	<p>for this field when configuring an add certificate job.</p> <ul style="list-style-type: none"> • OnRemove: If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job. • OnReenrollment: If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. 										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every 										

Name	Description
	 use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.12.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Note: Certificate store types can only be updated in a very limited way if they are actively in use (there are any certificate stores defined for them). Updates to the Name, ShortName and adding a job type are supported in this case as are additions to the SupportedOperations, but no other updates can be saved.

Table 263: PUT Certificate Store Types Input Parameters

Name	In	Description				
StoreType	Body	Required. An integer indicating the Keyfactor Command reference ID for the certificate store type.				
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.				
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.				
Capability	Body	<p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div> Note: The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list.</div>				
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .				
SupportedOperations	Body	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none">• Add• Create• Discovery• Enrollment• Remove <p>The default for each value is <i>false</i>.</p>				
Properties	Body	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeID</td><td>Required. An integer identifying the</td></tr></table>	Name	Description	StoreTypeID	Required. An integer identifying the

This value is unset by default.</td></tr><tr><td>Options</td><td>A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i>. This value is unset by default.</td></tr></table>	Name	Description		for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This value is unset by default.	Options	A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> . This value is unset by default.
Name	Description							
	for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This value is unset by default.							
Options	A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> . This value is unset by default.							

For example, to set a multiple choice entry parameter:

```
"EntryParameter": [
  {
    "StoreTypeId": 111,
    "Name": "ZooAnimal",
    "DisplayName": "Favorite Zoo Animal",
    "Type": "MultipleChoice",
    "RequiredWhen": {
      "HasPrivateKey": false,
      "OnAdd": true,
      "OnRemove": true,
      "OnReenrollment": true
    },
    "DefaultValue": "Penguin",
    "Options": "Tiger-
,Bear,Giraffe,Lion,Wolf,Penguin,Zebra"
  }
]
```

This value is unset by default.

 **Tip:** What's the difference between properties (custom fields) and entry parameters?

- Properties are about the certificate store definition itself and are static. For example, you might use a

Name	In	Description
		 <p>property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul style="list-style-type: none"> • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).

Table 264: PUT Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> • String • Bool </td></tr> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> • String • Bool
Name	Description								
Name	A string containing the short name of the property.

In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.13 Component Installation

The Component Installation methods are used to list the servers that various Keyfactor Command components have been installed on or to decommission a Keyfactor Command server that is no longer in use.

Table 265: Component Installation Endpoints

Endpoint	Method	Description	Link
/	GET	Return a list of all the Keyfactor Command servers in the current implementation including the components installed on each, with paging (number of pages to return and number of results per page) and sorting options.	GET Component Installation on the next page

Endpoint	Method	Description	Link
/id}	DELETE	Delete the Keyfactor Command server with the specified ID from the Keyfactor Command database.	DELETE Component Installation ID below

2.6.13.1 DELETE Component Installation ID

The DELETE /ComponentInstallation/{id} method is used to delete the Keyfactor Command server with the specified ID and all its components from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

Important: Servers should not be deleted if they are serving any active role in the Keyfactor Command environment, as this operation cannot be undone.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/system_settings/modify/

Table 266: DELETE Component Installation {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the Keyfactor Command server to delete. Use the <i>GET /ComponentInstallation</i> method (see GET Component Installation below) to determine the ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.13.2 GET Component Installation

The GET /ComponentInstallation method is used to return a list of all the Keyfactor Command components installed for the current implementation. This method returns HTTP 200 OK on a success with details about the installed components on each server. This method allows URL parameters to specify paging and the level of information detail.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/system_settings/read/`

Table 267: GET Component Installation Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Machine• Version
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 268: GET Component Installation Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the server installation.
Machine	A string containing the FQDN of the server.
Version	A string containing the version of Keyfactor Command installed on the server.
Components	<p>A string containing a comma-separated list of the components installed on the server. Possible components include:</p> <ul style="list-style-type: none"> • Console The server with this role provides the web-based administration interface (the Management Portal) that is used to view and report on certificates issued in the environment and enroll for certificates. This role is required on all Keyfactor Command servers. • Logi The server with this role hosts the Logi Analytics Platform for reporting. This role is required on all Keyfactor Command servers. • Agents The server with this role hosts the back-end service for receiving requests from and sending requests to Keyfactor agents and orchestrators. This role is optional. • KeyfactorAPI The server with this role hosts the newer Keyfactor API. This role is required on all Keyfactor Command servers. • Service The server with this role hosts back-end services required to support Keyfactor Command. This includes the Keyfactor Command Service, which is used for all periodic tasks throughout Keyfactor Command, including CA synchronization, monitoring alerts, and report automation. This role is required on all Keyfactor Command servers.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.14 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 269: CSR Generation Endpoints

Endpoint	Method	Description	Link
/Pending/{id}	DELETE	Deletes a pending CSR by ID.	DELETE CSR Generation Pending ID below
/Pending/{id}	GET	Returns the details of a specific CSR request based on the ID number.	GET CSR Generation Pending ID on the next page
/Pending	DELETE	Deletes multiple pending CSRs.	DELETE CSR Generation Pending on the next page
/Pending	GET	Returns a list of all pending CSRs.	GET CSR Generation Pending on page 712
/Generate	POST	Generate and configure a CSR request.	POST CSR Generation Generate on page 713

2.6.14.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 270: DELETE CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate signing request for the CSR that should be deleted. Use the <i>GET /CSRGeneration/Pending</i> method (see GET CSR Generation Pending on page 712) to retrieve a list of all the pending CSRs to determine the CSR IDs.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.14.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the GET /CSRGeneration/Pending method (see [GET CSR Generation Pending on the next page](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 271: GET CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the CSR that should be retrieved.

Table 272: GET CSR Generation Pending {id} Response Data

Name	Description
CSRFilePath	The proposed file name for the CSR file. This is considered deprecated and may be removed in a future release.
CSR	The text of the CSR in PEM format.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.14.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 273: DELETE CSR Generation Pending Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name):</p> <pre>[8,14,27]</pre> <p>Use the <i>GET /CSRGeneration/Pending</i> method (see GET CSR Generation Pending below) to retrieve a list of all the pending CSRs to determine the CSR IDs.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.14.4 GET CSR Generation Pending

The *GET /CSRGeneration/Pending* method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/requests/manage/

Table 274: GET CSR Generation Pending Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 275: GET CSR Generation Pending Response Data

Name	Description
Id	A unique integer for the CSR generated.
CSR	A string containing the text of the CSR in PEM format.
RequestTime	A string containing the date and time that the CSR was generated in UTC time.
Subject	An array or strings containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.14.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 782](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 327](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificates/enrollment/csr/generation/`

Note: This endpoint no longer includes the `CSRFilePath` return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 276: POST CSR Generation Generate Input Parameters

Name	In	Description				
Curve	Body	<p>Required*. A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none">• 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1• 1.3.132.0.34 = P-384/secp384r1• 1.3.132.0.35 = P-521/secp521r1 <p>This value is required only if <i>KeyType</i> = ECC. Friendly names are not supported for ECC curves.</p>				
KeyLength	Body	<p>Required*. An integer indicating the desired key size of the certificate. Supported key sizes are:</p> <ul style="list-style-type: none">• 255• 256• 384• 448• 521• 2048• 3072• 4096• 8192 <p>This value is required only if <i>KeyType</i> = RSA.</p>				
KeyType	Body	<p>Required. A string indicating the desired key encryption of the certificate. Supported key types are:</p> <ul style="list-style-type: none">• RSA• ECC• Ed448• Ed25519				
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr></table>	Value	Description	rfc822	RFC 822 Name
Value	Description					
rfc822	RFC 822 Name					

Name	In	Description																		
		<table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></tbody></table> <p>For example:</p> <pre>"SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] }</pre>	Value	Description	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																			
dns	DNS Name																			
directory	Directory Name																			
uri	Uniform Resource Identifier																			
ip4	IP v4 Address																			
ip6	IP v6 Address																			
registeredid	Registered ID (an OID)																			
ms_ntprincipalname	MS_NTPrincipalName (a string)																			
ms_ntdsreplication	MS_NTDSReplication (a GUID)																			
Subject	Body	<p>Required. A string containing the subject name for the certificate using X.500 format for the full distinguished name (DN). For example:</p> <pre>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> <p>Supported subject name fields are:</p> <table><thead><tr><th>Name</th><th>Abbreviation</th><th>Description</th></tr></thead><tbody><tr><td>CommonName</td><td>CN</td><td>Required*. The desired common name of the certificate to be</td></tr></tbody></table>	Name	Abbreviation	Description	CommonName	CN	Required* . The desired common name of the certificate to be												
Name	Abbreviation	Description																		
CommonName	CN	Required* . The desired common name of the certificate to be																		

Name	In	Description		
				<p>requested with the CSR.</p> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.*</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
		Organization	O	The desired organization of the certificate to be requested with the CSR.
		OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.
		Locality	L	The desired city of the certificate to be requested with the CSR.
		State	ST	The desired state of the certificate to be requested with the CSR.
		Country	C	The desired country (two characters) of the certificate to be requested with the CSR.

Name	In	Description						
		<table> <tr> <th>Name</th><th>Abbreviation</th><th>Description</th></tr> <tr> <td>Email</td><td>E</td><td>The desired email address of the certificate to be requested with the CSR.</td></tr> </table>	Name	Abbreviation	Description	Email	E	The desired email address of the certificate to be requested with the CSR.
Name	Abbreviation	Description						
Email	E	The desired email address of the certificate to be requested with the CSR.						
Template	Body	<p>A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional.</p> <div>  Important: The template will not be included in the CSR. The template is referenced in order to retrieve key and other information to help populate the CSR. In addition, the CSR generation function supports template-level regular expressions for both subject parts and SANs. If system-wide and template-level regular expressions exists for the same field and you select a template, the template-level regular expression is applied. If you choose to select a template during CSR generation, you will need to choose the same template during CSR Enrollment, because the CSR file will contain elements from the template which may conflict with other template configurations. </div>						

Table 277: POST CSR Generation Generate Response Data

Name	Description
CSR	The text of the CSR in PEM format.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.15 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that

requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 278: Custom Job Types Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the custom job type for the specified ID.	DELETE Custom Job Types ID below
/id}	GET	Returns details for the custom job type for the specified ID.	GET Custom Job Types ID on the next page
/	GET	Returns all the custom job types.	GET Custom Job Types on page 722
/	POST	Creates a custom job type.	POST Custom Job Types on page 724
/	PUT	Updates an existing custom job type.	PUT Custom Job Types on page 728

2.6.15.1 DELETE Custom Job Types ID

The DELETE /JobTypes/Custom/{id} method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

Table 279: DELETE JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 722) to retrieve a list of all the custom job types to determine the job type GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.15.2 GET Custom Job Types ID

The GET /JobTypes/Custom/{id} method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 280: GET JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 722) to retrieve a list of all the custom job types to determine the job type GUID.

Table 281: GET JobTypes Custom {id} Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.15.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 282: GET Job Types Custom Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 283: GET Job Types Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.15.4 POST Custom Job Types

The POST /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of custom job type details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

Table 284: POST JobTypes Custom Input Parameters

Name	In	Description																									
JobTypeName	Body	Required. A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.																									
JobTypeFields	Body	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>Required. A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td>Required. A value that indicates the data type of the job type field. It may be entered as either an integer or the matching enum value. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></td></tr><tr><td>DefaultValue</td><td>Required*. A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>. This field is required if the <i>Required</i> parameter is set to <i>true</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i>.</td></tr></table></div>	Name	Description	Name	Required. A string that indicates the name for the job type field.	Type	Required. A value that indicates the data type of the job type field. It may be entered as either an integer or the matching enum value. Possible values are: <table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	Required* . A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This field is required if the <i>Required</i> parameter is set to <i>true</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i> .
Name	Description																										
Name	Required. A string that indicates the name for the job type field.																										
Type	Required. A value that indicates the data type of the job type field. It may be entered as either an integer or the matching enum value. Possible values are: <table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean											
Integer Value	Enum Value	Description																									
1	String	String																									
2	Int	Integer																									
3	DateTime	Date																									
4	Bool	Boolean																									
DefaultValue	Required* . A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This field is required if the <i>Required</i> parameter is set to <i>true</i> .																										
Required	A Boolean that sets whether the job type field is required (true) or not (false). The default is <i>false</i> .																										

For example:

Name	In	Description
		<pre>"JobTypeFields": [{ "Name": "Favorite Type of Pet", "Type": "String", "DefaultValue": "Cat", "Required": true }, { "Name": "Model Year of First Car", "Type": "Int" }, { "Name": "Mother's Birthday", "Type": "DateTime" }]</pre>

Table 285: POST JobTypes Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<div>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string that indicates the name for the job type field.</td></tr><tr><td>Type</td><td><div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div></td></tr><tr><td>DefaultValue</td><td>A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean

DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.15.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 286: PUT JobTypes Custom Input Parameters

Name	In	Description																									
Id	Body	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	Body	Required. A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.

