GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.6 GET SSL

The GET /SSL method is used to return a list of all discovered SSL endpoints, limited by the provided parameters. This method returns HTTP 200 OK on a success with details about the requested endpoints.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 625: GET SSL Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>AgentPoolName</i> • <i>CertificateCN</i> • <i>CertificateFound</i> (True, False) • <i>Status</i> (6-Certificate Found, 1-Timed Out Connecting, 2-Exception Connecting, 3-Timed Out Downloading, 4-Exception Downloading, 5-Not SSL, 7-Exception in Sql, 8-Invalid or Unreachable Host, 9-Connection Refused, 10-Bad SSL Handshake, 11-Client Authentication Failed, 12-No Certificate, 13-SSL Refused, 14-Not Probed, 0-Unknown) • <i>IpAddress</i> • <i>IsMonitored</i> (True, False) • <i>IssuerDN</i> • <i>NetworkName</i> • <i>Port</i> • <i>ReverseDNS</i> • <i>Reviewed</i> (True, False) • <i>SelfSigned</i> (True, False) • <i>SNIName</i>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ReverseDNS</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 626: GET SSL Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
ReverseDNS	A string indicating the DNS name resolved for the endpoint based on the discovered IP address. If a host name could not be resolved, this will be the IP address.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
IpAddress	A string indicating the IP address of the endpoint.
Port	An integer indicating the port at which the endpoint was found.
CertificateFound	A Boolean indicating whether a certificate was found at the endpoint (true) or not (false).
AgentPoolName	A string indicating the name of the orchestrator pool that performed a scan (discovery or monitoring) on the endpoint.
NetworkName	A string indicating the name of the SSL network that performed a scan (discovery or monitoring) on the endpoint.
MonitorStatus	A Boolean indicating whether the endpoint should be monitored (true) or not (false).
CertificateCN	A string indicating the common name of the certificate that was found at the endpoint.
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.7 GET SSL Networks

The GET /SSL/Networks method is used to retrieve one or more SSL networks from Keyfactor Command. Results can be limited to selected SSL networks using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified SSL networks.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/read/`

Table 627: GET SSL Networks Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Network Scan Details Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Name• Pool
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending. This field is optional.

Table 628: GET SSL Networks Response Data

Name	Description										
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled

Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <i>GET /SSL/Networks</i> method. Use the <i>GET /SSL/Networks/{id}</i> method to return data in this field. </div>																

Name	Description
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a GET /robots.txt request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.8 POST SSL Networks

The POST /SSL/Networks method is used to create an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSL network.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 629: POST SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<div>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
DiscovererPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.															

Name	In	Description																
Monit- orPer- centComplete	Bod- y	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Bod- y	An integer indicating the status of the discovery job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov- erLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																

Name	In	Description
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Bod- y	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	<p>An array of objects providing the list of scheduled quiet hour periods. For example:</p> <pre>"QuietHours": [{ "StartDay": "Monday",</pre>

Name	In	Description
		<pre>"StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }]</pre>

Table 630: POST SSL Networks Response Data

Name	Description
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An object providing the discovery schedule for the SSL network group.
MonitorSchedule	An object providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	 Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.9 PUT SSL Networks

The `PUT /SSL/Networks` method is used to update an SSL network in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSL network.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 631: PUT SSL Networks Input Parameters

Name	In	Description										
NetworkId	Body	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	Body	Required. A string indicating the name for the SSL network.										
AgentPoolName	Body	Required. A string indicating the name of the orchestrator pool assigned to the SSL network. See in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	Body	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	Body	Required. A string indicating the description of the SSL network.										
Enabled	Body	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	Body	<div>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Immediate</td><td><div>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></div></td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
Day	The number of the day, in the month, to run the job.																
ExactlyOnce		<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).											
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
DiscovererPercentComplete	Body	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.															

Name	In	Description																
Monit- orPer- centComplete	Bod- y	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins. This field is for reference and is not configurable.																
DiscoverStatus	Bod- y	An integer indicating the status of the discovery job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
MonitorStatus	Bod- y	An integer indicating the status of the monitoring job. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>Unknown</td></tr><tr><td>1</td><td>Not Scheduled</td></tr><tr><td>2</td><td>Running</td></tr><tr><td>3</td><td>Previously Scanned</td></tr><tr><td>4</td><td>Scheduled</td></tr><tr><td>5</td><td>Disabled</td></tr><tr><td>6</td><td>In Quiet Hours</td></tr></tbody></table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																	
0	Unknown																	
1	Not Scheduled																	
2	Running																	
3	Previously Scanned																	
4	Scheduled																	
5	Disabled																	
6	In Quiet Hours																	
Discov- erLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.																

Name	In	Description
Monit- orLastScanned	Bod- y	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes. This field is for reference and is not configurable.
SslAlertRecipients	Bod- y	<p>An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.</p> <div>  Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field. </div>
AutoMonitor	Bod- y	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	Bod- y	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
Discov- erTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	Bod- y	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
Expir- ationAlertDays	Bod- y	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a discovery job. This field is for reference and is not configurable.
MonitorJobParts	Bod- y	An integer that indicates the number of job parts that have been created for a monitoring job. This field is for reference and is not configurable.
QuietHours	Bod- y	<p>An array of objects providing the list of scheduled quiet hour periods. For example:</p> <div> <pre>"QuietHours": [{ "StartDay": "Monday",</pre> </div>

Name	In	Description
		<pre>"StartTime": "2022-11-21T14:00:08Z", "EndDay": "Tuesday", "EndTime": "2022-11-22T14:00:08Z" }, { "StartDay": "Saturday", "StartTime": "2022-11-26T04:00:08Z", "EndDay": "Sunday", "EndTime": "2022-11-27T16:00:08Z" }]</pre>

Table 632: PUT SSL Networks Response Data

Name	Description
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.
Name	A string indicating the name for the SSL network.
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.
Description	A string indicating the description of the SSL network.
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.
DiscoverSchedule	An object providing the discovery schedule for the SSL network group.
MonitorSchedule	An object providing the monitoring schedule for the SSL network group.
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.
DiscoverStatus	An integer indicating the status of the discovery job. Possible values are:

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
MonitorStatus	<p>An integer indicating the status of the monitoring job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> <tr> <td>2</td><td>Running</td></tr> <tr> <td>3</td><td>Previously Scanned</td></tr> <tr> <td>4</td><td>Scheduled</td></tr> <tr> <td>5</td><td>Disabled</td></tr> <tr> <td>6</td><td>In Quiet Hours</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled	2	Running	3	Previously Scanned	4	Scheduled	5	Disabled	6	In Quiet Hours
Value	Description																
0	Unknown																
1	Not Scheduled																
2	Running																
3	Previously Scanned																
4	Scheduled																
5	Disabled																
6	In Quiet Hours																
DiscoverLastScanned	A string indicating the date and time, in UTC, of the most recent discovery job. This field is populated as soon as the job is initiated and updated when the job completes.																
MonitorLastScanned	A string indicating the date and time, in UTC, of the most recent monitoring job. This field is populated as soon as the job is initiated and updated when the job completes.																
SslAlertRecipients	An array of strings providing the list of recipients who will receive email messages regarding the status of SSL discovery and monitoring jobs.																

Name	Description
	 Note: To improve performance in requests, data is not returned in this field for the <code>GET /SSL/Networks</code> method. Use the <code>GET /SSL/Networks/{id}</code> method to return data in this field.
AutoMonitor	A Boolean that indicates whether automatic monitoring of discovered endpoints is enabled (true) or not (false).
GetRobots	A Boolean that indicates whether orchestrators should perform a <code>GET /robots.txt</code> request during scans in order to behave like a webcrawler and provide an explanation of network activity (true) or not (false).
DiscoverTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to discover the endpoint. Shorter timeout periods will increase the overall scanning throughput, however they will also increase the chance of missing a certificate on a slow or congested network.
MonitorTimeoutMs	An integer that indicates the amount of time (in milliseconds) the scan will wait (before timing out) to receive the discovered endpoint certificate expiration details.
ExpirationAlertDays	An integer that indicates the number of days within which to begin providing warnings regarding upcoming expiration in notification email messages.
DiscoverJobParts	An integer that indicates the number of job parts that have been created for a discovery job.
MonitorJobParts	An integer that indicates the number of job parts that have been created for a monitoring job.
QuietHours	An array of objects providing the list of scheduled quiet hour periods.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.10 GET SSL Endpoints ID History

The `GET /SSL/Endpoints/{id}/History` method is used to return a list of history found for a given SSL endpoint. URL parameters can be used to specify paging and the level of information detail. This

method returns HTTP 200 OK on a success with details for the specified endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/read/`

Table 633: GET SSL Endpoints {id} History Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL endpoint for which to return history information. Use the <code>GET /SSL</code> method (see GET SSL on page 1392) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
PageReturned	Query	An integer that specifies how many multiples of the <code>returnLimit</code> to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 634: GET SSL Endpoints {id} History Response Data

Name	Description																																
HistoryId	A string indicating the Keyfactor Command reference GUID for the history entry.																																
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint with which the history is associated.																																
AuditId	An integer indicating the Keyfactor Command ID used to track progress during scan jobs.																																
Timestamp	A string indicating the date and time the history entry was created.																																
Status	<p>An integer containing the status of the scan for which the history item was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>TimeOutConnecting</td></tr> <tr> <td>2</td><td>ExceptionConnecting</td></tr> <tr> <td>3</td><td>TimeoutDownloading</td></tr> <tr> <td>4</td><td>ExceptionDownloading</td></tr> <tr> <td>5</td><td>NotSsl</td></tr> <tr> <td>6</td><td>CertificateFound</td></tr> <tr> <td>7</td><td>ExceptionInSql</td></tr> <tr> <td>8</td><td>InvalidOrUnreachableHost</td></tr> <tr> <td>9</td><td>ConnectionRefused</td></tr> <tr> <td>10</td><td>BadSslHandshake</td></tr> <tr> <td>11</td><td>ClientAuthenticationFailed</td></tr> <tr> <td>12</td><td>NoCertificate</td></tr> <tr> <td>13</td><td>SslRefused</td></tr> <tr> <td>14</td><td>NotProbed</td></tr> </table>	Value	Description	0	Unknown	1	TimeOutConnecting	2	ExceptionConnecting	3	TimeoutDownloading	4	ExceptionDownloading	5	NotSsl	6	CertificateFound	7	ExceptionInSql	8	InvalidOrUnreachableHost	9	ConnectionRefused	10	BadSslHandshake	11	ClientAuthenticationFailed	12	NoCertificate	13	SslRefused	14	NotProbed
Value	Description																																
0	Unknown																																
1	TimeOutConnecting																																
2	ExceptionConnecting																																
3	TimeoutDownloading																																
4	ExceptionDownloading																																
5	NotSsl																																
6	CertificateFound																																
7	ExceptionInSql																																
8	InvalidOrUnreachableHost																																
9	ConnectionRefused																																
10	BadSslHandshake																																
11	ClientAuthenticationFailed																																
12	NoCertificate																																
13	SslRefused																																
14	NotProbed																																
JobType	An integer containing the type of scan job from which the history entry was created.																																

Name	Description												
	<p>The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Discovery</td></tr> <tr> <td>2</td><td>Monitoring</td></tr> <tr> <td>3</td><td>Compliance</td></tr> </table>	Value	Description	0	Unknown	1	Discovery	2	Monitoring	3	Compliance		
Value	Description												
0	Unknown												
1	Discovery												
2	Monitoring												
3	Compliance												
ProbeType	<p>An integer containing the type of connection made to the endpoint for the scan from which the history entry was created. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>2</td><td>SSLv2</td></tr> <tr> <td>3</td><td>TLS</td></tr> </table>	Value	Description	2	SSLv2	3	TLS						
Value	Description												
2	SSLv2												
3	TLS												
ReverseDNS	<p>A string indicating the DNS name of the endpoint resolved based on the discovered IP address at the time the history entry was created. If a host name could not be resolved, this will be the IP address.</p>												
HistoryCertificates	<p>An array of objects indicating the certificates found at the endpoint during the scan from which the history entry was created. Information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>A string indicating the date, in UTC, on which the certificate expires.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	A string indicating the date, in UTC, on which the certificate expires.
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the certificate.												
IssuedDN	A string indicating the distinguished name of the certificate.												
SerialNumber	A string indicating the serial number of the certificate.												
NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.												
NotAfter	A string indicating the date, in UTC, on which the certificate expires.												

Name	Description	
	Name	Description
	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.
	Thumbprint	A string indicating the thumbprint of the certificate.
	IssuerDN	A string indicating the distinguished name of the issuer.
	IssuedCN	A string indicating the common name of the certificate.

Name	Description
SubjectAltNameElements	

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.11 GET SSL Networks ID Parts

The GET /SSL/Networks/{id}/Parts method returns a list of scan job segments for an SSL network defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the scan job segments for the specified SSL network. The results will only include more than one segment if the SSL management job was broken up into segments due to the number of endpoints it contained. The number of endpoints per segment is configurable (see the *SSL Maximum Discovery Scan Job Size* and *SSL Maximum Monitoring Scan Job Size* settings in *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). The results from this method are of the currently in progress job or the latest completed job.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 635: GET SSL Networks {id} Parts Input Parameters

Name	In	Description
ID	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve scan job segments. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Network Scan Details Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Agent • EndTime • EndpointCount • Status • StartTime
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Status</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 636: GET SSL Networks {id} Parts Response Data

Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
Agent	A string indicating the client machine name of the orchestrator that ran the scan job segment.								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.								
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that are in progress, this value will be null.								
EndpointCount	An integer indicating the number of endpoints scanned for the segment.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.12 POST SSL NetworkRanges

The POST /SSL/NetworkRanges method is used to add network ranges to a specified SSL network. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 637: POST SSL Network Ranges Input Parameters

Name	In	Description
NetworkId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see GET SSL Networks on page 1394) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p>Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.13 PUT SSL NetworkRanges

The PUT /SSL/NetworkRanges method is used to update network ranges for a specified SSL network. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 638: PUT SSL Network Ranges {id} Input Parameters

Name	In	Description
NetworkId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the SSL network.</p> <p>Use the GET /SSL/Networks method (see GET SSL Networks on page 1394) to retrieve a list of your defined SSL networks to determine the GUID of the SSL network you want to use.</p>
Ranges	Body	<p>Required. An array of strings indicating the value(s) for the network range(s), including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).</p> <p>For example:</p> <pre>"Ranges": ["192.168.12.0/24:443", "keyexample.com:443", "222.33.44.55:443"]</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.14 PUT SSL Endpoints Review Status

The PUT /SSL/Endpoints/ReviewStatus method is used to update the reviewed status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 639: PUT SSL Endpoints Review Status Input Parameters

Name	In	Description
Id	Body	<p>Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated.</p> <p>Use the GET /SSL method (see GET SSL on page 1392) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.</p>
Status	Body	<p>Required. A Boolean indicating whether the endpoint should be marked as reviewed (true) or not (false).</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.15 PUT SSL Endpoints Monitor Status

The PUT /SSL/Endpoints/MonitorStatus method is used to update the monitoring status of the specified endpoint. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 640: PUT SSL Endpoints Monitor Status Input Parameters

Name	In	Description
Id	Body	Required. A string indicating the Keyfactor Command reference GUID for the endpoint to be updated. Use the <i>GET /SSL</i> method (see GET SSL on page 1392) to retrieve a list of all the SSL endpoints to determine the GUID of the desired endpoint.
Status	Body	Required. A Boolean indicating whether monitoring should be enabled on this endpoint (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.16 PUT SSL Endpoints Review All

The PUT /SSL/Endpoints/ReviewAll method is used to update all endpoints in the given query to set the reviewed status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 641: PUT SSL Endpoints Review All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as reviewed (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as reviewed. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.17 PUT SSL Endpoints Monitor All

The PUT /SSL/Endpoint/MonitorAll method is used to update all endpoints in the given query to set the monitoring status to true. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 642: PUT SSL Endpoints Monitor All Input Parameter

