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.  |             |             |   |  |      |             |      |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.9.18 POST Certificate Stores Certificates Remove

The POST /CertificateStores/Certificates/Remove method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 792](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*  
CertificateStoreManagement: *Schedule*

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 213: POST Certificate Stores Certificates Remove Input Parameters

| Name  | In   | Description  |      |             |       |  |                     |  |           |   |

## 2.5.10 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 214: Certificate Store Containers Endpoints

| Endpoint | Method | Description  | Link   |
|----------|--------|--|--|
| /        | GET    | Returns a list of certificate store containers.                | <a href="#">GET Certificate Store Containers on the next page</a>  |
| /        | POST   | Adds a certificate store container.                            | <a href="#">POST Certificate Store Containers on page 560</a>      |
| / {id}   | DELETE | Deletes a certificate store container.                         | <a href="#">DELETE Certificate Store Containers ID on page 568</a> |
| / {id}   | GET    | Returns details for the specified certificate store container. | <a href="#">GET Certificate Store Containers ID on page 569</a>    |
| / {id}   | PUT    | Edits a certificate store container.                           | <a href="#">PUT Certificate Store Containers on page 564</a>       |

### 2.5.10.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 215: GET Certificate Store Containers Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Containers Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>CertStoreType</i> (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmaonWebServices, 101-FileTransferProtocol)</li><li>• <i>HasSchedule</i> (True, False)</li><li>• <i>Id</i></li><li>• <i>Name</i>(Short Name)</li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 216: GET Certificate Stores Containers Response Data

| Name                | Description  |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
|---------------------|--|------|-------------|---------|---|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|---|
| Id                  | An integer indicating the ID of the container.   |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
| Name                | A string indicating the name of the container.   |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
| Over-writeSchedules | A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).  |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
| Schedule            | <p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> </td></tr> </table> | Name | Description | Off     | Turn off a previously configured schedule.  | Interval | <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> | Name | Description | Minutes | An integer indicating the number of minutes between each interval. | Daily | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. | Name          | Description   |      |             |  |  |
|---------------|---|------|-------------|--|--|
|               | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> | Name | Description |  | <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> |
| Name          | Description   |      |             |  |  |
|               | <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>  |      |             |  |  |
| CertStoreType | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)  |      |             |  |  |
| StoreCount    | An integer indicating the number of stores of the type referenced by CertStoreType in the container.  |      |             |  |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.10.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 217: POST Certificate Stores Containers Input Parameters

| Name     | In  | Description   |             |             |  |  |          |  |      |             |         |  |       |   |      |             |      |  |
|----------|---|---|-------------|-------------|--|--|----------|--|------|-------------|---------|--|-------|---|------|-------------|------|--|
| Name     | Body  | <b>Required.</b> A string indicating the name of the container.   |             |             |  |  |          |  |      |             |         |  |       |   |      |             |      |  |
| Schedule | Body  | <p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. | CertStoreType | An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. (0-Javakeystore,2-PEMFile, 3-F5SSLProfiles,4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol)   |      |             |  |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.10.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 219: PUT Certificate Store Containers Input Parameters

| Name     | In   | Description   |             |             |  |  |          |  |      |             |         |  |       |  |      |             |      |  |
|----------|--|---|-------------|-------------|--|--|----------|--|------|-------------|---------|--|-------|--|------|-------------|------|--|

#### 2.5.10.4 DELETE Certificate Store Containers ID

The DELETE /CertificateStoreContainers/{id} method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 221: DELETE Certificate Store Containers {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> A string containing the ID of the certificate store container to delete. Use the <i>GET /CertificateStoreContainers</i> method (see <a href="#">GET Certificate Store Containers on page 558</a> ) to retrieve a list of all the certificate store containers to determine the certificate store container ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.10.5 GET Certificate Store Containers ID

The GET /CertificateStoreContainers/{id} method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 222: GET Certificate Store Containers {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> A string containing the ID of the certificate store container.<br>Use the GET /CertificateStoreContainers method (see <a href="#">GET Certificate Store Containers on page 558</a> ) to retrieve a list of all the certificate store containers to determine the certificate store container ID. |

Table 223: GET Certificate Stores Containers {id} Response Data

| Name     | Description  |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
|----------|--|------|-------------|---------|---|----------|---|------|-------------|---------|--|-------|--|------|-------------|------|---|
| Id       | An integer indicating the ID of the container.   |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
| Name     | A string indicating the name of the container.   |      |             |         |   |          |   |      |             |         |  |       |  |      |             |      |   |
| Schedule | <p>A string containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.11 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 224: Certificate Store Type Endpoints

| Endpoint     | Method | Description   | Link  |
|--------------|--------|---|---|
| / {id}       | DELETE | Deletes a certificate store type using StoreType number.  | <a href="#">DELETE Certificate Store Types ID below</a>         |
| / {id}       | GET    | Returns certificate store type details for the specified certificate store type using StoreType number. | <a href="#">GET Certificate Store Types ID on the next page</a> |
| /Name/{name} | GET    | Returns certificate store type details for the specified certificate store type using ShortName.        | <a href="#">GET CertificateStoreTypes Name Name on page 582</a> |
| /            | DELETE | Delete multiple certificate store types using StoreType number.   | <a href="#">DELETE Certificate Store Types on page 588</a>      |
| /            | GET    | Returns all certificate store types with paging and options to the specified detail level.              | <a href="#">GET Certificate Store Types on page 589</a>         |
| /            | POST   | Creates a new certificate store type.   | <a href="#">POST Certificate Store Types on page 595</a>        |
| /            | PUT    | Updates a certificate store type using StoreType number.  | <a href="#">PUT Certificate Store Types on page 609</a>         |

### 2.5.11.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Table 225: DELETE Certificate Store Types {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The ID of the certificate store type to delete.<br>Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 589</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.11.2 GET Certificate Store Types ID

The *GET /CertificateStoreTypes/{id}* method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Table 226: GET Certificate Store Types {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The ID of the certificate store type.<br>Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types on page 589</a> ) to retrieve a list of all the certificate store types to determine the certificate store type ID. |

Table 227: GET Certificate Store Types {id} Response Data

| Name                | Description  |      |             |      |   |             |  |      |   |
|---------------------|--|------|-------------|------|---|-------------|--|------|---|
| Name                | A string containing the full name of the certificate store type.   |      |             |      |   |             |  |      |   |
| ShortName           | A string containing the short name assigned to the certificate store type.   |      |             |      |   |             |  |      |   |
| Capability          | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).   |      |             |      |   |             |  |      |   |
| StoreType           | A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.  |      |             |      |   |             |  |      |   |
| ImportType          | An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.   |      |             |      |   |             |  |      |   |
| LocalStore          | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.  |      |             |      |   |             |  |      |   |
| SupportedOperations | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>  |      |             |      |   |             |  |      |   |
| Properties          | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the property. | DisplayName | A string containing the full display name of the property. | Type | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> |
| Name                | Description  |      |             |      |   |             |  |      |   |
| Name                | A string containing the short name of the property.  |      |             |      |   |             |  |      |   |
| DisplayName         | A string containing the full display name of the property.   |      |             |      |   |             |  |      |   |
| Type                | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>  |      |             |      |   |             |  |      |   |

| Name            | Description  |      |             |                |  |           |   |              |  |          |   |
|-----------------|--|------|-------------|----------------|--|-----------|---|--------------|--|----------|---|

|              | <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers</li> </ul>   |      |             |  |  |           |   |              |  |         |   |

| Name              | Description   |
|-------------------|---|
|                   |  with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). |
| InventoryEndpoint | A string containing the orchestrator endpoint to which inventory updates are sent.  |
| InventoryJobType  | A GUID identifying the job type for inventory jobs.   |
| ManagementJobType | A GUID identifying the job type for management jobs.  |
| DiscoveryJobType  | A GUID identifying the job type for discovery jobs.   |
| EnrollmentJobType | A GUID identifying the job type for reenrollment jobs.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.11.3 GET CertificateStoreTypes Name Name

The GET /CertificateStoreTypes/Name/{name} method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Read*

Table 228: GET Certificate Store Types Name {ShortName} Input Parameters

| Name | In   | Description  |
|------|------|--|
| name | Path | <b>Required.</b> The short name of the certificate store type.<br>Use the GET /CertificateStoreTypes method (see <a href="#">GET Certificate Store Types on page 589</a> ) to retrieve a list of all the certificate store types to determine the certificate store type short name. |

Table 229: GET Certificate Store Types Name {ShortName} Response Data

| Name                | Description  |      |             |      |   |             |  |      |   |
|---------------------|--|------|-------------|------|---|-------------|--|------|---|
| Name                | A string containing the full name of the certificate store type.   |      |             |      |   |             |  |      |   |
| ShortName           | A string containing the short name assigned to the certificate store type.   |      |             |      |   |             |  |      |   |
| Capability          | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).   |      |             |      |   |             |  |      |   |
| StoreType           | A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.  |      |             |      |   |             |  |      |   |
| ImportType          | An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.   |      |             |      |   |             |  |      |   |
| LocalStore          | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.  |      |             |      |   |             |  |      |   |
| SupportedOperations | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>  |      |             |      |   |             |  |      |   |
| Properties          | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the property. | DisplayName | A string containing the full display name of the property. | Type | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> |
| Name                | Description  |      |             |      |   |             |  |      |   |
| Name                | A string containing the short name of the property.  |      |             |      |   |             |  |      |   |
| DisplayName         | A string containing the full display name of the property.   |      |             |      |   |             |  |      |   |
| Type                | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>  |      |             |      |   |             |  |      |   |

| Name            | Description  |      |             |                |  |           |   |              |  |          |   |

|              | <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers</li> </ul>   |      |             |  |  |           |   |              |  |         |   |

| Name              | Description   |
|-------------------|---|
|                   |  with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). |
| InventoryEndpoint | A string containing the orchestrator endpoint to which inventory updates are sent.  |
| InventoryJobType  | A GUID identifying the job type for inventory jobs.   |
| ManagementJobType | A GUID identifying the job type for management jobs.  |
| DiscoveryJobType  | A GUID identifying the job type for discovery jobs.   |
| EnrollmentJobType | A GUID identifying the job type for reenrollment jobs.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.11.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. The certificate store type IDs should be supplied in the request body as a JSON array of integers. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

Table 230: DELETE Certificate Store Types Input Parameters

| Name | In   | Description   |
|------|------|---|
| ids  | Body | <p><b>Required.</b> An array of Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name):</p> <pre>[106,108,109]</pre> <p>Use the <i>GET /CertificateStoreTypes</i> method (see <a href="#">GET Certificate Store Types below</a>) to retrieve a list of all the certificate store types to determine the certificate store type IDs.</p> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.11.5 GET Certificate Store Types

The GET /CertificateStoreTypes method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Read*

Table 231: GET Certificate Store Types Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| pageReturned | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1. |
| returnLimit  | Query | An integer that specifies how many results to return per page. The default is 50.   |

Table 232: GET Certificate Store Types Response Data

| Name                | Description  |      |             |      |   |             |  |      |   |
|---------------------|--|------|-------------|------|---|-------------|--|------|---|
| Name                | A string containing the full name of the certificate store type.   |      |             |      |   |             |  |      |   |
| ShortName           | A string containing the short name assigned to the certificate store type.   |      |             |      |   |             |  |      |   |
| Capability          | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).   |      |             |      |   |             |  |      |   |
| StoreType           | A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.  |      |             |      |   |             |  |      |   |
| ImportType          | An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.   |      |             |      |   |             |  |      |   |
| LocalStore          | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.  |      |             |      |   |             |  |      |   |
| SupportedOperations | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>  |      |             |      |   |             |  |      |   |
| Properties          | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the property. | DisplayName | A string containing the full display name of the property. | Type | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> |
| Name                | Description  |      |             |      |   |             |  |      |   |
| Name                | A string containing the short name of the property.  |      |             |      |   |             |  |      |   |
| DisplayName         | A string containing the full display name of the property.   |      |             |      |   |             |  |      |   |
| Type                | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>  |      |             |      |   |             |  |      |   |

|              | <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers</li> </ul>   |      |             |  |  |           |   |              |  |         |   |

| Name              | Description   |
|-------------------|---|
|                   |  with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). |
| InventoryEndpoint | A string containing the orchestrator endpoint to which inventory updates are sent.  |
| InventoryJobType  | A GUID identifying the job type for inventory jobs.   |
| ManagementJobType | A GUID identifying the job type for management jobs.  |
| DiscoveryJobType  | A GUID identifying the job type for discovery jobs.   |
| EnrollmentJobType | A GUID identifying the job type for reenrollment jobs.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.11.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Modify*

Table 233: POST Certificate Store Types Input Parameters

| Name                | In  | Description   |      |             |      |  |             |   |
|---------------------|---|---|------|-------------|------|--|-------------|---|
| Name                | Body  | <b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.  |      |             |      |  |             |   |
| ShortName           | Body  | <b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.  |      |             |      |  |             |   |
| Capability          | Body  | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).  |      |             |      |  |             |   |
| LocalStore          | Body  | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .   |      |             |      |  |             |   |
| SupportedOperations | Body  | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"><li>• Add</li><li>• Create</li><li>• Discovery</li><li>• Enrollment</li><li>• Remove</li></ul> <p>The default for each value is <i>false</i>.</p>  |      |             |      |  |             |   |
| Properties          | Body  | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b>.</td></tr><tr><td>DisplayName</td><td><b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b>.</td></tr></table> | Name | Description | Name | <b>Required.</b> A string containing the short name of the property. If you choose to define a property, this field is <b>required</b> . | DisplayName | <b>Required.</b> A string containing the full display name of the property. If you choose to define a property, this field is <b>required</b> . |
| Name                | Description   |   |      |             |      |  |             |   |

If <i>Type</i> is <i>Multiple Choice</i>, this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This value is unset by default.</p>  |      |             |  |  |           |  |  |              |  |  |         |  |  |
| Options   |  | <p>A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i>. This value is unset by default.</p>  |      |             |  |  |           |  |  |              |  |  |         |  |  |
| <p>For example, to set a multiple choice entry parameter:</p>   |  |   |      |             |  |  |           |  |  |              |  |  |         |  |  |
| <pre>"EntryParameter": [<br/>  {<br/>    "Name": "ZooAnimal",<br/>    "DisplayName": "Favorite Zoo Animal",</pre> |  |   |      |             |  |  |           |  |  |              |  |  |         |  |  |

| Name | In | Description   |
|------|----|---|
|      |    | <pre>         "Type": "MultipleChoice",         "RequiredWhen": {             "HasPrivateKey": false,             "OnAdd": true,             "OnRemove": true,             "OnReenrollment": true         },         "DefaultValue": "Penguin",         "Options": "Tiger- , Bear, Giraffe, Lion, Wolf, Penguin, Zebra"     } ] </pre> <p>This value is unset by default.</p> <div>  <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?             <ul style="list-style-type: none"> <li>Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul> </div> |

Table 234: POST Certificate Store Types Response Data

| Name                | Description  |      |             |      |   |             |  |      |   |
|---------------------|--|------|-------------|------|---|-------------|--|------|---|
| Name                | A string containing the full name of the certificate store type.   |      |             |      |   |             |  |      |   |
| ShortName           | A string containing the short name assigned to the certificate store type.   |      |             |      |   |             |  |      |   |
| Capability          | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).   |      |             |      |   |             |  |      |   |
| StoreType           | A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.  |      |             |      |   |             |  |      |   |
| ImportType          | An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.   |      |             |      |   |             |  |      |   |
| LocalStore          | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.  |      |             |      |   |             |  |      |   |
| SupportedOperations | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>  |      |             |      |   |             |  |      |   |
| Properties          | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the property. | DisplayName | A string containing the full display name of the property. | Type | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> |
| Name                | Description  |      |             |      |   |             |  |      |   |
| Name                | A string containing the short name of the property.  |      |             |      |   |             |  |      |   |
| DisplayName         | A string containing the full display name of the property.   |      |             |      |   |             |  |      |   |
| Type                | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>  |      |             |      |   |             |  |      |   |

| Name            | Description  |      |             |                |  |           |   |              |  |          |   |

|              | <p> <b>Tip:</b> What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> <li>• Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</li> <li>• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers</li> </ul>   |      |             |  |  |           |   |              |  |         |   |

| Name              | Description   |
|-------------------|---|
|                   |  with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). |
| InventoryEndpoint | A string containing the orchestrator endpoint to which inventory updates are sent.  |
| InventoryJobType  | A GUID identifying the job type for inventory jobs.   |
| ManagementJobType | A GUID identifying the job type for management jobs.  |
| DiscoveryJobType  | A GUID identifying the job type for discovery jobs.   |
| EnrollmentJobType | A GUID identifying the job type for reenrollment jobs.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.11.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateStoreManagement: *Modify*

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 235: PUT Certificate Store Types Input Parameters

| Name                | In   | Description   |
|---------------------|------|---|
| StoreType           | Body | <b>Required.</b> The Keyfactor Command reference ID for the certificate store type.   |
| Name                | Body | <b>Required.</b> A string containing the full name of the certificate store type. A unique value must be supplied.  |
| ShortName           | Body | <b>Required.</b> A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.  |
| Capability          | Body | <p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div>  <b>Note:</b> The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list.         </div> |
| LocalStore          | Body | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .   |
| SupportedOperations | Body | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul> <p>The default for each value is <i>false</i>.</p>  |
| Properties          | Body | An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include:   |

| Name         | In  | Description  |      |             |             |   |      |  |             |   |      |  |           |   |              |  |
|--------------|---|--|------|-------------|-------------|---|------|--|-------------|---|------|--|-----------|---|--------------|--|
|              |   | <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeID</td><td><b>Required.</b> An integer identifying the certificate store type. | Name    | In   | Description  |      |             |  |   |         |  |
|---------|--|--|------|-------------|--|---|---------|--|
|         |  | <table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>entry parameter. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This value is unset by default.</td></tr><tr><td>Options</td><td>A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i>. This value is unset by default.</td></tr></table> | Name | Description |  | entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This value is unset by default. | Options | A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> . This value is unset by default. |
| Name    | Description  |  |      |             |  |   |         |  |
|         | entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This value is unset by default.  |  |      |             |  |   |         |  |
| Options | A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> . This value is unset by default. |  |      |             |  |   |         |  |

For example, to set a multiple choice entry parameter:

```
"EntryParameter": [  
  {  
    "StoreTypeId": 111,  
    "Name": "ZooAnimal",  
    "DisplayName": "Favorite Zoo Animal",  
    "Type": "MultipleChoice",  
    "RequiredWhen": {  
      "HasPrivateKey": false,  
      "OnAdd": true,  
      "OnRemove": true,  
      "OnReenrollment": true  
    },  
    "DefaultValue": "Penguin",  
    "Options": "Tiger-  
,Bear,Giraffe,Lion,Wolf,Penguin,Zebra"  
  }  
]
```

This value is unset by default.

 **Tip:** What's the difference between properties (custom fields) and entry parameters?

- Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.

| Name | In | Description  |
|------|----|--|
|      |    |  <ul style="list-style-type: none"> <li>Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).</li> </ul> |

Table 236: PUT Certificate Store Types Response Data

| Name                | Description  |      |             |      |   |             |  |      |   |
|---------------------|--|------|-------------|------|---|-------------|--|------|---|
| Name                | A string containing the full name of the certificate store type.   |      |             |      |   |             |  |      |   |
| ShortName           | A string containing the short name assigned to the certificate store type.   |      |             |      |   |             |  |      |   |
| Capability          | A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).   |      |             |      |   |             |  |      |   |
| StoreType           | A unique integer for the certificate store type. The ID is automatically assigned by Keyfactor Command.  |      |             |      |   |             |  |      |   |
| ImportType          | An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.   |      |             |      |   |             |  |      |   |
| LocalStore          | A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.  |      |             |      |   |             |  |      |   |
| SupportedOperations | <p>An array containing a series of Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> <li>• Add</li> <li>• Create</li> <li>• Discovery</li> <li>• Enrollment</li> <li>• Remove</li> </ul>  |      |             |      |   |             |  |      |   |
| Properties          | <p>An array of unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the property. | DisplayName | A string containing the full display name of the property. | Type | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul> |
| Name                | Description  |      |             |      |   |             |  |      |   |
| Name                | A string containing the short name of the property.  |      |             |      |   |             |  |      |   |
| DisplayName         | A string containing the full display name of the property.   |      |             |      |   |             |  |      |   |
| Type                | <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> </ul>  |      |             |      |   |             |  |      |   |

| Name            | Description  |      |             |                |  |           |   |              |  |          |   |

| ServerRequired    | A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote server.   |      |             |  |                                |               |   |       |  |
| PowerShell        | A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).   |      |             |  |                                |               |   |       |  |
| BlueprintAllowed  | A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see <i>Orchestrator Blueprints</i> in the <i>Keyfactor Command Reference Guide</i> .   |      |             |  |                                |               |   |       |  |

| Name               | Description   |      |             |      |  |             |   |      |  |              |  |
|--------------------|---|------|-------------|------|--|-------------|---|------|--|--------------|--|
| CustomAliasAllowed | <p>A string containing the selected certificate store type alias option:</p> <ul style="list-style-type: none"> <li>• <i>Forbidden</i>: A custom alias is not required and cannot be supplied.</li> <li>• <i>Optional</i>: A custom alias is optional.</li> <li>• <i>Required</i>: A custom alias is required.</li> </ul> <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>  |      |             |      |  |             |   |      |  |              |  |
| EntryParameters    | <p>An array of unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the entry parameter.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the entry parameter.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> </td></tr> <tr> <td>RequiredWhen</td><td> <p>An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</p> <ul style="list-style-type: none"> <li>• <b>HasPrivateKey</b>: If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd</b>: If set to <i>true</i>, a value must be provided for this field when configuring an add certi-</li> </ul> </td></tr> </table> | Name | Description | Name | A string containing the short name of the entry parameter. | DisplayName | A string containing the full display name of the entry parameter. | Type | <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul> | RequiredWhen | <p>An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</p> <ul style="list-style-type: none"> <li>• <b>HasPrivateKey</b>: If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd</b>: If set to <i>true</i>, a value must be provided for this field when configuring an add certi-</li> </ul> |
| Name               | Description   |      |             |      |  |             |   |      |  |              |  |
| Name               | A string containing the short name of the entry parameter.  |      |             |      |  |             |   |      |  |              |  |
| DisplayName        | A string containing the full display name of the entry parameter.   |      |             |      |  |             |   |      |  |              |  |
| Type               | <p>A string containing the type of the entry parameter:</p> <ul style="list-style-type: none"> <li>• String</li> <li>• Bool</li> <li>• MultipleChoice</li> <li>• Secret</li> </ul>  |      |             |      |  |             |   |      |  |              |  |
| RequiredWhen       | <p>An array of Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. These are:</p> <ul style="list-style-type: none"> <li>• <b>HasPrivateKey</b>: If set to <i>true</i>, a value must be provided for this field when configuring a management job (either add or remove) if the certificate has an associated private key in Keyfactor Command. This would be the case, for example, when doing a PFX enrollment and adding the resulting certificate to a certificate store.</li> <li>• <b>OnAdd</b>: If set to <i>true</i>, a value must be provided for this field when configuring an add certi-</li> </ul>  |      |             |      |  |             |   |      |  |              |  |

| Name         | Description  |
|--------------|--|
|              | <p>ificate job.</p> <ul style="list-style-type: none"><li>• <b>OnRemove:</b> If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job.</li><li>• <b>OnReenrollment:</b> If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job.</li></ul>              |
| DependsOn    | A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.  |
| DefaultValue | A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . |
| Options      | A string containing a comma-separated list of multiple choice options for this entry parameter.  |