If <i>Type</i> is <i>Boolean</i>, this field should contain <i>true</i> or <i>false</i>.</td></tr><tr><td>Required</td><td>A Boolean that sets whether the job type field is required (true) or not (false).</td></tr></table></div>	Name	Description	Name	A string that indicates the name for the job type field.	Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean	DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Required	A Boolean that sets whether the job type field is required (true) or not (false).
Name	Description																									
Name	A string that indicates the name for the job type field.																									
Type	<div>A value that indicates the data type of the job type field. Possible values are:<table><tr><th>Integer Value</th><th>Enum Value</th><th>Description</th></tr><tr><td>1</td><td>String</td><td>String</td></tr><tr><td>2</td><td>Int</td><td>Integer</td></tr><tr><td>3</td><td>DateTime</td><td>Date</td></tr><tr><td>4</td><td>Bool</td><td>Boolean</td></tr></table></div>	Integer Value	Enum Value	Description	1	String	String	2	Int	Integer	3	DateTime	Date	4	Bool	Boolean										
Integer Value	Enum Value	Description																								
1	String	String																								
2	Int	Integer																								
3	DateTime	Date																								
4	Bool	Boolean																								
DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFXs).

Table 288: Enrollment Endpoints

Endpoint	Method	Description	Link
/Settings/{Id}	GET	Returns the template settings to use during enrollment.	GET Enrollment Settings ID on the next page
/CSR/Context/My	GET	Returns the templates available for CSR enrollment by the current user.	GET Enrollment CSR Content My on page 740
/PFX/Context/My	GET	Returns the templates available for PFX enrollment by the current user.	GET Enrollment PFX Content My on page 758
/AvailableRenewal/Id/{id}	GET	Returns the type of renewals available for the referenced certificate ID.	GET Enrollment Available Renewal ID on page 777
/AvailableRenewal/Thumbprint/{thumbprint}	GET	Returns the type of renewals available for the referenced certificate thumbprint.	GET Enrollment Available Renewal Thumbprint on page 780
/CSR	POST	Performs a CSR enrollment.	POST Enrollment CSR on page 782
/PFX	POST	Performs a PFX enrollment.	POST Enrollment PFX on page 789
/CSR/Parse	POST	Returns information found in a CSR in a human friendly form.	POST Enrollment CSR Parse on page 807
/PFX/Deploy	POST	Adds a certificate into a certificate store following a PFX enrollment or certificate renewal.	POST Enrollment PFX Deploy on page 809
/PFX/Replace	POST	Replaces a certificate in a certificate store following a PFX enrollment.	POST Enrollment PFX Replace on page 815

Endpoint	Method	Description	Link
/Renew	POST	Performs a certificate renewal.	POST Enrollment Renew on page 818

2.6.16.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/enrollment/csr/

OR

/certificates/enrollment/pfx/

OR

/certificates/enrollment/csr/generation/

Table 289: GET Enrollment Settings {id} Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the enrollment template. Use the <i>GET /Templates</i> method (see GET Templates on page 1493) to retrieve a list of all the templates to determine the template ID.

Table 290: GET Enrollment Settings {id} Response Data

Name	Description										
TemplateRege- xes	<p>An array of objects containing the regular expressions resolved for the template. Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/enrollment/csr/

Table 291: GET Enrollment CSR Content My Response Data

Name	Description														
Template-s	<p>An array of objects containing the templates available for enrollment by the user. Each object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td></tr> <tr> <td>Name</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td></tr> <tr> <td>DisplayName</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td></tr> <tr> <td>RequiresApproval</td><td>A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td></tr> <tr> <td>CAs</td><td>An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate template.	Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. Name	Description										
Enroll-mentFields	<p>An array of objects containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The array contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>An integer indicating the parameter type. The options are:</td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are:
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.										
Options	For multiple choice values, an array of strings containing the value choices.										
DataType	An integer indicating the parameter type. The options are:

	accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.												
KeySize	A string indicating the minimum supported key size of the template.												
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.												
StandaloneCAs	An array of objects containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:												

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.</td></tr> <tr> <td>SubscriberTerms</td><td>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).</td></tr> </table>	Name	Description	Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.	RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.	SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).
Name	Description								
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.								
RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.								
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).								

Tip: Configure a link to the custom terms using the *URL to Subscriber Terms* application setting. See *Application Settings: Enrollment Tab* in the *Keyfactor Command Reference Guide* for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.3 GET Enrollment PFX Content My

The GET /Enrollment/PFX/Context/My method is used to check the templates and CAs available for PFX enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor

Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for PFX enrollment in Keyfactor Command.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificates/enrollment/pfx/`

Table 292: GET Enrollment PFX Content My Response Data

Name	Description														
Template-s	<p>An array of objects containing the templates available for enrollment by the user. Each object contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate template.</td></tr> <tr> <td>Name</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td></tr> <tr> <td>DisplayName</td><td>A string containing the common name (short name) of the template. This name typically does not contain spaces. In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td></tr> <tr> <td>CAs</td><td>An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate template.	Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.	DisplayName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.	RequiresApproval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).	RFCEnforcement	A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.	CAs	An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the certificate template.														
Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.														
DisplayName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.														
RequiresApproval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).														
RFCEnforcement	A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.														
CAs	An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:														

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the full name of the CA, made up of the DNS hostname of the certificate authority (e.g. corpca01.keyexample.com) and the logical name (e.g. CorpIssuingCA1) for a full name similar to corpca01.keyexample.-com\\CorpIssuingCA1.</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). Name	Description										
Enroll- mentFields	<p>An array of objects containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div>  Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions. </div> <p>The array contains the following parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the ID of the custom enrollment field.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td></tr> <tr> <td>Options</td><td>For multiple choice values, an array of strings containing the value choices.</td></tr> <tr> <td>DataType</td><td>An integer indicating the parameter type. The options are:</td></tr> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are:
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.										
Options	For multiple choice values, an array of strings containing the value choices.										
DataType	An integer indicating the parameter type. The options are:

	accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level.												
KeySize	A string indicating the minimum supported key size of the template.												
Curve	A string indicating the OID of the elliptical curve algorithm configured for the template, for ECC templates.												
StandaloneCAs	An array of objects containing enrollment information for standalone certificate authorities available for enrollment for the current user. Information about the CA includes:												

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.</td></tr> <tr> <td>RFCEnforcement</td><td>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.</td></tr> <tr> <td>SubscriberTerms</td><td>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).</td></tr> </table>	Name	Description	Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.	RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.	SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).
Name	Description								
Name	The full name of the CA, made up of the DNS hostname of the certificate authority (e.g. myca.keyexample.com) and the logical name (e.g. CorpStandaloneCA1) for a full name similar to myca.keyexample.com\\CorpStandaloneCA1.								
RFCEnforcement	A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.								
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).								

Tip: Configure a link to the custom terms using the *URL to Subscriber Terms* application setting. See *Application Settings: Enrollment Tab* in the *Keyfactor Command Reference Guide* for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.4 GET Enrollment Available Renewal ID

The GET /Enrollment/AvailableRenewal/ID/{id} method is used to check a specific certificate by ID to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/Thumbprint method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 293: GET Enrollment Available Renewal ID {id} Input Parameters

Name	In	Description
id	Path	Required. An integer specifying the Keyfactor Command reference ID of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 294: GET Enrollment Available Renewal ID {id} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—renewal is not supported for this certificate.</td></tr> <tr> <td>1</td><td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td></tr> <tr> <td>2</td><td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </td></tr> </table> <p> Tip: If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information. 								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.5 GET Enrollment Available Renewal Thumbprint

The GET /Enrollment/AvailableRenewal/Thumbprint/{thumbprint} method is used to check a specific certificate by thumbprint to determine which renewal types are supported, if any. This method or the GET /Enrollment/AvailableRenewal/ID method can be used before using the POST /Enrollment/Renew method to make a determination as to which fields need to be submitted, depending on whether one-click renewal is supported. This method returns HTTP 200 OK on a success with the supported renewal type.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the note under the *CollectionId* input parameter, below.

Table 295: GET Enrollment Available Renewal Thumbprint {thumbprint} Input Parameters

Name	In	Description
thumbprint	Path	Required. The thumbprint of the certificate on which to check the renewal status. Use the <i>GET /Certificates</i> method to determine the certificate thumbprint. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 296: GET Enrollment Available Renewal Thumbprint {thumbprint} Response Data

Name	Description								
AvailableRenewalType	<p>An integer indicating the supported renewal type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—renewal is not supported for this certificate.</td></tr> <tr> <td>1</td><td>Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.</td></tr> <tr> <td>2</td><td> <p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </td></tr> </table> <p> Tip: If the <i>AvailableRenewalType</i> is 2, 1 is also supported for the certificate.</p>	Value	Description	0	None—renewal is not supported for this certificate.	1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.	2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Value	Description								
0	None—renewal is not supported for this certificate.								
1	Seeded PFX is supported. A renewal can be done if a template and certificate authority are supplied in the renewal request, but one-click renewal is not supported.								
2	<p>One-click renewal is supported. A renewal can be done using the same template and certificate authority used in the original certificate, and a template and certificate authority do not need to be supplied in the renewal request.</p> <p>One-click renewal is only supported if either one of the following is true:</p> <ul style="list-style-type: none"> • The certificate is located together with its private key in one or more managed certificate store(s). • The certificate was enrolled with a template that has been configured in Keyfactor Command to allow private keys to be encrypted and stored in the Keyfactor Command database. See <i>Certificate Templates</i> in the <i>Keyfactor Command Reference Guide</i> for more information. 								
Message	A message providing more details about the available renewal type result (e.g. “One click renewal is not available for this certificate. Template does not have PFX enrollment enabled.”).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.6 POST Enrollment CSR

The POST /Enrollment/CSR method is used to enroll for a certificate using a certificate signing request (CSR). This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificates/enrollment/csr/`

Tip: Use the GET /Enrollment/CSR/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 297: POST Enrollment CSR Input Parameters

Name	In	Description
CSR	Body	Required. The base-64 encoded CSR that will be passed in for enrollment.
PrivateKey	Body	A string containing the base-64 encoded private key that corresponds to the CSR to be saved with the enrollment. This is done to support private key retention in Keyfactor Command for requests made through CSR enrollment. The key should be provided in unencrypted PKCS#8 format. The private key option is only supported for enrollments done using templates configured in Keyfactor Command for private key retention.
Timestamp	Body	Required. The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Template	Body	Required* A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required unless the enrollment is being done against a standalone CA.
CertificateAuthority	Body	Required* A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>host-name\\logical name</i> format or as just the <i>logical name</i> . For example: <div>corpca01.keyexample.com\\CorplIssuingCA1 OR CorplIssuingCA1</div> If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i> . This field is optional unless the enrollment is being done against a standalone CA, in which case it is required .
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>false</i> .
Metadata	Body	An object of key/value pairs that set the values for the metadata fields that will be associated with the certificate

Name	In	Description																
		<p>once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>																
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr></table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)
Value	Description																	
rfc822	RFC 822 Name																	
dns	DNS Name																	
directory	Directory Name																	
uri	Uniform Resource Identifier																	
ip4	IP v4 Address																	
ip6	IP v6 Address																	
registeredid	Registered ID (an OID)																	

Name	In	Description						
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <pre>"SANS": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] }</pre> <div> Note: Entering SANs with this option may either append or overwrite the SANs in the CSR request depending on how the issuing CA is configured. Please be sure to check that the certificate has the correct SANs after issuance. Any SAN added automatically as a result of the RFC 2818 compliance settings (see GET Templates on page 1493) will still be added alongside anything you add here. Review the SAN Attribute Policy Handler for the Keyfactor CA Policy Module (see <i>Installing the Keyfactor CA Policy Module Handlers</i> in the <i>Keyfactor Command Server Installation Guide</i>) for more information.</div>	Value	Description	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description							
ms_ntprincipalname	MS_NTPrincipalName (a string)							
ms_ntdsreplication	MS_NTDSReplication (a GUID)							
AdditionalEnrollmentFields	Body	<p>An object that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "ValueOne", "CustomMultiChoiceTwo": "ValueTwo" }</pre> <p>See <i>Configuring Template Options</i> in the <i>Keyfactor</i></p>						

Name	In	Description
		<i>Command Reference Guide</i> for more information.
x-CertificateFormat	Header	Required. A string indicating the desired output format for the certificate. Available options are DER and PEM.

Table 298: POST Enrollment CSR Response Data

Value	Description																
CertificateInformation	<p>An object containing information about the certificate that was requested. CSR information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td></tr> <tr> <td>Certificates</td><td> <p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p> </td></tr> <tr> <td>WorkflowInstancelid</td><td> <p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div>  <p>Tip: Both the <i>WorkflowInstancelid</i> and the <i>WorkflowReferencelid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div> </td></tr> <tr> <td>WorkflowReferencelid</td><td>An integer containing the Keyfactor Command reference ID of the workflow instance.</td></tr> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	Certificates	<p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p>	WorkflowInstancelid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div>  <p>Tip: Both the <i>WorkflowInstancelid</i> and the <i>WorkflowReferencelid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div>	WorkflowReferencelid	An integer containing the Keyfactor Command reference ID of the workflow instance.
Value	Description																
SerialNumber	A string indicating the serial number of the certificate.																
IssuerDN	A string indicating the issuer DN of the certificate.																
Thumbprint	A string indicating the thumbprint of the certificate.																
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.																
Certificates	<p>An array of certificates in the order of:</p> <ul style="list-style-type: none"> • end entity • intermediate CA • Root CA <p>Intermediate CA and root CA certificates will only be included if the request parameter <i>IncludeChain</i> was set to <i>true</i>.</p>																
WorkflowInstancelid	<p>A string containing the Keyfactor Command reference GUID of the workflow instance.</p> <div>  <p>Tip: Both the <i>WorkflowInstancelid</i> and the <i>WorkflowReferencelid</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p> </div>																
WorkflowReferencelid	An integer containing the Keyfactor Command reference ID of the workflow instance.																