Name	In	Description
Query	Query	A string containing a query to limit the endpoints that will be marked as monitored (e.g. field1 -eq value1 AND field2 -gt value2). If this parameter is not supplied, all endpoints will be marked as monitored. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Using the Discovery Results Search Feature section.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.18 POST SSL Networks ID Scan

The POST /SSL/Networks/{id}/Scan method is used to initiate a scan job for an SSL network defined in Keyfactor Command. A scan may be manually initiated for a configured network at any time that a scan is not already running for the network or the network is not in quiet hours. When you initiate a scan, you can choose whether to run a discovery scan, a monitoring scan, or both. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 643: POST SSL Networks {id} Scan Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to initiate a manual scan. Use the GET /SSL/Networks method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.
Discovery	Body	A Boolean indicating whether to initiate a manual discovery scan (true) or not (false).
Monitoring	Body	A Boolean indicating whether to initiate a manual monitoring scan (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.19 POST SSL Networks ID Reset

The POST /SSL/Networks/{id}/Reset method is used to reset an SSL scan. Reset deletes all scan jobs, scan job parts, logical scan jobs, and current schedules associated with the selected network. The agent job status relating to the SSL scans is set to failed and completed, and the agent is forced to register for a new session. Afterward, *Scan Now* is enabled to allow you to initiate a manual scan. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/modify/`

Table 644: POST SSL Networks {id} Reset Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network for which to reset. Use the GET /SSL/Networks method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.20 POST SSL NetworkRanges Validate

The POST `/SSL/NetworkRanges/Validate` method ensures that network ranges supplied in the request are of valid structure. This endpoint returns 204 with no content upon success. Use this method to test a proposed network range before using POST `/SSL/NetworkRanges` or PUT `/SSL/NetworkRanges` to configure it for an SSL network.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/read/`

Table 645: POST SSL Network Ranges Validate Input Parameters

Name	In	Description
networkRangesToVerify	Body	Required. An array of strings indicating the network ranges to validate. For example: <pre>["10.5.4.0/24:443", "192.168.12.0/16:443,22", "keyexample.com:443"]</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.21 DELETE SSL Networks ID

The DELETE /SSL/Networks/{id} method is used to delete an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/modify/

Table 646: DELETE SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL network to be deleted. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.37 Status

The Status component of the Keyfactor API includes methods necessary to retrieve the current list of Keyfactor API endpoints.

Table 647: Status Endpoints

Endpoint	Method	Description	Link
/Endpoints	GET	Returns a list of the Keyfactor API endpoints.	GET Status Endpoints on the next page

2.6.37.1 GET Status Endpoints

The GET /Status/Endpoints method returns a list of all the endpoints currently available for use in the Keyfactor API. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). This method returns HTTP 200 OK on a success with a list of all the API endpoints available in the Keyfactor API.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
None

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38 Templates

The Templates component of the Keyfactor API includes methods necessary to programmatically edit, import and retrieve templates. Editing a template in Keyfactor Command will only apply within the software.

Table 648: Templates Endpoints

Endpoint	Method	Description	Link
/id}	GET	Returns information about the specified template.	GET Templates ID on the next page
/Settings	GET	Returns the global template policy settings.	GET Templates Settings on page 1466
/Settings	PUT	Sets global values for template policy.	PUT Templates Settings on page 1473
/SubjectParts	GET	Returns a list of supported subject parts for template regular expressions and default subjects.	GET Templates Subject Parts on page 1492
/	GET	Returns a list of templates.	GET Templates on page 1493

Endpoint	Method	Description	Link
/	PUT	Updates selected settings for the specified template.	PUT Templates on page 1506
/Import	POST	Import templates from a specified configuration tenant into Keyfactor Command	POST Templates Import on page 1542

2.6.38.1 GET Templates ID

The GET /Templates/{id} method is used to retrieve a specified template from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the requested template.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/read/

Table 649: GET Templates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the ID of the template in Keyfactor Command. Use the <i>GET /Templates</i> method (see GET Templates on page 1493) to retrieve a list of all the templates to determine the template ID.

Table 650: GET Templates {id} Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p>																

Name	Description																
	<p>The metadata fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td></tr> <tr> <td>Enrollment</td><td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.																
DefaultValue	A string containing the default value defined for the metadata field for the specific template.																
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.																
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _.\-]*@ (keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.												
Value	Description																
0	Optional Users have the option to either enter a value or not enter a value in the field.																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> </td></tr> <tr> <td>Message</td><td>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.	Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).
Name	Description												
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.						
Value	Description												
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.												
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.												
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).												
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment & PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation

TemplateRegexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1466. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>TemplateId</td><td>An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>Regex</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td></tr> </table> </td></tr> </table>	Name	Description	TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	Regex	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td></tr> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first
Name	Description												
TemplateId	An integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.												
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).												
Regex	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the GET /Templates/SubjectParts method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td>This regular expression specifies that the data entered in the field must consist of some number of characters in the first</td></tr> </table>	Subject Part	Example	CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first								
Subject Part	Example												
CN (Common Name)	This regular expression specifies that the data entered in the field must consist of some number of characters in the first

UseAllowedRequesters	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level</p>														

Name	Description
	on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AllowedRequesters	An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.
RFCEnforcement	A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1115 1404 1711"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p>Figure 8: Microsoft Issuance Requirements on a Template for Manager Approval</p> </div>
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in

Name	Description																																	
	<p>Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in</td></tr></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in																																	

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>Active Directory.</td></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description		Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description								
	Active Directory.								
Oid	A string containing the object ID of the extended key usage.								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).								
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> P-256 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 P-384 1.3.132.0.34 = P-384/secp384r1 P-521 1.3.132.0.35 = P-521/secp521r1 <p>If the template supports more than one curve, this field contains the minimum curve value.</p>								
AllowOneClick-Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>								
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.2 GET Templates Settings

The GET /Templates/Settings method is used to retrieve the global template policy settings Keyfactor Command. This method returns HTTP 200 OK on a success with details about the global template policy settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1506](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/read/

Table 651: GET Templates Settings Response Data

Name	Description										
TemplateRege- xes	<p>An array of objects containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA). Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.3 PUT Templates Settings

The PUT /Templates/Settings method is used to create or update the global template policy settings in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the template policy settings.

Tip: Template policies may also be set at an individual template level to apply to a single template (see [PUT Templates on page 1506](#)). Template policies set at the individual template level take precedence over template policies set at the global level.

Note: Global template settings replaced and expanded upon select enrollment-related applications settings in release 10.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_templates/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 652: PUT Templates Settings Input Parameters

Name	Description										
TemplateRege- xes	<p>An array of objects containing the system-wide template regular expression settings. These apply to all enrollments that are not otherwise overridden by individual template settings, including those that do not use a template (e.g. from a standalone CA).  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.4 GET Templates Subject Parts

The GET /Templates/SubjectParts method is used to retrieve a list of the certificate subject parts that are supported for regular expressions (TemplateRegexes) and defaults (TemplateDefaults). This method returns HTTP 200 OK on a success with the list of supported certificate subject part fields. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/read/

Table 654: GET Templates Subject Parts Response Data

Name	Description
SubjectPart	A string indicating the supported subject part code (e.g. L for City/Locality).
SubjectPartName	A string containing a friendly name for the subject part (e.g. City/Locality).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.5 GET Templates

The GET /Templates method is used to retrieve one or more templates from Keyfactor Command. Results can be limited to selected templates using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the specified templates.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/read/

Table 655: GET Templates Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Template Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> AllowedEnrollmentType (1-PFX Enrollment, 2-CSR Enrollment, 3-CSR Generation, 0-None) ConfigurationTenant DisplayName ForestRoot (deprecated) FriendlyName HasPrivateKeyRetention (True, False) IsDefaultTemplate (True, False) ShortName <div>  Tip: To filter out all the built-in Active Directory templates and display only your custom templates, use the following query: <code>IsDefaultTemplate -eq "false"</code> To filter out all templates that are not configured for either PFX Enrollment or CSR Enrollment, use the following query: <code>AllowedEnrollmentType -eq "3"</code> A value of 1 will filter out all templates except those configured for PFX Enrollment. A value of 2 will filter out all templates except those configured for CSR Enrollment. </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .

Name	In	Description
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 656: GET Templates Response Data

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p>																

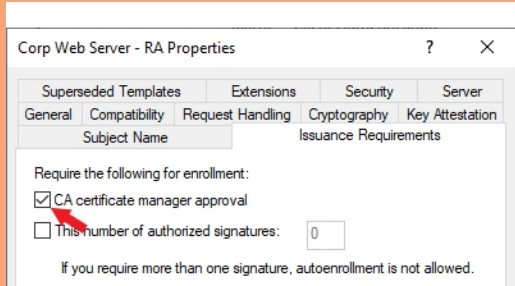

Name	Description																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment & PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> <tr> <td>5</td><td>CSR Generation & PFX Enrollment</td></tr> <tr> <td>6</td><td>CSR Generation & CSR Enrollment</td></tr> <tr> <td>7</td><td>CSR Enrollment, PFX Enrollment & CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation	5	CSR Generation & PFX Enrollment	6	CSR Generation & CSR Enrollment	7	CSR Enrollment, PFX Enrollment & CSR Generation

0	None																		
1	PFX Enrollment																		
2	CSR Enrollment																		
3	CSR Enrollment & PFX Enrollment																		
4	CSR Generation																		
5	CSR Generation & PFX Enrollment																		
6	CSR Generation & CSR Enrollment																		
7	CSR Enrollment, PFX Enrollment & CSR Generation																		
TemplateRegexes	<p>An array of objects containing individual template-level regular expressions against which to validate the subject data. Regular expressions defined on a template apply to enrollments made with that template only. Template-level regular expressions, if defined, take precedence over system-wide regular expressions. For more information about system-wide regular expressions, see GET Templates Settings on page 1466. The template regular expression object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>TemplateId</td><td>In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.</td></tr> <tr> <td>SubjectPart</td><td>A string indicating the portion of the subject the regular expression applies to (e.g. CN).</td></tr> <tr> <td>RegEx</td><td> <p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p> </td></tr> </table>	Name	Description	TemplateId	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.	SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).	RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>										
Name	Description																		
TemplateId	In integer indicating the Keyfactor Command reference ID of the certificate template the regular expression is associated with.																		
SubjectPart	A string indicating the portion of the subject the regular expression applies to (e.g. CN).																		
RegEx	<p>A string specifying the regular expression against which data entered in the indicated subject part field (e.g. CN) in the enrollment pages of the Keyfactor Command Management Portal or using an API enrollment method will be validated.</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> <p>The following are some regular expression examples:</p>																		

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_-\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p> </td></tr> <tr> <td>OU (Organization Unit)</td><td> <p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p> </td></tr> </table> </td></tr> </table>	Name	Description		<table> <tr> <th>Subject Part</th><th>Example</th></tr> <tr> <td>CN (Common Name)</td><td> <p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_-\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p> </td></tr> <tr> <td>O (Organization)</td><td> <p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p> </td></tr> <tr> <td>OU (Organization Unit)</td><td> <p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p> </td></tr> </table>	Subject Part	Example	CN (Common Name)	<p>This regular expression specifies that the data entered in the field must consist of some number of characters in the first portion of the field made up only of lower-case letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly <i>.keyexample.com</i>:</p> <pre>^[a-zA-Z0-9'_-\.\-]*\.keyexample\.com\$</pre> <p>The default value for the Common Name regular expression is:</p> <pre>.+</pre> <p>This requires entry of at least one character in the Common Name field in the enrollment pages.</p>	O (Organization)	<p>This regular expression requires that the organization name entered in the field be one of “Key Example Inc”, “Key Example” or “Key Example Inc.”:</p> <pre>^(?:Key Example Inc Key Example Key Example, Inc\.)\$</pre> <p>The period in the final company name (Key Example, Inc.) needs to be escaped in the regular expression with a slash (“\”) but the comma does not.</p>	OU (Organization Unit)	<p>This regular expression requires that the organizational unit entered in the field be one of these four departments:</p>

Your custom message follows this.</p>														

Name	Description
UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AllowedRequesters	An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div>  Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment. </div>  <p><i>Figure 9: Microsoft Issuance Requirements on a Template for Manager Approval</i></p>
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in

Name	Description																																	
	<p>Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><thead><tr><th>Value</th><th>Function</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></tbody></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in</td></tr></tbody></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in																																	

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>Active Directory.</td></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description		Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description								
	Active Directory.								
Oid	A string containing the object ID of the extended key usage.								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).								
AllowOneClick-Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>								
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.6 PUT Templates

The PUT /Templates method is used to update selected information about a certificate template. This method returns HTTP 200 OK on a success with details about the specified template.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should

first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 657: PUT Templates Input Parameters

Name	In	Description										
Id	Body	Required. An integer indicating the ID of the template in Keyfactor Command.										
FriendlyName	Body	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	Body	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>None</td><td>The private key will not be retained.</td></tr><tr><td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr><tr><td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr><tr><td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr></table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description											
None	The private key will not be retained.											
Indefinite	The private key will be retained until it is explicitly deleted.											
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.											
KeyRetentionDays	Body	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	Body	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	Body	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none">• Preventing users from requesting invalid certificates, based on your										

Name	In	Description																
		<p>specific certificate requirements per template.</p> <ul style="list-style-type: none">• Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div><div></div><div>Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</div></div> <p>The enrollment fields object contains the following parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr><tr><td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr><tr><td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr><tr><td>DataType</td><td>An integer indicating the parameter type. The options are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr></table></td></tr></table> <p>For example:</p> <div><pre>"EnrollmentFields": [{</pre></div>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String: A free-form data entry field.</td></tr><tr><td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. TemplatePolicy	Body	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see GET Templates Settings on page 1466. The template policy object contains the following parameters:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>TemplateId</td><td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td></tr><tr><td>AllowKeyReuse</td><td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.</td></tr><tr><td>AllowWildcards</td><td>A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.</td></tr><tr><td>RFCEnforcement</td><td>A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i>, certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.</td></tr></table>	Value	Description	TemplateId	The Keyfactor Command reference ID of the certificate template the policy is associated with.	AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.	AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.	RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.
Value	Description											
TemplateId	The Keyfactor Command reference ID of the certificate template the policy is associated with.											
AllowKeyReuse	A Boolean that indicates whether private key reuse is allowed (true) or not (false). This option applies to certificate renewals. By default, this is set to <i>true</i> at a system-wide level.											
AllowWildcards	A Boolean that indicates whether wildcards are allowed (true) or not (false). By default, this is set to <i>true</i> at a system-wide level.											
RFCEnforcement	A Boolean that indicates whether RFC 2818 compliance enforcement is enabled (true) or not (false). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.