 **Tip:** What's the difference between properties (custom fields) and entry parameters?

- Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.
- Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers

| Name              | Description   |
|-------------------|---|
|                   |  with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). |
| InventoryEndpoint | A string containing the orchestrator endpoint to which inventory updates are sent.  |
| InventoryJobType  | A GUID identifying the job type for inventory jobs.   |
| ManagementJobType | A GUID identifying the job type for management jobs.  |
| DiscoveryJobType  | A GUID identifying the job type for discovery jobs.   |
| EnrollmentJobType | A GUID identifying the job type for reenrollment jobs.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.12 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 237: CSR Generation Endpoints

| Endpoint      | Method | Description   | Link  |
|---------------|--------|---|---|
| /Pending/{id} | DELETE | Deletes a pending CSR by ID.  | <a href="#">DELETE CSR Generation Pending ID on the next page</a> |
| /Pending/{id} | GET    | Returns the details of a specific CSR request based on the ID number. | <a href="#">GET CSR Generation Pending ID on the next page</a>    |
| /Pending      | DELETE | Deletes multiple pending CSRs.  | <a href="#">DELETE CSR Generation Pending on page 626</a>         |
| /Pending      | GET    | Returns a list of all pending CSRs.                                   | <a href="#">GET CSR Generation Pending on page 627</a>            |

| Endpoint  | Method | Description                           | Link   |
|-----------|--------|---------------------------------------|--|
| /Generate | POST   | Generate and configure a CSR request. | <a href="#">POST CSR Generation Generate on page 628</a> |

### 2.5.12.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *PendingCsr*

Table 238: DELETE CSR Generation Pending {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <p><b>Required.</b> The ID of the certificate signing request for the CSR that should be deleted.</p> <p>Use the <i>GET /CSRGeneration/Pending</i> method (see <a href="#">GET CSR Generation Pending on page 627</a>) to retrieve a list of all the pending CSRs to determine the CSR IDs.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.12.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the *GET /CSRGeneration/Pending* method (see [GET CSR Generation Pending on page 627](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *PendingCsr*

Table 239: GET CSR Generation Pending {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The ID of the CSR that should be retrieved. |

Table 240: GET CSR Generation Pending {id} Response Data

| Name        | Description   |
|-------------|---|
| CSRFilePath | The proposed file name for the CSR file.<br>This is considered deprecated and may be removed in a future release. |
| CSR         | The text of the CSR in PEM format.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.12.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. The IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *PendingCsr*

Table 241: DELETE CSR Generation Pending Input Parameters

| Name | In   | Description   |
|------|------|---|
| ids  | Body | <p><b>Required.</b> An array of Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name):</p> <pre>[8,14,27]</pre> <p>Use the <i>GET /CSRGeneration/Pending</i> method (see <a href="#">GET CSR Generation Pending on the next page</a>) to retrieve a list of all the pending CSRs to determine the CSR IDs.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.12.4 GET CSR Generation Pending

The GET /CSRGeneration/Pending method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *PendingCsr*

Table 242: GET CSR Generation Pending Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 243: GET CSR Generation Pending Response Data

| Name        | Description  |
|-------------|--|
| Id          | A unique integer for the CSR generated.  |
| CSR         | A string containing the text of the CSR in PEM format.   |
| RequestTime | A string containing the date and time that the CSR was generated in UTC time.  |
| Subject     | An array containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.12.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 686](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 300](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *CsrGeneration*

**Note:** This endpoint no longer includes the CSRFilePath return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 244: POST CSR Generation Generate Input Parameters

| Name               | In           | Description   |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |
|--------------------|--------------|---|------|--------------|-------------|------------|----|---|--------------|---|---|--------------------|----|--|----------|---|---|
| Subject            | Body         | <p><b>Required.</b> A string containing the subject name for the certificate using X.500 format for the full distinguished name (DN). For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>Supported subject name fields are:</p> <table> <tr> <th>Name</th><th>Abbreviation</th><th>Description</th></tr> <tr> <td>CommonName</td><td>CN</td><td> <p><b>Required*</b>. The desired common name of the certificate to be requested with the CSR.</p> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </td></tr> <tr> <td>Organization</td><td>O</td><td>The desired organization of the certificate to be requested with the CSR.</td></tr> <tr> <td>OrganizationalUnit</td><td>OU</td><td>The desired organizational unit of the certificate to be requested with the CSR.</td></tr> <tr> <td>Locality</td><td>L</td><td>The desired city of the certificate to be requested with the CSR.</td></tr> </table> | Name | Abbreviation | Description | CommonName | CN | <p><b>Required*</b>. The desired common name of the certificate to be requested with the CSR.</p> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> | Organization | O | The desired organization of the certificate to be requested with the CSR. | OrganizationalUnit | OU | The desired organizational unit of the certificate to be requested with the CSR. | Locality | L | The desired city of the certificate to be requested with the CSR. |
| Name               | Abbreviation | Description   |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |
| CommonName         | CN           | <p><b>Required*</b>. The desired common name of the certificate to be requested with the CSR.</p> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>   |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |
| Organization       | O            | The desired organization of the certificate to be requested with the CSR.   |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |
| OrganizationalUnit | OU           | The desired organizational unit of the certificate to be requested with the CSR.  |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |
| Locality           | L            | The desired city of the certificate to be requested with the CSR.   |      |              |             |            |    |   |              |   |   |                    |    |  |          |   |   |

| Name      | In           | Description  |      |              |             |       |    |  |         |   |   |       |   |  |
|-----------|--------------|--|------|--------------|-------------|-------|----|--|---------|---|---|-------|---|--|
|           |              | <table> <tr> <th>Name</th><th>Abbreviation</th><th>Description</th></tr> <tr> <td>State</td><td>ST</td><td>The desired state of the certificate to be requested with the CSR.</td></tr> <tr> <td>Country</td><td>C</td><td>The desired country (two characters) of the certificate to be requested with the CSR.</td></tr> <tr> <td>Email</td><td>E</td><td>The desired email address of the certificate to be requested with the CSR.</td></tr> </table>  | Name | Abbreviation | Description | State | ST | The desired state of the certificate to be requested with the CSR. | Country | C | The desired country (two characters) of the certificate to be requested with the CSR. | Email | E | The desired email address of the certificate to be requested with the CSR. |
| Name      | Abbreviation | Description  |      |              |             |       |    |  |         |   |   |       |   |  |
| State     | ST           | The desired state of the certificate to be requested with the CSR.   |      |              |             |       |    |  |         |   |   |       |   |  |
| Country   | C            | The desired country (two characters) of the certificate to be requested with the CSR.  |      |              |             |       |    |  |         |   |   |       |   |  |
| Email     | E            | The desired email address of the certificate to be requested with the CSR.   |      |              |             |       |    |  |         |   |   |       |   |  |
| KeyType   | Body         | <b>Required.</b> A string indicating the desired key encryption of the certificate. Accepted key types are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECC</li> </ul>   |      |              |             |       |    |  |         |   |   |       |   |  |
| KeyLength | Body         | <b>Required.</b> An integer indicating the desired key size of the certificate. Accepted key sizes are: <ul style="list-style-type: none"> <li>• 256</li> <li>• 384</li> <li>• 521</li> <li>• 2048</li> <li>• 4096</li> <li>• 8192</li> </ul>  |      |              |             |       |    |  |         |   |   |       |   |  |
| Template  | Body         | A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional. <div>  <b>Tip:</b> Although you can include a template in your CSR, template handling in CSRs is future functionality, and the template will not be parsed back out of the CSR. Instead, submit a template directly with your CSR enrollment (see <a href="#">POST Enrollment CSR on page 686</a>). </div> |      |              |             |       |    |  |         |   |   |       |   |  |
| SANs      | Body         | An array of key/value pairs that represent the elements for Keyfactor  |      |              |             |       |    |  |         |   |   |       |   |  |

| Name               | In                            | Description   |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                               |                    |                             |

| ms_ntdsreplication | MS_NTDSReplication (a GUID)   |   |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                               |                    |                             |

Table 245: POST CSR Generation Generate Response Data

| Name | Description                        |
|------|------------------------------------|
| CSR  | The text of the CSR in PEM format. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.13 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 246: Custom Job Types Endpoints

| Endpoint | Method | Description   | Link   |
|----------|--------|---|--|
| / {id}   | DELETE | Deletes the custom job type for the specified ID.             | <a href="#">DELETE Custom Job Types ID below</a>         |
| / {id}   | GET    | Returns details for the custom job type for the specified ID. | <a href="#">GET Custom Job Types ID on the next page</a> |
| /        | GET    | Returns all the custom job types.                             | <a href="#">GET Custom Job Types on page 635</a>         |
| /        | POST   | Creates a custom job type.                                    | <a href="#">POST Custom Job Types on page 637</a>        |
| /        | PUT    | Updates an existing custom job type.                          | <a href="#">PUT Custom Job Types on page 641</a>         |

### 2.5.13.1 DELETE Custom Job Types ID

The DELETE /JobTypes/Custom/{id} method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 247: DELETE JobTypes Custom {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 635</a> ) to retrieve a list of all the custom job types to determine the job type GUID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.13.2 GET Custom Job Types ID

The *GET /JobTypes/Custom/{id}* method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: AgentManagement: *Read*

Table 248: GET JobTypes Custom {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 635</a> ) to retrieve a list of all the custom job types to determine the job type GUID. |

Table 249: GET JobTypes Custom {id} Response Data

| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
|---------------|---|---------------|-------------|-------------|--|--------|---|---------------|------------|-------------|---|----------|--------|---|------|---------|---|----------|------|---|------|---------|--------------|--|----------|---|
| Id            | The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| JobTypeName   | A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Description   | A string containing a description for the custom job type.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| JobTypeFields | <div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field.<br/>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div> | Name          | Description | Name        | A string that indicates the name for the job type field. | Type   | <div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div> | Integer Value | Enum Value | Description | 1 | String   | String | 2 | Int  | Integer | 3 | DateTime | Date | 4 | Bool | Boolean | DefaultValue | A string containing the default value of the job type field.<br>If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . | Required | A Boolean that sets whether the job type field is required (true) or not (false). |
| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Name          | A string that indicates the name for the job type field.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Type          | <div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>   | Integer Value | Enum Value  | Description | 1  | String | String  | 2             | Int        | Integer     | 3 | DateTime | Date   | 4 | Bool | Boolean |   |          |      |   |      |         |              |  |          |   |

### 2.5.13.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 250: GET JobTypes Custom Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| pageReturned | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1. |
| returnLimit  | Query | An integer that specifies how many results to return per page. The default is 50.   |

Table 251: GET JobTypes Custom Response Data

| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
|---------------|---|---------------|-------------|-------------|--|--------|---|---------------|------------|-------------|---|----------|--------|---|------|---------|---|----------|------|---|------|---------|--------------|--|----------|---|
| Id            | The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| JobTypeName   | A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Description   | A string containing a description for the custom job type.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| JobTypeFields | <div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field.<br/>If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div> | Name          | Description | Name        | A string that indicates the name for the job type field. | Type   | <div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div> | Integer Value | Enum Value | Description | 1 | String   | String | 2 | Int  | Integer | 3 | DateTime | Date | 4 | Bool | Boolean | DefaultValue | A string containing the default value of the job type field.<br>If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . | Required | A Boolean that sets whether the job type field is required (true) or not (false). |
| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Name          | A string that indicates the name for the job type field.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Type          | <div>A value that indicates the data type of the job type field.<br/>Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>   | Integer Value | Enum Value  | Description | 1  | String | String  | 2             | Int        | Integer     | 3 | DateTime | Date   | 4 | Bool | Boolean |   |          |      |   |      |         |              |  |          |   |
| Integer Value | Enum Value  | Description   |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| 1             | String  | String        |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| 2             | Int   | Integer       |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| 3             | DateTime  | Date          |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| 4             | Bool  | Boolean       |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| DefaultValue  | A string containing the default value of the job type field.<br>If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Required      | A Boolean that sets whether the job type field is required (true) or not (false).   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |

#### 2.5.13.4 POST Custom Job Types

The POST /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of custom job type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 252: POST JobTypes Custom Input Parameters

| Name          | In   | Description  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
|---------------|--|--|------------|-------------|------|---|--------|--|---------------|------------|-------------|----------|--------|--------|------|---------|---------|---|----------|------|---|------|---------|--------------|---|----------|---|
| JobTypeName   | Body   | <b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| Description   | Body   | A string containing a description for the custom job type.   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |

| 4             | Bool  | Boolean       |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| DefaultValue  | A string containing the default value of the job type field.<br>If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |
| Required      | A Boolean that sets whether the job type field is required (true) or not (false).   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |  |          |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.13.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 254: PUT JobTypes Custom Input Parameters

| Name          | In   | Description  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
|---------------|--|--|------------|-------------|------|---|--------|--|---------------|------------|-------------|----------|--------|--------|------|---------|---------|---|----------|------|---|------|---------|--------------|---|----------|---|
| Id            | Body   | The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| JobTypeName   | Body   | <b>Required.</b> A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| Description   | Body   | A string containing a description for the custom job type.   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| JobTypeFields | Body   | <div>An array of job type fields that indicate the type of tasks the job type is designed to perform. | 1             | String   | String   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| 2             | Int  | Integer  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| 3             | DateTime   | Date   |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| 4             | Bool   | Boolean  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| DefaultValue  | <b>Required*</b> . A string containing the default value of the job type field.<br>If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .<br>This field is <b>required</b> if the <i>Required</i> parameter is set to <i>true</i> .  |  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |
| Required      | A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i> .  |  |            |             |      |   |        |  |               |            |             |          |        |        |      |         |         |   |          |      |   |      |         |              |   |          |   |

| Name | In | Description  |
|------|----|--|
|      |    | <p>For example:</p> <pre> "JobTypeFields": [   {     "Name": "Favorite Type of Pet",     "Type": "String",     "DefaultValue": "Cat",     "Required": true   },   {     "Name": "Model Year of First Car",     "Type": "Int"   },   {     "Name": "Mother's Birthday",     "Type": "DateTime"   } ] </pre> |

Table 255: PUT JobTypes Custom Response Data

| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
|---------------|---|---------------|-------------|-------------|--|--------|---|---------------|------------|-------------|---|----------|--------|---|------|---------|---|----------|------|---|------|---------|--------------|---|----------|---|
| Id            | The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| JobTypeName   | A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| Description   | A string containing a description for the custom job type.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| JobTypeFields | <div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div> | Name          | Description | Name        | A string that indicates the name for the job type field. | Type   | <div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div> | Integer Value | Enum Value | Description | 1 | String   | String | 2 | Int  | Integer | 3 | DateTime | Date | 4 | Bool | Boolean | DefaultValue | A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . | Required | A Boolean that sets whether the job type field is required (true) or not (false). |
| Name          | Description   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| Name          | A string that indicates the name for the job type field.  |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| Type          | <div>A value that indicates the data type of the job type field. | Integer Value | Enum Value  | Description   |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| 1             | String  | String        |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| 2             | Int   | Integer       |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| 3             | DateTime  | Date          |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| 4             | Bool  | Boolean       |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| DefaultValue  | A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |
| Required      | A Boolean that sets whether the job type field is required (true) or not (false).   |               |             |             |  |        |   |               |            |             |   |          |        |   |      |         |   |          |      |   |      |         |              |   |          |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.14 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFXs).

Table 256: Enrollment Endpoints

| Endpoint                                  | Method | Description  | Link  |
|---|--------|--|---|
| /Settings/{Id}                            | GET    | Returns the template settings to use during enrollment.  | <a href="#">GET Enrollment Settings ID on the next page</a>             |
| /CSR/Context/My                           | GET    | Returns the templates available for CSR enrollment by the current user.                        | <a href="#">GET Enrollment CSR Content My on page 653</a>               |
| /PFX/Context/My                           | GET    | Returns the templates available for PFX enrollment by the current user.                        | <a href="#">GET Enrollment PFX Content My on page 667</a>               |
| /AvailableRenewal/Id/{id}                 | GET    | Returns the type of renewals available for the referenced certificate ID.                      | <a href="#">GET Enrollment Available Renewal ID on page 681</a>         |
| /AvailableRenewal/Thumbprint/{thumbprint} | GET    | Returns the type of renewals available for the referenced certificate thumbprint.              | <a href="#">GET Enrollment Available Renewal Thumbprint on page 684</a> |
| /CSR                                      | POST   | Performs a CSR enrollment.   | <a href="#">POST Enrollment CSR on page 686</a>                         |
| /PFX                                      | POST   | Performs a PFX enrollment.   | <a href="#">POST Enrollment PFX on page 693</a>                         |
| /CSR/Parse                                | POST   | Returns information found in a CSR in a human friendly form.                                   | <a href="#">POST Enrollment CSR Parse on page 709</a>                   |
| /PFX/Deploy                               | POST   | Adds a certificate into a certificate store following a PFX enrollment or certificate renewal. | <a href="#">POST Enrollment PFX Deploy on page 711</a>                  |
| /PFX/Replace                              | POST   | Replaces a certificate in a certificate store following a PFX enrollment.                      | <a href="#">POST Enrollment PFX Replace on page 717</a>                 |

| Endpoint | Method | Description                     | Link  |
|----------|--------|---------------------------------|---|
| /Renew   | POST   | Performs a certificate renewal. | <a href="#">POST Enrollment Renew on page 719</a> |

### 2.5.14.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *EnrollCSR* or CertificateEnrollment: *EnrollPFX* or CertificateEnrollment: *CsrGeneration*

Table 257: GET Enrollment Settings {id} Input Parameters

| Name | Description   |
|------|---|
| id   | The enrollment template Id.<br>Use the <i>GET /Templates</i> method (see <a href="#">GET Templates on page 1365</a> ) to retrieve a list of all the templates to determine the template ID. |

Table 258: GET Enrollment Settings {id} Response Body

| Name                 | Description  |              |             |                  |   |       |  |              |         |                  |   |
|----------------------|--|--------------|-------------|------------------|---|-------|--|--------------|---------|------------------|---|
| TemplateRege-<br>xes | <p>An object containing the regular expressions resolved for the template. **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.14.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *EnrollCSR*

Table 259: GET Enrollment CSR Content My Response Body

| Name             | Description   |      |             |    |   |      |  |             |  |        |   |         |   |                  |   |                |   |     |   |

|      |                 | ment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.  |
|      | SubscriberTerms | <p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).</p> <div>  <b>Tip:</b> Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.14.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters. It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *EnrollPFX*

Table 260: GET Enrollment PFX Content My Response Body

| Name             | Description   |      |             |    |   |      |  |             |  |        |   |         |   |                  |   |                |   |     |   |

| Enroll-<br>mentFields | <p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> <li>Preventing users from requesting invalid certificates, based on your specific certificate requirements per template.</li> <li>Providing additional information to the CA with the CSR.</li> </ul> <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  <b>Note:</b> These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The array contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>An integer indicating the parameter type. The options are:</td></tr> </table> | Name | Description | Id | An integer indicating the ID of the custom enrollment field. | Name | A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages. | Options | For multiple choice values, an array of strings containing the value choices. | DataType | An integer indicating the parameter type. The options are: |
| Name                  | Description  |      |             |    |  |      |   |         |   |          |  |
| Id                    | An integer indicating the ID of the custom enrollment field.   |      |             |    |  |      |   |         |   |          |  |
| Name                  | A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.  |      |             |    |  |      |   |         |   |          |  |
| Options               | For multiple choice values, an array of strings containing the value choices.  |      |             |    |  |      |   |         |   |          |  |
| DataType              | An integer indicating the parameter type. The options are:   |      |             |    |  |      |   |         |   |          |  |

| Name           | Description   |       |             |   |  |       |   |   |   |       |   |   |                                       |   |   |

#### 2.5.14.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 261: GET Enrollment Available Renewal ID {id} Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| id           | Path  | <p><b>Required.</b> An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status.</p> <p>Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.</p>   |
| CollectionId | Query | <p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> |

Table 262: GET Enrollment Available Renewal ID {id} Response Body

| Name                 | Description  |       |             |   |   |   |   |   |  |
|----------------------|--|-------|-------------|---|---|---|---|---|--|
| AvailableRenewalType | <p>An integer indicating the supported renewal type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—renewal is not supported for this certificate.</td></tr> <tr> <td>1</td><td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td></tr> <tr> <td>2</td><td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul> </td></tr> </table> <p> <b>Tip:</b> If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p> | Value | Description | 0 | None—renewal is not supported for this certificate. | 1 | Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported. | 2 | <p>One-click renewal is supported. | 0                    | None—renewal is not supported for this certificate.  |       |             |   |   |   |   |   |  |
| 1                    | Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.  |       |             |   |   |   |   |   |  |
| 2                    | <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> <li>• The certificate is located together with its private key in one or more managed certificate store(s).</li> <li>• The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</li> </ul>   |       |             |   |   |   |   |   |  |
| Message              | A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).   |       |             |   |   |   |   |   |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (🔍) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.14.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Certificates: *Read*

At either the global or collection level. See note under CollectionId, below.

Table 263: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

| Name         | In    | Description  |
|--------------|-------|--|
| thumbprint   | Path  | <b>Required.</b> The thumbprint of the certificate on which to check the renewal status.<br><br>Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.   |
| CollectionId | Query | An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user’s certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

Table 264: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Body

#### 2.5.14.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateEnrollment: *EnrollCSR*

**Tip:** Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 265: POST Enrollment CSR Input Parameters

| Name                 | In   | Description  |
|----------------------|------|--|
| CSR                  | Body | <b>Required.</b> The base-64 encoded CSR that will be passed in for enrollment.  |
| PrivateKey           | Body | A string containing the base-64 encoded private key that corresponds to the CSR to be saved with the enrollment. This is done to support private key retention in Keyfactor Command for requests made through CSR enrollment. The key should be provided in unencrypted PKCS#8 format. The private key option is only supported for enrollments done using templates configured in Keyfactor Command for private key retention.  |
| Timestamp            | Body | <b>Required.</b> The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).   |
| Template             | Body | <b>Required*</b> . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.<br><br>This field is <b>required</b> unless the enrollment is being done against a standalone CA.   |
| CertificateAuthority | Body | <b>Required*</b> . A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>host-name\\logical name</i> format or as just the <i>logical name</i> . For example:<br><br><div>corpca01.keyexample.com\\CorplssuingCA1<br/><b>OR</b> CorplssuingCA1</div><br>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i> .<br><br>This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b> . |
| IncludeChain         | Body | A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .  |
| Metadata             | Body | An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate   |

| Name               | In                          | Description   |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                       |
|--------------------|-----------------------------|---|-------|-------------|--------|--------------|-----|----------|-----------|----------------|-----|-----------------------------|-----|---------------|-----|---------------|--------------|------------------------|--------------------|-----------------------|
|                    |                             | <p>once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": {<br/>  "AppOwnerFirstName": "William", // This is a<br/>  String field.<br/>  "AppOwnerLastName": "Smith",<br/>  "AppOwnerEmailAddress": "willi-<br/>am.smith@keyexample.com",<br/>  "BusinessCritical": "true",      // This is a<br/>  Boolean field.<br/>  "BusinessUnit": "E-Business",   // This is a<br/>  Multiple Choice field with a pre-defined value.<br/>  "Notes": "Here are some notes.", // This is a<br/>  BigText field.<br/>  "SiteCode": 3,                  // This is an<br/>  integer field.<br/>  "TicketResolutionDate": "2021-07-23" // This<br/>  is a Date field in yyyy-mm-dd format.<br/>}</pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                       |
| SANs               | Body                        | <p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a</td></tr></table>   | Value | Description | rfc822 | RFC 822 Name | dns | DNS Name | directory | Directory Name | uri | Uniform Resource Identifier | ip4 | IP v4 Address | ip6 | IP v6 Address | registeredid | Registered ID (an OID) | ms_ntprincipalname | MS_NTPrincipalName (a |
| Value              | Description                 |   |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                       |

| Name                  | Description   |       |             |                       |  |                    |  |                    |   |                    |  |                   |   |
| MetadataFieldTypeName | A string containing the name of the metadata field in Keyfactor Command.  |       |             |                       |  |                    |  |                    |   |                    |  |                   |   |
| Value                 | The value of the metadata.  |       |             |                       |  |                    |  |                    |   |                    |  |                   |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.14.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 706](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 711](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 717](#)).