Value	Description												
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td>  Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer. </td></tr> <tr> <td>KeyfactorRequestId</td><td>An integer indicating the Keyfactor Command reference ID of the request.</td></tr> <tr> <td>RequestDisposition</td><td>A string indicating the state of the request (e.g. ISSUED).</td></tr> <tr> <td>DispositionMessage</td><td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description		 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.	KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.	RequestDisposition	A string indicating the state of the request (e.g. ISSUED).	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description												
	 Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.												
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.												
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).												
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).												
EnrollmentContext	An internally used Keyfactor Command field.												
Metadata	<p>An array of the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>A string containing the name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.						
Name	Description												
MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.												
Value	The value of the metadata.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.7 POST Enrollment PFX

The POST /Enrollment/PFX method is used to enroll for a certificate by supplying data in the desired fields. This method returns HTTP 200 OK on a success with a message body containing a list of certificate details and any metadata that was associated with the certificate request.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/enrollment/pfx/

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store (see the [x-CertificateFormat on page 804](#) parameter) using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 809](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 815](#)).

Tip: Use the GET /Enrollment/PFX/Context/My method before this method to check which templates and CAs are available for enrollment for the requesting user before submitting the enrollment request.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

Version 2

Version 2 of the POST /Enrollment/PFX method redesigns how enrollment flow works to handle require approval functionality in a Keyfactor Command workflow with support for delivery into certificate stores. Users who are planning to use require approval workflow functionality *and* deliver enrolled certificates into certificate stores must use version 2 of this endpoint.

Note: The supported key algorithms for a certificate template are determined based on global template policy, individual template policy, and the template's supported algorithm. When configuring template-level policies for key information, only key sizes that are valid for the algorithm will be available, according to the global template policy, the template policy, and the supported key sizes. For PFX and CSR enrollment, you must select a valid Key Length and Key Type for the enrollment.

Note: The *PopulateMissingValuesFromAD* parameter has been removed from the version 2 endpoint.

Table 299: POST Enrollment PFX v2 Input Parameters

Name	In	Description
AdditionalEnrollmentFields	Body	<p>An object that provide values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre>"AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" }</pre> <p>See <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre>corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1</pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
Curve	Body	<p>Required*. A string indicating the elliptic curve for the requested key.</p> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 <p>This value is required only if <i>KeyType</i> = ECC. ECC curve friendly names are not supported in the API.</p>
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> applic-</p>

Name	In	Description
		ation setting is set to <i>true</i> (the default is <i>false</i>). See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i> .
InstallIntoExistingCertificateStores	Body	A Boolean that sets whether to deploy the certificate to certificate stores (true) or not (false). The default is <i>true</i> . The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i> , the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.
KeyLength	Body	Required *. A string indicating the key size for the requested key. Supported key sizes are: <ul style="list-style-type: none"> • 255 • 256 • 384 • 448 • 521 • 2048 • 3072 • 4096 • 8192 This value is required only if <i>KeyType</i> = RSA.
KeyType	Body	Required . A string indicating the algorithm for the request. Supported values are: <ul style="list-style-type: none"> • RSA • ECC • Ed448 • Ed25519
Metadata	Body	An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. For example:

Name	In	Description				
		<div><pre>"Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. }</pre></div> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Password	Body	<p>Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is 12. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
RenewalCertificateId	Body	<p>An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.</p> <p>The <i>RenewalCertificateId</i> parameter is used in conjunction with <i>InstallIntoExistingCertificateStores</i> parameter to make the determination as to distribution of the certificate to certificate stores. If <i>InstallIntoExistingCertificateStores</i> is <i>true</i>, the certificate will be distributed to certificate stores that the certificate identified in <i>RenewalCertificateId</i> is found in.</p>				
Stores	Body	<p>An array of objects indicating the certificate stores to which the certificate should be distributed. Store details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td>A string indicating the GUID of the certificate store to which the certificate should be deployed.</td></tr></table>	Name	Description	StoreId	A string indicating the GUID of the certificate store to which the certificate should be deployed.
Name	Description					
StoreId	A string indicating the GUID of the certificate store to which the certificate should be deployed.					

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>Use the <code>GET /CertificateStores</code> method (see GET Certificate Stores on page 482) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</td></tr><tr><td>Alias</td><td>A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Over-write</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Over-write</td><td><p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p><p>Use the <code>GET /Certificates/Locations/{id}</code> method (see GET Certificates Locations ID on page 276) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p></td></tr><tr><td>Properties</td><td>An object indicating the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <code>GET CertificateStoreTypes</code> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <code>GET CertificateStoreTypes</code> like so:</td></tr></table>	Name	Description		Use the <code>GET /CertificateStores</code> method (see GET Certificate Stores on page 482) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).	Alias	A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Over-write</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Over-write	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <code>GET /Certificates/Locations/{id}</code> method (see GET Certificates Locations ID on page 276) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>	Properties	An object indicating the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <code>GET CertificateStoreTypes</code> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <code>GET CertificateStoreTypes</code> like so:
Name	Description											
	Use the <code>GET /CertificateStores</code> method (see GET Certificate Stores on page 482) with a query of “Approved -eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).											
Alias	A string containing the alias of the certificate upon entry into the store. The format of and requirement for this varies depending on the certificate store type and whether the <i>Over-write</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.											
Over-write	<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the new certificate (true) or not (false). The default is <i>false</i>.</p> <p>Use the <code>GET /Certificates/Locations/{id}</code> method (see GET Certificates Locations ID on page 276) to retrieve a list of the locations an existing certificate is in to determine the alias used for the certificate in the certificate store.</p>											
Properties	An object indicating the unique parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <code>GET CertificateStoreTypes</code> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <code>GET CertificateStoreTypes</code> like so:

Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <div>"Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</div> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.+</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>				
Timestamp	Body	<p>Required. A string indicating the current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>				
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The</p>				

Name	In	Description																				
		template short name should be used. This field is required unless the enrollment is being done against a standalone CA.																				
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table> <p>For example:</p> <pre>"SANs": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] }</pre>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					
UseLegacyEncryption	Body	A Boolean that sets whether legacy encryption should be used in generating the PKCS#12 file resulting from the enrollment request (true) or not (false). Legacy encryption algorithms include PBE-SHA1-RC2-40 and PBE-SHA1-3DES. When																				

Name	In	Description
		legacy is not selected, encryption algorithms include AES-256-CBC, PBES2 with PBKDF2, and PBE-SHA1-3DES. The default is <i>false</i> .
x-CertificateFormat	Header	<p>Required. A string containing the desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> • JKS Select the JKS option when you intend to create a Java keystore with the returned PKCS12Blob. • PEM Select the PEM option when you intend to create a PEM file with the returned PKCS12Blob. • PFX Select the PFX option when you intend to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob. • Replace The Replace option is designed to be used when pushing an updated certificate to a certificate store (see POST Enrollment PFX Replace on page 815). Selecting this item causes data to be staged in preparation for the replace step. • Store The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see POST Enrollment PFX Deploy on page 809). Selecting this item causes data to be staged in preparation for the deploy step. • Zip Select the Zip option when you intend to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.

Table 300: POST Enrollment PFX v2 Response Data

Value	Description												
SuccessfulStores	An array of strings containing a comma delimited list of certificate stores, referenced by certificate store GUID, to which the certificate was successfully scheduled for deployment.												
CertificateInformation	<p>An object containing information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre> </td></tr> </table>	Value	Description	SerialNumber	A string indicating the serial number of the certificate.	IssuerDN	A string indicating the issuer DN of the certificate.	Thumbprint	A string indicating the thumbprint of the certificate.	KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.	PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre>
Value	Description												
SerialNumber	A string indicating the serial number of the certificate.												
IssuerDN	A string indicating the issuer DN of the certificate.												
Thumbprint	A string indicating the thumbprint of the certificate.												
KeyfactorID	An integer indicating the Keyfactor Command reference ID of the issued certificate.												
PKCS12Blob	<p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both Zip and PFX. This can be accomplished in a number of ways. For example, using PowerShell:</p> <pre> \$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String (\$b64) [IO.File]::WriteAllBytes (\$targetFile, \$bytes) </pre>												

Value	Description														
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td> <p> Note: No value is returned for the PKCS12Blob if you select a certificate format of <i>Store</i> in the header. WorkflowReferenceId	<p>An integer containing the Keyfactor Command reference ID of the workflow instance.</p> <p> Tip: Both the <i>WorkflowInstanceId</i> and the <i>WorkflowReferenceId</i> refer to the same workflow instance record—one using a GUID and one using a more human readable integer.</p>														
KeyfactorRequestId	An integer indicating the Keyfactor Command reference ID of the request.														
RequestDisposition	A string indicating the state of the request (e.g. ISSUED).														

Value	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>DispositionMessage</td><td>A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).</td></tr> <tr> <td>EnrollmentContext</td><td>An internally used Keyfactor Command field.</td></tr> </table>	Value	Description	DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).	EnrollmentContext	An internally used Keyfactor Command field.
Value	Description						
DispositionMessage	A string providing a message regarding the enrollment (e.g. The private key was successfully retained.).						
EnrollmentContext	An internally used Keyfactor Command field.						
Metadata	<p>An object containing the custom metadata values set on the certificate. The values vary depending on customization done in your environment. The information is presented in the following structure:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>MetadataFieldTypeName</td><td>A string containing the name of the metadata field in Keyfactor Command.</td></tr> <tr> <td>Value</td><td>The value of the metadata.</td></tr> </table> <p>See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Name	Description	MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.	Value	The value of the metadata.
Name	Description						
MetadataFieldTypeName	A string containing the name of the metadata field in Keyfactor Command.						
Value	The value of the metadata.						

Version 1

Version 1 of the POST /Enrollment/PFX method includes the same capabilities as version 2 except when used in conjunction with Keyfactor Command workflows that require approval with an intended end goal of delivering the resulting certificate into a certificate store. In this specific case, version 2 must be used.

Table 301: POST Enrollment PFX v1 Input Parameters

Name	In	Description
AdditionalEnrollmentFields	Body	<p>An object that provides values for any custom enrollment fields set on the certificate template to supply custom request attributes to the CA during the enrollment process. For example:</p> <pre> "AdditionalEnrollmentFields": { "CustomStringOne": "MyValue", "CustomMultiChoiceOne": "ValueTwo" } </pre> <p>See <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
CertificateAuthority	Body	<p>Required*. A string that sets the name of the certificate authority that will be used to enroll against if there is more than one available with the provided template name. The certificate authority name can either be provided in <i>hostname\\logical name</i> format or as just the <i>logical name</i>. For example:</p> <pre> corpca01.keyexample.com\\CorpIssuingCA1 OR CorpIssuingCA1 </pre> <p>If no certificate authority is provided, one will be chosen at random from the certificate authorities available for enrollment with the provided <i>Template</i>.</p> <p>This field is optional unless the enrollment is being done against a standalone CA, in which case it is required.</p>
ChainOrder	Body	<p>A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i>. Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i>.</p>
CustomFriendlyName	Body	<p>Required*. A string that sets a custom friendly name for the certificate.</p> <p>This field is required if the <i>Require Custom Friendly Name</i> application setting is set to <i>true</i> (the default is <i>false</i>). See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Curve	Body	<p>Required*. A string indicating the elliptic curve for the requested key.</p> <p>ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p>

Name	In	Description
		<ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 <p>This value is required only if <i>KeyType</i> = ECC. ECC curve friendly names are not supported in the API.</p>
IncludeChain	Body	A Boolean that sets whether to include the certificate chain in the response (true) or not (false). The default is <i>true</i> .
KeyLength	Body	<p>Required*. A string indicating the key size for the requested key.</p> <p>This value is required only if <i>KeyType</i> = RSA.</p>
KeyType	Body	<p>Required. A string indicating the algorithm for the request. Supported values are:</p> <ul style="list-style-type: none"> RSA ECC Ed448 Ed25519
Metadata	Body	<p>An object that set the values for the metadata fields that will be associated with the certificate once it is in Keyfactor Command. The <i>key</i> is the field name and the <i>value</i> is the value for the field. For example:</p> <pre> "Metadata": { "AppOwnerFirstName": "William", // This is a String field. "AppOwnerLastName": "Smith", "AppOwnerEmailAddress": "willi- am.smith@keyexample.com", "BusinessCritical": "true", // This is a Boolean field. "BusinessUnit": "E-Business", // This is a Multiple Choice field with a pre-defined value. "Notes": "Here are some notes.", // This is a BigText field. "SiteCode": 3, // This is an integer field. "TicketResolutionDate": "2021-07-23" // This is a Date field in yyyy-mm-dd format. } </pre>