Name	In	Description
		<pre> "AllowKeyReuse": false, "AllowWildcards": true, "RFCEnforcement": true, "KeyInfo": { "ECDSA": { "bit_lengths": [256, 384, 521], "curves": ["1.2.840.10045.3.1.7", "1.3.132.0.34", "1.3.132.0.35"] }, "RSA": null, "Ed448": null, "Ed25519": null } </pre>
UseAllowedRequesters	Body	<p>A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
AllowedRequesters	Body	<p>An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template. For example:</p> <pre> "AllowedRequesters": ["Administrator", "Power Users", "Revokers"] </pre>

Name	In	Description																		
RequiresApproval	Body	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div>  <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p><i>Figure 10: Microsoft Issuance Requirements on a Template for Manager Approval</i></p> </div>																		
KeyUsage	Body	<p>An integer indicating the total key usage of the certificate. Key usage is stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table> <tr> <th>Value</th><th>Function</th><th>Description</th></tr> <tr> <td>0</td><td>None</td><td>No key usage parameters.</td></tr> <tr> <td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr> <tr> <td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr> <tr> <td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr> <tr> <td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman</td></tr> </table>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman
Value	Function	Description																		
0	None	No key usage parameters.																		
1	Encipherment Only	The key can be used for encryption only.																		
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																		
4	Key Certificate Signing	The key can be used to sign certificates.																		
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman																		

Name	In	Description																					
		<table> <tr> <th>Value</th><th>Function</th><th>Description</th></tr> <tr> <td></td><td></td><td>key agreement algorithm.</td></tr> <tr> <td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr> <tr> <td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr> <tr> <td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr> <tr> <td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr> <tr> <td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr> </table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description			key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																					
		key agreement algorithm.																					
16	Data Encipherment	The key can be used for data encryption.																					
32	Key Encipherment	The key can be used for key encryption.																					
64	Nonrepudiation	The key can be used for authentication.																					
128	Digital Signature	The key can be used as a digital signature.																					
32768	Decipherment Only	The key can be used for decryption only.																					
AllowOneClick-Renewals	Body	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>																					

Table 658: PUT Templates Response Body

Name	Description
Id	An integer indicating the ID of the template in Keyfactor Command.
CommonName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name>_<certificate profile name></i> . This field is populated based on information retrieved from the CA and is not configurable.
TemplateName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name. For a template generated for an EJBCA CA, this will be built using a naming scheme of <i><end entity profile name> (<certificate profile name>)</i> . This field is populated based on information retrieved from the CA and is not configurable.
Oid	A string containing the object ID of the template in Active Directory. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is generated within Keyfactor Command as an object identifier, but does not follow official OID conventions. The field is not configurable.
KeySize	A string indicating the minimum supported key size of the template as returned by the CA. This value is calculated based on the algorithms provided in the template from the CA (see <i>KeyAlgorithms</i>). The algorithm key types and sizes are evaluated in order (RSA, ECC, Ed448, and Ed25519) and from these, the minimum type and size is determined. For example, if the template supports RSA, Ed448, and Ed25519, the minimum key type will be evaluated to RSA. Then for that algorithm, the minimum key size returned by the CA will be selected (e.g. 2048 if 2048 and 4096 are returned for RSA). See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
KeyType	A string indicating the key type of the template as returned by the CA. See details under <i>KeySize</i> . See the <i>KeyAlgorithms</i> field for the complete list of supported key sizes and types. The field is not configurable.
ForestRoot	<p>A string indicating the forest root of the template. For Microsoft templates, this field is populated from Active Directory and is not configurable.</p> <div>  Note: The ForestRoot has been replaced by the ConfigurationTenant from release 10, but is retained for backwards compatibility. </div>
ConfigurationTenant	A string indicating the configuration tenant of the template. For Microsoft templates, this field is populated from Active Directory. For EJBCA templates, this field is populated from the Keyfactor Command CA record. The field is not configurable.

Name	Description										
FriendlyName	A string indicating the Keyfactor Command friendly name of the template. Template friendly names, if configured, appear in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation in place of the template names. This can be useful in environments where the template names are long or not very human readable.										
KeyRetention	<p>A string indicating the type of key retention certificates enrolled with this template will use to store their private key in Keyfactor Command. The key retention object contains the following parameters:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>None</td><td>The private key will not be retained.</td></tr> <tr> <td>Indefinite</td><td>The private key will be retained until it is explicitly deleted.</td></tr> <tr> <td>AfterExpiration</td><td>The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> <tr> <td>FromIssuance</td><td>The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.</td></tr> </table>	Value	Description	None	The private key will not be retained.	Indefinite	The private key will be retained until it is explicitly deleted.	AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.	FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.
Value	Description										
None	The private key will not be retained.										
Indefinite	The private key will be retained until it is explicitly deleted.										
AfterExpiration	The private key will be retained until the specified number of days after the certificate expires (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
FromIssuance	The private key will be retained until the specified number of days after the date on which the certificate was issued (<i>KeyRetentionDays</i>), at which point it will be scheduled for deletion.										
KeyRetentionDays	An integer indicating the number of days a certificate's private key will be retained in Keyfactor Command before being scheduled for deletion, if private key retention is enabled.										
KeyArchival	A Boolean indicating whether the template has been configured with the key archival setting in Active Directory (true) or not (false). This is a reference field and is not configurable.										
EnrollmentFields	<p>An object containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued</p>										

Name	Description																
	<p>Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div data-bbox="477 359 1404 527">  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The enrollment fields object contains the following parameters:</p> <table data-bbox="477 600 1404 1304"> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td> An integer indicating the parameter type. The options are: <table data-bbox="695 995 1373 1283"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are: <table data-bbox="695 995 1373 1283"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.
Name	Description																
Id	An integer indicating the ID of the custom enrollment field.																
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.																
Options	For multiple choice values, an array of strings containing the value choices.																
DataType	An integer indicating the parameter type. The options are: <table data-bbox="695 995 1373 1283"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String: A free-form data entry field.</td></tr> <tr> <td>2</td><td>Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.</td></tr> </table>	Value	Description	1	String: A free-form data entry field.	2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.										
Value	Description																
1	String: A free-form data entry field.																
2	Multiple Choice: Provides a list of acceptable values for the field. The multiple choice values are provided in the <i>Options</i> parameter.																
MetadataFields	<p>An array of objects containing template-level metadata field settings. Template-level metadata field configurations can override global metadata field configurations in these possible ways:</p> <ul style="list-style-type: none"> • Configuration on the metadata field of <i>required</i>, <i>optional</i> or <i>hidden</i>. • The <i>default value</i> for the metadata field. • A <i>regular expression</i> defined for the field (string fields only) against which entered data will be validated along with its associated message. • For fields of data type <i>multiple choice</i>, the list of values that appear in multiple choice dropdowns. <p>Metadata field settings defined on a template apply to enrollments made with that template only. Template-level metadata field settings, if defined, take precedence over global-level metadata field settings.</p>																

Name	Description																
	<p>The metadata fields object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.</td></tr> <tr> <td>DefaultValue</td><td>A string containing the default value defined for the metadata field for the specific template.</td></tr> <tr> <td>MetadataId</td><td>An integer indicating the global metadata field associated with the template-specific settings.</td></tr> <tr> <td>Validation</td><td> <p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> </td></tr> <tr> <td>Enrollment</td><td> <p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table> </td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.	DefaultValue	A string containing the default value defined for the metadata field for the specific template.	MetadataId	An integer indicating the global metadata field associated with the template-specific settings.	Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>	Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.
Name	Description																
Id	An integer indicating the Keyfactor Command reference ID of the template-specific metadata setting.																
DefaultValue	A string containing the default value defined for the metadata field for the specific template.																
MetadataId	An integer indicating the global metadata field associated with the template-specific settings.																
Validation	<p>A string containing the template-specific regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\. \-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p>																
Enrollment	<p>An integer that indicates how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> </table>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.												
Value	Description																
0	Optional Users have the option to either enter a value or not enter a value in the field.																

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> </td></tr> <tr> <td>Message</td><td>A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).</td></tr> </table>	Name	Description		<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.	Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).
Name	Description												
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table>	Value	Description	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.						
Value	Description												
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.												
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.												
Message	A string containing a message to present when a user enters information in a metadata field that does not match the template-specific regular expression (<i>Validation</i> field).												
AllowedEnrollmentTypes	<p>An integer indicating the type of enrollment allowed for the certificate template. Setting these options causes the template to appear in dropdowns in the corresponding section of the Management Portal. In the case of CSR Enrollment and PFX Enrollment, the templates only appear in dropdowns on the enrollment pages if they are available for enrollment from a CA also configured for enrollment within Keyfactor Command. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>CSR Enrollment & PFX Enrollment</td></tr> <tr> <td>4</td><td>CSR Generation</td></tr> </table>	Value	Description	0	None	1	PFX Enrollment	2	CSR Enrollment	3	CSR Enrollment & PFX Enrollment	4	CSR Generation
Value	Description

TemplateDefaults	An array of objects containing individual template-level template default settings. Template defaults defined on a template apply to enrollments made with that template only. Template-level defaults, if defined, take precedence over system-wide template defaults. For more information about system-wide template defaults,												

Name	Description										
	<p>see GET Templates Settings on page 1466. The template default object contains the following parameters:</p> <table data-bbox="479 359 1404 730"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SubjectPart</td><td> <p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p> </td></tr> <tr> <td>Value</td><td>A string containing the value to assign as the default for that subject part (e.g. Chicago).</td></tr> </table>	Value	Description	SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p>	Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).				
Value	Description										
SubjectPart	<p>A string indicating the portion of the subject the default applies to (e.g. L for City/Locality).</p> <p>Use the <i>GET /Templates/SubjectParts</i> method (see GET Templates Subject Parts on page 1492) to retrieve a list of all the supported subject parts.</p>										
Value	A string containing the value to assign as the default for that subject part (e.g. Chicago).										
TemplatePolicy	<p>An object containing the individual template-level template policy settings. Template policies defined on a template apply to enrollments made with that template only. Template-level policies, if defined, take precedence over system-wide template policies. For more information about system-wide template policies, see GET Templates Settings on page 1466. The template policy object contains the following parameters:</p> <table data-bbox="479 989 1404 1717"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>TemplateId</td><td>The Keyfactor Command reference ID of the certificate template the policy is associated with.</td></tr> <tr> <td>AllowKeyReuse</td><td>A Boolean that indicates whether private key reuse is allowed (true) or not (false). UseAllowedRequesters	A Boolean that indicates whether the Restrict Allowed Requesters option should be enabled (true) or not (false). The Restrict Allowed Requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command using this template. This is typically used for EJBCA templates and Microsoft templates that are not in the local Active Directory forest, since in these cases, Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates; this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the template level														

Name	Description
	on a Microsoft CA. In addition to granting permissions at the template level, you need enable the Restrict Allowed Requesters option to grant permissions at the CA level. See <i>Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
AllowedRequesters	An array of strings containing the list of Keyfactor Command security roles—as strings—that have been granted enroll permission on the template.
DisplayName	A string indicating the Keyfactor Command display name of the template. If a template friendly name is configured, this is used as the display name. If not, the template name is used. The display name appears in the dropdowns for PFX enrollment, CSR enrollment, and CSR generation. The display name is a generated field and is not directly configurable.
RFCEnforcement	A Boolean indicating whether RFC 2818 compliance enforcement is enabled (<i>true</i>) or not (<i>false</i>). When this option is set to <i>true</i> , certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.
RequiresApproval	<p>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (<i>true</i>) or not (<i>false</i>).</p> <div data-bbox="479 1115 1404 1711"> <p>Important: Any templates that are configured on the Microsoft CA Issuance Requirements tab for <i>CA certificate manager approval</i> cannot be used for enrollment and associated alerting in Keyfactor Command without configuring private key retention. Any of the enabled private key retention settings (settings other than none as described for <i>KeyRetention</i>) will allow a template requiring manager approval to work with Keyfactor Command PFX and CSR enrollment.</p>  <p>Figure 11: Microsoft Issuance Requirements on a Template for Manager Approval</p> </div>
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is stored in

Name	Description																																	
	<p>Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><thead><tr><th>Value</th><th>Function</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></tbody></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
ExtendedKeyUsages	<p>An array of objects containing the extended key usage information for the template. This field is populated from the CA and is not configurable. The extended key usage object contains the following parameters:</p> <table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>An integer indicating the ID of the extended key usage in</td></tr></tbody></table>	Name	Description	Id	An integer indicating the ID of the extended key usage in																													
Name	Description																																	
Id	An integer indicating the ID of the extended key usage in																																	

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>Active Directory.</td></tr> <tr> <td>Oid</td><td>A string containing the object ID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string specifying the display name of the extended key usage (e.g. Server Authentication).</td></tr> </table>	Name	Description		Active Directory.	Oid	A string containing the object ID of the extended key usage.	DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).
Name	Description								
	Active Directory.								
Oid	A string containing the object ID of the extended key usage.								
DisplayName	A string specifying the display name of the extended key usage (e.g. Server Authentication).								
Curve	<p>A string indicating the friendly name of the elliptic curve algorithm configured for the template returned from the CA, for ECC templates. Possible values include:</p> <ul style="list-style-type: none"> P-256 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 P-384 1.3.132.0.34 = P-384/secp384r1 P-521 1.3.132.0.35 = P-521/secp521r1 <p>If the template supports more than one curve, this field contains the minimum curve value.</p>								
AllowOneClick-Renewals	<p>A Boolean indicating whether <i>One-Click Renewal</i> will be allowed for certificate renewals requested with this template (true) or not (false).</p> <p>If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>). For more information about one-click renewals, see <i>Certificate Operations: Renew</i> in the <i>Keyfactor Command Reference Guide</i>.</p>								
KeyTypes	<p>A string containing a comma-delimited list of the key sizes and types supported for the template returned from the CA as they are displayed in the Management Portal templates grid. Possible values include RSA 2048, ECC P-384, Ed25519, and Ed448.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.38.7 POST Templates Import

The POST /Templates/Import method is used to import templates from a specified configuration tenant into Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_templates/modify/

Table 659: POST Templates Import Input Parameters

Name	Description
ConfigurationTenant	A string indicating the name of the configuration tenant from which to import.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39 Workflow Certificates

The endpoints in Keyfactor Command that are found under /Workflow/Certificates refer to the process through which certificate requests that are require manager approval at the CA level before issuance are approved or denied. These endpoints provide the ability to obtain a list of pending certificate enrollment requests, and approve or deny current requests. Endpoints are also included to view denied and external validation requests.

 **Note:** Certificate requests that require approval at the Keyfactor Command workflow level (see [Workflow Definitions](#) in the *Keyfactor Command Reference Guide*) are not managed with these endpoints. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Table 660: Workflow Certificates Endpoints

Endpoint	Method	Description	Link
/Certificates/{id}	GET	Retrieve certificate request information for a single request.	GET Workflow Certificates ID on the next page
/Certificates/Denied	GET	Retrieve a list of denied certificate request(s).	GET Workflow Certi-

Endpoint	Method	Description	Link
			ificates Denied on page 1547
/Certificates/Pending	GET	Retrieve a list of outstanding pending certificate request(s).	GET Workflow Certificates Pending on page 1550
/Certificates/ExternalValidation	GET	Retrieve a list of certificate request(s) requiring external validation.	GET Workflow Certificates External Validation on page 1553
/Certificates/Approve	POST	Approve a list of pending certificate request(s).	POST Workflow Certificates Approve on page 1558
/Certificates/Deny	POST	Deny a list of pending certificate request(s).	POST Workflow Certificates Deny on page 1556

2.6.39.1 GET Workflow Certificates ID

The Workflow GET /Certificates/{id} method is used to return details for a certificate enrollment request stored within Keyfactor Command that requires manager approval at the CA level. This method returns HTTP 200 OK on a success with the specified certificate request. This method will return certificate requests with any state (e.g. Pending, Denied, External Validation).

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 661: GET Workflow Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate request to retrieve. Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1550) to retrieve a list of all the certificate requests to determine the certificate request ID.

Table 662: GET Workflow Certificates {id} Input Parameters

Name	Description
Id	<p>An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.</p> <div>  Note: The reference ID for the certificate request in Keyfactor Command does not necessarily match the reference ID for the issued certificate in Keyfactor Command. </div>
CARquestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	<p>A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1</pre>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	<p>An integer indicating the request state of the certificate. The possible values are:</p> <ul style="list-style-type: none"> • Unknown (0) • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8)
StateString	A string indicating the request state of the certificate (e.g. Pending).