**Tip:** Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

**Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 5](#).

## Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

**Note:** The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 267: POST Enrollment PFX v2 Input Parameters

| Name       | In  | Description   |      |             |         |   |       |   |            |   |            |  |
|------------|---|---|------|-------------|---------|---|-------|---|------------|---|------------|--|
| Stores     | Body  | <p>An object containing a comma delimited set of arrays indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Over-write</i> flag is selected. See <a href="#">PFX Enrollment</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p></td></tr><tr><td>Over-write</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 253</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td><p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. | CustomFriendlyName | Body   | <p><b>Required</b><sup>*</sup>. A string that sets a custom friendly name for the certificate.</p> <p>This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>  |      |             |  |  |
| Password           | Body   | <p><b>Required</b>. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The</p>  |      |             |  |  |

| Name                 | In   | Description  |
|----------------------|------|--|
|                      |      | default is 12. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.  |
| Subject              | Body | <p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>  |
| IncludeChain         | Body | A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i> .   |
| ChainOrder           | Body | A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .  |
| RenewalCertificateId | Body | <p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>   |
| CertificateAuthority | Body | <p><b>Required</b>*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorplIssuingCA1 OR CorplIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p> |

| Name      | In           | Description  |       |             |        |              |
|-----------|--------------|--|-------|-------------|--------|--------------|
| Metadata  | Body         | <p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": {<br/>  "AppOwnerFirstName": "William",  // This is a String<br/>  field.<br/>  "AppOwnerLastName": "Smith",<br/>  "AppOwnerEmailAddress": "willi-<br/>am.smith@keyexample.com",<br/>  "BusinessCritical": "true",      // This is a Boolean<br/>  field.<br/>  "BusinessUnit": "E-Business",    // This is a<br/>  Multiple Choice field with a pre-defined value.<br/>  "Notes": "Here are some notes.", // This is a BigText<br/>  field.<br/>  "SiteCode": 3,                  // This is an<br/>  integer field.<br/>  "TicketResolutionDate": "2021-07-23"  // This is a<br/>  Date field in yyyy-mm-dd format.<br/>}</pre> <p>See <a href="#">Certificate Metadata</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> |       |             |        |              |
| Timestamp | Body         | <p>The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>  |       |             |        |              |
| Template  | Body         | <p><b>Required</b>*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is <b>required</b> unless the enrollment is being done against a standalone CA.</p>   |       |             |        |              |
| SANs      | Body         | <p>An array of key/value pairs that represent the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr></table>  | Value | Description | rfc822 | RFC 822 Name |
| Value     | Description  |  |       |             |        |              |

| InstallIntoExistingCertificateStores | Body                          | <p>A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i>.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>   |       |             |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                               |                    |                             |
| AdditionalEnrollmentFields           | Body                          | <p>An array of key/value pairs that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p>  |       |             |     |          |           |                |     |                             |     |               |     |               |              |                        |                    |                               |                    |                             |

| Name                | In     | Description   |
|---------------------|--------|---|
|                     |        | <pre>"AdditionalEnrollmentFields": {   "CustomStringOne": "MyValue",   "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See <a href="#">Configuring Template Options</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>   |
| x-CertificateFormat | Header | <p><b>Required.</b> The desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> <li>• JKS<br/>Selecting the JKS option allows you to create a Java keystore with the returned PKCS12Blob.</li> <li>• PFX<br/>Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob.</li> <li>• Store<br/>If Store is selected, no certificate blob will be returned in the response. The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see <a href="#">POST Enrollment PFX Deploy on page 711</a>).</li> <li>• Zip<br/>Selecting the Zip option allows you to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.</li> </ul> |

Table 268: POST Enrollment PFX v2 Response Data

| Value                  | Description   |       |             |              |   |          |   |            |  |             |   |            |  |
|------------------------|---|-------|-------------|--------------|---|----------|---|------------|--|-------------|---|------------|--|
| SuccessfulStores       | An object containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.  |       |             |              |   |          |   |            |  |             |   |            |  |
| CertificateInformation | <p>Information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre> </td></tr> </table> | Value | Description | SerialNumber | A string indicating the serial number of the certificate. | IssuerDN | A string indicating the issuer DN of the certificate. | Thumbprint | A string indicating the thumbprint of the certificate. | KeyfactorID | An integer indicating the Keyfactor Command reference ID of the issued certificate. | PKCS12Blob | <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre> |
| Value                  | Description   |       |             |              |   |          |   |            |  |             |   |            |  |
| SerialNumber           | A string indicating the serial number of the certificate.   |       |             |              |   |          |   |            |  |             |   |            |  |
| IssuerDN               | A string indicating the issuer DN of the certificate.   |       |             |              |   |          |   |            |  |             |   |            |  |
| Thumbprint             | A string indicating the thumbprint of the certificate.  |       |             |              |   |          |   |            |  |             |   |            |  |
| KeyfactorID            | An integer indicating the Keyfactor Command reference ID of the issued certificate.   |       |             |              |   |          |   |            |  |             |   |            |  |
| PKCS12Blob             | <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file'  \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre>  |       |             |              |   |          |   |            |  |             |   |            |  |

| Value               | Description   |       |             |  |   |          |   |                    |   |                     |   |                    |  |                    |   |
|---------------------|---|-------|-------------|--|---|----------|---|--------------------|---|---------------------|---|--------------------|--|--------------------|---|
|                     | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td> <p> <b>Note:</b> No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. |-----------------------|--|-------|-------------|-----------------------|--|-------------------|---|
|                       | <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>DispositionMessage</td><td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>  | Value | Description | DispositionMessage    | A string providing a message regarding the enrollment (e.g. The private key was successfully retained.). | EnrollmentContext | An internally used Keyfactor Command field. |
| Value                 | Description  |       |             |                       |  |                   |   |
| DispositionMessage    | A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).   |       |             |                       |  |                   |   |
| EnrollmentContext     | An internally used Keyfactor Command field.  |       |             |                       |  |                   |   |
| Metadata              | <p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>A string containing the name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See <a href="#">Certificate Metadata</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> | Name  | Description | MetadataFieldTypeName | A string containing the name of the metadata field in Keyfactor Command.                                 | Value             | The value of the metadata.                  |
| Name                  | Description  |       |             |                       |  |                   |   |
| MetadataFieldTypeName | A string containing the name of the metadata field in Keyfactor Command.   |       |             |                       |  |                   |   |
| Value                 | The value of the metadata.   |       |             |                       |  |                   |   |

## Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 269: POST Enrollment PFX v1 Input Parameters

| Name                        | In   | Description   |
|-----------------------------|------|---|
| CustomFriendlyName          | Body | <p><b>Required</b>*. A string that sets a custom friendly name for the certificate.</p> <p>This field is <b>required</b> if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>   |
| Password                    | Body | <p><b>Required</b>. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>  |
| PopulateMissingValuesFromAD | Body | <p>A Boolean that sets whether to populate the information in the subject from Active Directory (true) or not (false). The default is <i>false</i>.</p>   |
| Subject                     | Body | <p><b>Required</b>*. A string containing the subject name using X.500 format. For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\ Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>This field is <b>required</b> if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <a href="#">Application Settings: Enrollment Tab</a> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> |
| IncludeChain                | Body | <p>A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i>.</p>  |
| ChainOrder                  | Body | <p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>  |
| RenewalCertificateId        | Body | <p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p>   |

| Name                 | In   | Description  |
|----------------------|------|--|
| CertificateAuthority | Body | <p><b>Required</b>*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is <b>required</b>.</p>                   |
| Timestamp            | Body | <p>The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</p>   |
| Template             | Body | <p><b>Required</b>*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is <b>required</b> unless the enrollment is being done against a standalone CA.</p>   |
| Metadata             | Body | <p>An array of key/value pairs that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": {   "AppOwnerFirstName": "William", // This is a String field.   "AppOwnerLastName": "Smith",   "AppOwnerEmailAddress": "willi- am.smith@keyexample.com",   "BusinessCritical": "true",      // This is a Boolean field.   "BusinessUnit": "E-Business",   // This is a Multiple Choice field with a pre-defined value.   "Notes": "Here are some notes.", // This is a BigText field.   "SiteCode": 3,                  // This is an integer field. }</pre> |

| Name                    | In                            | Description   |       |             |        |              |     |          |           |                |     |                             |     |               |     |               |              |                        |                         |                               |                    |                             |

| Name                  | Description  |       |             |                       |  |       |                            |
| MetadataFieldTypeName | A string containing the name of the metadata field in Keyfactor Command.   |       |             |                       |  |       |                            |
| Value                 | The value of the metadata.   |       |             |                       |  |       |                            |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.14.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

Table 271: POST Enrollment CSR Parse Input Parameters

| Name | In   | Description   |
|------|------|---|
| CSR  | Body | <b>Required.</b> Base-64-encoded CSR with the Begin and End Certificate Request tags. |

Table 272: POST Enrollment CSR Parse Response Data

| Name  | Description  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |

| ST  | The state of the certificate.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| C   | The country (two characters) of the certificate.   |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| E   | The email address of the certificate.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| DNS Name  | A SAN value containing a DNS name.   |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| IP Address  | A SAN value containing an IP v4 or IP v6 address.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| RFC822 Name   | A SAN value containing an email message.   |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| URL   | A SAN value containing a uniform resource identifier.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| Directory Name  | A SAN value containing a directory name.   |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| Registered ID   | A SAN value containing a registered ID.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| Other name:Principal Name   | A SAN value containing a user principal name (UPN) value.  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
| Other name:DS Object Guid   | A SAN value containing the MS_NTDSReplication value.   |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |
|  <b>Note:</b> Some of these fields cannot be added to a CSR generated within Keyfactor |  |      |             |            |  |          |  |    |                                     |   |                                      |    |   |   |                              |    |                               |   |  |   |                                       |          |                                    |            |   |             |  |     |   |                |  |               |   |                           |   |                           |  |

| Name | Description  |
|------|--|
|      |  Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command. |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.14.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 693](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Schedule*  
CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 273: POST Enrollment PFX Deploy Input Parameters

| Name       | Type   | Description  |      |             |         |  |       |   |           |   |            |  |
|------------|--|--|------|-------------|---------|--|-------|---|-----------|---|------------|--|
| Stores     | Body   | <p><b>Required</b>*. An array indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p></td></tr><tr><td>Overwrite</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 253</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td><p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p></td></tr></table> | Name | Description | StoreId | <p>An array of GUIDs indicating the certificate store(s) to which the certificate should be deployed.</p> <p>Use the <i>GET /CertificateStores</i> method (see <a href="#">GET Certificate Stores on page 427</a>) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p> | Alias | <p>The alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> | Overwrite | <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The format of and requirement for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>  |  |      |             |         |  |       |   |           |   |            |  |
| Overwrite  | <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <i>GET /Certificates/Locations/{id}</i> method (see <a href="#">GET Certificates Locations ID on page 253</a>) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>  |  |      |             |         |  |       |   |           |   |            |  |
| Properties | <p>An array of key/value pairs for the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> |  |      |             |         |  |       |   |           |   |            |  |

| Password      | Body  | <b>Required*</b> . A string with a password used to secure the certificate in the certificate store. This field is <b>required</b> for store types that require an entry password, such as PEM stores.  |      |             |  |   |
| CertificateId | Body  | <b>Required*</b> . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> . <div> <b>Note:</b> For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is <b>required</b>. The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.</div>   |      |             |  |   |
| RequestId     | Body  | <b>Required*</b> . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> . <p>See the note under <i>CertificateId</i> regarding when this field is required and</p>  |      |             |  |   |

Table 274: POST Enrollment PFX Deploy Response Data

| Name             | Description  |
|------------------|--|
| SuccessfulStores | <p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div> |
| FailedStores     | An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.14.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 693](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateStoreManagement: *Schedule*  
CertificateEnrollment: *EnrollPFX*

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Note:** You could achieve the same end using the *POST /Enrollment/PFX/Deploy* method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the

*POST /Enrollment/PFX/Replace* method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the *POST /Enrollment/PFX/Deploy* method (see [POST Enrollment PFX Deploy on page 711](#)).

**Tip:** The *POST /Enrollment/PFX/Replace* method must be used within 5 minutes of acquiring a certificate with the *POST /Enrollment/PFX* or *POST /Enrollment/Renew* method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 275: POST Enrollment PFX Replace Input Parameters

| Name                  | In   | Description   |
|-----------------------|------|---|
| ExistingCertificateId | Body | <b>Required.</b> The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found.<br>Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.          |
| CertificateId         | Body | <b>Required*</b> . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request.<br>Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.  |
| RequestId             | Body | <b>Required*</b> . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> request.<br>Either the <i>CertificateId</i> or the <i>RequestId</i> is <b>required</b> but not both.  |
| Password              | Body | <b>Required*</b> . A string with a password used to secure the certificate in the certificate store.<br>This field is <b>required</b> for store types that require an entry password, such as PEM stores.   |
| JobTime               | Body | The date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).<br>Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately. |

Table 276: POST Enrollment PFX Replace Response Data

| Name             | Description  |
|------------------|--|
| SuccessfulStores | <p>An array of GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  <b>Note:</b> Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store.         </div> |
| FailedStores     | An array of GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.14.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
 Certificates: *Read*  
 CertificateEnrollment: *EnrollPFX*

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 711](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 717](#)).

 **Note:** As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to

the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions](#)).

Table 277: POST Enrollment Renew Input Parameters

| Name                 | In   | Description   |
|----------------------|------|---|
| CertificateId        | Body | <b>Required</b> *. The integer for the certificate in Keyfactor Command that needs to be renewed.<br>Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.  |
| Thumbprint           | Body | <b>Required</b> *. The thumbprint for the certificate that needs to be renewed.<br>Either the <i>CertificateId</i> or the <i>Thumbprint</i> is <b>required</b> but not both.  |
| Timestamp            | Body | <b>Required</b> . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |
| CertificateAuthority | Body | <b>Required</b> *. A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>hostname\\logical name</i> format. For example:<br><br>corpca01.keyexample.com\\CorpIssuingCA1<br><br>This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 681</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 684</a> ). |
| Template             | Body | <b>Required</b> *. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.<br><br>This field is <b>required</b> if one-click renewal is not supported for the certificate (see <a href="#">GET Enrollment Available Renewal ID on page 681</a> or <a href="#">GET Enrollment Available Renewal Thumbprint on page 684</a> ).  |

Table 278: POST Enrollment Renew Response Data

| Name               | Description  |
|--------------------|--|
| KeyfactorID        | ID of the certificate in Keyfactor Command.  |
| KeyfactorRequestID | ID of the request in Keyfactor Command.  |
| Thumbprint         | Thumbprint of the certificate.   |
| SerialNumber       | Serial number of the certificate.  |
| IssuerDN           | Issuer DN of the certificate.  |
| RequestDisposition | State of the request (e.g. issued).  |
| DispositionMessage | Enrollment message (e.g. The private key was successfully retained.).  |
| Password           | A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.15 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 279: License Endpoint

| Endpoint | Method | Description                  | Link                              |
|----------|--------|------------------------------|-----------------------------------|
| /        | GET    | Returns the current license. | <a href="#">GET License below</a> |

### 2.5.15.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters. For more information regarding licensing, see *Licensing* in the *Keyfactor Command Reference Guide*.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Read*

Table 280: GET License Response Data

| Name             | Description   |      |             |           |  |             |   |          |   |      |  |    |  |
|------------------|---|------|-------------|-----------|--|-------------|---|----------|---|------|--|----|--|
| KeyfactorVersion | A string indicating the Keyfactor Command version number in the format:<br><div>majorversion.incrementalversion.patchnumber</div>   |      |             |           |  |             |   |          |   |      |  |    |  |

| Quantity         | <p>An integer indicating one of:</p> <ul style="list-style-type: none"> <li>How many of the elements you are licensed for.</li> <li>For those features which have no licensing limits, <i>null</i>.</li> </ul> <p>Unlimited is indicated by 9999999999.</p>  |      |             |           |   |             |  |                  |   |          |   |                |   |             |  |         |  |          |   |                |   |
| ExpirationDate   | This field is unused and will always return <i>null</i> .  |      |             |           |   |             |  |                  |   |          |   |                |   |             |  |         |  |          |   |                |   |

| Name | Description   |
|------|---|
|      |  <b>Tip:</b> Currently there is only one licensed product offered, which is Keyfactor Command. |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.16 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 281: MacEnrollment Endpoints

| Endpoint | Method | Description  | Link   |
|----------|--------|--|--|
| /        | GET    | Returns the current Mac auto-enrollment configuration. | <a href="#">GET MacEnrollment below</a>            |
| /        | PUT    | Updates the Mac auto-enrollment configuration.         | <a href="#">PUT MacEnrollment on the next page</a> |

### 2.5.16.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SystemSettings: Read

Table 282: GET MacEnrollment Response Data

| Name          | Description   |
|---------------|---|
| Id            | An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.   |
| Enabled       | An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).   |
| Interval      | An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.   |
| UseMetadata   | A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false).<br>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.   |
| MetadataField | A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.  |
| MetadataValue | A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.16.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SystemSettings: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 283: PUT MacEnrollment Response Data

| Name          | In   | Description   |
|---------------|------|---|
| Id            | Body | An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.   |
| Enabled       | Body | An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).   |
| Interval      | Body | An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.   |
| UseMetadata   | Body | <p>A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false).</p> <p>See in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.</p>  |
| MetadataField | Body | A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .  |
| MetadataValue | Body | A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available. |

Table 284: PUT MacEnrollment Response Data

| Name          | Description   |
|---------------|---|
| Id            | An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.   |
| Enabled       | An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).   |
| Interval      | An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.   |
| UseMetadata   | A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false).<br>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.   |
| MetadataField | A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.  |
| MetadataValue | A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.17 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 285: MetadataFields Endpoints

| Endpoint | Method | Description  | Link  |
|----------|--------|--|---|
| /id}     | DELETE | Deletes an existing metadata field.                            | <a href="#">DELETE MetadataFields ID on the next page</a> |
| /id}     | GET    | Returns detailed information for the specified metadata field. | <a href="#">GET MetadataFields ID</a>                     |

| Endpoint     | Method | Description  | Link  |
|--------------|--------|--|---|
|              |        |  | <a href="#">on page 730</a>                             |
| / {name}     | GET    | Returns detailed information for the specified metadata field.   | <a href="#">GET MetadataFields Name on page 733</a>     |
| / {id}/InUse | GET    | Returns a Boolean stating whether the metadata type is associated with a certificate.                            | <a href="#">GET MetadataFields ID InUse on page 737</a> |
| /            | DELETE | Deletes multiple metadata fields specified in the request body.  | <a href="#">DELETE MetadataFields on page 738</a>       |
| /            | GET    | Returns all metadata field types with paging (number of pages to return and number of results per page) options. | <a href="#">GET MetadataFields on page 739</a>          |
| /            | POST   | Creates a new metadata field using values supplied in the request body.  | <a href="#">POST MetadataFields on page 743</a>         |
| /            | PUT    | Updates an existing metadata field using values supplied in the request body.                                    | <a href="#">PUT MetadataFields on page 751</a>          |

### 2.5.17.1 DELETE MetadataFields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 286: DELETE MetadataFields {id} Input Parameters

| Name  | In    | Description   |
|-------|-------|---|
| id    | Path  | <b>Required.</b> The Keyfactor Command reference ID for the metadata field to be deleted.<br>Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields on page 739</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID.  |
| Force | Query | A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> .<br>Use the <i>GET /MetadataFields/{id}/InUse</i> method (see <a href="#">GET MetadataFields ID InUse on page 737</a> ) to determine whether a metadata field is in use. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.17.2 GET MetadataFields ID

The *GET /MetadataFields/{id}* method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 287: GET MetadataFields {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field.<br>Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields on page 739</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID. |

Table 288: GET MetadataFields {id} Response Data

| Name        | Description   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|---|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | A string indicating the description for the metadata field.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | <p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>   | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | <p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | <p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | Description   |       |             |   |  |   |  |   |  |
|------------|---|-------|-------------|---|--|---|--|---|--|
|            | <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</p>  |       |             |   |  |   |  |   |  |
| Enrollment | <p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional<br/>Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required<br/>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden<br/>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</p> | Value | Description | 0 | Optional<br>Users have the option to either enter a value or not enter a value in the field. | 1 | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page. | 2 | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page. |
| Value      | Description   |       |             |   |  |   |  |   |  |
| 0          | Optional<br>Users have the option to either enter a value or not enter a value in the field.  |       |             |   |  |   |  |   |  |
| 1          | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.  |       |             |   |  |   |  |   |  |
| 2          | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.  |       |             |   |  |   |  |   |  |
| Message    | <p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</p>  |       |             |   |  |   |  |   |  |
| Options    | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>   |       |             |   |  |   |  |   |  |

| Name           | Description  |
|----------------|--|
|                |  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).   |
| DefaultValue   | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | <p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.17.3 GET MetadataFields Name

The GET /MetadataFields/{name} method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 289: GET MetadataFields {name} Input Parameters

| Name | In   | Description  |
|------|------|--|
| name | Path | <b>Required.</b> A string that indicates the name of the metadata field. This value is not case sensitive. |

Table 290: GET MetadataFields {name} Response Data

| Name        | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|--|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | <p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>  | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | <p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | Description   |       |             |   |  |   |  |   |  |
|------------|---|-------|-------------|---|--|---|--|---|--|
|            | <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. This field still appears on the certificate details and the Add Certificate page. |
| Value      | Description   |       |             |   |  |   |  |   |  |
| 0          | Optional<br>Users have the option to either enter a value or not enter a value in the field.  |       |             |   |  |   |  |   |  |
| 1          | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.  |       |             |   |  |   |  |   |  |
| 2          | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.  |       |             |   |  |   |  |   |  |
| Message    | <p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</p>  |       |             |   |  |   |  |   |  |
| Options    | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>   |       |             |   |  |   |  |   |  |

| Name           | Description  |
|----------------|--|
|                |  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).   |
| DefaultValue   | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | <p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.17.4 GET MetadataFields ID InUse

The GET /MetadataFields/{id}/InUse method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is

useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 291: GET MetadataFields {id} In Use Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields on the next page</a> ) to retrieve a list of all the metadata fields to determine the metadata field's ID. |