Name	In	Description																				
		See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Password	Body	Required. A string that sets the password used to encrypt the contents of the PFX file. The minimum password length is controlled by the <i>Password Length</i> application setting. The default is <i>12</i> . See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
PopulateMissingValuesFromAD	Body	A Boolean that sets whether to populate the information in the subject from Active Directory (true) or not (false). The default is <i>false</i> .																				
RenewalCertificateId	Body	An integer that sets the ID of the certificate to be renewed when the method is called on a certificate renewal.																				
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>rfc822</td><td>RFC 822 Name</td></tr><tr><td>dns</td><td>DNS Name</td></tr><tr><td>directory</td><td>Directory Name</td></tr><tr><td>uri</td><td>Uniform Resource Identifier</td></tr><tr><td>ip4</td><td>IP v4 Address</td></tr><tr><td>ip6</td><td>IP v6 Address</td></tr><tr><td>registeredid</td><td>Registered ID (an OID)</td></tr><tr><td>ms_ntprincipalname</td><td>MS_NTPrincipalName (a string)</td></tr><tr><td>ms_ntdsreplication</td><td>MS_NTDSReplication (a GUID)</td></tr></table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name	directory	Directory Name	uri	Uniform Resource Identifier	ip4	IP v4 Address	ip6	IP v6 Address	registeredid	Registered ID (an OID)	ms_ntprincipalname	MS_NTPrincipalName (a string)	ms_ntdsreplication	MS_NTDSReplication (a GUID)
Value	Description																					
rfc822	RFC 822 Name																					
dns	DNS Name																					
directory	Directory Name																					
uri	Uniform Resource Identifier																					
ip4	IP v4 Address																					
ip6	IP v6 Address																					
registeredid	Registered ID (an OID)																					
ms_ntprincipalname	MS_NTPrincipalName (a string)																					
ms_ntdsreplication	MS_NTDSReplication (a GUID)																					

Name	In	Description
		<p>For example:</p> <pre> "SANs": { "dns": ["dnssan1.keyexample.com", "dnssan2.keyexample.com", "dnssan3.keyexample.com"], "ip4": ["192.168.2.73"] } </pre>
Subject	Body	<p>Required*. A string containing the subject name using X.500 format. For example:</p> <pre> "Subject": "CN=websrvr14.keyexample.com,OU=IT,O=\ Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <i>.*</i>. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Template	Body	<p>Required*. A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used.</p> <p>This field is required unless the enrollment is being done against a standalone CA.</p>
Timestamp	Body	<p>Required. A string indicating the current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>
UseLegacyEncryption	Body	<p>A Boolean that sets whether legacy encryption should be used in generating the PKCS#12 file resulting from the enrollment request (true) or not (false). Legacy encryption algorithms include PBE-SHA1-RC2-40 and PBE-SHA1-3DES. When legacy is not selected, encryption algorithms include AES-256-CBC, PBES2 with PBKDF2, and PBE-SHA1-3DES. The default is <i>false</i>.</p>

Name	In	Description
x-CertificateFormat	Header	<p>Required. A string containing the desired output format for the certificate. Available options are:</p> <ul style="list-style-type: none"> • JKS Select the JKS option when you intend to create a Java keystore with the returned PKCS12Blob. • PEM Select the PEM option when you intend to create a PEM file with the returned PKCS12Blob. • PFX Select the PFX option when you intend to create a PKCS#12 (PFX/P12) file with the returned PKCS12Blob. • Replace The Replace option is designed to be used when pushing an updated certificate to a certificate store (see POST Enrollment PFX Replace on page 815). Selecting this item causes data to be staged in preparation for the replace step. • Store The Store option is designed to be used when pushing a newly obtained certificate to a certificate store (see POST Enrollment PFX Deploy on page 809). Selecting this item causes data to be staged in preparation for the deploy step. • Zip Select the Zip option when you intend to output the returned PKCS12Blob as separate PEM-encoded certificate, private key, and optional chain certificate files wrapped together in a zip file.

Table 302: POST Enrollment PFX v1 Response Data

Value	Description												
CertificateInformation	<p>An object containing information about the certificate that was requested. Certificate information includes:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the issuer DN of the certificate.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>KeyfactorID</td><td>An integer indicating the Keyfactor Command reference ID of the issued certificate.</td></tr> <tr> <td>PKCS12Blob</td><td> <p>A string containing the base-64-encoded representation of the certificate in Zip or PFX format with the optional certificate chain. Value	The value of the metadata.
Name	Description						
MetadataFieldName	A string containing the name of the metadata field in Keyfactor Command.						
Value	The value of the metadata.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.8 POST Enrollment CSR Parse

The POST /Enrollment/CSR/Parse method takes a CSR in the body, parses it, and returns all elements that were found in the CSR. This method returns HTTP 200 OK on a success with the parsed CSR contents.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
None

Table 303: POST Enrollment CSR Parse Input Parameters

Name	In	Description
CSR	Body	Required. Base-64-encoded CSR with the Begin and End Certificate Request tags.

Table 304: POST Enrollment CSR Parse Response Data

Name	Description																																				
(CSR Contents)	<p>An array of strings in the form Name=Value containing all the elements in the CSR. Possible values include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Key Length</td><td>An integer indicating the desired key size of the certificate.</td></tr> <tr> <td>Key Type</td><td>A string indicating the desired key encryption of the certificate.</td></tr> <tr> <td>CN</td><td>The common name of the certificate.</td></tr> <tr> <td>O</td><td>The organization of the certificate.</td></tr> <tr> <td>OU</td><td>The organizational unit of the certificate.</td></tr> <tr> <td>L</td><td>The city of the certificate.</td></tr> <tr> <td>ST</td><td>The state of the certificate.</td></tr> <tr> <td>C</td><td>The country (two characters) of the certificate.</td></tr> <tr> <td>E</td><td>The email address of the certificate.</td></tr> <tr> <td>DNS Name</td><td>A SAN value containing a DNS name.</td></tr> <tr> <td>IP Address</td><td>A SAN value containing an IP v4 or IP v6 address.</td></tr> <tr> <td>RFC822 Name</td><td>A SAN value containing an email message.</td></tr> <tr> <td>URL</td><td>A SAN value containing a uniform resource identifier.</td></tr> <tr> <td>Directory Name</td><td>A SAN value containing a directory name.</td></tr> <tr> <td>Registered ID</td><td>A SAN value containing a registered ID.</td></tr> <tr> <td>Other name:Principal Name</td><td>A SAN value containing a user principal name (UPN) value.</td></tr> <tr> <td>Other name:DS Object Guid</td><td>A SAN value containing the MS_NTDSReplication value.</td></tr> </table>	Name	Description	Key Length	An integer indicating the desired key size of the certificate.	Key Type	A string indicating the desired key encryption of the certificate.	CN	The common name of the certificate.	O	The organization of the certificate.	OU	The organizational unit of the certificate.	L	The city of the certificate.	ST	The state of the certificate.	C	The country (two characters) of the certificate.	E	The email address of the certificate.	DNS Name	A SAN value containing a DNS name.	IP Address	A SAN value containing an IP v4 or IP v6 address.	RFC822 Name	A SAN value containing an email message.	URL	A SAN value containing a uniform resource identifier.	Directory Name	A SAN value containing a directory name.	Registered ID	A SAN value containing a registered ID.	Other name:Principal Name	A SAN value containing a user principal name (UPN) value.	Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.
Name	Description																																				
Key Length	An integer indicating the desired key size of the certificate.																																				
Key Type	A string indicating the desired key encryption of the certificate.																																				
CN	The common name of the certificate.																																				
O	The organization of the certificate.																																				
OU	The organizational unit of the certificate.

Other name:Principal Name	A SAN value containing a user principal name (UPN) value.																																				
Other name:DS Object Guid	A SAN value containing the MS_NTDSReplication value.																																				
 Note: Some of these fields cannot be added to a CSR generated within Keyfactor																																					

Name	Description
	 Command (e.g. URL) and will only be found in CSRs generated outside Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.9 POST Enrollment PFX Deploy

The POST /Enrollment/PFX/Deploy method is used to put a certificate into a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Store* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 789](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Tip:** The POST /Enrollment/PFX/Deploy method must be used within 5 minutes of acquiring a certificate with the POST /Enrollment/PFX or POST /Enrollment/Renew method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 305: POST Enrollment PFX Deploy Input Parameters

Name	Type	Description										
Stores	Body	<p>Required*. An array of objects indicating the certificate stores to which the certificate should be deployed with additional properties as needed based on the store type and whether an existing certificate is being overwritten with the new certificate. Store parameters are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreId</td><td><p>A string indicating the GUID of the certificate store(s) to which the certificate should be deployed.</p><p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 482) with a query of “Approved - eq true” to retrieve a list of all your approved certificate stores to determine the GUID(s) of the store(s).</p></td></tr><tr><td>Alias</td><td><p>A string indicating the alias of the certificate upon entry into the store. Name	Description					
	<p><i>CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": { "NetscalerVserver": "MyVirtualServerName" }</pre> <p> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</p>					
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.				
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorId</i> .				
		<p> Note: For enrollments that do not require manager approval (where the certificate is issued immediately), the <i>CertificateId</i> is required. The <i>RequestId</i> may be provided but is not required in this case. For enrollments that do require manager approval (where the certificate is not issued immediately), only the <i>KeyfactorRequestId</i> will be returned on the enrollment and the <i>RequestId</i> is required for deployment.</p>				
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the <i>POST /Enrollment/PFX</i> or <i>POST /Enrollment/Renew</i> request as the <i>KeyfactorRequestId</i> .				

Name	Type	Description																
		See the note under <i>CertificateId</i> regarding when this field is required and when it is not.																
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.																
StoreIds	Body	<p>An array of strings containing the certificate store GUIDs for the stores to which the certificate should be added.</p> <p>The StoreIds parameter is obsolete as of Keyfactor Command version 9.4 and has been replaced by the Stores parameter. It is still supported for backward compatibility, but no longer required.</p>

For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p><pre>"JobProperties": ["NetscalerVserver"]</pre><p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p><p>The setting is referenced using the following format:</p><pre>"Properties": [{ "NetscalerVserver": "MyVirtualServerName" }]</pre><div> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div></td></tr></table>	Name	Description		<p>defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": [{ "NetscalerVserver": "MyVirtualServerName" }]</pre> <div> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div>
Name	Description					
	<p>defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate the certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"Properties": [{ "NetscalerVserver": "MyVirtualServerName" }]</pre> <div> Note: The only built-in certificate store type that makes use of properties that can be set on a certificate-by-certificate basis in the store is NetScaler. You may have custom certificate store types that make use of this functionality.</div>					

Table 306: POST Enrollment PFX Deploy Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.10 POST Enrollment PFX Replace

The POST /Enrollment/PFX/Replace method is used to replace a certificate in a certificate store. It is intended to be used immediately after using the POST /Enrollment/PFX method to enroll for a PFX using the *Replace* value for the *x-certificateformat* header (see [POST Enrollment PFX on page 789](#)) or the POST /Enrollment/Renew method to renew a certificate already in a certificate store. This method returns HTTP 200 OK on a success with a message body containing the failed and succeeded stores.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate_stores/schedule/
- /certificates/enrollment/pfx/
- OR
- /certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)
- /certificates/enrollment/pfx/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Note: You could achieve the same end using the *POST /Enrollment/PFX/Deploy* method, but in that case you would need to provide the certificate store GUID(s), the alias of the current certificate in the certificate store(s), the certificate store type(s), and set the overwrite flag to true (as well as the certificate ID of the new certificate). To achieve a replacement with the *POST /Enrollment/PFX/Replace* method you only need to provide the certificate IDs of the certificate being replaced and the new certificate. All the rest of the work is done for you. The certificate will be replaced in all locations in which the certificate is found. If you want to replace the certificate in only some of the locations in which it is found, you will need to use the *POST /Enrollment/PFX/Deploy* method (see [POST Enrollment PFX Deploy on page 809](#)).

Tip: The *POST /Enrollment/PFX/Replace* method must be used within 5 minutes of acquiring a certificate with the *POST /Enrollment/PFX* or *POST /Enrollment/Renew* method as the same user who executed the certificate request. After 5 minutes, the temporary staging data needed in order to deploy the certificate is automatically cleared and is no longer available for deployment.

Table 307: POST Enrollment PFX Replace Input Parameters

Name	In	Description
ExistingCertificateId	Body	Required. The integer of the certificate that will be replaced that is already in the store(s). A management job will be created to replace the certificate in all stores in which it is found. Use the <i>GET /Certificates</i> method to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CertificateId	Body	Required* . The integer for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
RequestId	Body	Required* . The integer of the request ID for the certificate that needs to be deployed. This is returned in the response to the POST /Enrollment/PFX request. Either the <i>CertificateId</i> or the <i>RequestId</i> is required but not both.
Password	Body	Required* . A string with a password used to secure the certificate in the certificate store. This field is required for store types that require an entry password, such as PEM stores.
JobTime	Body	A string containing the date and time when the certificate should be deployed. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). Dates in the past will cause a management job to be created to run immediately. Dates in the future will result in a management job set to run in the future. The default is to create a management job that runs immediately.