Name	Description								
Metadata	An object containing the metadata fields populated for the certificate request.								
DenialComment	A string containing the user-provided comment entered when the certificate request was denied.								
KeyLength	An integer indicating the key length of the certificate request.								
SANs	An array of strings listing the subject alternative name (SAN) elements of the certificate request.								
CertStores	<p>An array of objects containing the certificate store locations to which the certificate resulting from the request will be distributed once approved. Certificate store location data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>EntryName</td><td>A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the machine on which the certificate store is located.</td></tr> <tr> <td>StorePath</td><td>A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.</td></tr> </table>	Name	Description	EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.	ClientMachine	A string indicating the machine on which the certificate store is located.	StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.
Name	Description								
EntryName	A string indicating the alias of the certificate in the certificate store. This value will be blank for store types that use information from the issued certificate (e.g. the thumbprint) as the alias until the request is approved and a certificate issued.								
ClientMachine	A string indicating the machine on which the certificate store is located.								
StorePath	A string indicating the path on the machine where the certificate store is located. The format of this will vary depending on the type of store.								
Curve	<p>A string indicating the OID of the elliptic curve algorithm configured used for the certificate request, for ECC certificate requests. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 								
SubjectAltNames	<p>An array of objects indicating the subject alternative name (SAN) elements for the certificate request. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Value</td><td>A string indicating the value set for the SAN element.</td></tr> <tr> <td>Type</td><td>A string indicating the type of SAN element (e.g. DNS Name).</td></tr> </table>	Name	Description	Value	A string indicating the value set for the SAN element.	Type	A string indicating the type of SAN element (e.g. DNS Name).		
Name	Description								
Value	A string indicating the value set for the SAN element.								
Type	A string indicating the type of SAN element (e.g. DNS Name).								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39.2 GET Workflow Certificates Denied

The GET /Workflow/Certificates/Denied method is used to return a list of denied certificate enrollment requests stored within Keyfactor Command for requests that required manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified denied certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 663: GET Workflow Certificates Denied Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> CAHostname CALogical CommonName Requester RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 3. SubmissionDate Template <div>  Tip: For example, for recent denied requests from requester key_service: <pre>SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 664: GET Workflow Certificates Denied Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 3 (denied).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Denied state.
Metadata	An object containing the metadata fields populated for the certificate request.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39.3 GET Workflow Certificates Pending

The GET /Workflow/Certificates/Pending method is used to return a list of pending certificate enrollment requests stored within Keyfactor Command for requests that require manager approval at the CA level. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified pending certificate requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsoft CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 665: GET Workflow Certificates Pending Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> CAHostname CALogical CommonName Requester RequestType (3-Denied, 5-Pending, 8-External Validation) <p>This method only returns records of type (State) 5.</p> <ul style="list-style-type: none"> SubmissionDate Template <div>  Tip: For example, for recent pending requests from requester key_service: <pre>SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 666: GET Workflow Certificates Pending Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CARestId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 5 (pending).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with a Pending state.
Metadata	An object containing the metadata fields populated for the certificate request.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39.4 GET Workflow Certificates External Validation

The GET /Workflow/Certificates/ExternalValidation method is used to return a list of certificate enrollment requests requiring external validation (at the public CA level) stored within Keyfactor Command. Results can be limited to selected requests using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with the specified certificate requests requiring external validation.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 667: GET Workflow Certificates External Validation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> CAHostname CALogical CommonName Requester RequestType (3-Denied, 5-Pending, 8-External Validation) This method only returns records of type (State) 8. SubmissionDate Template <div>  <p>Tip: For example, for recent external validation requests from requester key_service:</p> <pre>SubmissionDate -ge "2023-09-01T00:00:00Z" AND Requester -eq "KEYEXAMPLE\key_service"</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CommonName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 668: GET Workflow Certificates External Validation Response Data

Name	Description
Id	An integer indicating the reference ID in Keyfactor Command for the certificate request as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the KeyfactorRequestId parameter for pending certificate request approve and deny actions.
CAResultId	An integer indicating the row index of the certificate request in the certificate authority.
CommonName	A string indicating the common name of the requested certificate.
DistinguishedName	A string indicating the distinguished name of the requested certificate.
SubmissionDate	The date and time at which the certificate request was received, as an ISO-8601 formatted UTC timestamp.
CertificateAuthority	A string indicating the name of the certificate authority from which the certificate was requested in hostname\logical name format. For example: <code>corpca01.keyexample.com\CorpNetIssuingCA1</code>
Template	A string indicating the name of the template used for the certificate request.
Requester	A string containing the name of the identity that requested the certificate.
State	An integer indicating the request state of the certificate.  Note: This method returns only requests with state 8 (external validation).
StateString	A string indicating the request state of the certificate (e.g. Pending).  Note: This method returns only requests with an External Validation state.
Metadata	An object containing the metadata fields populated for the certificate request.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39.5 POST Workflow Certificates Deny

The POST /Workflow/Certificates/Deny method will attempt to deny the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied denial requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on page 1559](#) and [Workflow Instances on page 1705](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 669: POST Workflow Certificates Deny Input Parameters

Name	In	Description
CertificateRequestIds	Body	Required. An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be denied in the form: <div>[23,45,12]</div> Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1550) to retrieve a list of all the pending certificate requests to determine the certificate request's IDs.
Comment	Body	A string providing a comment regarding the denial. This comment can be delivered to the requester or other interested party using a denied request alert.

Table 670: POST Workflow Certificates Deny Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful denial response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARquestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A comment about the denial. For example, for a deny that succeeds, the comment will be “Successful”. Denies that fail or are denies will have alternate comments (see below).												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the denial requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the deny.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.39.6 POST Workflow Certificates Approve

The POST /Workflow/Certificates/Approve method will attempt to approve the provided pending certificate enrollment request(s) that require manager approval at the CA level. This method returns HTTP 200 OK on a success with details about successful, failed and denied approval requests.

Note: Certificate requests that require approval at the Keyfactor Command workflow level (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*) are not managed with this endpoint. Instead, refer to the Workflow Definitions and Workflow Instances endpoints (see [Workflow Definitions on the next page](#) and [Workflow Instances on page 1705](#)).

Note: Certificate requests that require approval at the CA level are supported only for Microsort CAs and select CA gateways. This feature is not supported for EJBCA CAs. Use workflow for configuring Keyfactor Command-level approvals for EJBCA CAs (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 671: POST Workflow Certificates Approve Input Parameters

Name	In	Description
requestIds	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate request IDs for certificate requests that should be approved in the form (without parameter name):</p> <div>[23,45, 12]</div> <p>Use the <i>GET /Workflow/Certificates/Pending</i> method (see GET Workflow Certificates Pending on page 1550) to retrieve a list of all the certificate requests to determine the certificate request’s IDs.</p>

Table 672: POST Workflow Certificates Approve Response Data

Name	Description												
Successes	<p>An array of strings indicating the successful approval response details. Response details contain the following information:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAHost</td><td>Host name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CALogicalName</td><td>Logical name of the certificate authority to which the certificate enrollment request was submitted.</td></tr> <tr> <td>CARquestId</td><td>The row index of the certificate request in the certificate authority.</td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.</td></tr> <tr> <td>Comment</td><td>A reason or description about why the request denials succeeded, failed or were denied.</td></tr> </table>	Name	Description	CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.	CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.	CARquestId	The row index of the certificate request in the certificate authority.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.	Comment	A reason or description about why the request denials succeeded, failed or were denied.
Name	Description												
CAHost	Host name of the certificate authority to which the certificate enrollment request was submitted.												
CALogicalName	Logical name of the certificate authority to which the certificate enrollment request was submitted.												
CARquestId	The row index of the certificate request in the certificate authority.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID for the requested certificate as stored in the Keyfactor Command database. This is not the same as the request ID issued by the CA. This maps to the Id response parameter for the <i>GET /Workflow/Certificate/Pending</i> method.												
Comment	A reason or description about why the request denials succeeded, failed or were denied.												
Failures	An array of strings indicating the failed approval response details containing the information noted above for successes. Failures of this type are generally exceptions.												
Denials	An array of strings indicating the approval requests that were denied containing the information noted above for successes. Denials are usually the result of insufficient user permissions required to perform the approval.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.40 Workflow Definitions

The Workflow Definitions component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and test workflow definitions. There are two types of workflow definition:

- Global

The global workflow definitions are built into the product and cannot be deleted, though they can be modified to add workflow steps, if desired. Global workflow definitions do not have a specific associated *key*—in the case of the currently available workflows, this is a *certificate template*—and apply to all requests of the workflow’s type (e.g. enrollment) that are not otherwise handled by a custom workflow specifying a key.

- Custom

Custom workflow definitions are any additional workflow definitions you define beyond the built-in ones. Custom workflows are associated with a specific *key* (certificate template or certificate collection) and each workflow only applies to requests made using that key.

All enrollment, certificate renewal, and revocation requests go through workflow even if you haven’t created any workflow steps or added any custom workflow definitions. In the absence of customization, the global workflow definitions are used. Monitoring certificate collections on a periodic basis for certificates that change membership status based on the query criteria of a specified certificate collection can be configured to flow through workflow as well, but there are no global workflows for these.

For more information about workflows, see *Workflow Definitions* in the *Keyfactor Command Reference Guide*.

Table 673: Workflow Definitions Endpoints

Endpoint	Method	Description	Link
/Steps/{extensionName}	GET	Returns information about the structure of the workflow definition step with the specified name.	GET Workflow Definitions Steps Extension Name on the next page
/_{definitionId}	DELETE	Deletes the workflow definition with the specified GUID.	DELETE Workflow Definitions Definition ID on page 1566
/_{definitionId}	GET	Returns details of the workflow definition, including steps, for the workflow with the specified GUID.	GET Workflow Definitions Definition ID on page 1566
/_{definitionId}	PUT	Updates the name and description of the workflow definition with the specified GUID.	PUT Workflow Definitions Definition ID on page 1591
/	GET	Returns a list of workflow definitions, without steps.	GET Workflow Definitions on page 1616
/	POST	Creates a new workflow definition, without steps.	POST Workflow Definitions on page 1619
/Steps	GET	Returns information about the	GET Workflow Defin-

Endpoint	Method	Description	Link
		structure of the workflow definitions.	itions Steps on page 1645
/Types	GET	Returns a list of the defined workflow definition types.	GET Workflow Definitions Types on page 1651
/{{definitionId}}/Steps	PUT	Updates the workflow definition with the specified GUID to add new steps or modify existing steps.	PUT Workflow Definitions Definition ID Steps on page 1654
/{{definitionId}}/Publish	POST	Publishes the workflow definition with the specified GUID to activate it for use.	POST Workflow Definitions Definition ID Publish on page 1680

2.6.40.1 GET Workflow Definitions Steps Extension Name

The GET /Workflow/Definitions/Steps/{extensionName} method is used to retrieve the workflow definition step structure for the step with the specified extensionName. Its primary use case is to populate the UI dialog in which step information is configured. When you are developing a custom workflow step, it can be used to confirm that the workflow step will display correctly in the UI. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition step.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/read/

Table 674: GET Workflow Definitions Steps {extensionName} Input Parameters

Name	In	Description
extensionName	Path	<p>Required. A string indicating the <i>extensionName</i> of the workflow definition step to retrieve.</p> <p>Use the <i>GET /Workflow/Definitions/Steps</i> method (see GET Workflow Definitions Steps on page 1645) to retrieve a list of all the workflow definition steps to determine the extensionName.</p>

Table 675: GET Workflow Definitions Steps {extensionName} Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> ConvertFrom-Csv ConvertFrom-Json ConvertFrom-Markdown ConvertFrom-SddlString ConvertFrom-StringData ConvertTo-Csv ConvertTo-Html ConvertTo-Json ConvertTo-Xml ForEach-Object Get-Command Where-Object CustomPowerShell <p>Run a PowerShell script that has been imported into the Keyfactor Command database. All scripts in the database that have been configured with the workflow category will be available for use. See <i>Extension/Scripts</i> in the <i>Keyfactor API</i></p>

Name	Description
	<p><i>Reference Guide</i> for adding scripts to the database.</p> <ul style="list-style-type: none"> RequireApproval Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="730 745 1404 940">  Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <div data-bbox="730 966 1404 1161">  Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request. </div> <div data-bbox="730 1186 1404 1455">  Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>). </div> RESTRequest Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file. OAuthRESTRequest Run a REST (API) request using Keyfactor Identity Provider as an identity provider and Token authentication. The REST

Name	Description
	<p>request contents are embedded within the step. It does not call out to an external file.</p> <ul style="list-style-type: none"> EnrollmentAgent (Enrollment Only) <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="730 1260 1404 1459">  Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality. </div> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template,</p>

Name	Description
	<p>which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div>  Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>. </div> <ul style="list-style-type: none"> • EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. • NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. • RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.
Outputs	An array of strings containing the outputs for the workflow definition step. For the built-in steps, the only output is an indicator for the next step in the workflow.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.2 DELETE Workflow Definitions Definition ID

The DELETE /Workflow/Definitions/{definitionid} method is used to delete the workflow definition with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/modify/

Note: The built-in global workflow definitions (*Global Revocation Workflow* and *Global Enrollment Workflow*) cannot be deleted. A workflow definition cannot be deleted if there is an active or suspended workflow instance for the workflow definition.

Table 676: DELETE Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to delete.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1616) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.3 GET Workflow Definitions Definition ID

The GET /Workflow/Definitions/{definitionid} method is used to retrieve the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the specified workflow definition.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/read/

Table 677: GET Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to retrieve.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1616) to retrieve a list of all the workflow definitions to determine the GUID.</p>
definitionVersion	Query	An integer indicating which version of the workflow definition to return. The default is to return the most recent version (which may not necessarily be the published version).
exportable	Query	A Boolean indicating whether any security RoleIds (see Security Roles on page 1172) in the workflow definition should be removed from the response (true) or not (false). A value of <i>true</i> allows for the workflow definition to be exported without role-specific data. The default is <i>false</i> .

Table 678: GET Workflow Definitions {definitionsid} Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following: <pre>\$(MyResponse.[0].ClientMachine)</pre> </div>	Verb	A string indicating the HTTP verb for the type of request to perform. Supported values are: <ul style="list-style-type: none"> • DELETE • GET • HEAD • OPTIONS • POST • PUT • TRACE 				
Value	Description												
	 assumed if no version is specified. Content type and authorization headers do not need to be specified, since those are addressed elsewhere in the configuration.												
DataBucketProperty	A string containing the variable that the response from the request will be returned in, if any. You can then reference this parameter from subsequent steps in the workflow. <div>  Tip: The response is stored as a serialized JObject. To make use of only a portion of the response data in your subsequent step, use JSON path syntax. For example, say you returned the data from a GET /Agents request in a variable called <i>MyResponse</i> and you wanted to reference the <i>ClientMachine</i> name for the orchestrator in a subsequent email message. To limit the data to the first result and only the ClientMachine name, in the email message you would enter the following: <pre>\$(MyResponse.[0].ClientMachine)</pre> </div>												
Verb	A string indicating the HTTP verb for the type of request to perform. Supported values are: <ul style="list-style-type: none"> • DELETE • GET • HEAD • OPTIONS • POST • PUT • TRACE

	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Outputs</td><td> An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table> </td></tr> </table>	Name	Description	Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.4 PUT Workflow Definitions Definition ID

The PUT /Workflow/Definitions/{definitionid} method is used to update the name and description for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/modify/

 **Tip:** A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [PUT Workflow Definitions Definition ID above](#)) and edit the copy to change the key.

Note: If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 679: PUT Workflow Definitions {definitionid} Input Parameters

Name	In	Description
definitionId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.