Table 292: GET MetadataFields {id} In Use Response Data

| Name | Description   |
|------|---|
|      | A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name. |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon () at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.17.5 DELETE MetadataFields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. The metadata fields IDs should be supplied in the request body as a JSON array of integers. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 293: DELETE MetadataFields Input Parameters

| Name  | In    | Description  |
|-------|-------|--|
| ids   | Body  | <b>Required.</b> An array of Keyfactor Command reference IDs for the metadata fields to be deleted.<br>Use the <i>GET /MetadataFields</i> method (see <a href="#">GET MetadataFields below</a> ) to retrieve a list of all the metadata fields to determine the metadata field IDs.                                    |
| Force | Query | A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see <a href="#">GET MetadataFields ID InUse on page 737</a> ) to determine whether a metadata field is in use. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.17.6 GET MetadataFields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Read*

Table 294: GET MetadataFields Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Logons Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• <i>Name</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 295: GET MetadataFields Response Data

| Name        | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|--|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | <p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>  | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | <p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | Description   |       |             |   |  |   |  |   |  |
|------------|---|-------|-------------|---|--|---|--|---|--|
|            | <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>  |       |             |   |  |   |  |   |  |
| Enrollment | <p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional<br/>Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required<br/>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden<br/>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div> | Value | Description | 0 | Optional<br>Users have the option to either enter a value or not enter a value in the field. | 1 | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page. | 2 | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page. |
| Value      | Description   |       |             |   |  |   |  |   |  |
| 0          | Optional<br>Users have the option to either enter a value or not enter a value in the field.  |       |             |   |  |   |  |   |  |
| 1          | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.  |       |             |   |  |   |  |   |  |
| 2          | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.  |       |             |   |  |   |  |   |  |
| Message    | <p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>  |       |             |   |  |   |  |   |  |
| Options    | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>   |       |             |   |  |   |  |   |  |

| Name           | Description  |
|----------------|--|
|                |  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).   |
| DefaultValue   | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | <p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.17.7 POST MetadataFields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

Table 296: POST MetadataFields Input Parameters

| Name        | In              | Description   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|-----------------|---|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| Name        | Body            | <b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | Body            | <b>Required.</b> A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | Body            | <b>Required.</b> An integer indicating the data type of the metadata field. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></tbody></table>  | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description     |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String          |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer         |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date            |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean         |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text        |   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | Body            | A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field.<br><br>This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | Body            | A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div><pre>^[a-zA-Z0-9'_\.\-]*@(\keyexample\.org keyexample\.com)\$</pre></div><br>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, under- |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | In   | Description  |       |             |   |  |   |  |   |  |

| Message    | Body   | <p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p>   |       |             |   |  |   |  |   |  |

| Name           | In   | Description  |
|----------------|------|--|
|                |      |  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).  |
| Options        | Body | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is <b>required</b> for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).  |
| DefaultValue   | Body | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | Body | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | Body | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | Body | <p>An integer indicating the order in which the metadata field should be</p>   |

| Name | In | Description  |
|------|----|--|
|      |    | displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details). |

Table 297: POST MetadataFields Response Data

| Name        | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|--|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | <p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>  | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | <p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | <p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | Description   |       |             |   |  |   |  |   |  |
|------------|---|-------|-------------|---|--|---|--|---|--|
|            | <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <p> <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</p>  |       |             |   |  |   |  |   |  |
| Enrollment | <p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional<br/>Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required<br/>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden<br/>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <p> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. |----------------|--|
|                |  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).   |
| DefaultValue   | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | <p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.17.8 PUT MetadataFields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
CertificateMetadataTypes: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 298: PUT MetadataFields Input Parameters

| Name        | In              | Description   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|-----------------|---|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | Body            | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | Body            | <b>Required.</b> A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported. |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | Body            | <b>Required.</b> A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden<br/>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certi-ficate page.</td></tr></table> <p>The default is <i>optional</i>.</p> <div> <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>).</div> | Value | Description | 0 | Optional<br>Users have the option to either enter a value or not enter a value in the field. | 1 | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page. | 2 | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certi-ficate page. |
| Value      | Description  |  |       |             |   |  |   |  |   |   |
| 0          | Optional<br>Users have the option to either enter a value or not enter a value in the field.   |  |       |             |   |  |   |  |   |   |
| 1          | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page. |  |       |             |   |  |   |  |   |   |
| 2          | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certi-ficate page.                                    |  |       |             |   |  |   |  |   |   |
| Message    | Body   | A string containing a message to present when a user enters information  |       |             |   |  |   |  |   |   |

| Name           | In   | Description  |
|----------------|------|--|
|                |      | <p>in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>   |
| Options        | Body | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is <b>required</b> for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p> <div>  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>  |
| DefaultValue   | Body | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <div>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div> |
| AllowAPI       | Body | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | Body | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |

| Name         | In   | Description  |
|--------------|------|--|
| DisplayOrder | Body | An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details). |

Table 299: PUT MetadataFields Response Data

| Name        | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
|-------------|--|-------|-------------|---|--------|---|---------|---|------|---|---------|---|-----------------|---|----------|
| ID          | An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Name        | A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Description | A string indicating the description for the metadata field.  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| DataType    | <p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>  | Value | Description | 1 | String | 2 | Integer | 3 | Date | 4 | Boolean | 5 | Multiple Choice | 6 | Big Text |
| Value       | Description  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 1           | String   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 2           | Integer  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 3           | Date   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 4           | Boolean  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 5           | Multiple Choice  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| 6           | Big Text   |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Hint        | <p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>  |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |
| Validation  | <p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> |       |             |   |        |   |         |   |      |   |         |   |                 |   |          |

| Name       | Description   |       |             |   |  |   |  |   |  |
|------------|---|-------|-------------|---|--|---|--|---|--|
|            | <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  <b>Tip:</b> If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>  |       |             |   |  |   |  |   |  |
| Enrollment | <p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional<br/>Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required<br/>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden<br/>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  <b>Tip:</b> If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div> | Value | Description | 0 | Optional<br>Users have the option to either enter a value or not enter a value in the field. | 1 | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page. | 2 | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page. |
| Value      | Description   |       |             |   |  |   |  |   |  |
| 0          | Optional<br>Users have the option to either enter a value or not enter a value in the field.  |       |             |   |  |   |  |   |  |
| 1          | Required<br>Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.  |       |             |   |  |   |  |   |  |
| 2          | Hidden<br>The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.  |       |             |   |  |   |  |   |  |
| Message    | <p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  <b>Tip:</b> If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a>). </div>  |       |             |   |  |   |  |   |  |
| Options    | <p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>   |       |             |   |  |   |  |   |  |

| Name           | Description  |
|----------------|--|
|                |  <b>Tip:</b> If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ).   |
| DefaultValue   | <p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  <b>Tip:</b> If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see <a href="#">GET Templates ID on page 1326</a> ). |
| AllowAPI       | <p>A Boolean that sets whether methods in the Classic API can be used to manipulate data in the metadata record (true) or not (false). The default is <i>true</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>  |
| ExplicitUpdate | <p>A Boolean that sets whether methods in the Classic API must submit an overwrite flag in the request in order to overwrite an existing value in the metadata record (true) or not (false). The default is <i>false</i>. This setting does not apply to the Keyfactor API.</p> <p>This is considered deprecated and may be removed in a future release.</p>   |
| DisplayOrder   | <p>An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.18 Monitoring Revocation

The Monitoring Revocation component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 300: Monitoring Revocation Endpoints

| Endpoint     | Method | Description  | Link  |
|--------------|--------|--|---|
| / {id}       | DELETE | Deletes the revocation monitoring location with the specified ID.  | <a href="#">DELETE Monitoring Revocation ID below</a>           |
| / {id}       | GET    | Returns details for the revocation monitoring location with the specified ID.                                  | <a href="#">GET Monitoring Revocation ID on the next page</a>   |
| /            | PUT    | Edits the revocation monitoring location with the specified ID.  | <a href="#">PUT Monitoring Revocation on page 777</a>           |
| /            | GET    | Returns details for all revocation monitoring location according to the provided filter and output parameters. | <a href="#">GET Monitoring Revocation on page 765</a>           |
| /            | POST   | Creates a new revocation monitoring location.  | <a href="#">POST Monitoring Revocation on page 770</a>          |
| /ResolveOSCP | POST   | Resolves the given OSCP certificate authority.   | <a href="#">POST Monitoring Resolve OSCP on page 784</a>        |
| /Test        | POST   | Tests the revocation monitoring alert with the specified ID.   | <a href="#">POST Monitoring Revocation Test on page 785</a>     |
| /TestAll     | POST   | Tests the revocation monitoring alerts.  | <a href="#">POST Monitoring Revocation Test All on page 787</a> |

### 2.5.18.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 301: DELETE Monitoring Revocation {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 765</a> ) to retrieve a list of all the revocation monitoring locations to determine the ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.18.2 GET Monitoring Revocation ID

The *GET /Monitoring/Revocation/{id}* method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Read*

Table 302: GET Monitoring Revocation {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see <a href="#">GET Monitoring Revocation on page 765</a> ) to retrieve a list of all the revocation monitoring locations to determine the ID. |

Table 303: GET Monitoring Revocation {id} Response Data

| Name           | Description  |       |             |                |  |              |   |            |  |
|----------------|--|-------|-------------|----------------|--|--------------|---|------------|--|
| Id             | An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.  |       |             |                |  |              |   |            |  |
| Name           | A string indicating the name of the revocation monitoring location.  |       |             |                |  |              |   |            |  |
| EndpointType   | A string indicating the type of revocation monitoring endpoint: OCSP or CRL.   |       |             |                |  |              |   |            |  |
| Location       | <p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>   |       |             |                |  |              |   |            |  |
| Email          | <p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table> | Value | Description | EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false).  | WarningDays  | An integer indicating the number of days before expiration to send the warning email.   | Recipients | An object containing a list of strings with email addresses to which the email reminders should be sent. |
| Value          | Description  |       |             |                |  |              |   |            |  |
| EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false).  |       |             |                |  |              |   |            |  |
| WarningDays    | An integer indicating the number of days before expiration to send the warning email.  |       |             |                |  |              |   |            |  |
| Recipients     | An object containing a list of strings with email addresses to which the email reminders should be sent.   |       |             |                |  |              |   |            |  |
| Dashboard      | <p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td></tr> </table>   | Value | Description | Show           | A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). | WarningHours | An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. |            |  |
| Value          | Description  |       |             |                |  |              |   |            |  |
| Show           | A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).   |       |             |                |  |              |   |            |  |
| WarningHours   | An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  |       |             |                |  |              |   |            |  |

| Name | Description        |   |
|------|--------------------|---|
|      | Value              | Description   |
|      | AuthorityKeyId     | A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID). |
|      | SampleSerialNumber | A string indicating the serial number of the CA.  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.18.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*

Table 304: GET Monitoring Revocation Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>DashboardWarningValue</i> (WarningHours value)</li> <li>• <i>DisplayName</i> (Name)</li> <li>• <i>EndpointType</i> (1-CRL, 2-OCSP)</li> <li>• <i>SendWarning</i> (emailreminder) (true, false)</li> <li>• <i>ShowOnDashboard</i> (true, false)</li> <li>• <i>Url</i></li> <li>• <i>WarningDays</i></li> </ul> <div>  <p><b>Tip:</b> To return all revocation monitoring locations of type CRL, use the following query:</p> <p style="text-align: center;">EndpointType -eq 1</p> <p>To return locations of type OCSP, use this query:</p> <p style="text-align: center;">EndpointType -eq 2</p> </div> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 305: GET Monitoring Revocation Response Data

| Name           | Description  |       |             |                |  |              |   |            |  |
|----------------|--|-------|-------------|----------------|--|--------------|---|------------|--|
| Id             | An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.  |       |             |                |  |              |   |            |  |
| Name           | A string indicating the name of the revocation monitoring location.  |       |             |                |  |              |   |            |  |
| EndpointType   | A string indicating the type of revocation monitoring endpoint: OCSP or CRL.   |       |             |                |  |              |   |            |  |
| Location       | <p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>   |       |             |                |  |              |   |            |  |
| Email          | <p>For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr> </table> | Value | Description | EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false).  | WarningDays  | An integer indicating the number of days before expiration to send the warning email.   | Recipients | An object containing a list of strings with email addresses to which the email reminders should be sent. |
| Value          | Description  |       |             |                |  |              |   |            |  |
| EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false).  |       |             |                |  |              |   |            |  |
| WarningDays    | An integer indicating the number of days before expiration to send the warning email.  |       |             |                |  |              |   |            |  |
| Recipients     | An object containing a list of strings with email addresses to which the email reminders should be sent.   |       |             |                |  |              |   |            |  |
| Dashboard      | <p>An array indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td></tr> </table>   | Value | Description | Show           | A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). | WarningHours | An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. |            |  |
| Value          | Description  |       |             |                |  |              |   |            |  |
| Show           | A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).   |       |             |                |  |              |   |            |  |
| WarningHours   | An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.  |       |             |                |  |              |   |            |  |

| Name | Description        |   |
|------|--------------------|---|
|      | Value              | Description   |
|      | AuthorityKeyId     | A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID). |
|      | SampleSerialNumber | A string indicating the serial number of the CA.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.18.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

Table 306: POST Monitoring Revocation Input Parameters

| Name           | In  | Description  |       |             |                |   |             |   |            |  |
|----------------|---|--|-------|-------------|----------------|---|-------------|---|------------|--|
| Id             | Path  | <b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.   |       |             |                |   |             |   |            |  |
| Name           | Body  | <b>Required.</b> A string indicating the name of the revocation monitoring location.   |       |             |                |   |             |   |            |  |
| EndpointType   | Body  | <b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.  |       |             |                |   |             |   |            |  |
| Location       | Body  | <p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> <b>Important:</b> Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p> |       |             |                |   |             |   |            |  |
| Email          | Body  | <p><b>Required*</b>. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>   | Value | Description | EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false. | WarningDays | An integer indicating the number of days before expiration to send the warning email. | Recipients | An object containing a list of strings with email addresses to which the email reminders should be sent. |
| Value          | Description   |  |       |             |                |   |             |   |            |  |
| EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false. |  |       |             |                |   |             |   |            |  |
| WarningDays    | An integer indicating the number of days before expiration to send the warning email.                               |  |       |             |                |   |             |   |            |  |
| Recipients     | An object containing a list of strings with email addresses to which the email reminders should be sent.            |  |       |             |                |   |             |   |            |  |
| Dashboard      | Body  | <b>Required.</b> An array indicating the configuration for display on the dashboard.   |       |             |                |   |             |   |            |  |

| Value                  | Description   |       |             |                        |  |               |   |                 |   |                |  |                    |   |
| CertificateAuthorityId | <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>Use the <a href="#">GET /CertificateAuthority</a> method (see <a href="#">GET Certificate Authority on page 326</a>) to retrieve a list of all the CAs to determine the ID.</p> <p>This value will be null on a response if the endpoint was configured using the <i>CertificateContents</i> option.</p>  |       |             |                        |  |               |   |                 |   |                |  |                    |   |
| AuthorityName          | <p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>   |       |             |                        |  |               |   |                 |   |                |  |                    |   |
| AuthorityNameId        | <p>A base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>   |       |             |                        |  |               |   |                 |   |                |  |                    |   |
| AuthorityKeyId         | <p>A base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>  |       |             |                        |  |               |   |                 |   |                |  |                    |   |
| SampleSerialNumber     | <p>A string indicating the serial number of the CA.</p>   |       |             |                        |  |               |   |                 |   |                |  |                    |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.18.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Modify*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 308: PUT Monitoring Revocation {id}Input Parameters

| Name           | In  | Description  |       |             |                |   |             |   |            |  |
|----------------|---|--|-------|-------------|----------------|---|-------------|---|------------|--|
| Id             | Path  | <b>Required.</b> An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.   |       |             |                |   |             |   |            |  |
| Name           | Body  | <b>Required.</b> A string indicating the name of the revocation monitoring location.   |       |             |                |   |             |   |            |  |
| EndpointType   | Body  | <b>Required.</b> A string indicating the type of revocation monitoring endpoint: OCSP or CRL.  |       |             |                |   |             |   |            |  |
| Location       | Body  | <p><b>Required.</b> A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> <b>Important:</b> Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p> |       |             |                |   |             |   |            |  |
| Email          | Body  | <p><b>Required*</b>. for CRL endpoints. For CRL endpoints only, an array indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An object containing a list of strings with email addresses to which the email reminders should be sent.</td></tr></table>   | Value | Description | EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false. | WarningDays | An integer indicating the number of days before expiration to send the warning email. | Recipients | An object containing a list of strings with email addresses to which the email reminders should be sent. |
| Value          | Description   |  |       |             |                |   |             |   |            |  |
| EnableReminder | A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false. |  |       |             |                |   |             |   |            |  |
| WarningDays    | An integer indicating the number of days before expiration to send the warning email.                               |  |       |             |                |   |             |   |            |  |
| Recipients     | An object containing a list of strings with email addresses to which the email reminders should be sent.            |  |       |             |                |   |             |   |            |  |
| Dashboard      | Body  | <b>Required.</b> An array indicating the configuration for display on the dashboard.   |       |             |                |   |             |   |            |  |

| Name         | In   | Description  |             |             |  |   |              |  |      |             |         |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.18.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: WorkflowManagement: *Modify*

Table 310: POST Monitoring Resolve OCSP Input Parameters

| Name                   | In   | Description   |
|------------------------|------|---|
| CertificateContents    | Body | <b>Required*</b> . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve.<br>One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.   |
| CertificateAuthorityId | Body | <b>Required*</b> . An integer indicating the Keyfactor Command reference ID of the CA in the database.<br>Use the <i>GET /CertificateAuthority</i> method (see <a href="#">GET Certificate Authority on page 326</a> ) to retrieve a list of all the CAs to determine the ID.<br>One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both. |

Table 311: POST Monitoring Resolve OCSP Response Data

| Name                   | Description   |
|------------------------|---|
| CertificateAuthorityId | An integer indicating the Keyfactor Command reference ID of the CA in the database. |
| AuthorityName          | A string indicating the resolved certificate authority's name in X.500 format.      |
| AuthorityNameId        | A string indicating the hash of the certificate authority's name in hex format.     |
| AuthorityKeyId         | A string indicating the public key of the certificate authority's certificate.      |
| SampleSerialNumber     | A string indicating the serial number of the certificate authority's certificate.   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.18.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

**Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 312: POST Monitoring Revocation Test Input Parameters

| Name                                 | In  | Description   |      |             |         |   |                |   |            |  |

The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An object containing the recipient(s) for the alert.</td></tr> </table> | Name | Description | Subject | A string indicating the email message subject for each alert. The content of this subject is not user configurable. | Message | A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable. | Recipients | An object containing the recipient(s) for the alert. |
| Name                       | Description  |      |             |         |   |         |  |            |  |
| Subject                    | A string indicating the email message subject for each alert. The content of this subject is not user configurable.  |      |             |         |   |         |  |            |  |
| Message                    | A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.   |      |             |         |   |         |  |            |  |
| Recipients                 | An object containing the recipient(s) for the alert.   |      |             |         |   |         |  |            |  |
| AlertBuildResult           | A string indicating the outcome of the test (e.g. Success).  |      |             |         |   |         |  |            |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.18.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

 **Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log

for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
WorkflowManagement: *Read*  
WorkflowManagement: *Test*

Table 314: POST Monitoring Revocation Test All Input Parameters

| Name                                 | In   | Description  |      |             |                |  |            |  |

| Message                    | A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.   |      |             |         |   |         |  |            |  |
| Recipients                 | An object containing the recipient(s) for the alert.   |      |             |         |   |         |  |            |  |
| AlertBuildResult           | A string indicating the outcome of the test (e.g. Success).  |      |             |         |   |         |  |            |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.19 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 316: Orchestrator Jobs Endpoints

| Endpoint        | Method | Description   | Link   |
|-----------------|--------|---|--|
| /JobStatus/Data | GET    | Retrieves the results of a custom job using the provided information.                   | <a href="#">GET Orchestrator Jobs Job Status Data on the next page</a> |
| /JobHistory     | GET    | Returns the details of history records on orchestrator jobs, including in-process jobs. | <a href="#">GET Orchestrator Jobs Job History on page 792</a>          |
| /ScheduledJobs  | GET    | Returns the details of active scheduled jobs, including in-process jobs.                | <a href="#">GET Orchestrator Jobs Scheduled Jobs on</a>                |

| Endpoint     | Method | Description   | Link   |
|--------------|--------|---|--|
|              |        |   | <a href="#">page 798</a>                                       |
| /Custom      | POST   | Schedules a custom job on the orchestrator using the provided information.      | <a href="#">POST Orchestrator Jobs Custom on page 802</a>      |
| /Reschedule  | POST   | Reschedules a failed orchestrator job.  | <a href="#">POST Orchestrator Jobs Reschedule on page 807</a>  |
| /Unschedule  | POST   | Unschedules an active orchestrator job.   | <a href="#">POST Orchestrator Jobs Unschedule on page 809</a>  |
| /Acknowledge | POST   | Sets the status of a failed orchestrator job to acknowledged.                   | <a href="#">POST Orchestrator Jobs Acknowledge on page 810</a> |
| /Custom/Bulk | POST   | Schedules a custom job on multiple orchestrator using the provided information. | <a href="#">POST Orchestrator Jobs Reschedule on page 807</a>  |

### 2.5.19.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

 **Tip:** This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

 **Tip:** If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:

```

2021-08-05 10:47:23.1940
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response
status code does not indicate success: 413 (Request Entity Too Large).

at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_
/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172

```

```
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri,
Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\
work\24\s\src\OrchestratorServices\HttpService.cs:line 38
```

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See *Fetch Logs* in the *Keyfactor Command Reference Guide* for more information.