Table 308: POST Enrollment PFX Replace Response Data

Name	Description
SuccessfulStores	<p>An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate were successfully created.</p> <div>  Note: Successful creation of a management job to deploy a certificate to a certificate store does not necessarily mean that a certificate will successfully be deployed to the store. A management job may fail for any number of reasons (e.g. permissions on the store). Use the <i>GET /Certificates/{id}</i> method with <i>includeLocations=true</i> to confirm that the certificate has successfully been deployed to the target store(s). The locations won't appear in the certificate record until after a certificate store inventory has been completed for each store. </div>
FailedStores	An array of strings containing the GUIDs for the certificates stores for which management jobs to deploy the certificate could not be created.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.16.11 POST Enrollment Renew

The POST /Enrollment/Renew method is used to enroll for a certificate renewal for a certificate that exists in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new certificate. For certificates in a certificates store, this method does not automatically deploy the new certificate to the certificate store. In this case, the renew request should be followed by a call to either the POST /Enrollment/PFX/Deploy method or POST /Enrollment/PFX/Replace method to deploy the new certificate to the certificate store.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/read/
- /certificates/enrollment/pfx/

OR

- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
- /certificates/enrollment/pfx/

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Global or container-level schedule permissions for certificate stores are needed to install a certificate generated with this method into a certificate store using the POST /Enrollment/PFX/Deploy method (see [POST Enrollment PFX Deploy on page 809](#)) or POST /Enrollment/PFX/Replace method (see [POST Enrollment PFX Replace on page 815](#)).

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 309: POST Enrollment Renew Input Parameters

Name	In	Description
CertificateId	Body	Required* . The integer for the certificate in Keyfactor Command that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Thumbprint	Body	Required* . The thumbprint for the certificate that needs to be renewed. Either the <i>CertificateId</i> or the <i>Thumbprint</i> is required but not both.
Timestamp	Body	Required . The current date and time. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
CertificateAuthority	Body	Required* . A string that sets the name of the certificate authority that will be used to enroll against. The certificate authority name should be provided in <i>hostname\\logical name</i> format. For example: <div>corpca01.keyexample.com\\CorplssuingCA1</div> This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 777 or GET Enrollment Available Renewal Thumbprint on page 780).
Template	Body	Required* . A string that sets the name of the certificate template that should be used to issue the certificate. The template short name should be used. This field is required if one-click renewal is not supported for the certificate (see GET Enrollment Available Renewal ID on page 777 or GET Enrollment Available Renewal Thumbprint on page 780).

Table 310: POST Enrollment Renew Response Data

Name	Description
KeyfactorID	ID of the certificate in Keyfactor Command.
KeyfactorRequestID	ID of the request in Keyfactor Command.
Thumbprint	Thumbprint of the certificate.
SerialNumber	Serial number of the certificate.
IssuerDN	Issuer DN of the certificate.
RequestDisposition	State of the request (e.g. issued).
DispositionMessage	Enrollment message (e.g. The private key was successfully retained.).
Password	A password generated for convenience for use on installation to a certificate store. This password may be used when deploying the certificate to a certificate store using the POST /Enrollment/Deploy method, though an alternate password may be used. The passwords do not need to match.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.17 Event Handler Registration

EventHandlerRegistration endpoints includes methods necessary to list, add, edit and delete event handler registrations for Alerts in Keyfactor Command.

Table 311: EventHandlerRegistration Endpoints

Endpoint	Method	Description	Link
/id	DELETE	Deletes an event handler.	DELETE Event Handler Registration ID on page 827
/id	GET	Returns a registered event handler that matches the provided ID.	GET Event Handler Registration ID on page 824
/id	PUT	Updates a registered event handler's information.	PUT Event Handler Registration ID on page 825
/	GET	Returns all registered event handlers according to the provided filter and output parameters.	GET Event Handler Registration below
/	POST	Registers an event handler.	POST Event Handler Registration on page 823

2.6.17.1 GET Event Handler Registration

The GET /EventHandlerRegistration method is used to retrieve a list of the Event Handler Registrations in Keyfactor Command (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the event handler. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/handlers/registration/read/

Table 312: GET Event Handler Registration Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>DisplayName</i> • <i>Enabled</i>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 313: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	<p>A string indicating which application events the event handler supports. Built-in events include:</p> <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.17.2 POST Event Handler Registration

The POST /Event Handler Registration method is used to register an event handler (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the added event handler(s).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/handlers/registration/modify/

Table 314: POST Event Handler Registration Input Parameters

Name	In	Description
AssemblyName	Body	Required. A string containing the assembly name of the event handler to register. The handler file must be in the configured extensions directory on the machine running the Management Portal (see <i>Application Settings: Console Tab</i> in the <i>Keyfactor Command Reference Guide</i>).

Table 315: POST Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	<p>A string indicating which application events the event handler supports. Built-in events include:</p> <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.17.3 GET Event Handler Registration ID

The GET `/EventHandlerRegistration/{id}` method is used to retrieve a registered event handler that matches the provided ID in Keyfactor Command (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the specified event handler.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/handlers/registration/read/`

Table 316: GET Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see GET Event Handler Registration on page 821) to retrieve a list of all the event handlers to determine the ID.

Table 317: GET Event Handler Registration Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <i>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</i>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none"> • Certificate Expiration Handler • Denied Certificate Request Handler • Issued Certificate Handler • Key Rotation Handler • Pending Certificate Handler

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.17.4 PUT Event Handler Registration ID

The PUT */EventHandlerRegistration/{id}* method is used to update the indicated registered event handler's *DisplayName* or *Enabled* status (see *Event Handler Registration* in the *Keyfactor Command Reference Guide*). This method returns HTTP 200 OK on a success with details of the updated event handler.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/handlers/registration/modify/`

Table 318: PUT Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <code>GET /EventHandlerRegistration</code> method (see GET Event Handler Registration on page 821) to retrieve a list of all the event handlers to determine the ID.
DisplayName	Body	A string indicating the display name of the event handler.
Enabled	Body	A Boolean indicating whether the event handler is enabled (true) or not (false).

Table 319: PUT Event Handler Registration {id} Response Data

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the event handler.
DisplayName	A string indicating the display name of the event handler.
ClassName	A string indicating the class name of the event handler (for example, <code>CSS.CMS.Monitoring.EventHandling.Denied.DeniedLogger</code>).
Enabled	A Boolean indicating whether the event handler is enabled (true) or not (false).
SupportedEvents	A string indicating which application events the event handler supports. Built-in events include: <ul style="list-style-type: none">• Certificate Expiration Handler• Denied Certificate Request Handler• Issued Certificate Handler• Key Rotation Handler• Pending Certificate Handler

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.17.5 DELETE Event Handler Registration ID

The DELETE /EventHandlerRegistration/{id} method is used to delete the event handler with the provided ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/handlers/registration/modify/

Table 320: DELETE Event Handler Registration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the event handler. Use the <i>GET /EventHandlerRegistration</i> method (see GET Event Handler Registration on page 821) to retrieve a list of all the event handlers to determine the ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.18 Extensions Scripts

The Extensions Scripts component of the Keyfactor API includes methods necessary to create, update, retrieve and delete scripts configured for certificate requests, SSH alerts, and workflows. The Extensions Scripts endpoints are new as of Keyfactor Command version 11 and replace previous functionality which stored scripts for alert event handlers and workflow PowerShell steps in files in the directory structure on the server. The new method of storing the scripts in the database ensures they are stored safely and accessed only with appropriate permissions. Also see PowerShell Scripts in the *Keyfactor Command Reference Guide* for important information about working with scripts in Keyfactor Command.

Important: When upgrading from a version of Keyfactor Command prior to version 11, the upgrade process will search the file location defined in the *Application settings > Console Tab > Extension Handler Path* setting and add all the files found in that directory to the database with the naming convention of *foldername (_subfolder name, if applicable)_filename* so it is clear which scripts were imported from which location (e.g., *net6.0_Workflow_CustomPowerShellExample*). The upgrade process will also identify which, if any, of the categories the script is configured for and add that information to the database with the script.

Table 321: Extensions Scripts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a script.	DELETE Extensions Scripts ID below
/id}	GET	Returns a single script that matches the provided ID.	GET Extensions Scripts ID on the next page
/	GET	Returns all scripts according to the provided filter and output parameters.	GET Extensions Scripts on page 830
/	POST	Adds a new script.	POST Extensions Scripts on page 832
/	PUT	Updates a script.	PUT Extensions Scripts on page 836

2.6.18.1 DELETE Extensions Scripts ID

The DELETE /Extensions/Scripts/{id} method is used to delete a script. Scripts cannot be deleted if configured for an alert or workflow. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/scripts/modify/

Table 322: DELETE Extensions Scripts Input Parameters

Name	In	Description
id	Path	Required. In integer indicating the Keyfactor Command reference ID for the script to be deleted. Use the <i>GET /Extensions/Scripts</i> method (see GET Extensions Scripts on page 830) to retrieve a list of all the scripts to determine the ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.18.2 GET Extensions Scripts ID

The GET /Extensions/Scripts/{id} method is used to return the details of the script that matches the provided ID. This method returns HTTP 200 OK on a success with details of the specified script record.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/scripts/read/

Table 323: GET Extensions Scripts {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the script to be retrieved. Use the <i>GET /Extensions/Scripts</i> method (see GET Extensions Scripts on the next page) to retrieve a list of all the scripts to determine the ID.

Table 324: GET Extensions Scripts {id} Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table><tr><th>Code</th><th>Category Name</th></tr><tr><td>1</td><td>Expiration</td></tr><tr><td>2</td><td>Pending</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Issued</td></tr><tr><td>5</td><td>KeyRotation</td></tr><tr><td>6</td><td>Workflow</td></tr></table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.18.3 GET Extensions Scripts

The GET /Extensions/Scripts method is used to return a list of all scripts configured in Keyfactor Command according to the provided filter and output parameters. This method returns HTTP 200 OK on a success with details of the script records.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/scripts/read/

Table 325: GET Extensions Scripts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • <i>Name</i> • <i>Category</i> <p>Use the equal (-eq) operator; the -ne operator is not supported. For example: <i>Category -eq "Expiration"</i> will return any scripts that have Expiration in their categories.</p>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 326: GET Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Categories	<div>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:<table><tr><th>Code</th><th>Category Name</th></tr><tr><td>1</td><td>Expiration</td></tr><tr><td>2</td><td>Pending</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Issued</td></tr><tr><td>5</td><td>KeyRotation</td></tr><tr><td>6</td><td>Workflow</td></tr></table></div>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.18.4 POST Extensions Scripts

The POST /Extensions/Scripts method is used to add a new script to the database. This method returns HTTP 200 OK on a success with details of the newly created script record.

Important: This is the only means to add a script to the database. There is no UI equivalent for security reasons. (Upgrading from a version previous to version 11 will import existing scripts into the database as the only other means of adding scripts to the database).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

Table 327: POST Extensions Scripts Input Parameters

Name	In	Description														
Name	Body	Required. A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	Body	Required. A JSON-escaped string containing the contents of the script on a single line. <div> Tip: See below for examples of creating and handling this string.</div>														
Categories	Body	Required. An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table><tr><th>Code</th><th>Category Name</th></tr><tr><td>1</td><td>Expiration</td></tr><tr><td>2</td><td>Pending</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Issued</td></tr><tr><td>5</td><td>KeyRotation</td></tr><tr><td>6</td><td>Workflow</td></tr></table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration															
2	Pending															
3	Denied															
4	Issued															
5	KeyRotation															
6	Workflow															

Two Approaches to Importing Scripts to the Database

To create a string value for the *Contents* field, you need to take your script, turn it into a string, and JSON-escape the string so that CR/LFs, tabs and the like will be encoded appropriately and the string will be on a single line. For example, the following string contains escaped CR/LFs (`\r\n`):

```
$MyVar = \"Hello, World!\"\\r\\n\\r\\nWrite-Host $MyVar
```

One approach to doing this uses a PowerShell script similar to the following, which takes the script to be uploaded as input and creates an output file with the JSON-escaped string:

```
# Path to the input file
$filePath = "C:\Stuff\UpdateSubjectSANS.ps1"

# Get the contents of the input file as a string (as opposed to an array of strings) into a variable
$fileContent = Get-Content -Path $filePath -Raw

# Set variables for the other body parameters - for multiple categories, use commas (e.g. 2,3,4)
$ScriptName = "UpdateSubjectSANS"
[int32[]]$Categories = 6

# Build the body
$body = @{
    "Name" = $ScriptName
    "Contents" = $fileContent.ToString()
    "Categories" = $Categories
}

# JSON escape the body elements
$JSONbody = ConvertTo-JSON $body

# Output the body elements including the escaped Contents string to a file
Set-Content -Value $JSONbody -Path C:\Stuff\MyOutFile.txt
```

The contents of the output file will look something like (the Contents field is shown truncated here):

```
{
  "Categories": [
    6
  ],
  "Contents": "# Declare your parameters at the beginning ($CSRSubject, $CSRSANS)\r\nparam(\r\n
[string]$CSRSubject,\r\n    [string]$CSRSANS,\r\n",
  "Name": "UpdateSubjectSANS"
}
```

You can then open the output file, display the content without line wrapping the Contents field, and copy either the entire body or the JSON-escaped Contents string for pasting into your API command. Any line wraps that display on the screen in the Contents field will be interpreted by copy/paste as CR/LF, which will cause the API command to fail. If your script is long, you will need to be sure to use a text editor to open the file that can display the entire length of the Contents string as a single line. The built-in Windows Notepad application will display a maximum of 1024 characters on a line before wrapping even if word wrap is disabled. A tool such as the third-party Notepad++ is much less limited.