Table 680: PUT Workflow Definitions {definitionid} Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. Value	Description														
ScriptParameters	An object defining any parameters to be used in the PowerShell script.														
ScriptName	<p>A string containing the Keyfactor Command reference name of PowerShell script as stored in the Keyfactor Command database (see Extensions Scripts on page 827).</p> <p>A sample PowerShell script (CustomPowerShellExample.ps1) is provided in the \ExtensionLibrary\net6.0\Workflow directory on the Keyfactor Command server under the install directory. By default, this is:</p> <pre>C:\Program Files\Keyfactor\Keyfactor</pre>														

Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>Platform \ExtensionLibrary\net6.0\Workf1 OW</td></tr> </table> <p> Tip: Tokens (a.k.a. substitutable special text) may be used in the script parameter value field. Tokens use a variable in the workflow definition that is replaced by data from the certificate request, certificate, or certificate metadata at processing time. For example, you can take the revocation comment entered when the revocation request is approved—\$(cmnt)—and append additional data to it using PowerShell.</p> <p>Possible Email parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the subject line for the email message that will be delivered when the workflow definition step is executed.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered when the workflow definition step is executed. The email message is made up of regular text and tokens. If desired, you can format the message body using HTML. For example, for an enrollment pending request notification: “Hello,\n\nA certificate using the \$(template) template was requested by \$(requester:displayname) from \$(CA) on \$(subdate). Name	Description								
Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.5 GET Workflow Definitions

The GET /Workflow/Definitions method is used to retrieve the list of workflow definitions. This method returns HTTP 200 OK on a success with high level information about the workflow definitions. Use the GET /Workflow/Definitions/{definitionid} method (see [GET Workflow Definitions Definition ID on page 1566](#)) to return details including the workflow steps.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/read/

Table 681: GET Workflow Definitions Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • DisplayName • Id • IsPublished (true or false) • WorkflowType (CertificateEnteredCollection, CertificateLeftCollection, Enrollment, or Revocation)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 682: GET Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.

Name	Description
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.
PublishedVersion	An integer indicating the currently published version number of the workflow definition.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.6 POST Workflow Definitions

The POST /Workflow/Definitions method is used to create a new workflow definition without any steps. To add steps to the workflow, use the PUT /Workflow/Definitions/{definitionId}/Steps method (see [PUT Workflow Definitions Definition ID Steps on page 1654](#)). This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/modify/

Tip: A given workflow can only apply to one key. If you need to run the same workflow steps for more than one key (e.g. the same enrollment steps for more than one template), you can either add these steps to the global workflow or, if you want to run the steps for more than one type of enrollment, for example, but not all, you can configure one custom workflow and then export and re-import that workflow to duplicate it (see [POST Workflow Definitions above](#)) and edit the copy to change the key.

Table 683: POST Workflow Definitions Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name defined for the workflow definition.
Description	Body	A string indicating the description for the workflow definition.
Key	Body	<p>Required. A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i>. If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i>, this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i>, this field will contain the Keyfactor Command reference ID for the certificate collection.</p> <p>Use the GET /Templates method (see GET Templates on page 1493) to retrieve a list of your certificate templates to determine the template ID.</p> <p>Use the GET /CertificateCollections method (see GET Certificate Collections on page 452) to retrieve a list of your certificate collections to determine the collection ID.</p> <p>This field cannot be modified on an edit.</p>
KeyDisplayName	Body	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
WorkflowType	Body	<p>Required. A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a

Table 684: POST Workflow Definitions Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.7 GET Workflow Definitions Steps

The GET /Workflow/Definitions/Steps method is used to retrieve the workflow definition step structure for the workflow definition steps. This method returns HTTP 200 OK on a success with information about the structure of the workflow definition steps.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/read/

Table 685: GET Workflow Definitions Steps Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • DisplayName • ExtensionName • SupportedWorkflowTypes
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 686: GET Workflow Definitions Steps Response Data

Name	Description
DisplayName	A string indicating the display name of the workflow definition step.
ExtensionName	<p>A string indicating the extension name of the workflow definition step. The built-in extension names are:</p> <ul style="list-style-type: none"> Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> ConvertFrom-Csv ConvertFrom-Json ConvertFrom-Markdown ConvertFrom-SddlString ConvertFrom-StringData ConvertTo-Csv ConvertTo-Html ConvertTo-Json ConvertTo-Xml ForEach-Object Get-Command Where-Object CustomPowerShell <p>Run a PowerShell script that has been imported into the Keyfactor Command database. Name	Description
	<p><i>Reference Guide</i> for adding scripts to the database.</p> <ul style="list-style-type: none"> RequireApproval Require approval for a workflow step before the step can be completed. The require approval step can require approval from just one approver or multiple approvers. The workflow will be suspended at this point until the correct number of approvals from users with the correct security roles is received or until one deny is received before continuing to the next step. As part of this step, an email message is sent indicating whether the step was approved or denied—typically to the requester. This step does not include logic to send an email initiating the approval process (letting users know something needs approval). Use an <i>Email</i> type step for this. <div data-bbox="730 745 1404 940">  Important: Workflows are not supported with CA delegation when they contain steps that require approval. For more information, see the CA configuration <i>Authorization Methods Tab</i> in the <i>Keyfactor Command Reference Guide</i>. </div> <div data-bbox="730 966 1404 1161">  Note: The users that you send email to initiating the approval process must be members of a security role that is allowed to submit signals (approve/deny) for the workflow in order to approve or deny the request. </div> <div data-bbox="730 1186 1404 1455">  Tip: The workflow builder does not include a step to send a notification to the requester of a certificate on an enrollment once the certificate is issued by the CA (as opposed to approved in Keyfactor Command). Use the issued alerts for this (see <i>Issued Request Alert Operations</i> in the <i>Keyfactor Command Reference Guide</i>). </div> RESTRequest Run a REST (API) request using Active Directory as an identity provider and Basic or Windows authentication. The REST request contents are embedded within the step. It does not call out to an external file. OAuthRESTRequest Run a REST (API) request using Keyfactor Identity Provider as an identity provider and Token authentication. The REST

Name	Description
	<p>request contents are embedded within the step. It does not call out to an external file.</p> <ul style="list-style-type: none"> EnrollmentAgent (Enrollment Only) <p>On an enrollment (either CSR or PFX), create a resigned CSR to prepare an updated enrollment request for delivery to a Microsoft CA after a previous step in the workflow has been used to update either the SANs in the initial request, subject (DN) in the initial request or both. This step must be placed later in the workflow than the step(s) to modify the SANs and/or subject. The SANs and subject may be modified with either of the PowerShell step types or a custom step type. The step creates a new CSR using the same public key as the original CSR using the updated SAN and/or subject values. It signs the new CSR with the certificate provided in the step's configuration.</p> <p>For this type of step you will need an enrollment agent certificate available as a PKCS#12 (.PFX) file with included private key to import into Keyfactor Command. This can be a user certificate or a computer certificate (e.g. generated from a copy of the <i>Enrollment Agent</i> template or the <i>Enrollment Agent (Computer)</i> template) and must have a Certificate Request Agent EKU. Note that the built-in <i>Enrollment Agent</i> and <i>Enrollment Agent (Computer)</i> templates do not allow private keys to be exported by default. You will need a template that allows private key export or will need to manually override private key export to create a certificate with an exportable private key in order to create a PKCS#12 (.PFX) file.</p> <div data-bbox="730 1260 1404 1459">  Important: This step applies to Microsoft CAs only. If this step is added to workflow for requests directed to an EJBCA CA, it will fail on enrollment. Note that EJBCA supports submission of updated SAN or subject details as part of standard functionality. </div> SubjectFormatter (Enrollment Only) <p>On an enrollment done through the Keyfactor Windows Enrollment Gateway using a client-side template configured with the <i>Build from this Active Directory information</i> option on the template, this workflow step handles formatting the incoming subject, SANs, and/or SID in the certificate request appropriately such that the enrollment will complete successfully with the target CA and Keyfactor Command template,</p>

Name	Description
	<p>which is not configured to build from AD. Any Keyfactor Windows Enrollment Gateway using a client-side template configured with the subject as <i>Build from this Active Directory information</i> must be configured with a workflow step of this type on the Keyfactor Command template that has been mapped in the gateway to that template in order to complete an enrollment through the gateway. There are no configuration parameters for the step.</p> <div data-bbox="730 562 1404 863">  Important: The template in Keyfactor Command that is mapped to the client-side template configured to build the subject from Active Directory also needs to be configured with three enrollment fields to support handling the incoming subject, SANs, and/or SID. For more information about configuring this, see the <i>Keyfactor Windows Enrollment Gateway Installation and Configuration Guide</i>. </div> <ul style="list-style-type: none"> EnrollStep Enroll for a certificate through Keyfactor Command. The enroll step must always fall as the last step in the workflow, immediately following the EndNOOP step. NOOPStep An entry or exit step in which no operation occurs. Steps of this type indicate the start and end of the workflow. RevokeStep Revoke a certificate through Keyfactor Command. The revoke step must always fall as the last step in the workflow, immediately following the EndNOOP step.
SupportedWorkflowTypes	<p>An array of strings containing a list of the workflow types supported by the workflow definition step. Possible built-in values are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection

Name	Description
	<p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate.</p> <ul style="list-style-type: none"> • Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request. • Revocation The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.
ConfigurationParametersDefinition	An object containing the configuration parameters for the workflow definition step. These will vary depending on the step.
SignalsDefinition	An object containing the signals defined for the workflow definition step. These will vary depending on the step.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.8 GET Workflow Definitions Types

The GET /Workflow/Definitions/Types method is used to retrieve the workflow definition types that have been defined for use. This method returns HTTP 200 OK on a success with information about the defined workflow definition types.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/read/

Table 687: GET Workflow Definitions Types Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Definitions Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . Name	Description
	 Note: There are no built-in steps for workflows of types <i>certificate entered collection</i> and <i>certificate left collection</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.9 PUT Workflow Definitions Definition ID Steps

The PUT /Workflow/Definitions/{definitionid}/Steps method is used to add or update the workflow steps for the workflow definition with the specified GUID. This method returns HTTP 200 OK on a success with details about the updated workflow definition.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/definitions/modify/

 **Note:** If you edit an existing *published* workflow definition, a new version of the workflow definition will be created. If you edit an existing workflow definition which has *never been published*, the existing configuration will be overwritten with the changes you've made—a new version will not be created.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 689: PUT Workflow Definitions {definitionid} Steps Input Parameters

This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.40.10 POST Workflow Definitions Definition ID Publish

The POST `/Workflow/Definitions/{definitionid}/Publish` method is used to mark the most recent version of the workflow definition with the specified GUID as the published, active, version. When a definition is published, all new or restarted workflow instances (see [Workflow Instances on page 1705](#)) will be able to use the updated version of the workflow. This method returns HTTP 200 OK on a success with details about the workflow definition.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/workflows/definitions/modify/`

Table 691: POST Workflow Definitions {definitionid} Publish Input Parameters

Name	In	Description
definitionId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow definition to publish.</p> <p>Use the <i>GET /Workflow/Definitions</i> method (see GET Workflow Definitions on page 1616) to retrieve a list of all the workflow definitions to determine the GUID.</p>

Table 692: POST Workflow Definitions {definitionid} Publish Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.
DisplayName	A string indicating the display name defined for the workflow definition.
Description	A string indicating the description for the workflow definition.
Key	A string indicating the reference key for the workflow definition. The type of information contained in this field will vary depending on the <i>WorkflowType</i> . If the <i>WorkflowType</i> is <i>Enrollment</i> or <i>Revocation</i> , this field will contain the Keyfactor Command reference ID for the certificate template. If the <i>WorkflowType</i> is <i>CertificateLeftCollection</i> or <i>CertificateEnteredCollection</i> , this field will contain the Keyfactor Command reference ID for the certificate collection.
KeyDisplayName	A string indicating the friendly name defined in Keyfactor Command for the certificate template or display name for the certificate collection.
IsPublished	A Boolean indicating whether the workflow definition has been published (true) or not (false). A workflow definition must be published to activate it. For a newly created workflow, this will be <i>false</i> .
WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection. For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered. CertificateLeftCollection The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection. For example, when a certificate in the Web Server Certificates collection disappears, a REST request can be made to open a support ticket request to investigate the removal of a web server certificate. Enrollment (Including Renewals) The workflow is initiated by enrollment for a new or renewed certificate. Steps during the workflow can be used to do things such as require manager approval for the enrollment or manipulate the subject and/or SANs for the certificate request.

Name	Description										
	<ul style="list-style-type: none"> • Revocation <p>The workflow is initiated by revoking a certificate. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field.</p>										
Steps	<p>An array of objects indicating the steps in the workflow definition. The contents of each step will vary depending on the type of workflow and the type of step. For a newly created workflow, there will be no data in this value. Possible steps include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition step.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the step.</td></tr> <tr> <td>UniqueName</td><td>A string indicating the unique name for the step. This value must be unique among the steps in the particular workflow definition. It is intended to be used as a user-friendly reference ID.</td></tr> <tr> <td>ExtensionName</td><td> <p>A string indicating the type of step. The currently supported types are:</p> <ul style="list-style-type: none"> • Email <p>Send an email message. This is a separate email message from those typically sent as part of a <i>Require Approval</i> step. You might send an email message as part of an enrollment request to notify approvers that a new request needs approval. The email messages can be customized to provide detailed information about, for example, the certificate request.</p> • PowerShell <p>Run PowerShell commands within the confines of the workflow to populate variables with information to pass back to the workflow. The PowerShell script contents are embedded within the step. This step does not call out to an external file. This provides a high level of security by greatly limiting the number of standard PowerShell cmdlets that can be executed by the workflow step. A small number of PowerShell cmdlets have been white listed to allow them to be included in workflow steps of this type, including:</p> <ul style="list-style-type: none"> • ConvertFrom-Csv • ConvertFrom-Json • ConvertFrom-Markdown </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition step.	DisplayName	A string indicating the display name for the step.	UniqueName	A string indicating the unique name for the step. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).
Name	Description																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>RoleIds</td><td>An array of integers indicating the security roles whose members are allowed to approve the request.</td></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i>.</td></tr> </table> <div>  Important: If all the security roles configured for a workflow step are deleted from Keyfactor Command, no users will be able to submit signals for workflow instances initiated with that workflow definition. To remedy this, update the workflow definition with one or more current security roles, re-publish it, and then restart any outstanding workflow instances. </div>	Value	Description	RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.	SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .												
Value	Description																		
RoleIds	An array of integers indicating the security roles whose members are allowed to approve the request.																		
SignalName	A string indicating the name of the signal. This value will vary depending on the workflow step. For the built-in Require Approval step, the SignalName is <i>ApprovalStatus</i> .																		
Conditions	<p>An object containing conditions indicating whether the step should run (true) or not (false). Conditions may either have a static value of True or False or a token that will have a value of True or False at the time the step is run. More than one condition may be added. If multiple conditions are used in the same step, all conditions must have a value of True at the time the step is evaluated to be run in order for the step to run. If any single condition evaluates to False, the step will not run. Condition values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the condition.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).</td></tr> </table>	Value	Description	Id	A string indicating the Keyfactor Command reference GUID of the condition.	Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).												
Value	Description																		
Id	A string indicating the Keyfactor Command reference GUID of the condition.																		
Value	A string indicating the value of the condition. This should be one of true, false, or a token that will be set to either true or false in an earlier step in the workflow (see <i>Workflow Definition Operations: Adding or Modifying a Workflow Definition</i> in the <i>Keyfactor Command Reference Guide</i> for an example).																		

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Outputs</td><td> An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table> </td></tr> </table>	Name	Description	Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.
Name	Description								
Outputs	An object indicating the next step in the workflow. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>continue</td><td> A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain. </td></tr> </table>	Value	Description	continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.				
Value	Description								
continue	A string indicating the <i>UniqueName</i> of the next workflow step in the chain. This value will be null for the final step in the chain.								
DraftVersion	An integer indicating the version number of the workflow definition. If this version number does not match the <i>PublishedVersion</i> , changes have been made to the workflow definition that have not yet been published.								
PublishedVersion	An integer indicating the currently published version number of the workflow definition. For a newly created workflow, this value will be null.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41 Workflow Instances

The Workflow Instances component of the Keyfactor API includes methods necessary to programmatically retrieve, restart, delete and submit data into workflow instances.