Table 317: GET Orchestrator Jobs Job Status Data Input Parameters

| Name         | In    | Description   |
|--------------|-------|---|
| jobHistoryId | Query | <b>Required.</b> The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see <a href="#">GET Orchestrator Jobs Job History below</a> ) to retrieve a list of jobs to determine the job's history ID. |

Table 318: GET Orchestrator Jobs Job Status Data Response Data

| Name         | Description   |
|--------------|---|
| JobHistoryId | An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs. |
| Data         | A string containing up to 2 MB of data returned from the custom job.                                    |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.19.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 319: GET Orchestrator Jobs Job History Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 11</a> to find the ID)</li> <li>• <i>Agent</i> (ClientMachine)</li> <li>• <i>JobId</i></li> <li>• <i>Result</i> (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)</li> <li>• <i>Status</i> (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>Message</i></li> <li>• <i>OperationStart</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_ (Interval), D_ (Daily), W_ (Weekly), M_ ( Monthly), O_ (Once) )</li> <li>• <i>TargetPath</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 320: GET Orchestrator Jobs Job History Response Data

| Name         | Description   |      |             |           |   |          |   |      |             |         |  |       |   |
|--------------|---|------|-------------|-----------|---|----------|---|------|-------------|---------|--|-------|---|
| JobHistoryId | An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.   |      |             |           |   |          |   |      |             |         |  |       |   |
| AgentMachine | A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.   |      |             |           |   |          |   |      |             |         |  |       |   |
| JobId        | A string indicating the Keyfactor Command reference GUID assigned to the job.   |      |             |           |   |          |   |      |             |         |  |       |   |
| Schedule     | <p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table> | Name | Description | Immediate | <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> | Interval | <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre> | Name | Description | Minutes | An integer indicating the number of minutes between each interval. | Daily | A dictionary that indicates a job scheduled to run every day at the same time with the parameter: |
| Name         | Description   |      |             |           |   |          |   |      |             |         |  |       |   |
| Immediate    | <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>   |      |             |           |   |          |   |      |             |         |  |       |   |
| Interval     | <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": {   "Minutes": 60 }</pre>   | Name | Description | Minutes   | An integer indicating the number of minutes between each interval.  |          |   |      |             |         |  |       |   |
| Name         | Description   |      |             |           |   |          |   |      |             |         |  |       |   |
| Minutes      | An integer indicating the number of minutes between each interval.  |      |             |           |   |          |   |      |             |         |  |       |   |
| Daily        | A dictionary that indicates a job scheduled to run every day at the same time with the parameter:   |      |             |           |   |          |   |      |             |         |  |       |   |

| Name   | Description  |      |             |      |  |      |  |      |   |        |  |      |             |      |   |      |  |
|--------|--|------|-------------|------|--|------|--|------|---|--------|--|------|-------------|------|---|------|--|
|        | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. | Time        | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |      |             |         |  |      |  |      |   |     |  |             |  |      |             |      |   |
| JobType     | A string indicating the job type (e.g. IISInventory).  |      |             |         |  |      |  |      |   |     |  |             |  |      |             |      |   |

| Name           | Description   |
|----------------|---|
| OperationStart | The time, in UTC, at which the orchestrator job started.  |
| OperationEnd   | The time, in UTC, at which the orchestrator job finished.   |
| Message        | A string providing the error message for the operation, if any.   |
| Result         | A string indicating the result of the orchestrator job. Possible values are: <ul style="list-style-type: none"> <li>• Unknown</li> <li>• Success</li> <li>• Warning</li> <li>• Failure</li> </ul>   |
| Status         | A string indicating the status of the orchestrator job. Possible values are: <ul style="list-style-type: none"> <li>• Unknown</li> <li>• Waiting</li> <li>• In Process</li> <li>• Completed</li> <li>• Acknowledged</li> <li>• Completed Will Retry</li> </ul>  |
| StorePath      | A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.                        |
| ClientMachine  | A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.19.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Read*

Table 321: GET Orchestrator Jobs Scheduled Jobs Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Job History Search Feature</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>AgentId</i> (The GUID of the orchestrator. Run <a href="#">GET Agents on page 11</a> to find the ID)</li> <li>• <i>Agent Machine</i> (ClientMachine)</li> <li>• <i>AgentPlatform</i> (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator)</li> <li>• <i>JobType</i> (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)</li> <li>• <i>AgentType</i> *Use -contains comparison (Capabilities in <a href="#">GET Agents on page 11</a>)</li> <li>• <i>Requested</i> (DateTime)</li> <li>• <i>ScheduleType</i> (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_( Monthly), O_(Once) )</li> <li>• <i>TargetPath</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 322: GET Orchestrator Jobs Scheduled Jobs Response Data

| Name          | Description   |
|---------------|---|
| Id            | A string indicating the Keyfactor Command reference GUID assigned to the job.   |
| ClientMachine | A string indicating the name of the client machine. The value for this will vary depending on the certificate store type. For example, for a Java keystore or an F5 device, it is the hostname of the machine on which the store is located, but for an Amazon Web Services store, it is the FQDN of the Keyfactor Command Windows Orchestrator. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Target        | A string indicating the server name and path to the certificate store on the target (e.g. appsvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. |

| Name     | Description |
|----------|-------------|
| Schedule |             |

| Name      | Description   |
|-----------|---|
| Requested | The time, in UTC, at which the orchestrator job was initiated and added to the job queue. |
| JobType   | A string indicating the job type (e.g. IISInventory).                                     |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.19.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

**Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 792](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 791](#)) to retrieve the data.

Table 323: POST Orchestrator Jobs Custom Input Parameters

| Name        | In  | Description  |      |             |     |  |           |   |        |   |
|-------------|---|--|------|-------------|-----|--|-----------|---|--------|---|
| AgentId     | Body  | <p><b>Required.</b> A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a>) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p> |      |             |     |  |           |   |        |   |
| JobTypeName | Body  | <p><b>Required.</b> A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 635</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>  |      |             |     |  |           |   |        |   |
| Schedule    | Body  | <p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr></table>   | Name | Description | Off | Turn off a previously configured schedule. | Immediate | <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div> | Weekly | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters: |
| Name        | Description   |  |      |             |     |  |           |   |        |   |
| Off         | Turn off a previously configured schedule.  |  |      |             |     |  |           |   |        |   |
| Immediate   | <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div> |  |      |             |     |  |           |   |        |   |
| Weekly      | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:   |  |      |             |     |  |           |   |        |   |

| Name    | In   | Description   |             |             |   |  |  |             |      |   |      |  |  |   |         |  |  |      |             |      |  |

| Time  | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |   |             |             |  |  |  |             |  |  |     |  |   |  |      |             |      |   |

| Name      | In   | Description   |
|-----------|------|---|
|           |      | <div>  <b>Note:</b> Although the Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <p>The default is <i>Immediate</i>.</p>   |
| JobFields | Body | <p>An array of key/value pairs that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <div> <pre>"JobFields": {   "Favorite Type of Pet": "Rat",   "Mother's Birthday": "1952-05-21" }</pre> </div> <div>  <b>Note:</b> If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value. </div> <p>Use the <code>GET /JobTypes/Custom</code> method (see <a href="#">GET Custom Job Types on page 635</a>) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <div>  <b>Tip:</b> The built-in Fetch Logs job does not have any optional job fields. </div> |

Table 324: POST Orchestrator Jobs Custom Response Data

| Name             | Description   |
|------------------|---|
| JobId            | A string indicating the Keyfactor Command reference GUID for the job.   |
| OrchestratorId   | A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.        |
| JobTypeName      | A string indicating the reference name for the custom job type for the job.                                     |
| Schedule         | An object containing the schedule for the custom job.   |
| JobFields        | An array of key/value pairs that set the values for any optional job fields configured for the custom job type. |
| RequestTimestamp | The date, in UTC, when the custom job was submitted.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.19.5 POST Orchestrator Jobs Reschedule

The POST /OrchestratorJobs/Reschedule method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- Certificate Store Inventory  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 543](#)).
- Custom Jobs scheduled to run Immediately or Exactly Once  
A new custom job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 802](#)).

- **Fetch Logs**  
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 802](#)).
- **SSL Discovery and Monitoring**  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1296](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator**  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 368](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*  
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

**Tip:** Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 325: POST Orchestrator Jobs Reschedule Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| JobAuditIds | Body | <p><b>Required*</b>. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the <a href="#">GET /OrchestratorJobs/JobHistory</a> method (see <a href="#">GET Orchestrator Jobs Job History on page 792</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p> |
| Query       | Body | <p><b>Required*</b>. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Job History Search Feature</a> section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.19.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory  
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 543](#)).
- SSH Synchronization  
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1162](#)).
- SSL Discovery and Monitoring  
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1296](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator or Keyfactor Windows Orchestrator  
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 368](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*  
CertificateStoreManagement: *Schedule*

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 326: POST Orchestrator Jobs Unschedule Input Parameters

| Name   | In   | Description   |
|--------|------|---|
| JobIds | Body | <p><b>Required*</b>. An array of GUIDs indicating the job IDs of the jobs that should be unscheduled.</p> <p>Use the <code>GET /OrchestratorJobs/ScheduledJobs</code> method (see <a href="#">GET Orchestrator Jobs Scheduled Jobs on page 798</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p> |
| Query  | Body | <p><b>Required*</b>. A string containing a query to identify the jobs to unschedule (e.g. <code>field1 -eq value1 AND field2 -gt value2</code>). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Orchestrator Scheduled Job Search Feature</a> section.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.19.7 POST Orchestrator Jobs Acknowledge

The `POST /OrchestratorJobs/Acknowledge` method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see [Application Settings: Agents Tab](#) in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

Table 327: POST Orchestrator Jobs Acknowledge Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| JobAuditIds | Body | <p><b>Required</b>*. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the <a href="#">GET /OrchestratorJobs/JobHistory</a> method (see <a href="#">GET Orchestrator Jobs Job History on page 792</a>) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgement:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p> |
| Query       | Body | <p><b>Required</b>*. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> <a href="#">Job History Search Feature</a> section.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is <b>required</b>, but not both.</p>  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.19.8 POST Orchestrator Jobs Custom Bulk

The POST /OrchestratorJobs/Custom/Bulk method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
AgentManagement: *Modify*

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the [GET /OrchestratorJobs/JobHistory](#) method (see [GET Orchestrator Jobs Job History on page 792](#)) to determine the *JobHistoryId* of the completed job and then use the [GET /OrchestratorJobs/JobStatus/Data](#) method (see [GET Orchestrator Jobs Job Status Data on page 791](#)) to retrieve the data.

Table 328: POST Orchestrator Jobs Custom Bulk Input Parameters

| Name                 | In  | Description   |             |             |  |  |           |   |          |   |      |             |         |  |
|----------------------|---|---|-------------|-------------|--|--|-----------|---|----------|---|------|-------------|---------|--|
| Orches-<br>tratorIds | Body  | <p><b>Required.</b> A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a>) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see <a href="#">GET Agents on page 11</a>) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>   |             |             |  |  |           |   |          |   |      |             |         |  |
| JobTypeNam-<br>e     | Body  | <p><b>Required.</b> A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see <a href="#">GET Custom Job Types on page 635</a>) to retrieve a list of your defined custom job types to determine the job type name to use.</p>  |             |             |  |  |           |   |          |   |      |             |         |  |
| Schedule             | Body  | <p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td></tr></table> | Name        | Description | Off  | Turn off a previously configured schedule. | Immediate | <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> <b>Tip:</b> In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div> | Interval | <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> | Name | Description | Minutes | An integer indicating the number of minutes between each interval. |

| Value                | Description  |       |             |       |   |                |  |
| JobId                | A string indicating the Keyfactor Command reference GUID for the job.  |       |             |       |   |                |  |
| OrchestratorId       | A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.   |       |             |       |   |                |  |
| JobTypeName          | A string indicating the reference name for the custom job type for the job.  |       |             |       |   |                |  |
| Schedule             | An object containing the schedule for the custom job.  |       |             |       |   |                |  |
| JobFields            | An array of key/value pairs that set the values for any optional job fields configured for the custom job type.  |       |             |       |   |                |  |
| RequestTimestamp     | The date, in UTC, when the custom job was submitted.   |       |             |       |   |                |  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.20 PAM Providers

Privileged Access Management (PAM) functionality in Keyfactor Web APIs allows for configuration of third party PAM providers to secure certificate stores. In the current release, both CyberArk and Delinea (formerly Thycotic) are supported. The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM Providers.

Table 330: PamProviders Endpoints

| Endpoint | Method | Description   | Link  |
|----------|--------|---|---|
| / {id}   | DELETE | Deletes a PAM provider.                             | <a href="#">DELETE PAM Providers ID below</a>         |
| / {id}   | GET    | Returns information for the specified PAM provider. | <a href="#">GET PAM Providers ID on the next page</a> |
| /Types   | GET    | Returns a list of all available PAM provider types. | <a href="#">GET PAM Providers Types on page 827</a>   |
| /Types   | POST   | Creates a new PAM provider type.                    | <a href="#">POST PAM Providers Types on page 830</a>  |
| /        | GET    | Returns a list of all the configured PAM providers. | <a href="#">GET PAM Providers on page 833</a>         |
| /        | POST   | Creates a new PAM provider.                         | <a href="#">POST PAM Providers on page 843</a>        |
| /        | PUT    | Updates a PAM provider.                             | <a href="#">PUT PAM Providers on page 862</a>         |

### 2.5.20.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: PrivilegedAccessManagement: *Modify*

Table 331: DELETE PamProviders {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID for the PAM provider to be deleted.<br>Use the <i>GET /PamProviders</i> method (see <a href="#">GET PAM Providers on page 833</a> ) to retrieve a list of all the PAM providers to determine the PAM provider's ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.20.2 GET PAM Providers ID

The *GET /PamProviders/{id}* method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 332: GET PamProviders {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID of the PAM provider to retrieve.<br>Use the <i>GET /PAM/Providers</i> method (see <a href="#">GET PAM Providers on page 833</a> ) to retrieve a list of all the PAM providers to determine the provider's ID. |

Table 333: GET PamProviders {id} Response Data

| Name                | Description   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
|---------------------|---|-------|-------------|----|---|------|--|---------------------|---|-------|-------------|----|---|------|--|--------------|--|
| ID                  | An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Name                | A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Area                | An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| ProviderType        | <p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new</td></tr> </table> </td></tr> </table> | Value | Description | Id | A string indicating the Keyfactor Command reference GUID for the provider type.               | Name | A string indicating the name of the provider type.                         | Provider-TypeParams | <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter. | Name | A string indicating the internal name for the PAM provider type parameter. | DisplayNam-e | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new |
| Value               | Description   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Id                  | A string indicating the Keyfactor Command reference GUID for the provider type.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Name                | A string indicating the name of the provider type.  |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |

| InstanceGuid             | A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| Provider                 | An array containing information about the provider.  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| Provider-TypeParams      | An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |

| Name | Description |               |  |
|------|-------------|---------------|--|
|      | Value       | Description   |  |
|      |             | Value         | Description  |
|      |             | Id            | An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.  |
|      |             | Name          | A string indicating the internal name for the PAM provider type parameter.   |
|      |             | DisplayName   | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider. |
|      |             | DataType      | An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul>   |
|      |             | InstanceLevel | A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.  |
|      |             | Provider-Type | An array containing details for the provider type. Provider type parameters include:   |

| Name | Description |                     |   |
|------|-------------|---------------------|---|
|      | Value       | Description         |   |
|      |             | Value               | Description   |
|      |             | Value               | Description   |
|      |             | Id                  | The Keyfactor Command reference GUID for the PAM provider type parameter.   |
|      |             | Name                | A string indicating the internal name for the PAM provider type parameter.  |
|      |             | Provider-TypeParams | An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider |

| Name         | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |

| Value        | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |
|              | and certificate store records.  |       |             |  |  |       |             |  |  |       |             |  |                                |
| SecureAreald | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p> |       |             |  |  |       |             |  |  |       |             |  |                                |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.20.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 334: GET PamProviders Types Response Data

| Name | Description   |
|------|---|
| Id   | A string containing the Keyfactor Command reference GUID for the PAM provider type. |
| Name | A string containing the name of the PAM provider type.                              |

| Name               | Description  |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |

| 6                  | Rule Name  |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| 7                  | Thycotic Secret ID   |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| 8                  | Rule Key   |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| Name               | A string indicating the internal name for the PAM provider type parameter.   |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| DisplayName        | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.   |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| DataType           | <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul>  |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |
| InstanceLevel      | A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).  |       |             |    |   |       |                        |   |                                    |   |                        |   |                                    |   |                |   |                    |   |           |   |                    |   |          |      |  |             |  |          |   |               |   |

**Example:** For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:

- PrivateArk Safe: The name of the safe in CyberArk containing the certificate

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.20.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Modify*  
SystemSettings: *Read*

Table 335: POST PamProviders Types Input Parameters

| Name          | Description  |       |             |      |  |             |  |          |   |               |  |
|---------------|--|-------|-------------|------|--|-------------|--|----------|---|---------------|--|
| Name          | A string containing the name of the PAM provider type.   |       |             |      |  |             |  |          |   |               |  |
| Parameters    | <p>An array containing parameters for the provider type. Parameter details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i>, this name appears on the Server dialog for the parameter when a user creates a new PAM provider.</td></tr> <tr> <td>DataType</td><td> <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul> </td></tr> <tr> <td>InstanceLevel</td><td> <p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).</p> <div>  <p><b>Example:</b> For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:</p> <ul style="list-style-type: none"> <li>PrivateArk Safe: The name of the safe in CyberArk containing the certificate store password you wish to use.</li> <li>Application ID: The name of the application created in CyberArk for use with Keyfactor Command.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> </div> </td></tr> </table> | Value | Description | Name | A string indicating the internal name for the PAM provider type parameter. | DisplayName | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider. | DataType | <p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul> | InstanceLevel | <p>A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True).</p> <div>  <p><b>Example:</b> For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:</p> <ul style="list-style-type: none"> <li>PrivateArk Safe: The name of the safe in CyberArk containing the certificate store password you wish to use.</li> <li>Application ID: The name of the application created in CyberArk for use with Keyfactor Command.</li> </ul> <p>Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:</p> </div> |
| Value         | Description  |       |             |      |  |             |  |          |   |               |  |
| Name          | A string indicating the internal name for the PAM provider type parameter.   |       |             |      |  |             |  |          |   |               |  |

### 2.5.20.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
PrivilegedAccessManagement: *Read*  
SystemSettings: *Read*

Table 336: GET PamProviders Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Area</i></li> <li>• <i>Name</i></li> <li>• <i>ProviderType</i></li> <li>• <i>SecuredAreald</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 337: GET PamProviders Response Data

| Name                | Description   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
|---------------------|---|-------|-------------|----|---|------|--|---------------------|---|-------|-------------|----|---|------|--|--------------|--|
| ID                  | An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Name                | A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Area                | An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| ProviderType        | <p>An array containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new</td></tr> </table> </td></tr> </table> | Value | Description | Id | A string indicating the Keyfactor Command reference GUID for the provider type.               | Name | A string indicating the name of the provider type.                         | Provider-TypeParams | <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNam-e</td><td>A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i>, this name appears on the PAM provider dialog for the parameter when a user creates a new</td></tr> </table> | Value | Description | Id | An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter. | Name | A string indicating the internal name for the PAM provider type parameter. | DisplayNam-e | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new |
| Value               | Description   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Id                  | A string indicating the Keyfactor Command reference GUID for the provider type.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Name                | A string indicating the name of the provider type.  |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Provider-TypeParams | <p>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. | Value                    | A string indicating the value set for the parameter (e.g. the name of the CyberArk folder where the protected object that stores the username or password resides).  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| InstanceId               | An integer indicating the Keyfactor Command reference ID for the provider. If you are attaching to something with an integer Id, this will be used.  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| InstanceGuid             | A string indicating the Keyfactor Command reference GUID for the provider. If you are attaching to something with a GUID ID, this will be used.  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| Provider                 | An array containing information about the provider.  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |
| Provider-TypeParams      | An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. Provider type parameters values include:  |       |             |    |  |       |   |            |   |              |   |          |   |                     |   |

| Name | Description |               |  |
|------|-------------|---------------|--|
|      | Value       | Description   |  |
|      |             | Value         | Description  |
|      |             | Id            | An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.  |
|      |             | Name          | A string indicating the internal name for the PAM provider type parameter.   |
|      |             | DisplayName   | A string indicating the display name for the PAM provider type parameter. For parameters with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog for the parameter when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider. |
|      |             | DataType      | An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>1 = String</li> <li>2 = Secret</li> </ul>   |
|      |             | InstanceLevel | A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). See example, above.  |
|      |             | Provider-Type | An array containing details for the provider type. Provider type parameters include:   |

| Name | Description |                     |   |
|------|-------------|---------------------|---|
|      | Value       | Description         |   |
|      |             | Value               | Description   |
|      |             | Value               | Description   |
|      |             | Id                  | The Keyfactor Command reference GUID for the PAM provider type parameter.   |
|      |             | Name                | A string indicating the internal name for the PAM provider type parameter.  |
|      |             | Provider-TypeParams | An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider |

| Name         | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |

| Value        | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |
|              | and certificate store records.  |       |             |  |  |       |             |  |  |       |             |  |                                |
| SecureAreald | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p> |       |             |  |  |       |             |  |  |       |             |  |                                |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.20.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

- CertificateStoreManagement: *Modify*
- PrivilegedAccessManagement: *Modify*
- SystemSettings: *Read*

Table 338: POST PamProviders Input Parameters

| Name                | In   | Description  |             |             |   |   |  |  |  |  |       |             |    |   |      |  |             |  |
|---------------------|--|--|-------------|-------------|---|---|--|--|--|--|-------|-------------|----|---|------|--|-------------|--|
| Name                | Body   | <b>Required.</b> A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.   |             |             |   |   |  |  |  |  |       |             |    |   |      |  |             |  |
| Area                | Body   | An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.  |             |             |   |   |  |  |  |  |       |             |    |   |      |  |             |  |
| ProviderType        | Body   | <div>An array containing details about the provider type for the provider. Provider type details include:<table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. |              |      |  | Value  |
|              |      |  | Description  |
|              |      |  | the internal name for the PAM provider type parameter.   |
|              |      |  | Provider-TypeParams  |
|              |      |  | An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records. |
| SecureAreald | Body | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM</p> |  |

| Name | In | Description   |
|------|----|---|
|      |    | <p>provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p> |

Table 339: POST PamProviders Response Data

| Name                | Description   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
|---------------------|---|-------|-------------|----|---|------|--|---------------------|---|-------|-------------|----|---|------|--|--------------|--|
| ID                  | An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Name                | A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |
| Area                | An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.   |       |             |    |   |      |  |                     |   |       |             |    |   |      |  |              |  |

|      |               |             | PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the Server dialog for the parameter when a user creates a new PAM provider.   |
|      | DataType      |             | An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> <li>• 1 = String</li> <li>• 2 = Secret</li> </ul>  |
|      | InstanceLevel |             | A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a certificate store to use the PAM provider (True). <div>  <b>Example:</b> For CyberArk when defining a PAM provider, you configure two CyberArk-specific fields:           <ul style="list-style-type: none"> <li>• PrivateArk Safe: The name of the safe in CyberArk containing the certificate store password you wish to use.</li> <li>• Application ID: The name of the application created in CyberArk for use with Keyfactor Command.</li> </ul>           Because these fields are configured on the PAM provider definition, they appear as InstanceLevel=False like so:         </div> |

| Value        | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |
|              | and certificate store records.  |       |             |  |  |       |             |  |  |       |             |  |                                |
| SecureAreald | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p> |       |             |  |  |       |             |  |  |       |             |  |                                |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.20.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