Alternately, you can do the JSON-escaping and update to the Keyfactor Command database in a single PowerShell script and skip the file output with copy/paste. The following script will JSON-escape a script and add it to the database:

```
# Prompt for credentials to authenticate to the Keyfactor API
$cred = Get-Credential

# Encode credentials (assumes the Keyfactor API is using Basic authentication)
$pair = "$($cred.Username): $($cred.GetNetworkCredential().Password)"
$encodedCreds = [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($pair))
$basicAuthValue = "Basic $encodedCreds"

# Path to the input file
$filePath = "C:\Stuff\UpdateSubjectSANS.ps1"

# Keyfactor Command server name and optional port for API request
$APIServer = "keyfactor.keyexample.com"

# Set variables for the other body parameters - for multiple categories, use commas (e.g. 2,3,4)
$ScriptName = "UpdateSubjectSANS"
[int32[]]$Categories = 6

# Get the contents of the input file as a string (as opposed to an array of strings) into a variable
$fileContent = Get-Content -Path $filePath -Raw

# Build the headers
$headers = @{
    "Authorization"=$basicAuthValue
    "Accept"="application/json"
    "x-keyfactor-requested-with"="APIClient"
}

# Build the body
$body = @{
    "Name" = $ScriptName
    "Contents" = $fileContent.ToString()
    "Categories" = $Categories
}

# Make the API request to create a new script in the database
Invoke-WebRequest -Uri "https://$APIServer/KeyfactorAPI/Extensions/Scripts" -Method:Post -Headers $headers -ContentType "application/json" -Body ($body|ConvertTo-Json) -ErrorAction:Stop -TimeoutSec 60
```

Table 328: POST Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table> <tr> <th>Code</th><th>Category Name</th></tr> <tr> <td>1</td><td>Expiration</td></tr> <tr> <td>2</td><td>Pending</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Issued</td></tr> <tr> <td>5</td><td>KeyRotation</td></tr> <tr> <td>6</td><td>Workflow</td></tr> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.18.5 PUT Extensions Scripts

The PUT /Extensions/Scripts method is used to update a script. This method returns HTTP 200 OK on a success with details of the updated script record.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/scripts/modify/

Note: You cannot change the name of a script once it has been created, so that field is not available as an input parameter to the PUT method.

Table 329: PUT Extensions Scripts Input Parameters

Name	In	Description														
id	Body	Required. An integer indicating the Keyfactor Command reference ID for the script. Use the <i>GET /Extensions/Scripts</i> method (see GET Extensions Scripts on page 830) to retrieve a list of all the scripts to determine the ID.														
Contents	Body	A JSON-escaped string containing the contents of the script on a single line. If the contents field is not provided or is an empty string, the field will be ignored. (The contents of a script in the database cannot be cleared.)  Tip: See POST Extensions Scripts on page 832 for examples of creating and handling this string.														
Categories	Body	Required. An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are: <table><tr><th>Code</th><th>Category Name</th></tr><tr><td>1</td><td>Expiration</td></tr><tr><td>2</td><td>Pending</td></tr><tr><td>3</td><td>Denied</td></tr><tr><td>4</td><td>Issued</td></tr><tr><td>5</td><td>KeyRotation</td></tr><tr><td>6</td><td>Workflow</td></tr></table>  Tip: The list of categories provided will completely replace any previously supported categories for the script. However, you cannot remove a category if the script is configured to be used by that category. You can add additional categories to a script that is already in use by select categories by including the existing categories in the parameter entry and adding any others as desired.	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name															
1	Expiration															
2	Pending															
3	Denied															
4	Issued															
5	KeyRotation															
6	Workflow															

Table 330: PUT Extensions Scripts Response Data

Name	Description														
id	An integer indicating the Keyfactor Command reference ID for the script.														
Name	A string indicating the user-defined name of the script. The name of a script cannot be changed once posted.														
Contents	A JSON-escaped string containing the contents of the script on a single line.														
Categories	<p>An array of either integers or case-sensitive strings indicating which category or categories the script applies to. The category of a script cannot be changed if it is in use in any alerts or workflows of that category. Possible category values are:</p> <table> <tr> <th>Code</th><th>Category Name</th></tr> <tr> <td>1</td><td>Expiration</td></tr> <tr> <td>2</td><td>Pending</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Issued</td></tr> <tr> <td>5</td><td>KeyRotation</td></tr> <tr> <td>6</td><td>Workflow</td></tr> </table>	Code	Category Name	1	Expiration	2	Pending	3	Denied	4	Issued	5	KeyRotation	6	Workflow
Code	Category Name														
1	Expiration														
2	Pending														
3	Denied														
4	Issued														
5	KeyRotation														
6	Workflow														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.19 Identity Providers

The Identity Providers component of the Keyfactor API includes methods necessary to programmatically edit and retrieve identity providers within Keyfactor Command.

Table 331: Identity Providers Endpoint

Endpoint	Method	Description	Link
/id}	GET	Returns the identity provider with the specified ID.	GET Identity Providers ID on the

Endpoint	Method	Description	Link
			next page
/id}	PUT	Updates the identity provider with the specified ID.	PUT Identity Providers ID on page 851
/	GET	Returns all identity providers defined within Keyfactor Command with filtering and output options.	GET Identity Providers on page 878
/Types	GET	Returns details for all the identities provider types defined within Keyfactor Command.	GET Identity Providers Types on page 891

2.6.19.1 GET Identity Providers ID

The GET /Identity/Providers/{id} method is used to return an identity provider by ID. This method returns HTTP 200 OK on a success with details for the specified identity provider.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/identity_providers/read/

Table 332: GET Identity Providers{id} Input Parameters

Name	In	Description
id	Path	<p>Required. A string indicating the Keyfactor Command reference GUID of the identity provider to retrieve.</p> <p>Use the <i>GET /Identity/Providers</i> method (see GET Identity Providers on page 878) to retrieve a list of all the identity providers to determine the provider's ID.</p>

Table 333: GET Identity Providers {id} Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider.												
Name	A string indicating the short name for the identity provider.												
DisplayName	A string indicating the display name for the identity provider.												
Type	A string indicating the type of identity provider. Possible values are: <ul style="list-style-type: none">Active DirectoryGeneric (Keyfactor Identity Provider)												
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. Each parameter (Table 334: Identity Provider Parameters) contains the data shown in Table 335: Identity Provider Parameter Structure.</p> <p>Each parameter (Table 334: Identity Provider Parameters) contains the data shown in Table 335: Identity Provider Parameter Structure.</p> <p><i>Table 334: Identity Provider Parameters</i></p> <table><tr><th>Name</th><th>Type</th><th>Example</th><th>Description</th></tr><tr><td>Admin Querying Client Id</td><td>1 - String</td><td>Command-Token-Query</td><td><p>The client ID of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p><p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p><p>This parameter is required.</p></td></tr><tr><td>Admin Querying Client Secret</td><td>1 - String</td><td></td><td><p>The client secret of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p><p>For Keyfactor Identity Provider,</p></td></tr></table>	Name	Type	Example	Description	Admin Querying Client Id	1 - String	Command-Token-Query	<p>The client ID of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>	Admin Querying Client Secret	1 - String		<p>The client secret of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p> <p>For Keyfactor Identity Provider,</p>
Name	Type	Example	Description										
Admin Querying Client Id	1 - String	Command-Token-Query	<p>The client ID of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>										
Admin Querying Client Secret	1 - String		<p>The client secret of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p> <p>For Keyfactor Identity Provider,</p>										

Name	Description		
			<p>this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>
Audience	1 - String	Command-OIDC-Client	<p>The audience value for the identity provider. This should be set to the same value as the <i>Client Id</i>. For Keyfactor Identity Provider, this should be:</p> <div>Command-OIDC-Client</div> <p>This parameter is required.</p>
Authority	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor	<p>The issuer/authority endpoint URL for the identity provider. For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>This parameter is required.</p> <div>  Tip: When you add or update an identity provider, the provider's discovery document is </div>

Name	Description		
	Name	Type	Example
			<div> validated based on this authority URL. The discovery document is also validated periodically in the background. The following are validated:<ul style="list-style-type: none">• That the discovery document is reachable using the Authority value provided and can be parsed into a valid discovery document.• That the Authority URL matches the Issuer returned in the discovery document.• That all the URLs on the discovery document are using HTTPS.• That the JSONWebKeySetUri value is included on the discovery document.• That any endpoint configuration values (Authorization Endpoint, Token Endpoint, UserInfo Endpoint, JSONWebKeySetUri) that have been saved or are being saved match—including case—the values returned in the discovery document. The UserInfo Endpoint is not a required configuration field, but</div>

Name	Description		
			<div>  <p>if a value is provided, it must match what's in the discovery document.</p> <p>If any of these validation tests fail, any identity provider changes in process will not be saved and an error will be displayed or logged.</p> </div>
Authorization Endpoint	1 - String	https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/auth	<p>The authorization endpoint URL for the identity provider. For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i>). It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct. This parameter is required.</p>
Client Id	1 - String	Command-OIDC-Client	<p>The ID of the client application created in the identity provider for primary application use. For Keyfactor Identity Provider, this should be:</p> <div>Command-OIDC-Client</div> <p>For more information, see <i>Gath-</i></p>

Name	Description		
	Name	Type	Description
			<p>ering Keyfactor Identity Provider Data for the Keyfactor Command Installation in the Keyfactor Command Server Installation Guide).</p> <p>This parameter is required.</p>
	Client Secret	2 - Secret	<p>The secret for the client application created in the identity provider for primary application use.</p> <p>For Keyfactor Identity Provider, see <i>Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation</i> in the <i>Keyfactor Command Server Installation Guide</i> for help locating this. It is automatically returned by the <i>Discovery Document Endpoint Fetch</i> step. Review it to confirm that it appears correct.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description				
	Name	Type	Example	Description	
				Value	Description
				SecretValue	A string containing the secret. This parameter is used when PAM is not used as the storage location.
				Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.
	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.19.2 PUT Identity Providers ID

The PUT /Identity/Providers/{id} method is used to update an identity provider in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/identity_providers/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 336: PUT Identity Providers {id} Input Parameters

Name	In	Description												
Id	Path	Required. A string containing the Keyfactor Command reference GUID for the identity provider.												
Name	Body	Required. A string indicating the short name for the identity provider.												
DisplayN- ame	Body	Required. A string indicating the display name for the identity provider.												
Type	Body	Required. A string indicating the type of identity provider. Possible values are: <ul style="list-style-type: none">Active DirectoryGeneric (Keyfactor Identity Provider)												
Para- meters	Body	<p>Required. An array of objects containing information for each parameter set for the identity provider. Each parameter (Table 337: Identity Provider Parameters) contains the data shown in Table 338: Identity Provider Parameter Structure.</p> <p>Each parameter (Table 337: Identity Provider Parameters) contains the data shown in Table 338: Identity Provider Parameter Structure.</p> <p><i>Table 337: Identity Provider Parameters</i></p> <table><tr><th>Name</th><th>Typ- e</th><th>Example</th><th>Description</th></tr><tr><td>Admin Querying Client Id</td><td>1 - Strin- g</td><td>Command-Token- Query</td><td><p>The client ID of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p><p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p><p>This parameter is required.</p></td></tr><tr><td>Admin Querying</td><td>1 - Strin-</td><td></td><td>The client secret of the service account that Keyfactor</td></tr></table>	Name	Typ- e	Example	Description	Admin Querying Client Id	1 - Strin- g	Command-Token- Query	<p>The client ID of the service account that Keyfactor Command uses to query the identity provider database for information when resolving substitutable special text tokens.</p> <p>For Keyfactor Identity Provider, this is created as a client (see <i>Using Keyfactor Identity Provider: Service Accounts</i> in the <i>Keyfactor Command Server Installation Guide</i>).</p> <p>This parameter is required.</p>	Admin Querying	1 - Strin-		The client secret of the service account that Keyfactor

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the parameter.																
Name	A string indicating the short reference name for the parameter (e.g. NameClaimType).																
DisplayName	A string indicating the display name for the parameter (e.g. Name Claim Type).																
Required	A Boolean indicating whether the parameter is required (true) or not (false).																
DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> • 1 - String • 2 - Secret • 3 - Boolean 																
Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.																
SecretValue	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.19.3 GET Identity Providers

The GET /Identity/Providers method is used to return the list of security identity providers configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity providers.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

Table 342: GET Identity Providers Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Identity Provider Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• DisplayName• Name• Private• ProviderTypes
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 343: GET Identity Provider Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider.												
Name	A string indicating the short name for the identity provider.												
DisplayName	A string indicating the display name for the identity provider.												
Type	A string indicating the type of identity provider. Possible values are: <ul style="list-style-type: none">Active DirectoryGeneric (Keyfactor Identity Provider)												
Parameters	<p>An array of objects containing information for each parameter set for the identity provider. DataType	An integer indicating the data type for the parameter. Possible values are: <ul style="list-style-type: none"> • 1 - String • 2 - Secret • 3 - Boolean 																
Value	A string indicating the value set for the parameter, for parameters of type 1 or 3.																
SecretValue	A string indicating the value set for the parameter, for parameters of type 2. Due to its sensitive nature, this value is not returned in responses.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.19.4 GET Identity Providers Types

The GET /Identity/Providers/Types method is used to list the types of identity providers defined in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the identity provider types and their type parameters. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/identity_providers/read/`

Table 346: GET Identity Providers Types Response Data

Name	Description												
Id	A string containing the Keyfactor Command reference GUID for the identity provider type.												
Name	A string containing the name for the identity provider type.												
TypeParameters	<div>An object containing information about the identity provider types. Identity provider type information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the Keyfactor Command identifier for the identity provider type.</td></tr><tr><td>Name</td><td>A string containing the short reference name for the identity provider type.</td></tr><tr><td>DisplayName</td><td>A string containing the display name for the identity provider type.</td></tr><tr><td>DataType</td><td>An integer indicating the data type of the identity provider type. Possible values are:<ul style="list-style-type: none">1 - String2 - Secret3 - Boolean</td></tr><tr><td>Required</td><td>A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).</td></tr></table></div>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the identity provider type.	Name	A string containing the short reference name for the identity provider type.	DisplayName	A string containing the display name for the identity provider type.	DataType	An integer indicating the data type of the identity provider type. Possible values are: <ul style="list-style-type: none">1 - String2 - Secret3 - Boolean	Required	A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).
Name	Description												
Id	An integer containing the Keyfactor Command identifier for the identity provider type.												
Name	A string containing the short reference name for the identity provider type.												
DisplayName	A string containing the display name for the identity provider type.												
DataType	An integer indicating the data type of the identity provider type. Possible values are: <ul style="list-style-type: none">1 - String2 - Secret3 - Boolean												
Required	A Boolean that indicates whether the identity provider type has been marked as required (true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.20 License

The License component of the Keyfactor API is primarily intended to view the current license through the API with the GET /License Method.