Table 693: Workflow Instances Endpoints

Endpoint	Method	Description	Link
/instanceId	DELETE	Delete the workflow instance with the specified GUID.	DELETE Workflow Instances Instance Id on the next page
/instanceId	GET	Retrieve the workflow instance with the specified GUID.	GET Workflow Instances Instance ID on page 1707
/	GET	Retrieve a list of the workflow instances.	GET Workflow Instances on page 1732

Endpoint	Method	Description	Link
/My	GET	Retrieve the workflow instances created by the user making the API request.	GET Workflow Instances My on page 1737
/AssignedToMe	GET	Retrieve the workflow instances assigned to the user making the API request.	GET Workflow Instances AssignedToMe on page 1742
/{{instanceId}}/Stop	POST	Rejects a workflow instance, preventing it from continuing.	POST Workflow Instances Instance Id Stop on page 1747
/{{instanceId}}/Signals	POST	Input data to the workflow instance with the specified GUID.	POST Workflow Instances Instance ID Signals on page 1748
/{{instanceId}}/Restart	POST	Restart the specified workflow instance after a failure.	POST Workflow Instances Instance Id Restart on page 1750

2.6.41.1 DELETE Workflow Instances Instance Id

The DELETE /Workflow/Instances/{instanceId} method is used to delete the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/instances/manage/

Table 694: DELETE Workflow Instances {instanceId} Input Parameters

Name	In	Description
instanceId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to delete. Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1732) to retrieve a list of all the workflow instances to determine the GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.2 GET Workflow Instances Instance ID

The GET /Workflow/Instances/{instanceId} method is used to retrieve the initiated workflow with the specified instance GUID. Both in progress and completed workflows will be returned. This method returns HTTP 200 OK on a success with details about the workflow instance.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/instances/read/
OR
/workflows/instances/read/pending/
OR
/workflows/instances/read/mine/

Users with */mine/* or */pending/* will only be able to retrieve the workflow instances created by them (*/mine/*) or assigned to them (*/pending/*) unless they also have the higher level just */read/*.

Table 695: GET Workflow Instances {instanceId} Input Parameters

Name	In	Description
instanceId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to retrieve. Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1732) to retrieve a list of all the workflow instances to determine the GUID. Note that the integer workflow IDs (returned with <i>GET /Workflow/Instances/{instanceId}</i>) cannot be used with the API; only the GUID from <i>GET /Workflow/Instances</i> can be used in this case.

Table 696: GET Workflow Instances {instanceId} Response Data

Name	Description				
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.				
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended 				
CurrentStepId	A string indicating the Keyfactor Command reference GUID of the workflow instance step.				
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #. 				
Signals	<p>An array of objects containing the data used at the point in the workflow step where the workflow needs to continue based on user input. These will vary depending on the type of workflow and the type of step. Possible RequireApproval values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SignalName</td><td>A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i>.</td></tr> </table>	Value	Description	SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .
Value	Description				
SignalName	A string indicating the name of the signal. For a RequireApproval step, this is <i>ApprovalStatus</i> .				

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>StepSignalId</td><td>A string indicating the Keyfactor Command reference GUID of the signal in the step.</td></tr> <tr> <td>SignalReceived</td><td> <p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p> </td></tr> </table>	Value	Description	StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.	SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>				
Value	Description										
StepSignalId	A string indicating the Keyfactor Command reference GUID of the signal in the step.										
SignalReceived	<p>A Boolean indicating whether a signal (input) has been received from at least one end user (true) or not (false).</p> <p>For a RequireApproval workflow that requires approval from more than one user, the <i>SignalReceived</i> may be <i>true</i> while the workflow instance still has a <i>Suspended</i> status indicating further input is needed.</p>										
Definition	<p>An object containing the workflow definition. Workflow definition data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the workflow definition.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name defined for the workflow definition.</td></tr> <tr> <td>Version</td><td>An integer indicating the version number of the workflow definition.</td></tr> <tr> <td>WorkflowType</td><td> <p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.</p> CertificateLeftCollection <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p> </td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.	DisplayName	A string indicating the display name defined for the workflow definition.	Version	An integer indicating the version number of the workflow definition.	WorkflowType	<p>A string indicating the type of workflow definition. The currently supported types are:</p> <ul style="list-style-type: none"> CertificateEnteredCollection <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that now meet the query criteria of the specified certificate collection.</p> <p>For example, when a certificate discovered on an SSL scan becomes part of the Weak Keys collection, an email message can be generated notifying the PKI administrators that a new certificate with a weak key has been discovered.</p> CertificateLeftCollection <p>The workflow is initiated by an automated task that Keyfactor Command runs periodically against your collections to identify certificates that no longer meet the query criteria of the specified certificate collection.</p>
Name	Description										
Id	A string indicating the Keyfactor Command reference GUID of the workflow definition.										
DisplayName	A string indicating the display name defined for the workflow definition.										
Version	An integer indicating the version number of the workflow definition.										
WorkflowType	<p>A string indicating the type of workflow definition. Steps during the workflow can be configured to do things such as modify the revocation comment entered when the certificate is revoked, append an additional comment, and store the resulting extended comment in a metadata field. 				
CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				

Name	Description																		
StartDate	A string indicating the date and time when the instance was initiated.																		
InitialData	<div><p>An object containing the data included in the workflow instance when the workflow was initiated. Initial workflow instance data includes:</p><table><tr><th>Name</th><th>Operation Type</th><th>Description</th></tr><tr><td>CertificateAuthority</td><td>Enrollment and Revocation</td><td>A string indicating the certificate authority that will be used to enroll against, for enrollment requests, or that issued the certificate, for revocation requests in <i>host-name\logical name</i> format.</td></tr><tr><td>CertificateId</td><td>Certificate Collection and Revocation</td><td>An integer indicating the Keyfactor Command reference ID for the certificate.</td></tr><tr><td>SerialNumberString</td><td>Revocation</td><td>A string indicating the serial number of the certificate being revoked.</td></tr><tr><td>Thumbprint</td><td>Revocation</td><td>A string indicating the thumbprint of the certificate being revoked.</td></tr><tr><td>RevokeCode</td><td>Revocation</td><td>An integer containing the specific reason that the certificate is being revoked. CSR	A string containing the certificate signing request for the certificate request as returned by the CA.	Status	An integer indicating the status for the certificate as returned by the CA.	RequesterName	A string containing the requester name on the certificate request as returned by the CA.
	Name	Description											
	CARquestId	A string containing the ID assigned to the certificate request by the CA.											
	CSR	A string containing the certificate signing request for the certificate request as returned by the CA.											
	Status	An integer indicating the status for the certificate as returned by the CA.											
	RequesterName	A string containing the requester name on the certificate request as returned by the CA.											
			<div> Note: This field is populated only if the certificate request fails at the CA level or requires manager approval at the CA level.</div>										
	SerialNumber	Enrollment	A string indicating the serial number of the certificate.										
	IssuerDn	Enrollment	A string indicating the distinguished name of the issuer.										
Thumbprint	Enrollment	A string indicating the thumbprint of the certificate.											
KeyfactorId	Enrollment	An integer indicating the Keyfactor Command reference ID for the certificate.											

Name	Description		
	Name	Operation Type	Description
	KeyStatus	Enrollment	An integer indicating the status of the private key retention for the certificate within Keyfactor Command. Possible values are: <ul style="list-style-type: none"> • 0—Unknown • 1—Saved • 2—Expected • 3—NoRetention • 4—Failure • 5—Temporary
	PrivateKeyConverter	Enrollment	An internally used Keyfactor Command field.
Referenceld	A integer indicating the Keyfactor Command reference ID for the workflow instance.		

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.3 GET Workflow Instances

The GET /Workflow/Instances method is used to retrieve the list of workflows that have been initiated. Both in progress and completed workflows are included. This method returns HTTP 200 OK on a success with details about the workflow instances.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/instances/read/

Table 697: GET Workflow Instances Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Workflow Instances Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DefinitionId (workflow definition ID) • Id (workflow instance GUID) • InitiatingUserName (DOMAIN\username) • LastModified • ReferenceId (workflow instance integer ID) • StartDate • Status • Title • WorkflowType
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>CurrentStepDisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 698: GET Workflow Instances Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID of the workflow instance.
Status	<p>A string indicating the current status of the workflow instance. The possible statuses are:</p> <ul style="list-style-type: none"> • CanceledForRestart • Complete • Failed • Rejected • Running • Suspended
CurrentStepID	A string indicating the Keyfactor Command reference GUID of the workflow instance step.
StatusMessage	<p>A string indicating the current status message for the workflow instance. Possible status messages vary and may include:</p> <ul style="list-style-type: none"> • Access is denied • Awaiting # more approval(s) from approval roles. • Either the credentials are invalid, or the CA on [CA hostname] is not running • Issued • Issued. The private key was successfully retained. • Post-process Failed: [Message indicating reason for failure generally from the CA] • Pre-process failed: [Message indicating details of the failure] • Revoked • Step 'Keyfactor-Enroll' failed: [Message indicating details of the failure] • Step 'Keyfactor-Revoke' failed:[Message indicating details of the failure] • Step [custom step name] failed: [Message indicating details of the failure] • Taken Under Submission. The certificate template requires manager approval, and is marked as pending. • Workflow rejected by user with Id #.
Definition	An object containing the workflow definition. Workflow definition data includes:

CurrentStepDisplayName	A string indicating the display name defined for the workflow instance step.				
CurrentStepUniqueName	A string indicating the unique name defined for the workflow instance step. This value is unique among the steps in a particular workflow definition. It is intended to be used as a user-friendly reference ID.				
Title	<p>A string indicating a description for the action taking place in the step, made up of the <i>InitiatingUserName</i> (either DOMAIN\username or Timer Service) followed by an indication of the type of action and a specific message about the action. For example:</p> <p>"KEYEXAMPLE\jsmith is enrolling for a certificate with CN=appsrvr14.keyexample.com."</p> <p>Or</p> <p>"KEYEXAMPLE\jsmith is revoking certificate with CN=appsrvr12.keyexample.com."</p>				
LastModified	A string indicating the date and time on which the initiated instance was last updated. The instance is updated each time a step in the workflow is completed, when signals are received for a step that accepts signals (e.g. a requires approval step), or when an instance is stopped or restarted.				
StartDate	A string indicating the date and time when the instance was initiated.				
ReferenceId	A integer indicating the Keyfactor Command reference ID for the workflow instance.				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.4 GET Workflow Instances My

The GET /Workflow/Instances/My method is used to retrieve the list of initiated workflows created by the user making the API request—as a result of enrolling for a certificate, for example, or revoking a certificate. This method returns HTTP 200 OK on a success with details about the workflow instances.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/instances/read/
OR
/workflows/instances/read/mine/

Table 699: GET Workflow Instances My Input Parameters

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.6 POST Workflow Instances Instance Id Stop

The POST /Workflow/Instances/{instanceId}/Stop method is used to stop the workflow instance with the specified GUID, preventing it from continuing. This endpoint returns 204 with no content upon success.

 **Note:** Only workflow instances with a Status of *Suspended* can be stopped.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/workflows/instances/manage/

Table 703: POST Workflow Instances {instanceId} Stop Input Parameters

Name	In	Description
instanceId	Path	Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to stop. Use the <i>GET /Workflow/Instances</i> method (see GET Workflow Instances on page 1732) to retrieve a list of all the workflow instances to determine the GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.7 POST Workflow Instances Instance ID Signals

The POST /Workflow/Instances/{instanceId}/Signals method is used to input signals to the workflow instance with the specified GUID. This endpoint returns 204 with no content upon success.

Note: If a workflow instance is initiated for a workflow definition that has more than one step requiring input (signals), a user can only provide that input (e.g. approve or deny a require approval request) at the step in the workflow instance where the workflow instance was suspended pending input. The user cannot jump ahead and provide input for future steps in the workflow that have not yet occurred.

Note: A locking conflict may occur if two (or more) users attempt to provide input to a workflow instance (e.g. approve a request) at exactly the same time. If this happens, input from only one of the users will be reflected in the Management Portal, and the workflow instance will not be moved along to the next step if it should have been with input from the two users. The other input is still accepted, however, and there is a scheduled task that runs daily and attempts to continue all suspended workflows that may be eligible to continue but have not done so due to locking conflicts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
The user executing the request must hold at least one security role ID configured in the workflow definition step for which signal data is being input.

Table 704: POST Workflow Instances {instanceid} Signals Input Parameters

Name	In	Description						
instanceId	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to which to input a signal.</p> <p>Use the GET /Workflow/Instances method (see GET Workflow Instances on page 1732) to retrieve a list of all the workflow instances to determine the GUID.</p>						
SignalKey	Body	<p>Required. A string indicating the key for the signal. This is made up of the unique name for the step within the definition plus the signal type, separated by a period (UniqueName.SignalType). For a Require Approval step, the key input type will be <i>ApprovalStatus</i>, so the full <i>SignalKey</i> will look something like:</p> <div>RequireApproval1.ApprovalStatus</div> <p>Use the GET /Workflow/Definitions/{definitionid} method (see GET Workflow Definitions Definition ID on page 1566) to return workflow details including the workflow steps to determine the <i>UniqueName</i> of the step for which you want to input a signal or one of the GET methods for workflow instances (see GET Workflow Instances on page 1732, GET Workflow Instances AssignedToMe on page 1742, or GET Workflow Instances My on page 1737) to return the <i>CurrentStepUniqueName</i>.</p>						
Data	Body	<p>Required. An object providing the input information for the signal. The key(s) will vary depending on the signal. RequireApproval signal data values are:</p> <table><tr><th>Key</th><th>Value</th></tr><tr><td>Approved</td><td>Required. A Boolean indicating whether the request is approved (true) or denied (false).</td></tr><tr><td>Comment</td><td>A string containing a comment to associate with the signal. The maximum comment length is 500 characters.</td></tr></table> <p>For example, to approve a Require Approval step called <i>RequireApproval1</i> with a comment:</p> <pre>{ "SignalKey": "RequireApproval1.ApprovalStatus", "Data": { "Approved": "True", "Comment": "Here is my comment." } }</pre>	Key	Value	Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).	Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.
Key	Value							
Approved	Required. A Boolean indicating whether the request is approved (true) or denied (false).							
Comment	A string containing a comment to associate with the signal. The maximum comment length is 500 characters.							

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.41.8 POST Workflow Instances Instance Id Restart

The POST `/Workflow/Instances/{instanceid}/Restart` method is used to restart the workflow instance with the specified GUID. This can be used either after it has reached a failed state and the failure has been corrected (e.g. a CA was not responding when an enrollment was attempted or a PowerShell script failed to run to completion) or midstream while it's still active but in a suspended state waiting for signals to introduce a new version of the workflow definition. The workflow instance will restart from the beginning. This endpoint returns 204 with no content upon success.

Note: Only workflow instances with a Status of *Failed* or *Suspended* can be restarted.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/workflows/instances/manage/`
`/workflows/instances/read/`

Table 705: POST Workflow Instances {instanceid} Restart Input Parameters

Name	In	Description
instanceid	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the workflow instance to restart.</p> <p>Use the <code>GET /Workflow/Instances</code> method (see GET Workflow Instances on page 1732) to retrieve a list of all the workflow instances to determine the GUID.</p> <div> Note: When you restart an instance, it will be issued a new instance ID. </div>
version	Body	An integer indicating the version number of the workflow definition. If no version is specified, the workflow will be restarted using the most recently published version.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.7 API Change Log

In this section you will find the change history for the Keyfactor API endpoints from version 9.0 onwards.

2.7.1 v9 API Change Logs

Find the change logs for Keyfactor API major release 9.0 and subsequent incremental releases below.