- CertificateStoreManagement: *Modify*
- PrivilegedAccessManagement: *Modify*
- SystemSettings: *Read*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 340: PUT PamProviders Input Parameters

| Name                | In  | Description  |             |             |   |   |  |  |  |   |       |             |    |   |      |  |             |  |
|---------------------|---|--|-------------|-------------|---|---|--|--|--|---|-------|-------------|----|---|------|--|-------------|--|
| ID                  | Body  | <b>Required.</b> An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.   |             |             |   |   |  |  |  |   |       |             |    |   |      |  |             |  |
| Name                | Body  | <b>Required.</b> A string indicating the name of the PAM provider. This name used to identify the PAM provider throughout Keyfactor.   |             |             |   |   |  |  |  |   |       |             |    |   |      |  |             |  |
| Area                | Body  | An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they are used for certificate stores.  |             |             |   |   |  |  |  |   |       |             |    |   |      |  |             |  |
| ProviderType        | Body  | <div>An array containing details about the provider type for the provider.<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><div>An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type parameter.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. | SecureAreald        | Body   | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this</p> |             |             |   |  |  |             |                          |   |  |             |  |                          |                     |  |

| Value        | Description   |       |             |  |  |       |             |  |  |       |             |  |                                |
|              | and certificate store records.  |       |             |  |  |       |             |  |  |       |             |  |                                |
| SecureAreald | <p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>You can create a single PAM provider for each provider type (e.g. CyberArk), however, if you have opted to organize your certificate stores into containers, you will need to create multiple providers to match your container organization structure. The container field in the PAM provider definition is not required, but if one is supplied when creating a PAM provider, the PAM provider can only be used with certificate stores in the matching container. Likewise, a PAM provider defined with no container would be available for selection when setting passwords for any certificate store that also did not specify a container. A PAM provider configured in this way could be used across a variety of certificate stores (e.g. both JKS and F5) as long as they were not in containers.</p> |       |             |  |  |       |             |  |  |       |             |  |                                |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.21 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 342: Reports Endpoints

| Endpoint | Method | Description  | Link                                       |
|----------|--------|--|--|
| /id      | GET    | Returns the built-in report with the specified ID. | <a href="#">GET Reports ID on page 884</a> |

| Endpoint           | Method | Description   | Link  |
|--------------------|--------|---|---|
| /Custom/{id}       | DELETE | Deletes the custom report with the specified ID.                                    | <a href="#">DELETE Reports Custom ID on page 892</a>    |
| /Custom/{id}       | GET    | Returns the custom report with the specified ID.                                    | <a href="#">GET Reports Custom ID on page 893</a>       |
| /Schedules/{id}    | DELETE | Deletes the schedule for the built-in report with the specified schedule ID.        | <a href="#">DELETE Reports Schedules ID on page 894</a> |
| /Schedules/{id}    | GET    | Returns the schedule for the built-in report with the specified schedule ID.        | <a href="#">GET Reports Schedules ID on page 895</a>    |
| / {id} /Parameters | GET    | Returns the parameters for the built-in report with the specified report ID.        | <a href="#">GET Reports ID Parameters on page 899</a>   |
| / {id} /Parameters | PUT    | Updates the parameters for the built-in report with the specified report ID.        | <a href="#">PUT Reports ID Parameters on page 901</a>   |
| /                  | GET    | Returns all built-in reports with filtering and output options.                     | <a href="#">GET Reports on page 903</a>                 |
| /                  | PUT    | Updates the built-in report with the specified ID. Only some fields can be updated. | <a href="#">PUT Reports on page 906</a>                 |
| /Custom            | GET    | Returns all custom reports with filtering and output options.                       | <a href="#">GET Reports Custom on page 909</a>          |
| /Custom            | POST   | Creates a custom report.  | <a href="#">POST Reports Custom on page 911</a>         |
| /Custom            | PUT    | Updates the custom report with the specified ID.                                    | <a href="#">PUT Reports Custom on page 913</a>          |
| / {id} /Schedules  | GET    | Returns the schedule for the built-in report with the specified report ID.          | <a href="#">GET Reports ID Schedules on page 914</a>    |
| / {id} /Schedules  | POST   | Creates a schedule for the built-in report with the specified report ID.            | <a href="#">POST Reports ID Schedules on page 919</a>   |
| / {id} /Schedules  | PUT    | Updates a schedule for the built-in report with the specified report ID.            | <a href="#">PUT Reports ID Schedules on page 929</a>    |

2.5.21.1 GET Reports ID

The GET /Reports/{id} method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 343: GET Reports {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer containing the Keyfactor Command reference ID for the report that should be retrieved.<br><br>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a> ) to retrieve a list of your built-in reports to determine the report ID to use. |

Table 344: GET Reports {id} Response Data

| Name             | Description   |
|------------------|---|
| Id               | An integer containing the Keyfactor Command reference ID for the report.  |
| DisplayName      | <p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).         </div> |
| Description      | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.   |
| ReportPath       | A string containing the name of the report as referenced when retrieving it via Logi Analytics.   |
| VersionNumber    | A string containing the version number for the report.  |
| Categories       | <p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>  |
| ShortName        | A string containing the short reference name for the report.  |
| InNavigator      | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).   |
| Favorite         | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).  |
| RemoveDuplicates | <p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certi-         </div>   |

| Name            | Description  |      |             |    |   |               |  |               |   |
|-----------------|--|------|-------------|----|---|---------------|--|---------------|---|
|                 | <p> ficate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 407</a>). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> |      |             |    |   |               |  |               |   |
| UsesCollection  | A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).  |      |             |    |   |               |  |               |   |

This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).  |      |             |            |  |           |  |             |   |           |  |             |   |
| TemplateIds             | The Keyfactor Command identifiers for the templates to include in the report.   |      |             |            |  |           |  |             |   |           |  |             |   |
| AcceptedScheduleFormats | An array containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.  |      |             |            |  |           |  |             |   |           |  |             |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 345: DELETE Reports Custom {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link to be deleted.<br><br>Use the <i>GET /Reports/Custom</i> method (see <a href="#">GET Reports Custom on page 909</a> ) to retrieve a list of your custom report links to determine the report ID to use. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.3 GET Reports Custom ID

The *GET /Reports/Custom/{id}* method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 346: GET Reports Custom {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link that should be retrieved. |

Table 347: GET Reports Custom {id} Response Data

| Name        | Description  |
|-------------|--|
| CustomURL   | A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).<br><br> <b>Tip:</b> Custom reports are automatically opened in a new browser tab. |
| Id          | An integer containing the Keyfactor Command reference ID for the report link.  |
| DisplayName | A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.   |
| Description | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.  |
| InNavigator | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).  |
| Favorite    | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.21.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 348: DELETE Reports Schedules {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID of the report schedule.<br>Use the GET /Reports method (see <a href="#">GET Reports on page 903</a> ) to retrieve a list of your built-in reports to determine the report ID and then GET /Reports/{id} (see <a href="#">GET Reports ID on page 884</a> ) to retrieve the details for that report to determine the schedule ID to use. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.5 GET Reports Schedules ID

The GET /Reports/Schedules/{id} method is used to return the schedule for the built-in report with the specified **schedule** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the GET /Reports/{id}/Schedules method to return the schedule based on the **report** ID (see [GET Reports ID Schedules on page 914](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 349: GET Reports Schedules {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID of the report schedule.<br>Use the GET /Reports method (see <a href="#">GET Reports on page 903</a> ) to retrieve a list of your built-in reports to determine the report ID and then GET /Reports/{id} (see <a href="#">GET Reports ID on page 884</a> ) to retrieve the details for that report to determine the schedule ID to use. |

Table 350: GET Reports Schedules {id} Response Data

| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
|-------------------|--|------|-------------|------|---|-------|---|------|-------------|------|---|--------|---|
| Id                | The Keyfactor Command reference ID of the report <b>schedule</b> .   |      |             |      |   |       |   |      |             |      |   |        |   |
| SendReport        | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).   |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReport        | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).  |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReportPath    | A string containing the UNC path to which the report will be written, if configured.   |      |             |      |   |       |   |      |             |      |   |        |   |
| ReportFormat      | <p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>  |      |             |      |   |       |   |      |             |      |   |        |   |
| KeyfactorSchedule | <p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table> | Name | Description | Off  | Turn off a previously configured schedule.  | Daily | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). | Weekly | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters: |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Off               | Turn off a previously configured schedule.   |      |             |      |   |       |   |      |             |      |   |        |   |

| StartDate   | The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).   |      |             |            |   |            |   |            |  |           |  |             |   |
| TemplateIds | The Keyfactor Command identifiers for the templates to include in the report.  |      |             |            |   |            |   |            |  |           |  |             |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: Read

Table 351: GET Reports {id} Parameters Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the built-in report the parameter is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p> |

Table 352: GET Reports {id} Parameters Response Data

| Name                | Description   |
|---------------------|---|
| Id                  | The Keyfactor Command reference ID of the report <b>parameter</b> .   |
| ParameterName       | A string containing the short reference name for the report parameter (e.g. EvalDate).  |
| ParameterType       | <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul> |
| DisplayName         | A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).  |
| Description         | A string containing the description for the parameter.  |
| DefaultValue        | <p>A string containing the default value for the parameter.</p> <div>  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.         </div>   |
| DisplayOrder        | An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.  |
| ParameterVisibility | A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.21.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 353: PUT Reports {id} Parameters Input Parameters

| Name         | In   | Description   |
|--------------|------|---|
| id           | Path | <b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the parameter is associated with.<br>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a> ) to retrieve a list of your built-in reports to determine the report ID to use. |
| Id           | Body | <b>Required.</b> The Keyfactor Command reference ID of the report <b>parameter</b> .<br>Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 884</a> ) to retrieve the details for the desired report to determine the parameter ID to use.                         |
| DisplayName  | Body | A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).  |
| Description  | Body | A string containing the description for the parameter.  |
| DefaultValue | Body | A string containing the default value for the parameter. <div> <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.</div>                                      |

Table 354: PUT Reports {id} Parameters Response Data

| Name                | Description   |
|---------------------|---|
| Id                  | The Keyfactor Command reference ID of the report <b>parameter</b> .   |
| ParameterName       | A string containing the short reference name for the report parameter (e.g. EvalDate).  |
| ParameterType       | <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> <li>• Bool</li> <li>• CertAuth (certificate authorities)</li> <li>• Int</li> <li>• Metadata</li> <li>• OrchestratorPool</li> <li>• RelativeDate</li> <li>• SingleCA</li> <li>• SingleMetadata</li> <li>• SSHKeyType</li> <li>• Templates</li> <li>• TimePeriod</li> </ul> |
| DisplayName         | A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).  |
| Description         | A string containing the description for the parameter.  |
| DefaultValue        | <p>A string containing the default value for the parameter.</p> <div>  <b>Tip:</b> Default values that are integers are also stored as strings in this parameter.         </div>   |
| DisplayOrder        | An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.  |
| ParameterVisibility | A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 884](#)).

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 355: GET Reports Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Categories</i> (CertificateCounts, CertificateLifecycle, CertificateLocations, PKIOperations, SecurityVulnerability, SSHKeys)</li> <li>• <i>Custom</i></li> <li>• <i>Favorite</i> (true, false)</li> <li>• <i>InNavigator</i> (true, false)</li> <li>• <i>Scheduled</i> (Number of schedules)</li> </ul> <div>  <p><b>Tip:</b> This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category:</p> <p><code>Categories -contains "PKIOperations"</code></p> </div> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 356: GET Reports Response Data

| Name             | Description   |
|------------------|---|
| Id               | An integer containing the Keyfactor Command reference ID for the report.  |
| Scheduled        | An integer indicating the number of schedules configured for the report.  |
| DisplayName      | <p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  <b>Tip:</b> Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF).         </div> |
| Description      | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.   |
| ReportPath       | A string containing the name of the report as referenced when retrieving it via Logi Analytics.   |
| VersionNumber    | A string containing the version number for the report.  |
| Categories       | <p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> <li>• CertificateCounts</li> <li>• CertificateLifecycle</li> <li>• CertificateLocations</li> <li>• PKIOperations</li> <li>• SecurityVulnerability</li> <li>• SSHKeys</li> </ul>  |
| ShortName        | A string containing the short reference name for the report.  |
| InNavigator      | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).   |
| Favorite         | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).  |
| RemoveDuplicates | A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).   |

| Name           | Description   |
|----------------|---|
|                |  <b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.<br>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 407</a> ). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated. |
| UsesCollection | A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 919](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 929](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 901](#)). This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Modify*

Table 357: PUT Reports Input Parameters

| Name             | In   | Description   |
|------------------|------|---|
| Id               | Body | <p><b>Required.</b> The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>  |
| InNavigator      | Body | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).   |
| Favorite         | Body | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).  |
| RemoveDuplicates | Body | <p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <p><b>Tip:</b> When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see <a href="#">POST Certificate Collections on page 407</a>). Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated. |
| UsesCollection | A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.21.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Read*

Table 359: GET Reports Custom Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | <p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> <li>• <i>Categories</i> (CertificateCounts, CertificateLifecycle, CertificateLocations, PKIOperations, SecurityVulnerability, SSHKeys)</li> <li>• <i>Custom</i></li> <li>• <i>Favorite</i> (true, false)</li> <li>• <i>InNavigator</i> (true, false)</li> <li>• <i>Scheduled</i> (Number of schedules)</li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .  |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 360: GET Reports Custom Response Data

| Name        | Description   |
|-------------|---|
| CustomURL   | <p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p> |
| Id          | An integer containing the Keyfactor Command reference ID for the report link.   |
| DisplayName | A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.  |
| Description | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.   |
| InNavigator | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).   |
| Favorite    | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).  |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 361: POST Reports Custom Input Parameters

| Name        | In   | Description  |
|-------------|------|--|
| CustomURL   | Body | <p><b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <a href="https://my-webserver.keyexample.com/mycustomreport/">https://my-webserver.keyexample.com/mycustomreport/</a>).</p> <div>  <b>Tip:</b> Custom reports are automatically opened in a new browser tab. </div> |
| DisplayName | Body | <p><b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>   |
| Description | Body | <p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>   |
| InNavigator | Body | <p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>  |
| Favorite    | Body | <p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>   |

Table 362: POST Reports Custom Response Data

| Name        | Description   |
|-------------|---|
| CustomURL   | <p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <a href="https://my-webserver.keyexample.com/mycustomreport/">https://my-webserver.keyexample.com/mycustomreport/</a>).</p> <div>  <b>Tip:</b> Custom reports are automatically opened in a new browser tab. </div> |
| Id          | <p>An integer containing the Keyfactor Command reference ID for the report link.</p>  |
| DisplayName | <p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>   |
| Description | <p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>  |
| InNavigator | <p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).</p>  |
| Favorite    | <p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).</p>   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.21.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 363: PUT Reports Custom Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| CustomURL   | Body | <b>Required.</b> A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code> ).<br><br> <b>Tip:</b> Custom reports are automatically opened in a new browser tab. |
| Id          | Body | <b>Required.</b> An integer containing the Keyfactor Command reference ID for the report link.<br>Use the <i>GET /Reports/Custom</i> method (see <a href="#">GET Reports Custom on page 909</a> ) to retrieve a list of your custom report links to determine the report ID to use.   |
| DisplayName | Body | <b>Required.</b> A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.   |
| Description | Body | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.   |
| InNavigator | Body | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .   |
| Favorite    | Body | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .  |

Table 364: PUT Reports Custom Response Data

| Name        | Description  |
|-------------|--|
| CustomURL   | <p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> <b>Tip:</b> Custom reports are automatically opened in a new browser tab.</p> |
| Id          | An integer containing the Keyfactor Command reference ID for the report link.  |
| DisplayName | A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.   |
| Description | A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.  |
| InNavigator | A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).  |
| Favorite    | A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.21.13 GET Reports ID Schedules

The GET `/Reports/{id}/Schedules` method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the `GET /Reports/Schedules/{id}` method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 895](#)).

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
Reports: *Read*

Table 365: GET Reports {id} Schedules Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p> |

Table 366: GET Reports {id} Schedules Response Data

| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
|-------------------|--|------|-------------|------|---|-------|---|------|-------------|------|---|--------|---|
| Id                | The Keyfactor Command reference ID of the report <b>schedule</b> .   |      |             |      |   |       |   |      |             |      |   |        |   |
| SendReport        | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).   |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReport        | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).  |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReportPath    | A string containing the UNC path to which the report will be written, if configured.   |      |             |      |   |       |   |      |             |      |   |        |   |
| ReportFormat      | <p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>  |      |             |      |   |       |   |      |             |      |   |        |   |
| KeyfactorSchedule | <p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table> | Name | Description | Off  | Turn off a previously configured schedule.  | Daily | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). | Weekly | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters: |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Off               | Turn off a previously configured schedule.   |      |             |      |   |       |   |      |             |      |   |        |   |
| Daily             | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>  | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). |       |   |      |             |      |   |        |   |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Time              | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |      |             |      |   |       |   |      |             |      |   |        |   |
| Weekly            | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:  |      |             |      |   |       |   |      |             |      |   |        |   |

| Name    | Description   |      |             |      |   |      |  |      |   |      |  |         |   |      |             |      |   |     |  |
|---------|---|------|-------------|------|---|------|--|------|---|------|--|---------|---|------|-------------|------|---|-----|--|
|         | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": {   "Days": [     "Monday",     "Wednesday",     "Friday"   ],   "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.21.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 367: POST Reports {id} Schedules Input Parameters

| Name              | In   | Description   |
|-------------------|------|---|
| id                | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a>) to retrieve a list of your built-in reports to determine the report ID to use.</p>  |
| SendReport        | Body | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .  |
| SaveReport        | Body | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .   |
| SaveReportPath    | Body | <p><b>Required</b>*. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p><b>Note:</b> The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> <li>• Do not use a trailing “\” in the report path.</li> <li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li> <li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li> </ul> </div> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p> |
| ReportFormat      | Body | <p><b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>  |
| KeyfactorSchedule | Body | <p><b>Required.</b> An array providing the schedule for the report. The schedule can be one of:</p>   |

| Name   | In   | Description   |             |             |   |  |  |  |      |             |      |   |        |  |      |             |      |   |      |  |

| PeriodCount      | The number of days, weeks or months selected to report on.  |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| PeriodSize       | The selected reporting period (day, weeks or months).   |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| Requesters       | The certificate requesters selected to include in the report.   |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| SSHKeyType       | The SSH key type(s) selected to report on.  |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| StartDate        | The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).      |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| TemplateIds      | The Keyfactor Command identifiers for the templates to include in the report.   |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
|                  |   | <p>For example:</p> <pre>"RuntimeParameters": {<br/>  "StartDate": "60-Day-Before",<br/>  "EndDate": "7-Day-Before",<br/>  "Metadata": "AppOwnerFirstName, AppOwnerLastName",<br/>  "Requesters": "jsmith"<br/>}</pre>  |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |

| Name | In | Description   |
|------|----|---|
|      |    | This field is <b>required</b> for reports that have runtime parameters. |

Table 368: POST Reports {id} Schedules Response Data

| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
|-------------------|--|------|-------------|------|---|-------|---|------|-------------|------|---|--------|---|
| Id                | The Keyfactor Command reference ID of the report <b>schedule</b> .   |      |             |      |   |       |   |      |             |      |   |        |   |
| SendReport        | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).   |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReport        | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).  |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReportPath    | A string containing the UNC path to which the report will be written, if configured.   |      |             |      |   |       |   |      |             |      |   |        |   |
| ReportFormat      | <p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>  |      |             |      |   |       |   |      |             |      |   |        |   |
| KeyfactorSchedule | <p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table> | Name | Description | Off  | Turn off a previously configured schedule.  | Daily | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). | Weekly | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters: |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Off               | Turn off a previously configured schedule.   |      |             |      |   |       |   |      |             |      |   |        |   |
| Daily             | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre>  | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). |       |   |      |             |      |   |        |   |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Time              | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).  |      |             |      |   |       |   |      |             |      |   |        |   |
| Weekly            | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:  |      |             |      |   |       |   |      |             |      |   |        |   |

| Name    | Description   |      |             |      |   |      |  |      |   |      |  |         |   |      |             |      |   |     |  |
|---------|---|------|-------------|------|---|------|--|------|---|------|--|---------|---|------|-------------|------|---|-----|--|
|         | <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job.  **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.21.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: Reports: *Modify*

Table 369: PUT Reports {id} Schedules Input Parameters

| Name              | In   | Description   |
|-------------------|------|---|
| id                | Path | <b>Required.</b> The Keyfactor Command reference ID of the built-in <b>report</b> the schedule is associated with.<br>Use the <i>GET /Reports</i> method (see <a href="#">GET Reports on page 903</a> ) to retrieve a list of your built-in reports to determine the report ID to use.  |
| Id                | Body | <b>Required.</b> The Keyfactor Command reference ID of the report <b>schedule</b> .<br>Use the <i>GET /Reports/{id}</i> (see <a href="#">GET Reports ID on page 884</a> ) to retrieve the details for the desired report to determine the schedule ID to use.   |
| SendReport        | Body | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .  |
| SaveReport        | Body | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .   |
| SaveReportPath    | Body | <p><b>Required*</b>. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p><b>Note:</b> The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> <li>• Do not use a trailing “\” in the report path.</li> <li>• Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved.</li> <li>• When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted.</li> </ul> </div> <p>This field is <b>required</b> if <i>SaveReport</i> is set to <i>true</i>.</p> |
| ReportFormat      | Body | <b>Required.</b> A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>   |
| KeyfactorSchedule | Body | <b>Required.</b> An array providing the schedule for the report.  |

| Name   | In   | Description   |             |             |   |  |  |  |      |             |      |   |        |  |      |             |      |   |      |  |

| SSHKeyType       | The SSH key type(s) selected to report on.  |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| StartDate        | The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).      |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |
| TemplateIds      | The Keyfactor Command identifiers for the templates to include in the report.   |   |      |             |          |   |          |   |              |  |                  |  |             |  |            |   |            |   |            |  |           |  |             |   |

For example:

```
"RuntimeParameters": {  
  "StartDate": "60-Day-Before",  
  "EndDate": "7-Day-Before",  
  "Metadata": "AppOwnerFirstName, AppOwnerLastName",  
  "Requesters": "jsmith"  
}
```

| Name | In | Description   |
|------|----|---|
|      |    | This field is <b>required</b> for reports that have runtime parameters. |

Table 370: PUT Reports {id} Schedules Response Data

| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
|-------------------|--|------|-------------|------|---|-------|---|------|-------------|------|---|--------|---|
| Id                | The Keyfactor Command reference ID of the report <b>schedule</b> .   |      |             |      |   |       |   |      |             |      |   |        |   |
| SendReport        | A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).   |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReport        | A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).  |      |             |      |   |       |   |      |             |      |   |        |   |
| SaveReportPath    | A string containing the UNC path to which the report will be written, if configured.   |      |             |      |   |       |   |      |             |      |   |        |   |
| ReportFormat      | <p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> <li>• PDF</li> <li>• Excel</li> <li>• CSV</li> </ul>  |      |             |      |   |       |   |      |             |      |   |        |   |
| KeyfactorSchedule | <p>An array providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table> | Name | Description | Off  | Turn off a previously configured schedule.  | Daily | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {   "Time": "2022-02-25T23:30:00Z" }</pre> | Name | Description | Time | The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2021-05-19T16:23:01Z). | Weekly | A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters: |
| Name              | Description  |      |             |      |   |       |   |      |             |      |   |        |   |
| Off               | Turn off a previously configured schedule.   |      |             |      |   |       |   |      |             |      |   |        |   |
| Daily             | <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today). | TemplateIds | The Keyfactor Command identifiers for the templates to include in the report. |
| Name        | Description  |      |             |            |   |            |   |            |  |           |  |             |   |
| PeriodSize  | The selected reporting period (day, weeks or months).  |      |             |            |   |            |   |            |  |           |  |             |   |
| Requesters  | The certificate requesters selected to include in the report.  |      |             |            |   |            |   |            |  |           |  |             |   |
| SSHKeyType  | The SSH key type(s) selected to report on.   |      |             |            |   |            |   |            |  |           |  |             |   |
| StartDate   | The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).   |      |             |            |   |            |   |            |  |           |  |             |   |
| TemplateIds | The Keyfactor Command identifiers for the templates to include in the report.  |      |             |            |   |            |   |            |  |           |  |             |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.22 Security Identities

The Security Identities component of the Keyfactor API includes methods necessary to list, add, and delete security identities. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 371: Security Identities Endpoints

| Endpoint | Method | Description   | Link   |
|----------|--------|---|--|
| /id}     | DELETE | Deletes the security identity with the specified ID.                        | <a href="#">DELETE Security Identities ID below</a>        |
| /id}     | GET    | Returns permission details for the security identity with the specified ID. | <a href="#">GET Security Identities ID below</a>           |
| /Lookup  | GET    | Validates that the identity with the specified name exists.                 | <a href="#">GET Security Identities Lookup on page 944</a> |
| /        | GET    | Returns all security identities with filtering and output options.          | <a href="#">GET Security Identities on page 945</a>        |
| /        | POST   | Adds a new security identity into Keyfactor Command.                        | <a href="#">POST Security Identities on page 969</a>       |