Table 347: License Endpoint

Endpoint	Method	Description	Link
/	GET	Returns the current license.	GET License below

2.6.20.1 GET License

The GET /License method is used to view the current license. This method returns HTTP 200 OK on a success with the license details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)). For more information regarding licensing, see *Licensing* in the *Keyfactor Command Reference Guide*.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
SystemSettings > Read

Table 348: GET License Response Data

Name	Description												
KeyfactorVersion	A string indicating the Keyfactor Command version number in the format: <div>majorversion.incrementalversion.patchnumber</div>												
LicenseData	<p>An object containing your Keyfactor customer information. License data details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LicensesId</td><td>A string indicating the internal reference GUID of your Keyfactor license.</td></tr> <tr> <td>Customer</td><td> <p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table> </td></tr> </table>	Name	Description	LicensesId	A string indicating the internal reference GUID of your Keyfactor license.	Customer	<p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.
Name	Description												
LicensesId	A string indicating the internal reference GUID of your Keyfactor license.												
Customer	<p>An object containing identifying information about your organization.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing your company name as per your Keyfactor account.</td></tr> <tr> <td>Id</td><td>An integer containing your Keyfactor account number.</td></tr> </table>	Name	Description	Name	A string containing your company name as per your Keyfactor account.	Id	An integer containing your Keyfactor account number.						
Name	Description												
Name	A string containing your company name as per your Keyfactor account.												
Id	An integer containing your Keyfactor account number.												
IssuedDate	A string indicating the valid issue date of the license, in UTC.												
ExpirationDate	A string indicating the valid expiration date of the license, in UTC.												
LicensedProducts	<p>An array of objects containing details of the products and features included in the license. License product and feature details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>ProductId</td><td>A string indicating the Keyfactor Command product GUID for the product(s) included in the license.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.</td></tr> <tr> <td>MajorRev</td><td>A string indicating the valid major release</td></tr> </table>	Name	Description	ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.	DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.	MajorRev	A string indicating the valid major release				
Name	Description												
ProductId	A string indicating the Keyfactor Command product GUID for the product(s) included in the license.												
DisplayName	A string indicating the name of the licensed product. For Keyfactor Command, this is “Certificate Management System”.												
MajorRev	A string indicating the valid major release												

Name	Description																				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>version of the license.</td></tr> <tr> <td>MinorRev</td><td>A string indicating the valid incremental release version of the license.</td></tr> <tr> <td>LicensedFeatures</td><td> <p>An array of objects containing the Keyfactor Command features included in the license.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>FeatureID</td><td>A string indicating the ID code of feature.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the feature as displayed on the license page in the Management Portal.</td></tr> <tr> <td>Enabled</td><td>A Boolean that indicates whether the feature is enabled (true) or not (false).</td></tr> <tr> <td>Quantity</td><td> <p>An integer indicating one of:</p> <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. <p>Unlimited is indicated by 999999999.</p> </td></tr> <tr> <td>ExpirationDate</td><td>This field is unused and will always return <i>null</i>.</td></tr> </table> </td></tr> </table>	Name	Description		version of the license.	MinorRev	A string indicating the valid incremental release version of the license.	LicensedFeatures	<p>An array of objects containing the Keyfactor Command features included in the license.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>FeatureID</td><td>A string indicating the ID code of feature.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the feature as displayed on the license page in the Management Portal.</td></tr> <tr> <td>Enabled</td><td>A Boolean that indicates whether the feature is enabled (true) or not (false).</td></tr> <tr> <td>Quantity</td><td> <p>An integer indicating one of:</p> <ul style="list-style-type: none"> How many of the elements you are licensed for. DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.	Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).	Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. <p>Unlimited is indicated by 999999999.</p>	ExpirationDate	This field is unused and will always return <i>null</i> .								
Name	Description																				
FeatureID	A string indicating the ID code of feature.																				
DisplayName	A string indicating the name of the feature as displayed on the license page in the Management Portal.																				
Enabled	A Boolean that indicates whether the feature is enabled (true) or not (false).																				
Quantity	<p>An integer indicating one of:</p> <ul style="list-style-type: none"> How many of the elements you are licensed for. For those features which have no licensing limits, <i>null</i>. <p>Unlimited is indicated by 999999999.</p>																				
ExpirationDate	This field is unused and will always return <i>null</i> .																				

Name	Description
	 Tip: Currently there is only one licensed product offered, which is Keyfactor Command.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.21 MacEnrollment

The MacEnrollment component of the Keyfactor API includes methods to edit and retrieve the configuration for Mac auto-enrollment.

Table 349: MacEnrollment Endpoints

Endpoint	Method	Description	Link
/	GET	Returns the current Mac auto-enrollment configuration.	GET MacEnrollment below
/	PUTT	Updates the Mac auto-enrollment configuration.	PUT MacEnrollment on the next page

2.6.21.1 GET MacEnrollment

The GET /MacEnrollment method is used to retrieve details for the Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /agents/management/mac/auto-enrollment/management/read/

Table 350: GET MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See <i>Certificate Metadata</i> in the <i>Keyfactor Command Reference Guide</i> for more information about metadata fields.
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is true.
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is true. This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.21.2 PUT MacEnrollment

The PUT /MacEnrollment method is used to update the existing Mac Auto-Enrollment configuration. This method returns HTTP 200 OK on a success with the Mac Auto-Enrollment configuration details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/mac/auto-enrollment/management/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should

first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 351: PUT MacEnrollment input Parameters

Name	In	Description
Id	Body	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	Body	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	Body	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	Body	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). See for more information about metadata fields.
MetadataField	Body	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .
MetadataValue	Body	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Table 352: PUT MacEnrollment Response Data

Name	Description
Id	An integer indicating the Keyfactor Command referenced ID of the Mac auto-enrollment configuration.
Enabled	An Boolean indicating whether Mac auto-enrollment is configured in the environment (true) or not (false).
Interval	An integer indicating the frequency with which the Mac auto-enrollment agent should check to see if there are new certificates for which to enroll.
UseMetadata	A Boolean indicating whether to automatically associate data in a custom metadata field with an auto-enrolled Mac certificate (true) or not (false). <i>See Certificate Metadata in the Keyfactor Command Reference Guide for more information about metadata fields.</i>
MetadataField	A string indicating the name of the metadata field to populate for the certificate, if <i>UseMetadata</i> is <i>true</i> .
MetadataValue	A string indicating the value to populate for the metadata field, if <i>UseMetadata</i> is <i>true</i> . This may be either a static value (e.g. a fixed string that indicates this certificate was acquired as a result of an auto-enrollment on a Mac), or a variable retrieved from the Mac. In the current version of the agent, only the Mac serial number is available.

Tip: See the [Keyfactor API Reference and Utility](#) which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22 MetadataFields

MetadataFields contains definitions for metadata that can be associated with certificates in Keyfactor Command.

Table 353: MetadataFields Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes an existing metadata field.	DELETE Metadata Fields ID on the next page

Endpoint	Method	Description	Link
/ {id}	GET	Returns detailed information for the specified metadata field.	GET Metadata Fields ID on the next page
/ {name}	GET	Returns detailed information for the specified metadata field.	GET Metadata Fields Name on page 904
/ {id}/InUse	GET	Returns a Boolean stating whether the metadata type is associated with a certificate.	GET Metadata Fields ID In Use on page 908
/	DELETE	Deletes multiple metadata fields specified in the request body.	DELETE Metadata Fields on page 909
/	GET	Returns all metadata field types with paging (number of pages to return and number of results per page) options.	GET Metadata Fields on page 910
/	POST	Creates a new metadata field using values supplied in the request body.	POST Metadata Fields on page 914
/	PUT	Updates an existing metadata field using values supplied in the request body.	PUT Metadata Fields on page 920

2.6.22.1 DELETE Metadata Fields ID

The DELETE /MetadataFields/{id} method is used to delete a metadata field by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/modify/

Table 354: DELETE Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field to be deleted. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on page 910) to retrieve a list of all the metadata fields to determine the metadata field's ID.
Force	Query	A Boolean that sets whether to force deletion of the metadata field even if it is in use by one or more certificates (true) or not (false). The default is <i>false</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET Metadata Fields ID In Use on page 908) to determine whether a metadata field is in use.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.2 GET Metadata Fields ID

The *GET /MetadataFields/{id}* method is used to return details for the metadata field with a specified unique ID. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/read/

Table 355: GET Metadata Fields {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on page 910) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 356: GET Metadata Fields {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.3 GET Metadata Fields Name

The GET `/MetadataFields/{name}` method is used to return details for the metadata field with the specified unique name. This method returns HTTP 200 OK on a success with details for the requested metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/metadata/types/read/`

Table 357: GET Metadata Fields {name} Input Parameters

Name	In	Description
name	Path	Required. A string that indicates the name of the metadata field. This value is not case sensitive.

Table 358: GET Metadata Fields {name} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9' _\.-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.4 GET Metadata Fields ID In Use

The GET `/MetadataFields/{id}/InUse` method is used to return a Boolean indicating whether the specified metadata field contains any data for any of the certificates in Keyfactor Command. This is useful to determine before attempting to delete a metadata field. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/metadata/types/read/`

Table 359: GET Metadata Fields {id} In Use Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the metadata field. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields on the next page) to retrieve a list of all the metadata fields to determine the metadata field's ID.

Table 360: GET Metadata Fields {id} In Use Response Data

Name	Description
	A Boolean that indicates whether the specified metadata field contains data for any certificates within Keyfactor Command (true) or not (false). This value is returned without a parameter name.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.5 DELETE Metadata Fields

The DELETE /MetadataFields method is used to delete multiple metadata fields in one request. Delete operations will continue until the entire array of IDs has been processed. Note that metadata fields that are in use for any certificate cannot be deleted unless the force=true parameter is included in the request. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/modify/

Table 361: DELETE Metadata Fields Input Parameters

Name	In	Description
ids	Body	Required. An array of integers indicating the Keyfactor Command reference IDs for the metadata fields to be deleted. Use the <i>GET /MetadataFields</i> method (see GET Metadata Fields below) to retrieve a list of all the metadata fields to determine the metadata field IDs.
Force	Query	A Boolean that sets whether to force deletion of the metadata fields even if they are in use (true) or not (false). The default is <i>False</i> . Use the <i>GET /MetadataFields/{id}/InUse</i> method (see GET Metadata Fields ID In Use on page 908) to determine whether a metadata field is in use.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.6 GET Metadata Fields

The GET /MetadataFields method is used to return a list of all metadata fields. This method returns HTTP 200 OK on a success with details for the metadata fields.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/read/

Table 362: GET Metadata Fields Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Logons Search</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayOrder</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 363: GET Metadata Fields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div>  Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <div>  Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.7 POST Metadata Fields

The POST /MetadataFields method is used to create a new metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the new metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/modify/

Table 364: POST Metadata Fields Input Parameters

Name	In	Description														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	Required. An integer indicating the data type of the metadata field. Possible values are: <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></tbody></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text

The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.22.8 PUT Metadata Fields

The PUT /MetadataFields method is used to update an existing metadata field in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the updated metadata field.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/metadata/types/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 366: PUT Metadata Fields Input Parameters

Name	In	Description														
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	Body	Required. A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	Body	Required. A string indicating the description for the metadata field.														
DataType	Body	Required. An integer indicating the data type of the metadata field. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>String</td></tr><tr><td>2</td><td>Integer</td></tr><tr><td>3</td><td>Date</td></tr><tr><td>4</td><td>Boolean</td></tr><tr><td>5</td><td>Multiple Choice</td></tr><tr><td>6</td><td>Big Text</td></tr></table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description															
1	String															
2	Integer															
3	Date															
4	Boolean															
5	Multiple Choice															
6	Big Text															
Hint	Body	A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i> , <i>integer</i> , <i>date</i> or <i>big text</i> .														
Validation	Body	A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example: <div><pre>^[a-zA-Z0-9'_\.\-]*@(\keyexample\.org keyexample\.com)\$</pre></div>														