Release Type	Release Date	Link to Change Log
Major	August 2021	API Change Log v9.0 below
Incremental	September 2021	API Change Log v9.1 on page 1753
Incremental	October 2021	API Change Log v9.2 on page 1754
Incremental	November 2021	API Change Log v9.3 on page 1755
Incremental	December 2021	API Change Log v9.4 on page 1755
Incremental	January 2022	API Change Log v9.5 on page 1755
Incremental	February 2022	API Change Log v9.6 on page 1756
Incremental	March 2022	API Change Log v9.7 on page 1756
Incremental	April 2022	API Change Log v9.8 on page 1756
Incremental	May 2022	API Change Log v9.9 on page 1756

2.7.1.1 API Change Log v9.0

API changes for Keyfactor Command version 9.0 Major release

Table 706: API Change Log v9.0

Endpoint	Method	Action	Notes
/Agents/Approve	POST	Add	
/Agents/Disapprove	POST	Add	
/CertificateCollections	PUT	Add	
/CertificateCollections/Copy	POST	Add	
/Certificates/{id}/History	GET	Add	
/Certificates/{id}/Security	GET	Add	
/Certificates/{id}/Validate	GET	Add	
/Certificates/Locations/{id}	GET	Add	
/Certificates/Metadata/Compare	GET	Add	
/Certificates/Metadata/All	PUT	Add	
/Certificates/RevokeAll	POST	Add	
/CertificateStoreContainers	GET	Add	
/CertificateStoreContainers/{id}	GET	Add	
/CertificateStores/Certificates/Add	POST	Add	
/CertificateStores/Certificates/Remove	POST	Add	
/Enrollment/CSR/Context/My	GET	Add	
/Enrollment/PFX/Context/My	GET	Add	
/JobTypes/Custom	GET, POST, PUT	Add	
/JobTypes/Custom/{id}	GET, DELETE	Add	
/OrchestratorJobs/Custom	POST	Add	
/OrchestratorJobs/JobHistory	GET	Add	
/OrchestratorJobs/JobStatus/Data	GET	Add	
/Reports	GET, PUT	Add	

Endpoint	Method	Action	Notes
/Reports/{id}	GET	Add	
/Reports/{id}/Parameters	GET, PUT	Add	
/Reports/{id}/Schedules	GET, POST, PUT	Add	
/Reports/Custom	GET, POST, PUT	Add	
/Reports/Custom/{id}	GET, DELETE	Add	
/Reports/Schedules/{id}	GET, DELETE	Add	
/Security/Identities	GET, POST	Add	
/Security/Identities/{id}	DELETE	Add	
/Security/Identities/Lookup	GET	Add	
/Security/Roles	GET, POST, PUT	Add	
/Security/Roles/{id}	GET, DELETE	Add	
/SSH/Keys/Unmanaged	DELETE	Add	
/SSH/ServiceAccounts	DELETE	Add	
/SSH/Users/Access	POST	Add	
/SSL/Networks/{id}/Scan	POST	Add	

2.7.1.2 API Change Log v9.1

API changes for Keyfactor Command version 9.1 incremental release

Table 707: API Change Log v9.1

Endpoint	Methods	Action	Notes
/CertificateStores/{id}/Inventory	GET	Add	
/Enrollment/PFX/Replace	POST	Fix	SuccessfulStores collection now only includes Ids of stores that were successfully processed.
/Enrollment/PFX/Deploy	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertStoreTypes	POST/PUT	Update	EntryParameters can now be set via these methods.
/CertificateStores/Certificates/Add	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateStores/Certificates/Remove	POST	Update	Now allows for multiple stores of the same type with different parameters.
/CertificateCollections/{id}/Permissions	GET	Deprecate	

2.7.1.3 API Change Log v9.2

API changes for Keyfactor Command version 9.2 incremental release

Table 708: API Change Log v9.2

Endpoint	Methods	Action	Notes
/Certificates	GET	Fix	No longer fails if a collection id is not provided.
/OrchestratorJobs/JobHistory	GET	Fix	Request no longer fails for 'Dynamic' job types.
/Reports/Schedules/{id}	DELETE	Fix	Response code is now 200 when the user role does not have <i>Modify – Report</i> permission.

2.7.1.4 API Change Log v9.3

API changes for Keyfactor Command version 9.3 incremental release

Table 709: API Change Log v9.3

Endpoint	Methods	Action	Notes
/JobTypes/Custom	POST	Fix	No longer requires default field values.

2.7.1.5 API Change Log v9.4

API changes for Keyfactor Command version 9.4 incremental release

Table 710: API Change Log v9.4

Endpoint	Methods	Action	Notes
/Workflow/Certificates/Pending	GET	Update	Now returns the associated metadata.

2.7.1.6 API Change Log v9.5

API changes for Keyfactor Command version 9.5 incremental release

Table 711: API Change Log v9.5

Endpoint	Methods	Action	Notes
/Enrollment/PFX	POST	Update	No longer requires a certificate authority name to be provided.

2.7.1.7 API Change Log v9.6

API changes for Keyfactor Command version 9.6 incremental release.

No API endpoint changes were made in this release.

2.7.1.8 API Change Log v9.7

API changes for Keyfactor Command version 9.7 incremental release

Table 712: API Change Log v9.7

Endpoint	Methods	Action	Notes
/KeyfactorAPI/License	GET	Add	

2.7.1.9 API Change Log v9.8

API changes for Keyfactor Command version 9.8 incremental release.

No API endpoint changes were made in this release.

2.7.1.10 API Change Log v9.9

API changes for Keyfactor Command version 9.9 incremental release

Table 713: API Change Log v9.9

Endpoint	Methods	Action	Notes
/Reports/<any>	GET	Fix	Spaces within the sortField no longer results in an exception.
/Reports/{id}/Schedules	GET	Fix	An invalid sortField no longer results in an exception.
/Agents	GET	Update	New query parser to support the AgentId GUID.

2.7.2 v10 API Change Logs

Find the change logs for Keyfactor API major release 10.0 and subsequent incremental and hot fix releases below.

Release Type	Release Date	Link to Change Log
Major	September 2022	API Change Log v10.0 below
Incremental	November 2022	API Change Log v10.1 on page 1763
Incremental	January 2023	API Change Log v10.2 on page 1763
Hot Fix	April 2023	API Change Log v10.3.1 on page 1763
Incremental	May 2023	API Change Log v10.4 on page 1764
Hot Fix	July 2023	API Change Log v10.4.3 on page 1764
Hot Fix	September 2023	API Change Log v10.4.5 on page 1765
Hot Fix	September 2023	API Change Log v10.4.6 on page 1765

2.7.2.1 API Change Log v10.0

API changes for Keyfactor Command version 10.0 Major release

Table 714: API Change Log v10.0

Endpoint	Methods	Action	Notes
/Agents/{id}	GET	Add	
/Agents/Reset	POST	Add	
/AgentBlueprint	GET	Add	
/AgentBlueprint/{id}	GET, DELETE	Add	
/AgentBlueprint/{id}/Jobs	GET	Add	
/AgentBlueprint/{id}/Stores	GET	Add	
/AgentBluePrint/ApplyBlueprint	POST	Add	
/AgentBluePrint/GenerateBluePrint	POST	Add	
/Alerts/Denied	GET, PUT, POST	Add	
/Alerts/Denied/{id}	GET, DELETE	Add	
/Alerts/Expiration	GET, PUT, POST	Add	
/Alerts/Expiration/{id}	GET, DELETE	Add	
/Alerts/Expiration/Schedule	GET, PUT	Add	
/Alerts/Expiration/Test	POST	Add	
/Alerts/Expiration/TestAll	POST	Add	
/Alerts/IssuedAlerts	GET, PUT, POST	Add	
/Alerts/IssuedAlerts/{id}	GET, DELETE	Add	
/Alerts/Issued/Schedule	GET, PUT	Add	
/Alerts/KeyRotation	GET, PUT, POST	Add	

Endpoint	Methods	Action	Notes
/Alerts/KeyRotation/{id}	GET, DELETE	Add	
/Alerts/KeyRotation/Schedule	GET, PUT	Add	
/Alerts/KeyRotation/Test	POST	Add	
/Alerts/KeyRotation/TestAll	POST	Add	
/Alerts/Pending	GET, PUT, POST	Add	
/Alerts/Pending/{id}	GET, DELETE	Add	
/Alerts/Pending/Schedule	GET, PUT	Add	
/Alerts/Pending/Test	POST	Add	
/Alerts/Pending/Test/{id}	POST	Add	
/CertificateAuthorities	GET	Update	Schedules are now included in the results.
/CertificateAuthorities	POST	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	PUT	Update	Ability to turn off schedules, sessions are abandoned properly, and threshold monitoring schedule is included.
/CertificateAuthorities/{id}	DELETE	Update	Deletion is now prevented if schedules are associated.
/CertificateCollections	POST	Update	Query parameter no longer needed when a valid CopyFromId is provided.
/CertificateCollections/{id}/Permissions	POST	Deprecated	Replaced by /Security/Roles/{id}/Permissions/Collection.
/Certificates/Analyze	POST	Add	
/Certificates/IdentityAudit/{id}	GET	Add	

Endpoint	Methods	Action	Notes
/CertificateStoreContainers	POST	Add	
/CertificateStoreContainers/{id}	PUT, DELETE	Add	
/CertificateStores/Server	GET, POST, PUT	To Be Deprecated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/CertificateStores	GET, POST, PUT	Updated	Server usernames, server passwords, and the UseSSL flag are managed by the /CertificateStores API endpoints directly as JobProperties using the Properties parameter, replacing the deprecated /CertificateStores/Server API endpoints.
/Enrollment/PFX (v2)	POST	Add	
/Enrollment/Settings/{id}	GET	Add	
/JobTypes/Custom	POST	Update	DefaultValue property is no longer required, validation is now performed on the JobTypeFields/DefaultValue property, validation prevents names containing spaces.
/JobTypes/Custom/{id}	DELETE	Update	Includes validation so that deletion is prevented if at least one associated approved orchestrator implements the capability.
/MacEnrollment	GET, PUT	Add	
/Monitoring/Revocation	GET, POST	Update	Renamed from /Workflow/RevocationMonitoring

Endpoint	Methods	Action	Notes
/Monitoring/Revocation/{id}	GET, PUT, DELETE	Update	Renamed from /Workflow/RevocationMonitoring/{id}
/Monitoring/Revocation/Test	POST	Add	
/Monitoring/Revocation/TestAll	POST	Add	
/Orchestrators/JobHistory	GET	Update	Added JobId field.
/Orchestrators/ScheduledJobs	GET	Add	
/OrchestratorJobs/Reschedule	POST	Add	
/OrchestratorJobs/Unschedule	POST	Add	
/OrchestratorJobs/Acknowledge	POST	Add	
/Security/Identities/{id}	GET	Add	
/Security/Roles/{id}/Identities	GET, POST	Add	
/Security/Roles/{id}/Containers	GET, POST	Add	
/Security/Roles/{id}/Copy	POST	Add	
/Security/Roles/{id}/Permissions	GET	Add	
/Security/Roles/{id}/Permissions/Global	GET, POST, PUT	Add	
/Security/Roles/{id}/Permissions/Collections	GET, POST, PUT	Add	Replaced the /CertificateCollections/{id}/Permissions endpoint functionality.
/Security/Roles/{id}/Permissions/Containers	GET, POST, PUT	Add	Returns only containers that have a permission set for the selected security role.
/SMTP	GET, PUT	Add	
/SMTP/Test	POST	Add	
/Templates	GET, PUT	Update	Includes template-specific policy information.
/Templates/{id}	GET	Update	Includes template defaults.

Endpoint	Methods	Action	Notes
/Templates/Settings	GET, PUT	Update	Includes global template policies.
/Template/SubjectParts	GET	Add	
/Templates/Global/Settings	GET, PUT	Add	
/Templates/Import	POST	Add	
/Workflow/Certificates/Pending	GET	Update	Now supports query fields of Requester and RequestType.
/Workflow/Definitions/Steps/{extensionName}	GET	Add	
/Workflow/Definitions/{definitionId}	GET, PUT, DELETE	Add	
/Workflow/Definitions	GET, POST	Add	
/Workflow/Definitions/Steps	GET	Add	
/Workflow/Definitions/Types	GET	Add	
/Workflow/Definitions/{definitionId}/Steps	PUT	Add	
/Workflow/Definitions/{definitionId}/Publish	POST	Add	
/Workflow/Instances/{instanceId}	GET, DELETE	Add	
/Workflow/Instances	GET	Add	
/Workflow/Instances/My	GET	Add	
/Workflow/Instances/AssignedToMe	GET	Add	
/Workflow/Instances/{instanceId}/Stop	POST	Add	
/Workflow/Instances/{instanceId}/Signals	POST	Add	
/Workflow/Instances/{instanceId}/Restart	POST	Add	

2.7.2.2 API Change Log v10.1

API changes for Keyfactor Command version 10.1 incremental release

Table 715: API Change Log v10.1

Endpoint	Methods	Action	Notes
/Templates	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/{id}	GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.
/Templates/Settings	PUT, GET	Update	Ed448 and Ed25519 keys are now supported for certificate enrollment, policy, import and search.

2.7.2.3 API Change Log v10.2

API changes for Keyfactor Command version 10.2 incremental release

Table 716: API Change Log v10.2

Endpoint	Methods	Action	Notes
/Security/My	GET	Add	Returns all the security roles and global permissions for the requesting user.
/Enrollment/CSR	POST	Update	The workflow instance ID has been added to the response.
/Enrollment/CSR	POST	Update	A new PrivateKey input field has been added to support private key retention on CSR enrollment.
/Enrollment/PFX	POST	Update	The workflow instance ID has been added to the response.
/Certificates/Analyze	POST	Update	The endpoint requires Global Certificates-Read or Certificates-Import permissions.

2.7.2.4 API Change Log v10.3.1

API changes for Keyfactor Command version 10.3.1 hot fix release

Table 717: API Change Log v10.3.1

Endpoint	Methods	Action	Notes
/Reports/{id}/Schedules	POST	Fixed	Reports can be scheduled when the user scheduling the report only has permission to view one certificate collection.

2.7.2.5 API Change Log v10.4

API changes for Keyfactor Command version 10.4 incremental release

Table 718: API Change Log v10.4

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Included SANs entered outside the CSR in workflow instance details.

2.7.2.6 API Change Log v10.4.3

API changes for Keyfactor Command version 10.4.3 hot fix release

Table 719: API Change Log v10.4.3

Endpoint	Methods	Action	Notes
/CertificateAuthority/Test	POST	Fixed	EJBCA version 8 is supported.
/Enrollment/Renew	POST	Fixed	EJBCA version 8 is supported.
/Templates/Import	POST	Fixed	EJBCA version 8 is supported.

2.7.2.7 API Change Log v10.4.5

API changes for Keyfactor Command version 10.4.5 hot fix release

Table 720: API Change Log v10.4.5

Endpoint	Methods	Action	Notes
/CSRGeneration/Generate	POST	Update	3072-bit RSA keys are supported.
/Enrollment/CSR	POST	Update	3072-bit RSA keys are supported.
/Enrollment/PFX	POST	Update	3072-bit RSA keys are supported.
/Enrollment/Renew	POST	Update	3072-bit RSA keys are supported.

2.7.2.8 API Change Log v10.4.6

API changes for Keyfactor Command version 10.4.6 hot fix release

Table 721: API Change Log v10.4.6

Endpoint	Methods	Action	Notes
/Enrollment/CSR	POST	Fixed	Includes SANs entered outside the CSR only when the <i>Allow CSR SAN Entry</i> application setting is set to true. SANs entered outside the CSR replace SANs in the CSR rather than appending to SANs from the CSR.
/Workflow/Instances	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/AssignedToMe	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/My	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.
/Workflow/Instances/{instanceId}	GET	Fixed	Includes SANs entered outside the CSR in workflow instance details.

2.7.3 v11 API Change Logs

Find the change logs for Keyfactor API major release 11.0 below.