### 2.5.22.1 DELETE Security Identities ID

The DELETE /Security/Identities/{id} method is used to delete the security identity with the specified ID from Keyfactor Command. Use the [GET /Security/Identities](#) method (see [GET Security Identities on page 945](#)) to determine the ID of the security identity you wish to delete. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 372: DELETE Security Identities {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The ID of the security identity that should be deleted from Keyfactor Command. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.22.2 GET Security Identities ID

The GET /Security/Identities/{id} method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Read*

Table 373: GET Security Identities {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> An integer indicating the Keyfactor Command reference ID of the security identity to retrieve.<br><br>Use the <i>GET /Security/Identities</i> method (see <a href="#">GET Security Identities on page 945</a> ) to retrieve a list of all the security identities to determine the identity's ID. |

Table 374: GET Security Identities {id} Response Data

| Name                   | Description   |      |             |            |  |                |  |
|------------------------|---|------|-------------|------------|--|----------------|--|
| Identity               | <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>   |      |             |            |  |                |  |
| SecuredAreaPermissions | <p>An object containing a series of arrays with information about the global permissions granted to the security identity. Global permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td></tr> <tr> <td>GrantedByRoles</td><td>An object containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre>"SecuredAreaPermissions": [   {     "Permission": "AdminPortal:Read",     "GrantedByRoles": [       "Read Only",       "Staff"     ]   },   {     "Permission": "Reports:Read",     "GrantedByRoles": [       "Read Only"     ]   }, ]</pre> <p>For more information about global permissions, see the <a href="#">Security Roles and Identities</a> page in the <i>Keyfactor Command Reference Guide</i>.</p> | Name | Description | Permission | A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role. | GrantedByRoles | An object containing a list of roles that grant that permission. |
| Name                   | Description   |      |             |            |  |                |  |
| Permission             | A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.  |      |             |            |  |                |  |
| GrantedByRoles         | An object containing a list of roles that grant that permission.  |      |             |            |  |                |  |
| CollectionPermissions  | <p>An object containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p>  |      |             |            |  |                |  |

| Name                 | Description   |      |             |            |   |                |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.22.3 GET Security Identities Lookup

The GET `/Security/Identities/Lookup` method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using `POST /Security/Identities` (see [POST Security Identities on page 969](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Read*

Table 375: GET Security Identities Lookup Input Parameters

| Name | In    | Description   |
|------|-------|---|
| Name | Query | <b>Required.</b> The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@-domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name. |

Table 376: GET Security Identities Lookup Response Data

| Name  | Description  |
|-------|--|
| Valid | A Boolean that indicates whether the provided name is valid (true) or not (false). |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.22.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 377: GET Security Identities Input Parameters

| Name          | In    | Description   |
|---------------|-------|---|
| validate      | Query | A boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> . |
| queryString   |       | <i>Not used.</i>  |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.   |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.   |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .      |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.  |

Table 378: GET Security Identities Response Data

| Name         | Description  |  |    |             |    |      |  |      |      |  |             |      |   |         |      |  |           |      |   |       |      |  |         |      |   |
|--------------|--|--|----|-------------|----|------|--|------|------|--|-------------|------|---|---------|------|--|-----------|------|---|-------|------|--|---------|------|---|
| Id           | An integer containing the Keyfactor Command reference ID for the security identity.  |  |    |             |    |      |  |      |      |  |             |      |   |         |      |  |           |      |   |       |      |  |         |      |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br><div>KEYEXAMPLE\PKI Administrators</div>  |  |    |             |    |      |  |      |      |  |             |      |   |         |      |  |           |      |   |       |      |  |         |      |   |
| IdentityType | A string indicating the type of identity—User or Group.  |  |    |             |    |      |  |      |      |  |             |      |   |         |      |  |           |      |   |       |      |  |         |      |   |
| Roles        | <div>An array containing information about the security roles assigned to the security identity. Role information includes:</div> <table><tr><th>Name</th><th>In</th><th>Description</th></tr><tr><td>Id</td><td>Body</td><td><b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. |                                    |                                    |   |   |      |       |             |  |  |  |                   |         |   |                   |        |  |                                    |      |   |                                    |        |   |
|                                    |                                    |   |   |      |       |             |  |  |  |                   |         |   |                   |        |  |                                    |      |   |                                    |        |   |

| Name  | Description   |  |             |  |
|---|---|--|-------------|--|
|   | In  | Description                                      |             |  |
|   |   | Name   | Value       | Description  |
|   |   |  |             | alerts, and configure the pending alert delivery schedule.   |
|   |   | WorkflowManagement (a.k.a. Alerts)               | Test        | Users can test the pending alerts, including sending email to recipients. Users must also have Read permissions for <i>Workflow</i> .  |
|   |   | WorkflowManagement (a.k.a. Certificate Requests) | Participate | Users can participate in the pending, issued and denied workflow process by approving or denying certificate requests from the Certificate Requests page or from the individual pages reached from links included in alerts in the Management Portal and with related API endpoints. |
| For example:  |   |  |             |  |
| <pre>"Permissions": [<br/>  "AdminPortal:Read",<br/>  "Dashboard:Read"<br/>],</pre> |   |  |             |  |
| Valid   | A Boolean indicating whether the security identity’s audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with. |  |             |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.22.5 POST Security Identities

The POST /Security/Identities method is used to create a new security identity in Keyfactor Command. Use the GET /Security/Identities/Lookup method (see [GET Security Identities Lookup on page 944](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

**Tip:** This method cannot be used to assign roles to an identity. Use the PUT /Security/Roles method (see [PUT Security Roles on page 1061](#)) to assign roles to an identity.

Table 379: POST Security Identities Input Parameters

| Name        | In   | Description   |
|-------------|------|---|
| AccountName | Body | <b>Required.</b> A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example:<br><div>KEYEXAMPLE\PKI Administrators</div> |

Table 380: POST Security Identities Response Data

| Name         | Description   |
|--------------|---|
| Id           | An integer containing the Keyfactor Command identifier for the security identity.   |
| AccountName  | A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example:<br><div>KEYEXAMPLE\PKI Administrators</div>    |
| IdentityType | A string indicating the type of identity—User or Group.   |
| Roles        | An array containing information about the security roles assigned to the security identity. For new security identities, this will be blank.  |
| Valid        | A Boolean that indicates whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.23 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, container and collection-level.

Table 381: Security Roles Permissions Endpoints

| Endpoint                        | Method | Description  | Link   |
|---------------------------------|--------|--|--|
| /{{id}}/Permisssions            | GET    | Returns all permissions associated with the security role that matches the id  | <a href="#">GET Security Roles ID Permissions on the next page</a>         |
| /{{id}}/Permisssions/Global     | GET    | Returns all global permissions associated with the security role that matches the ID.  | <a href="#">GET Security Roles ID Permissions Global on page 973</a>       |
| /{{id}}/Permisssions/Global     | POST   | Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively. | <a href="#">POST Security Roles ID Permissions Global on page 974</a>      |
| /{{id}}/Permisssions/Global     | PUT    | Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively. | <a href="#">PUT Security Roles ID Permissions Global on page 999</a>       |
| /{{id}}/Permisssions/Containers | GET    | Returns all container permissions associated with the security role that matches the ID.   | <a href="#">GET Security Roles ID Permissions Containers on page 1025</a>  |
| /{{id}}/Permisssions/Containers | POST   | Adds container permissions to the security role that matches the ID.   | <a href="#">POST Security Roles ID Permissions Containers on page 1026</a> |
| /{{id}}/Permisssions/Containers | PUT    | Sets container permissions to the security role that matches the ID.   | <a href="#">PUT Security Roles ID Permissions Containers on page 1028</a>  |

| Endpoint                        | Method | Description   | Link  |
|---------------------------------|--------|---|---|
| / {id} /Permissions/Collections | GET    | Returns all collection permissions associated with the security role that matches the ID. | <a href="#">GET Security Roles ID Permissions Collections on page 1030</a>  |
| / {id} /Permissions/Collections | POST   | Adds collection permissions to the security role that matches the ID.                     | <a href="#">POST Security Roles ID Permissions Collections on page 1031</a> |
| / {id} /Permissions/Collections | PUT    | Sets collection permissions to the security role that matches the ID.                     | <a href="#">PUT Security Roles ID Permissions Collections on page 1032</a>  |

### 2.5.23.1 GET Security Roles ID Permissions

The GET /Security/Roles/{id}/Permissions method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 382: GET Security Roles {id} Permissions Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a>) to retrieve a list of all the security roles to determine the role's ID.</p> |

Table 383: GET Security Roles {id} Permissions Response Data

| Name       | Description  |      |             |      |  |      |   |            |   |
|------------|--|------|-------------|------|--|------|---|------------|---|
|            | <p>An object containing information about the permissions granted to the security role.  **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.23.2 GET Security Roles ID Permissions Global

The GET /Security/Roles/{id}/Permissions/Global method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 384: GET Security Roles {id} Global Permissions Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve global permissions.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a>) to retrieve a list of all the security roles to determine the role's ID.</p> |

Table 385: GET Security Roles {id} Global Permissions Response Data

| Name       | Description  |      |             |      |   |            |   |

| Name       | Description  |      |             |      |   |            |   |
| Area       | A string containing the name of the permission (e.g. Certificates).  |      |             |      |   |            |   |
| Permission | A string indicating the permission level granted in the area for this role (e.g. Read).  |      |             |      |   |            |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.23.3 POST Security Roles ID Permissions Global

The POST /Security/Roles/{id}/Permissions/Global method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

**Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 386: POST Security Roles {id}Global Permissions Input Parameters

| Name       | Description  |      |             |      |   |            |   |
|------------|--|------|-------------|------|---|------------|---|
|            | <p>An object containing information about the global permissions granted to the security role. Details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr> <tr> <td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr> </table> | Name | Description | Area | A string containing the name of the permission (e.g. Certificates). | Permission | A string indicating the permission level granted in the area for this role (e.g. Read). |
| Name       | Description  |      |             |      |   |            |   |
| Area       | A string containing the name of the permission (e.g. Certificates).  |      |             |      |   |            |   |
| Permission | A string indicating the permission level granted in the area for this role (e.g. Read).  |      |             |      |   |            |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.4 PUT Security Roles ID Permissions Global

The PUT /Security/Roles/{id}/Permissions/Global method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
`SecuritySettings: Read`

Table 390: GET Security Roles {id} Permissions Containers Input Parameters

| Name | In   | Description  |
|------|------|--|

### 2.5.23.6 POST Security Roles ID Permissions Containers

The `POST /Security/Roles/{id}/Permissions/Containers` method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 392: POST Security Roles {id} Permissions Containers Input Parameters

### 2.5.23.7 PUT Security Roles ID Permissions Containers

The PUT /Security/Roles/{id}/Permissions/Containers method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 394: PUT Security Roles {id} Permissions Containers Input Parameters

| Name                 | In  | Description  |      |             |             |   |            |   |

| Permission  | A string indicating the permission granted on the entity for this role.   |      |             |             |   |      |  |            |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.23.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 396: GET Security Roles {id} Permissions Collections Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions.<br><br>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a> ) to retrieve a list of all the security roles to determine the role's ID. |

Table 397: GET Security Roles {id} Permissions Collections Response Data

| Name         | Description  |      |             |              |  |      |  |            |   |
|--------------|--|------|-------------|--------------|--|------|--|------------|---|
|              | An object containing information about the certificate collection permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>An integer containing the collection ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate collection .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table> | Name | Description | CollectionId | An integer containing the collection ID. | Name | A string containing the name of the certificate collection . | Permission | A string indicating the permission granted on the entity for this role. |
| Name         | Description  |      |             |              |  |      |  |            |   |
| CollectionId | An integer containing the collection ID.   |      |             |              |  |      |  |            |   |
| Name         | A string containing the name of the certificate collection .   |      |             |              |  |      |  |            |   |
| Permission   | A string indicating the permission granted on the entity for this role.  |      |             |              |  |      |  |            |   |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.23.9 POST Security Roles ID Permissions Collections

The POST/Security/Roles/{id}/Permissions/Collections method is used to add new collection permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

 **Important:** Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

 **Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 398: POST Security Roles {id} Permissions Collections Input Parameters

| Name                  | In   | Description   |      |             |              |   |            |  |
|-----------------------|--|---|------|-------------|--------------|---|------------|--|

#### 2.5.23.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

**Important:** Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

**Note:** The API Endpoint utility displays a list of valid global permissions on the endpoint.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 400: PUT Security Roles {id} Permissions Collections Input Parameters

| Name                  | In  | Description  |      |             |              |  |            |   |
|-----------------------|---|--|------|-------------|--------------|--|------------|---|

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## 2.5.24 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles. The permissions set with these methods are used to control access to all aspects of Keyfactor Command.

Table 402: Security Roles Endpoints

| Endpoint           | Method | Description   | Link  |
|--------------------|--------|---|---|
| / {id}             | DELETE | Deletes the security role with the specified ID.  | <a href="#">DELETE Security Roles ID below</a>                |
| / {id}             | GET    | Returns details for the security role with the specified ID, including permissions granted to the role and security identities assigned the role. | <a href="#">GET Security Roles ID on the next page</a>        |
| / {id} /Identities | GET    | Returns the security identities assigned to the security role with the specified ID.  | <a href="#">GET Security Roles ID Identities on page 1037</a> |
| / {id} /Identities | PUT    | Updates the security identities assigned to the security role with the specified ID.  | <a href="#">PUT Security Roles ID Identities on page 1038</a> |
| /                  | GET    | Returns all security roles with filtering and output options.   | <a href="#">GET Security Roles on page 1039</a>               |
| /                  | POST   | Adds a new security role.   | <a href="#">POST Security Roles on page 1042</a>              |
| /                  | PUT    | Updates the security role with the specified ID.  | <a href="#">PUT Security Roles on page 1061</a>               |
| / {id} /Copy       | POST   | Adds a new security role by copying the existing security role with the specified ID.   | <a href="#">POST Security Roles ID Copy on page 1080</a>      |

### 2.5.24.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the GET /Security/Roles method (see [GET Security Roles on page 1039](#)) to determine the ID of

the security role you wish to delete. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 403: DELETE Security Roles {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The ID of the security role that should be deleted from Keyfactor Command. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.24.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Read*

Table 404: GET Security Roles {id} Input Parameters

| Name | In   | Description   |
|------|------|---|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a> ) to retrieve a list of all the security roles to determine the role's ID. |

Table 405: GET Security Roles {id} Response Data

| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
|--------------|--|------|-------------|----|---|-------------|--|--------------|---|-----|---|
| Id           | An integer containing the Keyfactor Command identifier for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Name         | A string containing the short reference name for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Description  | A string containing the description for the security role.   |      |             |    |   |             |  |              |   |     |   |
| Enabled      | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.  |      |             |    |   |             |  |              |   |     |   |
| Immutable    | A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.  |      |             |    |   |             |  |              |   |     |   |
| Valid        | A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.   |      |             |    |   |             |  |              |   |     |   |
| Private      | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br>This is considered deprecated and may be removed in a future release.   |      |             |    |   |             |  |              |   |     |   |
| Identities   | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br/>KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | AccountName | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators | IdentityType | A string indicating the type of identity—User or Group. | SID | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. |
| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
| Id           | An integer containing the Keyfactor Command identifier for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators   |      |             |    |   |             |  |              |   |     |   |
| IdentityType | A string indicating the type of identity—User or Group.  |      |             |    |   |             |  |              |   |     |   |
| SID          | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| Permissions  | An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.   |      |             |    |   |             |  |              |   |     |   |

| Name | Description   |
|------|---|
|      | <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.24.3 GET Security Roles ID Identities

The GET /Security/Roles/{id}/Identities method is used to return the security identities assigned to a security role by security role ID. This method returns HTTP 200 OK on a success with details of the security identities assigned to the specified security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: Read

Table 406: GET Security Roles {id} Identities Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to retrieve security identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a>) to retrieve a list of all the security roles to determine the role's ID.</p> |

Table 407: GET Security Roles {id} Identities Response Data

| Name | Description  |      |             |    |   |      |   |
|------|--|------|-------------|----|---|------|---|
|      | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>Name</td><td> <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p> </td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | Name | <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p> |
| Name | Description  |      |             |    |   |      |   |
| Id   | An integer containing the Keyfactor Command identifier for the security identity.  |      |             |    |   |      |   |
| Name | <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>  |      |             |    |   |      |   |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.24.4 PUT Security Roles ID Identities

The PUT /Security/Roles{id}/Identities method is used to update security identities assigned to a security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities actively assigned to the security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 408: PUT Security Roles {id} Identities Input Parameters

| Name       | In   | Description  |
|------------|------|--|
| id         | Path | <p><b>Required.</b> The Keyfactor Command reference ID of the security role for which to update identities.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on the next page</a>) to retrieve a list of all the security roles to determine the role's ID.</p>                            |
| identities | Body | <p>An array in which you provide a <b>complete</b> list of the identities that are associated with an Security Role Id.</p> <p>Use the <i>GET /Security/Identities</i> method (see <a href="#">GET Security Identities on page 945</a>) to retrieve a list of all the security identities to determine the identity ID(s).</p> |

Table 409: PUT Security Roles {id} Identities Response Data

| Name | Description   |      |             |    |   |      |  |
|------|---|------|-------------|----|---|------|--|
|      | An array containing information about the security identities assigned to the security role. Identity details include: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr><tr><td>Name</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<div>KEYEXAMPLE\PKI Administrators</div></td></tr></table></div> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | Name | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div> |
| Name | Description   |      |             |    |   |      |  |
| Id   | An integer containing the Keyfactor Command identifier for the security identity.   |      |             |    |   |      |  |
| Name | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>  |      |             |    |   |      |  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

2.5.24.5 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: Read

Table 410: GET Security Roles Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| validate      | Query | A boolean that specifies whether the optional parameter of <i>validate</i> is <b>false</b> , which allows the AuditXML validation to be skipped when loading records, or <b>true</b> (or not specified) in which case validation will occur. The default is <b>true</b> .  |
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Security Role Search Feature</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> <li>• <i>Name</i></li> </ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 411: GET Security Roles Response Data

| Name         | Description   |      |             |    |   |             |   |              |   |     |   |
|--------------|---|------|-------------|----|---|-------------|---|--------------|---|-----|---|
| Id           | An integer containing the Keyfactor Command identifier for the security role.   |      |             |    |   |             |   |              |   |     |   |
| Name         | A string containing the short reference name for the security role.   |      |             |    |   |             |   |              |   |     |   |
| Description  | A string containing the description for the security role.  |      |             |    |   |             |   |              |   |     |   |
| Enabled      | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.   |      |             |    |   |             |   |              |   |     |   |
| Immutable    | A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.   |      |             |    |   |             |   |              |   |     |   |
| Valid        | A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.  |      |             |    |   |             |   |              |   |     |   |
| Private      | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br>This is considered deprecated and may be removed in a future release.  |      |             |    |   |             |   |              |   |     |   |
| Identities   | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br/><code>KEYEXAMPLE\PKI Administrators</code></td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | AccountName | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br><code>KEYEXAMPLE\PKI Administrators</code> | IdentityType | A string indicating the type of identity—User or Group. | SID | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. |
| Name         | Description   |      |             |    |   |             |   |              |   |     |   |
| Id           | An integer containing the Keyfactor Command identifier for the security identity.   |      |             |    |   |             |   |              |   |     |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br><code>KEYEXAMPLE\PKI Administrators</code>   |      |             |    |   |             |   |              |   |     |   |
| IdentityType | A string indicating the type of identity—User or Group.   |      |             |    |   |             |   |              |   |     |   |
| SID          | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.   |      |             |    |   |             |   |              |   |     |   |
| Permissions  | An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.  |      |             |    |   |             |   |              |   |     |   |

| Name | Description   |
|------|---|
|      | <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

#### 2.5.24.6 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SecuritySettings: *Modify*

Table 412: POST Security Roles Input Parameters

| Name                                      | In     | Description   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
|---|--------|---|------|-------|-------------|---|------|---|-----------------------|------|--|-----------------------|--------|--|-----------------|------|---|
| Name                                      | Body   | <b>Required.</b> A string containing the short reference name for the security role.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| Description                               | Body   | <b>Required.</b> A string containing the description for the security role.   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| Enabled                                   | Body   | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .<br><br>This is considered deprecated and may be removed in a future release.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| Private                                   | Body   | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br><br>This is considered deprecated and may be removed in a future release.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| Permissions                               | Body   | <p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal<br/>(a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Read</td><td>Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Modify</td><td>Users can modify the agent auto-registration settings.</td></tr> <tr> <td>AgentManagement</td><td>Read</td><td>Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orches-</li> </ul> </td></tr> </table> | Name | Value | Description | AdminPortal<br>(a.k.a. Management Portal) | Read | Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal. | AgentAutoRegistration | Read | Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management. | AgentAutoRegistration | Modify | Users can modify the agent auto-registration settings. | AgentManagement | Read | Users can access the Management Portal areas and API endpoints to: <ul style="list-style-type: none"> <li>View orches-</li> </ul> |
| Name                                      | Value  | Description   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| AdminPortal<br>(a.k.a. Management Portal) | Read   | Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| AgentAutoRegistration                     | Read   | Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |
| AgentAutoRegistration                     | Modify | Users can modify the agent auto-registration settings.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |   |

Table 413: POST Security Roles Response Data

| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
|--------------|--|------|-------------|----|---|-------------|--|--------------|---|-----|---|
| Id           | An integer containing the Keyfactor Command identifier for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Name         | A string containing the short reference name for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Description  | A string containing the description for the security role.   |      |             |    |   |             |  |              |   |     |   |
| Enabled      | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.  |      |             |    |   |             |  |              |   |     |   |
| Immutable    | A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.  |      |             |    |   |             |  |              |   |     |   |
| Valid        | A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.   |      |             |    |   |             |  |              |   |     |   |
| Private      | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br>This is considered deprecated and may be removed in a future release.   |      |             |    |   |             |  |              |   |     |   |
| Identities   | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br/>KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | AccountName | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators | IdentityType | A string indicating the type of identity—User or Group. | SID | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. |
| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
| Id           | An integer containing the Keyfactor Command identifier for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators   |      |             |    |   |             |  |              |   |     |   |
| IdentityType | A string indicating the type of identity—User or Group.  |      |             |    |   |             |  |              |   |     |   |
| SID          | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| Permissions  | An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.   |      |             |    |   |             |  |              |   |     |   |

| Name | Description   |
|------|---|
|      | <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre> |

 **Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.24.7 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 414: PUT Security Roles Input Parameters

| Name                                      | In     | Description   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
|---|--------|---|------|-------|-------------|---|------|---|-----------------------|------|--|-----------------------|--------|--|-----------------|------|--|
| Id  | Body   | <b>Required.</b> An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a> ) to retrieve a list of all the security roles to determine the role's ID.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| Name                                      | Body   | <b>Required.</b> A string containing the short reference name for the security role.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| Description                               | Body   | <b>Required.</b> A string containing the description for the security role.   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| Enabled                                   | Body   | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> .<br><br>This is considered deprecated and may be removed in a future release.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| Private                                   | Body   | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br><br>This is considered deprecated and may be removed in a future release.  |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| Permissions                               | Body   | <p>An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. Possible values are:</p> <table> <tr> <th>Name</th><th>Value</th><th>Description</th></tr> <tr> <td>AdminPortal<br/>(a.k.a. Management Portal)</td><td>Read</td><td>Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Read</td><td>Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management.</td></tr> <tr> <td>AgentAutoRegistration</td><td>Modify</td><td>Users can modify the agent auto-registration settings.</td></tr> <tr> <td>AgentManagement</td><td>Read</td><td>Users can access the Management Portal</td></tr> </table> | Name | Value | Description | AdminPortal<br>(a.k.a. Management Portal) | Read | Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal. | AgentAutoRegistration | Read | Users can view the agent auto-registration settings; Users must also have Read permissions for Agent Management. | AgentAutoRegistration | Modify | Users can modify the agent auto-registration settings. | AgentManagement | Read | Users can access the Management Portal |
| Name                                      | Value  | Description   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |
| AdminPortal<br>(a.k.a. Management Portal) | Read   | Users can access the Management Portal. This permission must be enabled for all roles that will access the Management Portal.   |      |       |             |   |      |   |                       |      |  |                       |        |  |                 |      |  |

| Id           | An integer containing the Keyfactor Command identifier for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Name         | A string containing the short reference name for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Description  | A string containing the description for the security role.   |      |             |    |   |             |  |              |   |     |   |
| Enabled      | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.  |      |             |    |   |             |  |              |   |     |   |
| Immutable    | A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.  |      |             |    |   |             |  |              |   |     |   |
| Valid        | A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.   |      |             |    |   |             |  |              |   |     |   |
| Private      | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br>This is considered deprecated and may be removed in a future release.   |      |             |    |   |             |  |              |   |     |   |
| Identities   | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br/>KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | AccountName | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators | IdentityType | A string indicating the type of identity—User or Group. | SID | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. |
| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
| Id           | An integer containing the Keyfactor Command identifier for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators   |      |             |    |   |             |  |              |   |     |   |
| IdentityType | A string indicating the type of identity—User or Group.  |      |             |    |   |             |  |              |   |     |   |
| SID          | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| Permissions  | An object containing the permissions assigned to the role in a comma-separated list of Name:Value pairs.   |      |             |    |   |             |  |              |   |     |   |

| Name | Description   |
|------|---|
|      | <p>For example:</p> <pre>"Permissions": [   "AdminPortal:Read",   "Dashboard:Read" ],</pre> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.24.8 POST Security Roles ID Copy

The POST /Security/Roles{id}/Copy method is used to copy an existing security role in Keyfactor Command to create a new security role. This method returns HTTP 200 OK on a success with the details of the new security role.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature: SecuritySettings: *Modify*

Table 416: POST Security Roles {id} Copy Input Parameters

| Name        | In  | Description   |      |             |      |   |             |  |
|-------------|---|---|------|-------------|------|---|-------------|--|
| id          | Path  | <p><b>Required.</b> The Keyfactor Command reference ID of the security role from which to copy role information.</p> <p>Use the <i>GET /Security/Roles</i> method (see <a href="#">GET Security Roles on page 1039</a>) to retrieve a list of all the security roles to determine the role's ID.</p>  |      |             |      |   |             |  |
| role        | Body  | <p>An array containing information about the new security role to create. Role details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td><p><b>Required.</b> A string containing the short reference name for the security role.</p></td></tr><tr><td>Description</td><td><p><b>Required.</b> A string containing the description for the security role.</p></td></tr></table> | Name | Description | Name | <p><b>Required.</b> A string containing the short reference name for the security role.</p> | Description | <p><b>Required.</b> A string containing the description for the security role.</p> |
| Name        | Description   |   |      |             |      |   |             |  |
| Name        | <p><b>Required.</b> A string containing the short reference name for the security role.</p> |   |      |             |      |   |             |  |
| Description | <p><b>Required.</b> A string containing the description for the security role.</p>          |   |      |             |      |   |             |  |

Table 417: POST Security Roles {id} Copy Response Data

| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
|--------------|--|------|-------------|----|---|-------------|--|--------------|---|-----|---|
| Id           | An integer containing the Keyfactor Command identifier for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Name         | A string containing the short reference name for the security role.  |      |             |    |   |             |  |              |   |     |   |
| Description  | A string containing the description for the security role.   |      |             |    |   |             |  |              |   |     |   |
| Enabled      | A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.  |      |             |    |   |             |  |              |   |     |   |
| Immutable    | A Boolean that indicates whether the security role has been marked as editable (true) or not (false). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.  |      |             |    |   |             |  |              |   |     |   |
| Valid        | A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.   |      |             |    |   |             |  |              |   |     |   |
| Private      | A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> .<br>This is considered deprecated and may be removed in a future release.   |      |             |    |   |             |  |              |   |     |   |
| Identities   | <p>An array containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br/>KEYEXAMPLE\PKI Administrators</td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table> | Name | Description | Id | An integer containing the Keyfactor Command identifier for the security identity. | AccountName | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators | IdentityType | A string indicating the type of identity—User or Group. | SID | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. |
| Name         | Description  |      |             |    |   |             |  |              |   |     |   |
| Id           | An integer containing the Keyfactor Command identifier for the security identity.  |      |             |    |   |             |  |              |   |     |   |
| AccountName  | A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:<br>KEYEXAMPLE\PKI Administrators   |      |             |    |   |             |  |              |   |     |   |
| IdentityType | A string indicating the type of identity—User or Group.  |      |             |    |   |             |  |              |   |     |   |
| SID          | A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.  |      |             |    |   |             |  |              |   |     |   |

## 2.5.25 SSH

The SSH component of the Keyfactor Web APIs includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 418: SSH Endpoints

| Endpoint             | Method | Description  | Link  |
|----------------------|--------|--|---|
| /Keys/Unmanaged/{id} | DELETE | Delete a discovered unmanaged SSH key for the specified ID.                | <a href="#">DELETE SSH Keys Unmanaged ID on page 1087</a> |
| /Keys/Unmanaged/{id} | GET    | Retrieve details for a discovered unmanaged SSH key for the specified ID.  | <a href="#">GET SSH Keys Unmanaged ID on page 1088</a>    |
| /Keys/MyKey          | GET    | Retrieve details for a user's SSH key generated through Keyfactor Command. | <a href="#">GET SSH Keys My Key on page 1089</a>          |
| /Keys/MyKey          | POST   | Generate a new SSH key pair for a user through Keyfactor Command.          | <a href="#">POST SSH Keys My Key on page 1092</a>         |
| /Keys/MyKey          | PUT    | Update an SSH key for a user through Keyfactor Command.                    | <a href="#">PUT SSH Keys My Key on page 1096</a>          |
| /Keys/Unmanaged      | DELETE | Delete one or more discovered unmanaged SSH keys based on a                | <a href="#">DELETE SSH</a>                                |

| Endpoint             | Method | Description   | Link   |
|----------------------|--------|---|--|
|                      |        | selection query.  | <a href="#">Keys Unmanaged on page 1098</a>            |
| /Keys/Unmanaged      | GET    | Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.  | <a href="#">GET SSH Keys Unmanaged on page 1098</a>    |
| /Logons/{id}         | DELETE | Deletes a Linux logon from Keyfactor Command.   | <a href="#">DELETE SSH Logons ID on page 1101</a>      |
| /Logons/{id}         | GET    | Returns information about a Linux logons.   | <a href="#">GET SSH Logons ID on page 1102</a>         |
| /Logons/             | GET    | Returns information about one or more Linux logons.   | <a href="#">GET SSH Logons on page 1104</a>            |
| /Logons/             | POST   | Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server. | <a href="#">POST SSH Logons on page 1106</a>           |
| /Logons/Access       | POST   | Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.   | <a href="#">POST SSH Logons Access on page 1109</a>    |
| /Servers/{id}        | DELETE | Deletes the SSH server with the specified ID.   | <a href="#">DELETE SSH Servers ID on page 1111</a>     |
| /Servers/{id}        | GET    | Returns the SSH server with the specified ID.   | <a href="#">GET SSH Servers ID on page 1112</a>        |
| /Servers/Access/{id} | GET    | Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.                               | <a href="#">GET SSH Servers Access ID on page 1116</a> |
| /Servers/            | GET    | Returns a list of a SSH servers configured in Keyfactor Command.  | <a href="#">GET SSH Servers on</a>                     |

| Endpoint                  | Method | Description   | Link   |
|---------------------------|--------|---|--|
|                           |        |   | <a href="#">page 1118</a>                                    |
| /Servers/                 | POST   | Creates a new SSH server.   | <a href="#">POST SSH Servers on page 1123</a>                |
| /Servers/                 | PUT    | Updates an existing SSH server.   | <a href="#">PUT SSH Servers on page 1128</a>                 |
| /Servers/Access           | DELETE | Deletes Linux logon to user and service account mappings for an SSH server.   | <a href="#">DELETE SSH Servers Access on page 1133</a>       |
| /Servers/Access           | POST   | Creates Linux logon to user and service account mappings for an SSH server.   | <a href="#">POST SSH Servers Access on page 1135</a>         |
| /ServerGroups/{id}        | DELETE | Deletes the SSH server group with the specified ID.   | <a href="#">DELETE SSH Server Groups ID on page 1138</a>     |
| /ServerGroups/{id}        | GET    | Returns the SSH server group with the specified ID.   | <a href="#">GET SSH Server Groups ID on page 1139</a>        |
| /ServerGroups/{name}      | GET    | Returns the SSH server group with the specified name.   | <a href="#">GET SSH Server Groups Name on page 1143</a>      |
| /ServerGroups/Access/{id} | GET    | Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group. | <a href="#">GET SSH Server Groups Access ID on page 1147</a> |
| /ServerGroups/            | GET    | Returns a list of a SSH server groups configured in Keyfactor Command.  | <a href="#">GET SSH Server Groups on page 1150</a>           |
| /ServerGroups/            | POST   | Creates a new SSH server group.   | <a href="#">POST SSH</a>                                     |

| Endpoint                  | Method | Description  | Link   |
|---------------------------|--------|--|--|
|                           |        |  | <a href="#">Server Groups on page 1154</a>                   |
| /ServerGroups/            | PUT    | Updates an existing SSH server group.  | <a href="#">PUT SSH Server Groups on page 1162</a>           |
| /ServerGroups/Access      | DELETE | Deletes Linux logon to user and service account mappings for an SSH server group.                | <a href="#">DELETE SSH Server Groups Access on page 1170</a> |
| /ServerGroups/Access      | POST   | Creates Linux logon to user and service account mappings for an SSH server group.                | <a href="#">POST SSH Server Groups Access on page 1173</a>   |
| /ServiceAccounts/{id}     | DELETE | Deletes the SSH service account with the specified ID.   | <a href="#">DELETE SSH Service Accounts ID on page 1176</a>  |
| /ServiceAccounts/{id}     | GET    | Returns the SSH service account with the specified ID.   | <a href="#">GET SSH Service Accounts ID on page 1179</a>     |
| /ServiceAccounts/Key/{id} | GET    | Returns the public key and optional private key of an SSH service account with the specified ID. | <a href="#">GET SSH Service Accounts Key ID on page 1186</a> |
| /ServiceAccounts/         | DELETE | Deletes one or more SSH service accounts with the specified IDs.                                 | <a href="#">DELETE SSH Service Accounts on page 1190</a>     |
| /ServiceAccounts/         | GET    | Returns a list of SSH service accounts based on the specified filters.                           | <a href="#">GET SSH Service Accounts on page 1192</a>        |
| /ServiceAccounts/         | POST   | Creates a new SSH service account.   | <a href="#">POST SSH Service</a>                             |

| Endpoint                     | Method | Description  | Link   |
|------------------------------|--------|--|--|
|                              |        |  | <a href="#">Accounts on page 1200</a>                            |
| /ServiceAccounts/            | PUT    | Updates an existing SSH service account.                         | <a href="#">PUT SSH Service Accounts on page 1210</a>            |
| /ServiceAccounts/Rotate/{id} | POST   | Generates a new key pair for an existing service account.        | <a href="#">POST SSH Service Accounts Rotate ID on page 1218</a> |
| /Users/{id}                  | DELETE | Deletes the SSH user with the specified ID.                      | <a href="#">DELETE SSH Users ID on page 1222</a>                 |
| /Users/{id}                  | GET    | Returns the SSH user with the specified ID.                      | <a href="#">GET SSH Users ID on page 1223</a>                    |
| /Users/                      | GET    | Returns a list of SSH users based on the specified filters.      | <a href="#">GET SSH Users on page 1228</a>                       |
| /Users/                      | POST   | Creates a new SSH user.  | <a href="#">POST SSH Users on page 1239</a>                      |
| /Users/                      | PUT    | Updates an existing SSH user.                                    | <a href="#">PUT SSH Users on page 1240</a>                       |
| /Users/Access                | POST   | Creates a mapping from the SSH user to one or more Linux logons. | <a href="#">POST SSH Users Access on page 1242</a>               |

### 2.5.25.1 SSH Keys

The SSH Keys component of the Keyfactor Web APIs includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see *SSH Permissions* in the *Keyfactor Command Reference Guide*) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 419: SSH Keys Endpoints

| Endpoint        | Method | Description  | Link   |
|-----------------|--------|--|--|
| /Unmanaged/{id} | DELETE | Delete a discovered unmanaged SSH key for the specified ID.                                | <a href="#">DELETE SSH Keys Unmanaged ID below</a>         |
| /Unmanaged/{id} | GET    | Retrieve details for a discovered unmanaged SSH key for the specified ID.                  | <a href="#">GET SSH Keys Unmanaged ID on the next page</a> |
| /MyKey          | GET    | Retrieve details for a user's SSH key generated through Keyfactor Command.                 | <a href="#">GET SSH Keys My Key on page 1089</a>           |
| /MyKey          | POST   | Generate a new SSH key pair for a user through Keyfactor Command.                          | <a href="#">POST SSH Keys My Key on page 1092</a>          |
| /MyKey          | PUT    | Update an SSH key for a user through Keyfactor Command.                                    | <a href="#">PUT SSH Keys My Key on page 1096</a>           |
| Unmanaged       | DELETE | Delete one or more discovered unmanaged SSH keys based on a selection query.               | <a href="#">DELETE SSH Keys Unmanaged on page 1098</a>     |
| Unmanaged       | GET    | Retrieve details for one or more discovered unmanaged SSH keys based on a selection query. | <a href="#">GET SSH Keys Unmanaged on page 1098</a>        |

## DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 420: DELETE SSH Keys Unmanaged {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID for the unmanaged SSH key to be deleted.<br>Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 1098</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged ID

The *GET /SSH/Keys/Unmanaged/{id}* method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 421: GET SSH Keys Unmanaged {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID for the unmanaged SSH key to be retrieved.<br>Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged on page 1098</a> ) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID. |

Table 422: GET SSH Keys Unmanaged {id} Response Data

| Name           | Description  |
|----------------|--|
| ID             | An integer indicating the Keyfactor Command reference ID for the SSH key.  |
| Fingerprint    | A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.   |
| PublicKey      | A string indicating the public key of the key pair.  |
| KeyType        | A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>   |
| KeyLength      | An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.  |
| DiscoveredDate | The date, in UTC, on which the SSH key was discovered.   |
| Comments       | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment. |
| LogonCount     | An integer indicating the number of Linux logons associated with the SSH key.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 1092](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *User* OR  
SSH: *ServerAdmin* OR

Table 423: GET SSH Keys My Key Input Parameters

| Name                       | In     | Description   |
|----------------------------|--------|---|
| includePrivateKey          | Query  | A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .  |
| x-keyfactor-key-passphrase | Header | <b>Required*</b> . A string that sets a password used to secure the private key of the SSH key pair for download. This field is <b>required</b> if <i>IncludePrivateKey</i> is set to <i>true</i> .<br><br> <b>Tip:</b> This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download. |

Table 424: GET SSH Keys My Key Response Data

| Name         | Description   |
|--------------|---|
| ID           | The Keyfactor Command reference ID for the user's SSH key pair.   |
| Fingerprint  | A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.  |
| PublicKey    | A string indicating the public key of the key pair.   |
| PrivateKey   | A string indicating the private key of the key pair.  |
| KeyType      | A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>   |
| KeyLength    | An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.   |
| CreationDate | The date, in UTC, on which the SSH key pair was created.  |
| StaleDate    | The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Email        | A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.   |
| Comments     | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array. |
| LogonCount   | An integer indicating the number of Linux logons associated with the SSH key pair.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 1109](#), [POST SSH Server Groups Access on page 1173](#), and [POST SSH Servers Access on page 1135](#)). This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:

SSH: *User* OR

SSH: *ServerAdmin* OR

SSH: *EnterpriseAdmin*

Table 425: POST SSH Keys My Key Input Parameters

| Name             | In         | Description   |               |            |   |         |   |         |   |     |
|------------------|------------|---|---------------|------------|---|---------|---|---------|---|-----|
| KeyType          | Body       | <p><b>Required.</b> A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>  | Numeric Value | Text Value | 1 | ECDSA   | 2 | Ed25519 | 3 | RSA |
| Numeric Value    | Text Value |   |               |            |   |         |   |         |   |     |
| 1                | ECDSA      |   |               |            |   |         |   |         |   |     |
| 2                | Ed25519    |   |               |            |   |         |   |         |   |     |
| 3                | RSA        |   |               |            |   |         |   |         |   |     |
| PrivateKeyFormat | Body       | <p><b>Required.</b> A string indicating the format to use for the downloadable private key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>OpenSSH</td></tr><tr><td>2</td><td>PKCS8</td></tr></table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>  | Numeric Value | Text Value | 1 | OpenSSH | 2 | PKCS8   |   |     |
| Numeric Value    | Text Value |   |               |            |   |         |   |         |   |     |
| 1                | OpenSSH    |   |               |            |   |         |   |         |   |     |
| 2                | PKCS8      |   |               |            |   |         |   |         |   |     |
| KeyLength        | Body       | <p><b>Required</b><sup>*</sup>. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and <b>required</b> if the <i>KeyType</i> is set to RSA.</p>  |               |            |   |         |   |         |   |     |
| Email            | Body       | <p><b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>   |               |            |   |         |   |         |   |     |
| Password         | Body       | <p><b>Required.</b> A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div> <b>Tip:</b> This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see <a href="#">GET SSH Keys My Key on page 1089</a>) and encrypt it with a different pass-</div> |               |            |   |         |   |         |   |     |

| Name    | In   | Description  |
|---------|------|--|
|         |      |  word, if desired.  |
| Comment | Body | <p>An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p> <p>  <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery. </p> |

Table 426: POST SSH Keys My Key Response Data

| Name         | Description   |
|--------------|---|
| ID           | The Keyfactor Command reference ID for the user's SSH key pair.   |
| Fingerprint  | A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.  |
| PublicKey    | A string indicating the public key of the key pair.   |
| PrivateKey   | A string indicating the private key of the key pair.  |
| KeyType      | A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>   |
| KeyLength    | An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.   |
| CreationDate | The date, in UTC, on which the SSH key pair was created.  |
| StaleDate    | The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Email        | A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.   |
| Comments     | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array. |
| LogonCount   | An integer indicating the number of Linux logons associated with the SSH key pair.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *User* OR  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

**Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 427: PUT SSH Keys My Key Input Parameters

| Name    | In   | Description   |
|---------|------|---|
| ID      | Body | <b>Required.</b> The Keyfactor Command reference ID for the SSH key.  |
| Email   | Body | <b>Required.</b> A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.  |
| Comment | Body | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks. <div> <b>Note:</b> Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery.</div> |

Table 428: PUT SSH Keys My Key Response Data

| Name         | Description   |
|--------------|---|
| ID           | The Keyfactor Command reference ID for the user's SSH key pair.   |
| Fingerprint  | A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.  |
| PublicKey    | A string indicating the public key of the key pair.   |
| KeyType      | A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>   |
| KeyLength    | An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.   |
| CreationDate | The date, in UTC, on which the SSH key pair was created.  |
| StaleDate    | The date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.<br>The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.   |
| Email        | A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.   |
| Comments     | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array. |
| LogonCount   | An integer indicating the number of Linux logons associated with the SSH key pair.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 429: DELETE SSH Keys Unmanaged Input Parameters

| Name | In   | Description   |
|------|------|---|
| ids  | Body | <p><b>Required.</b> An array of the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <div>[ 4, 27, 89 ]</div> <p>Use the <i>GET /SSH/Keys/Unmanaged</i> method (see <a href="#">GET SSH Keys Unmanaged below</a>) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p> |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

## GET SSH Keys Unmanaged

The GET /SSH/Keys/Unmanaged method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 430: GET SSH Keys Unmanaged Input Parameters

| Name          | In    | Description  |
|---------------|-------|--|
| queryString   | Query | A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide: Using the Unmanaged Keys Search</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"><li>• <i>DiscoveredDate</i></li><li>• <i>KeyComments</i></li><li>• <i>KeyLength</i></li><li>• <i>KeyType</i></li><li>• <i>ServerId</i></li></ul> |
| pageReturned  | Query | An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.  |
| returnLimit   | Query | An integer that specifies how many results to return per page. The default is 50.  |
| sortField     | Query | A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.   |
| sortAscending | Query | An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.   |

Table 431: GET SSH Keys Unmanaged Response Data

| Name           | Description  |
|----------------|--|
| ID             | An integer indicating the Keyfactor Command reference ID for the SSH key.  |
| Fingerprint    | A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.   |
| PublicKey      | A string indicating the public key of the key pair.  |
| KeyType        | A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> <li>• RSA</li> <li>• ECDSA</li> <li>• Ed25519</li> </ul>   |
| KeyLength      | An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.  |
| DiscoveredDate | The date, in UTC, on which the SSH key was discovered.   |
| Comments       | An array containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment. |
| LogonCount     | An integer indicating the number of Linux logons associated with the SSH key.  |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### 2.5.25.2 SSH Logons

The SSH Logons component of the Keyfactor Web APIs includes methods necessary to view and manage the Linux user accounts associated with authorized\_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 432: SSH Logon Endpoints

| Endpoint | Method | Description   | Link  |
|----------|--------|---|---|
| /id}     | DELETE | Deletes a Linux logon from Keyfactor Command.   | <a href="#">DELETE SSH Logons ID below</a>          |

| /        | POST   | Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server. | <a href="#">POST SSH Logons on page 1106</a>        |
| /Access  | POST   | Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.   | <a href="#">POST SSH Logons Access on page 1109</a> |

## DELETE SSH Logons ID

The DELETE /SSH/Logons/{id} method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

**Note:** Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 433: DELETE SSH Logons {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
| id   | Path | <b>Required.</b> The Keyfactor Command reference ID for the SSH logon to be deleted.<br>Use the <i>GET /SSH/Logons</i> method (see <a href="#">GET SSH Logons on page 1104</a> ) to retrieve a list of all the SSH logons to determine the logon's ID. |

**Tip:** For code examples, see the *Keyfactor API Endpoint Utility*. To find the embedded web copy of this utility, click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Log Out** button.

### GET SSH Logons ID

The *GET /SSH/Logons/{id}* method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

**Tip:** The following permissions (see [Security Overview](#)) are required to use this feature:  
SSH: *ServerAdmin* OR  
SSH: *EnterpriseAdmin*

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *ServerAdmin* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 434: GET SSH Logons {id} Input Parameters

| Name | In   | Description  |
|------|------|--|