Release Type	Release Date	Link to Change Log
Major	October 2023	API Change Log v11.0 below

2.7.3.1 API Change Log v11.0

API changes for Keyfactor Command version 11.0 major release

Table 722: API Change Log v11.0

Endpoint	Methods	Action	Notes
AppSetting	GET, PUT	Added	
AppSetting/{id}	GET	Added	
AppSetting/{id}/Set	PUT	Added	
AppSetting/{name}/Set	PUT	Added	
CertificateAuthority/SourceCount	GET	Added	
CertificateAuthority/ConfigurationTenants	GET	Added	
CertificateAuthority/HealthMonitoring/Schedule	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients	POST	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}	PUT	Added	

Endpoint	Methods	Action	Notes
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	DELETE	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	GET	Added	
CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id}	PUT	Added	
CertificateAuthority/Import	POST	Added	
CertificateAuthority/ConfigurationTenants	GET	Changed	The endpoint is now renamed to GET /CertificateAuthority/AvailableForests and the definition is changed to: Returns a list of available forests that are in Active Directory.
Certificates/CSV	GET	Added	
Certificates/IdentityAudit/{id}	GET	Added to V2 definitions	This API endpoint is available in both the V1 and V2 definitions in the Keyfactor API Reference and Utility and acts exactly the same in both.
CertificateCollections/{id}/Permissions	POST	Removed	Instead use POST Security/Roles/{id}/Permissions/Collection.
CertificateCollections/{id}	DELETE	Added	
CertificateCollections/NavItems	GET	Added	

Endpoint	Method-s	Action	Notes
CertificateCollections/CollectionList	GET	Added	
CertificateCollections/{id}/Favorite	PUT	Added	
CertificateStores/Server	GET, POST, PUT	Deprec- ated	
CertificateStoreTypes	GET	Changed	<p>The API will return ALL certificate store types if at least one of these conditions are met:</p> <ul style="list-style-type: none"> • The end-user has one of the /certificate_stores/read/ global permissions. • The end-user has permission to at least one certificate store container.
ComponentInstallation/{id}	DELETE	Added	
ComponentInstallation/	GET	Added	
EventHandlerRegistration/{id}	GET, DELETE, PUT	Added	
EventHandlerRegistration/	GET, POST	Added	
Extensions/Scripts/{id}	DELETE, GET	Added	
Extensions/Scripts	GET, POST, PUT	Added	
IdentityProviders/{id}	GET, PUT	Added	
IdentityProviders	GET	Added	
IdentityProviders/Types	GET	Added	

Endpoint	Method-s	Action	Notes
Permissions	GET	Added	
PermissionSets/{id}	GET, DELETE	Added	
PermissionSets	GET, POST, PUT	Added	
Scheduling	POST	Added	
Security/Containers/{id}/Roles	GET, POST	Added	
Security/Audit/Collections/{id}	GET	Added	
Security/Claims/{id}	GET, DELETE	Added	
Security/Claims	GET, POST, PUT	Added	
Security/Claims/Roles	GET	Added	
Security/Identities	GET	Changed	The non-working query string field has been removed.
Security/Roles/{id}/Permissions/PamProviders	GET, PUT	Added	
Security/Roles (V1) Security/Roles/{id} (V1) Security/Roles/{id}/Identities(V1) Security/Roles/{id}/copy(V1)	GET, POST, PUT	Deprec- ated in V1	All SecurityRoles API endpoints (except DELETE / {id}) have been deprecated from the V1 API, as they only work against Active Directory users. There are new Security/Roles endpoints in the V2 API
Security/Roles(V2) Security/Roles/{id}(V2)	GET, POST, PUT	Added in V2	Security/ Roles API endpoints have been recreated in V2 API to work with both OAUTH and AD users.

Endpoint	Method-s	Action	Notes
Templates/{id}	GET	Changed	Now returns an object with a TemplatePolicy property and a KeyAlgorithms property that show the policies and algorithms the template supports.
Templates/Import	GET, POST	Changed	Now supports multiple algorithms.
Templates/Settings	GET, PUT	Changed	The Template Policy property used to update global application settings now contains four properties: ECDSA, RSA, Ed448, and Ed25519. These replace the AllowEd448, AllowEd25519, RSAValidCurves, and ECCValidCurves.

3.0 Glossary

A

AIA

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

AnyAgent

The AnyAgent, one of Keyfactor's suite of orchestrators, is used to allow management of certificates regardless of source or location by allowing customers to implement custom agent functionality via an API.

AnyGateway

The Keyfactor AnyGateway is a generic third party CA gateway framework that allows existing CA gateways and custom CA connections to share the same overall product framework.

API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Argument

A parameter or argument is a value that is passed into a function in an application.

Authority Information Access

The authority information access (AIA) is included in a certificate--if configured--and identifies a location from which the chain certificates for that certificate may be retrieved.

B

Bash Orchestrator

The Bash Orchestrator, one of Keyfactor's suite of orchestrators, is used to discover and manage SSH keys across an enterprise.

Blueprint

A snapshot of the certificate stores and scheduled jobs on one orchestrator, which can be used to create matching certificate stores and jobs on another orchestrator with just a few clicks.

C

CA

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Authority

A certificate authority (CA) is an entity that issues digital certificates. Within Keyfactor Command, a CA may be a Microsoft CA or a Keyfactor gateway to a cloud-based or remote CA.

Certificate Revocation List

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

Certificate Signing Request

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor

Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

CN

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Collection

The certificate search function allows you to query the Keyfactor Command database for certificates from any available source based on any criteria of the certificates and save the results as a collection that will be available in other places in the Management Portal (e.g. expiration alerts and certain reports).

Common Name

A common name (CN) is the component of a distinguished name (DN) that represents the primary name of the object. The value varies depending on the type of object. For a user object, this would be the user's name (e.g. CN=John Smith). For SSL certificates, the CN is typically the fully qualified domain name (FQDN) of the host where the SSL certificate will reside (e.g. server-name.keyexample.com or www.keyexample.com).

Configuration Tenant

A grouping of CAs. The Microsoft concept of forests is not used in EJBCA so to

accommodate the new EJBCA functionality, and to avoid confusion, the term forest needed to be renamed. The new name is configuration tenant. For EJBCA, there would be one configuration tenant per EJBCA server install. For Microsoft, there would be one per forest. Note that configuration tenants cannot be mixed, so Microsoft and EJBCA cannot exist on the same configuration tenant.

CRL

A Certificate Revocation List (CRL) is a list of digital certificates that have been revoked by the issuing Certificate Authority (CA) before their scheduled expiration date and should no longer be trusted.

CSR

A CSR or certificate signing request is a block of encoded text that is submitted to a CA when enrolling for a certificate. When you generate a CSR within Keyfactor Command, the matching private key for it is stored in Keyfactor Command in encrypted format and will be married with the certificate once returned from the CA.

D

DER

A DER format certificate file is a DER-encoded binary certificate. It contains a single certificate and does not support storage of private keys. It sometimes has an extension of .der but is often seen with .cer or .crt.

Distinguished Name

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs,

separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DN

A distinguished name (DN) is the name that uniquely identifies an object in a directory. In the context of Keyfactor Command, this directory is generally Active Directory. A DN is made up of attribute=value pairs, separated by commas. Any of the attributes defined in the directory schema can be used to make up a DN.

DNS

The Domain Name System is a service that translates names into IP addresses.

E

ECC

Elliptical curve cryptography (ECC) is a public key encryption technique based on elliptic curve theory that can be used to create faster, smaller, and more efficient cryptographic keys. ECC generates keys through the properties of the elliptic curve equation instead of the traditional method of generation as the product of very large prime numbers.

Endpoint

An endpoint is a URL that enables the API to gain access to resources on a server.

Enrollment

Certificate enrollment refers to the process by which a user requests a digital certificate. The user must submit the request to a certificate authority (CA).

EOBO

A user with an enrollment agent certificate can enroll for a certificate on behalf of another user. This is often used when provisioning technology such as smart cards.

F

Forest

An Active Directory forest (AD forest) is the top most logical container in an Active Directory configuration that contains domains, and objects such as users and computers.

G

Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

H

Host Name

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

Hosted Config Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor

Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hosted Configuration Portal

The Keyfactor Hosted Configuration Portal is used to configure connections between on-premise instances of the Keyfactor Gateway Connector and on-premise CAs to make them available to Azure-hosted instance of Keyfactor Command. The portal is Azure-hosted and managed by Keyfactor.

Hostname

The unique identifier that serves as name of a computer. It is sometimes presented as a fully qualified domain name (e.g. server-name.keyexample.com) and sometimes just as a short name (e.g. servername).

J

Java Agent

The Java Agent, one of Keyfactor's suite of orchestrators, is used to perform discovery of Java keystores and PEM certificate stores, to inventory discovered stores, and to push certificates out to stores as needed.

Java Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

JKS

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based

applications for authentication and encryption.

K

Key Length

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Pair

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Key Size

The key size or key length is the number of bits in a key used by a cryptographic algorithm.

Key Type

The key type identifies the type of key to create when creating a symmetric or asymmetric key. It references the signing algorithm and often key size (e.g. AES-256, RSA-2048, Ed25519).

Keyfactor CA Management Gateway

The Keyfactor CA Management Gateway is made up of the Keyfactor Gateway Connector, installed in the customer forest to provide a connection to the local CA, and the Azure-hosted and Keyfactor managed Hosted Configuration Portal. The solution is used to provide a connection between a customer's on-premise CA and an Azure-hosted instance of Keyfactor Command for synchronization, enrollment, and management of certificates.

Keyfactor Gateway Connector

The Keyfactor Gateway Connector is installed in the customer forest to provide a connection between the on-premise CA and the Azure-hosted, Keyfactor managed Hosted Configuration Portal to provide support for synchronization, enrollment and management of certificates through the Azure-hosted instance of Keyfactor Command for the on-premise CA. It is supported on both Windows and Linux.

Keyfactor Universal Orchestrator

The Keyfactor Universal Orchestrator, one of Keyfactor's suite of orchestrators, is used to interact with servers and devices for certificate management, run SSL discovery and management tasks, and manage synchronization of certificate authorities in remote forests. With the addition of custom extensions, it can provide certificate management capabilities on a variety of platforms and devices (e.g. Amazon Web Services (AWS) resources, Citrix\NetScaler devices, F5 devices, IIS stores, JKS keystores, PEM stores, and PKCS#12 stores) and execute tasks outside the standard list of certificate management functions. It runs on either Windows or Linux servers or Linux containers.

Keystore

A Java KeyStore (JKS) is a file containing security certificates with matching private keys. They are often used by Java-based applications for authentication and encryption.

L

Logical Name

The logical name of a CA is the common name given to the CA at the time it is created. For Microsoft CAs, this name can

be seen at the top of the Certificate Authority MMC snap-in. It is part of the FQDN\Logical Name string that is used to refer to CAs when using command-line tools and in some Keyfactor Command configuration settings (e.g. `ca2.keyexample.-com\Corp Issuing CA Two`).

M

MAC Agent

The MAC Agent, one of Keyfactor's suite of orchestrators, is used to manage certificates on any keychains on the Mac on which the Keyfactor MAC Agent is installed.

Metadata

Metadata provides information about a piece of data. It is used to summarize basic information about data, which can make working with the data easier. In the context of Keyfactor Command, the certificate metadata feature allows you to create custom metadata fields that allow you to tag certificates with tracking information about certificates.

O

Object Identifier

Object identifiers or OIDs are a standardized system for identifying any object, concept, or "thing" with a globally unambiguous persistent name.

OID

Object identifiers or OIDs are a standardized system for identifying any object, concept, or "thing" with a globally unambiguous persistent name.

Orchestrator

Keyfactor orchestrators perform a variety of functions, including managing certificate stores and SSH key stores.

P

P12

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

P7B

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

P7C

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

Parameter

A parameter or argument is a value that is passed into a function in an application.

PEM

A PEM format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PEM certificates always begin and end with entries like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. PEM certificates can contain a single certificate or a full certificate chain and may contain a private key. Usually, extensions of .cer and .crt are certificate files with no private key, .key is a separate private key file, and .pem is both a certificate and private key.

PFX

A PFX file (personal information exchange format), also known as a PKCS#12 archive, is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKCS #7

A PKCS #7 format certificate file is a base64-encoded certificate. Since it's presented in ASCII, you can open it in any text editor. PKCS #7 certificates always begin and end with entries that look something like -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. Unlike PEM files, PKCS #7 files can contain only a certificate and its certificate chain but NOT its private key. Extensions of .p7b or .p7c are usually seen on certificate files of this format.

PKCS#12

A PFX file (personal information exchange format), also known as a PKCS#12 archive,

is a single, password-protected certificate archive that contains both the public and matching private key and, optionally, the certificate chain. It is a common format for Windows servers.

PKI

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

Private Key

Private keys are used in cryptography (symmetric and asymmetric) to encrypt or sign content. In asymmetric cryptography, they are used together in a key pair with a public key. The private or secret key is retained by the key's creator, making it highly secure.

Public Key

In asymmetric cryptography, public keys are used together in a key pair with a private key. The private key is retained by the key's creator while the public key is widely distributed to any user or target needing to interact with the holder of the private key.

Public Key Infrastructure

A public key infrastructure (PKI) is a set of roles, policies, and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage public-key encryption.

R

Rogue Key

A rogue key, in the context of Keyfactor Command, is an SSH public key that appears in an `authorized_keys` file on a

server managed by the SSH orchestrator without authorization.

Root of Trust

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RoT

A root of trust (RoT) is a source within a cryptographic system that can always be trusted. It is typically a hardened hardware module. HSMs (hardware security modules) and TPMs (trusted platform modules) are examples of RoTs.

RPC

Remote procedure call (RPC) allows one program to call a function from a program located on another computer on a network without specifying network details. In the context of Keyfactor Command, RPC errors often indicate Kerberos authentication or delegation issues.

rsyslog

Rsyslog is an open-source software utility used on UNIX and Unix-like computer systems for forwarding log messages in an IP network.

S

SAN

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of SAN formats are supported, with DNS name being the most common.

server name indication

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SMTP

Short for simple mail transfer protocol, SMTP is a protocol for sending email messages between servers.

SNI

Server name indication (SNI) is an extension to TLS that provides for including the host-name of the target server in the initial handshake request to allow the server to respond with the correct SSL certificate or allow a proxy to forward the request to the appropriate target.

SSH

The SSH (secure shell) protocol provides for secure connections between computers. It provides several options for authentication, including public key, and protects the communications with strong encryption.

SSL

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Subject Alternative Name

The subject alternative name (SAN) is an extension to the X.509 specification that allows you to specify additional values when enrolling for a digital certificate. A variety of

SAN formats are supported, with DNS name being the most common.

T

Template

A certificate template defines the policies and rules that a CA uses when a request for a certificate is received.

TLS

TLS (Transport Layer Security) and its predecessor SSL (Secure Sockets Layer) are protocols for establishing authenticated and encrypted links between networked computers.

Trusted CA

A certificate authority in the forest in which Keyfactor Command is installed or in a forest in a two-way trust with the forest in which Keyfactor Command is installed.

U

Untrusted CA

A certificate authority in a forest in a one-way trust with the forest in which Keyfactor Command is installed or in a forest that is untrusted by the forest in which Keyfactor Command is installed. Non-domain-joined standalone CAs also fall into this category.

W

Web API

A set of functions to allow creation of applications. Keyfactor offers the Keyfactor API, which allows third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command.

Windows Orchestrator

The Windows Orchestrator, one of Keyfactor's suite of orchestrators, is used to manage synchronization of certificate authorities in remote forests, run SSL discovery and management tasks, and interact with Windows servers as well as F5 devices, NetScaler devices, Amazon Web Services (AWS) resources, and FTP capable devices, for certificate management. In addition, the AnyAgent capability of the Windows Orchestrator allows it to be extended to create custom certificate store types and management capabilities regardless of source platform or location.

Workflow

A workflow is a series of steps necessary to complete a process. In the context of Keyfactor Command, it refers to the workflow builder, which allows you automate event-driven tasks when a certificate is requested or revoked.

X

x.509

In cryptography, X.509 is a standard defining the format of public key certificates. An X.509 certificate contains a public key and an identity (e.g. a host name or an organization or individual name), and is either signed by a certificate authority or self-signed. When a certificate is signed by a trusted certificate authority it can be used to establish trusted secure communications with the owner of the corresponding private key. It can also be used to verify digitally signed documents and emails.