Name	In	Description								
		<p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, under-scores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p> <p>This field is only supported for metadata fields with data type <i>string</i>.</p> <div> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</div>								
Enrollment	Body	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr><tr><td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr><tr><td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr></table> <p>The default is <i>optional</i>.</p> <div> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</div>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description									
0	Optional Users have the option to either enter a value or not enter a value in the field.									
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.									
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.									
Message	Body	A string containing a message to present when a user enters information								

Name	In	Description
		<p>in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <div>  Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>
Options	Body	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is required for metadata fields with data type <i>multiple choice</i>. For other data types, it will be ignored.</p> <div>  Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>
DefaultValue	Body	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p> <div>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448). </div>
AllowAPI	Body	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	Body	This is considered deprecated and may be removed in a future release.
DisplayOrder	Body	Required. An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

Table 367: PUT Metadata Fields Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the metadata field. This ID is automatically set by Keyfactor Command.														
Name	A string indicating the name of the metadata field. This name appears in interfaces where you can use metadata, such as certificate details dialogs, alert dialogs, certificate imports and certificate requests. Once this field has a value associated with it for at least one certificate, you cannot change this name. The metadata name field cannot contain spaces; dashes and underscores are supported.														
Description	A string indicating the description for the metadata field.														
DataType	<p>An integer indicating the data type of the metadata field. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>String</td></tr> <tr> <td>2</td><td>Integer</td></tr> <tr> <td>3</td><td>Date</td></tr> <tr> <td>4</td><td>Boolean</td></tr> <tr> <td>5</td><td>Multiple Choice</td></tr> <tr> <td>6</td><td>Big Text</td></tr> </table>	Value	Description	1	String	2	Integer	3	Date	4	Boolean	5	Multiple Choice	6	Big Text
Value	Description														
1	String														
2	Integer														
3	Date														
4	Boolean														
5	Multiple Choice														
6	Big Text														
Hint	<p>A string indicating a short hint for the metadata field. This hint appears in unpopulated metadata string, integer, big text and date fields on editing interfaces to provide the user with a clue as to what type of data should be entered in the field. This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>date</i> or <i>big text</i>.</p>														
Validation	<p>A string containing a regular expression against which data entered in a string field will be validated. When a user enters information in a metadata field that does not match the specified regular expression, he or she will see the warning message specified in the <i>Message</i> field. For example:</p> <pre>^[a-zA-Z0-9'_\.\-]*@(keyexample\.org keyexample\.com)\$</pre> <p>This regular expression specifies that the data entered in the field must consist of some number of characters prior to the “@” made up only of lowercase letters, uppercase letters, numbers, apostrophes, underscores, periods, and/or hyphens followed by exactly either “@keyexample.org” or “keyexample.com”.</p>														

Name	Description								
	<p>This field is only supported for metadata fields with data type <i>string</i>.</p> <p> Tip: If a template specific option is set for a given metadata field, that takes precedence over the global options. The template-specific regular expression will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>								
Enrollment	<p>An integer indicating how metadata fields should be handled on the PFX and CSR Enrollment pages. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Optional Users have the option to either enter a value or not enter a value in the field.</td></tr> <tr> <td>1</td><td>Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.</td></tr> <tr> <td>2</td><td>Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.</td></tr> </table> <p> Tip: If a template-specific handling is set for a given metadata field, it takes precedence over this global setting. The template-specific handling will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>	Value	Description	0	Optional Users have the option to either enter a value or not enter a value in the field.	1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.	2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.
Value	Description								
0	Optional Users have the option to either enter a value or not enter a value in the field.								
1	Required Users are required to enter data in the field when populating metadata fields on the PFX and CSR Enrollment pages. The field is not required on the certificate details or Add Certificate page.								
2	Hidden The field is hidden and does not appear on the PFX and CSR Enrollment pages. This field still appears on the certificate details and the Add Certificate page.								
Message	<p>A string containing a message to present when a user enters information in a metadata field that does not match the specified regular expression (<i>Validation</i> field).</p> <p> Tip: If a template-specific regular expression message is set for a given metadata field, it takes precedence over this global regular expression message. The template-specific message will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).</p>								
Options	<p>An array containing a comma separated list of values that should appear in the field dropdown for multiple choice fields.</p> <p>This field is only supported for metadata fields with data type <i>multiple choice</i>.</p>								

Name	Description
	 Tip: If a template-specific options are set for a given metadata field, these takes precedence over these global options. The template-specific options will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
DefaultValue	<p>A string containing a default value with which to pre-populate the metadata field for new certificate requests made using PFX or CSR enrollment. Data type of Email will accept a comma separated list of email addresses (limit 100 characters per email address).</p> <p>This field is only supported for metadata fields with data types <i>string</i>, <i>integer</i>, <i>Boolean</i>, or <i>multiple choice</i>.</p>  Tip: If a template-specific default is set for a given metadata field, it takes precedence over this global default value. The template-specific default will be used in PFX and CSR enrollment requests using that template (see GET Templates ID on page 1448).
AllowAPI	This is considered deprecated and may be removed in a future release.
ExplicitUpdate	This is considered deprecated and may be removed in a future release.
DisplayOrder	An integer indicating the order in which the metadata field should be displayed on pages where the metadata fields are displayed (e.g. PFX enrollment, certificate details).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23 Monitoring

The Monitoring component of the Keyfactor API provides a set of methods to support management of CRL and OCSP monitoring locations.

Table 368: Monitoring Endpoints

Endpoint	Method	Description	Link
/Revocation/	POST	Creates a new revocation monitoring	POST Monitoring

Endpoint	Method	Description	Link
		location.	Revocation on page 938
/Revocation/	PUT	Edits the revocation monitoring location with the specified ID.	PUT Monitoring Revocation on page 946
/Revocation/	GET	Returns details for all revocation monitoring location according to the provided filter and output parameters.	GET Monitoring Revocation on page 933
/ResolveOSCP	POST	Resolves the given OSCP certificate authority.	POST Monitoring Resolve OSCP on page 954
/Revocation/{id}	GET	Returns details for the revocation monitoring location with the specified ID.	GET Monitoring Revocation ID on the next page
/Revocation/{id}	DELETE	Deletes the revocation monitoring location with the specified ID.	DELETE Monitoring Revocation ID below
/Revocation/Test	POST	Tests the revocation monitoring alert with the specified ID.	POST Monitoring Revocation Test on page 955
/Revocation/TestAll	POST	Tests the revocation monitoring alerts.	POST Monitoring Revocation Test All on page 957

2.6.23.1 DELETE Monitoring Revocation ID

The DELETE Monitoring/Revocation/{id} method is used to delete the revocation monitoring location with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 369: DELETE Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 933) to retrieve a list of all the revocation monitoring locations to determine the ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.2 GET Monitoring Revocation ID

The *GET /Monitoring/Revocation/{id}* method is used to retrieve the revocation monitoring location with the specified ID. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 370: GET Monitoring Revocation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the ID of the revocation monitoring location. Use the <i>GET /Monitoring/Revocation</i> method (see GET Monitoring Revocation on page 933) to retrieve a list of all the revocation monitoring locations to determine the ID.

Table 371: GET Monitoring Revocation {id} Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An array of strings indicating the email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td></tr> </table>	Value	Description		<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
	time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
OCSPParameters	<p>For OCSP endpoints only, an object indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p> </td></tr> <tr> <td>AuthorityName</td><td> <p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> </td></tr> <tr> <td>AuthorityNameId</td><td>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</td></tr> <tr> <td>AuthorityKeyId</td><td>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key</td></tr> </table>	Value	Description	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>	AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key
Value	Description										
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>										
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>										
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .										
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key										

Name	Description	
	Value	Description
		Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the certificate used to identity the CA.
	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used. This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.3 GET Monitoring Revocation

The GET /Monitoring/Revocation method is used to retrieve all revocation monitoring locations. This method returns HTTP 200 OK on a success with details of both OCSP and CRL revocation endpoint configurations.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 372: GET Monitoring Revocation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> DashboardWarningValue (WarningHours value) DisplayName (Name) EndpointType (1-CRL, 2-OCSP) SendWarning (emailreminder) (true, false) ShowOnDashboard (true, false) Url WarningDays <div>  Tip: To return all revocation monitoring locations of type CRL, use the following query: EndpointType -eq 1 To return locations of type OCSP, use this query: EndpointType -eq 2 </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 373: GET Monitoring Revocation Response Data

Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	A string indicating the name of the revocation monitoring location.								
EndpointType	A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	<p>A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	<p>An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false).</td></tr> <tr> <td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr> <tr> <td>Recipients</td><td>An array of strings indicating the email addresses to which the email reminders should be sent.</td></tr> </table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description								
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false).								
WarningDays	An integer indicating the number of days before expiration to send the warning email.								
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.								
Dashboard	<p>An object indicating the configuration for display on the dashboard. Dashboard details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Show</td><td>A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).</td></tr> <tr> <td>WarningHours</td><td>An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.</td></tr> </table>	Value	Description	Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).	WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.		
Value	Description								
Show	A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false).								
WarningHours	An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard.								

Name	Description																
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td></td><td> <p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p> </td></tr> </table>	Value	Description		<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>												
Value	Description																
	<p><i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>.</p> <p><i>WarningHours</i> is not supported for <i>EndpointType OCSP</i>.</p> <p>If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</p>																
Schedule	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC</td></tr> </table>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).		
Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description		time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).						
Name	Description										
	time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
OCSPParameters	<p>For OCSP endpoints only, an object indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> <p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p> </td></tr> <tr> <td>AuthorityName</td><td> <p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> </td></tr> <tr> <td>AuthorityNameId</td><td>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</td></tr> <tr> <td>AuthorityKeyId</td><td>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key</td></tr> </table>	Value	Description	CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>	AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key
Value	Description										
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>										
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>										
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .										
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key										

Name	Description	
	Value	Description
		Identifier (SKID).
	SampleSerialNumber	A string indicating the serial number of the certificate used to identity the CA.
	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used. This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.23.4 POST Monitoring Revocation

The POST /Monitoring/Revocation method is used to add a revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 374: POST Monitoring Revocation Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An array of strings indicating the email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	<p>Required. An object indicating the configuration for display on the dashboard. Dashboard details are:</p>								

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td></tr><tr><td>WarningHours</td><td>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr></table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.											
Schedule	Body	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. OCSPParameters	<p>For OCSP endpoints only, an object indicating the OCSP endpoint configuration. OCSP endpoint details are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>CertificateAuthorityId</td><td> An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option. </td></tr> <tr> <td>AuthorityName</td><td> A string indicating the distinguished name of the CA. For example: <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre> </td></tr> <tr> <td>AuthorityNameId</td><td>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</td></tr> <tr> <td>AuthorityKeyId</td><td>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</td></tr> <tr> <td>SampleSerialNumber</td><td>A string indicating the serial number of the certificate used to identify the CA.</td></tr> <tr> <td>FileName</td><td>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</td></tr> </table>	Value	Description	CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.	AuthorityName	A string indicating the distinguished name of the CA. For example: <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .	AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).	SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.	FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.
Value	Description														
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database. This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.														
AuthorityName	A string indicating the distinguished name of the CA. For example: <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>														
AuthorityNameId	A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i> .														
AuthorityKeyId	A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).														
SampleSerialNumber	A string indicating the serial number of the certificate used to identify the CA.														
FileName	A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.														

Name	Description	
	Value	Description
		This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.5 PUT Monitoring Revocation

The PUT /Monitoring/Revocation method is used to modify the revocation monitoring location. This method returns HTTP 200 OK on a success with details of the location.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 376: PUT Monitoring Revocation {id} Input Parameters

Name	In	Description								
Id	Path	Required. An integer indicating the Keyfactor Command reference ID of the revocation monitoring location.								
Name	Body	Required. A string indicating the name of the revocation monitoring location.								
EndpointType	Body	Required. A string indicating the type of revocation monitoring endpoint: OCSP or CRL.								
Location	Body	<p>Required. A string indicating the location for the revocation monitoring endpoint.</p> <p>For CRL endpoints, this can be either an HTTP location or an LDAP location. Be sure to monitor the CRL locations that are in use by applications in your environment—if you’re monitoring LDAP locations but applications are using an HTTP location, you’re not going to receive any warning if a CRL fails to publish to the HTTP location.</p> <div> Important: Because a “+” (plus sign) in a URL can represent either a space or a “+” Keyfactor Command has chosen to read “+” as a space. For CRL URLs that require a “+” (plus sign), rather than a space, replace plus signs in your CRL’s URL with “%2B”. Only replace the plus signs you don’t wish to be treated as a space.</div> <p>For OCSP endpoints, this is the full URL to the OCSP responder servicing this certificate authority’s CRL.</p>								
Email	Body	<p>Required*. for CRL endpoints. An object indicating the email recipients and reminder schedule for reminder alerts. Email reminder details are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>EnableReminder</td><td>A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.</td></tr><tr><td>WarningDays</td><td>An integer indicating the number of days before expiration to send the warning email.</td></tr><tr><td>Recipients</td><td>An array of strings indicating the email addresses to which the email reminders should be sent.</td></tr></table>	Value	Description	EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.	WarningDays	An integer indicating the number of days before expiration to send the warning email.	Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.
Value	Description									
EnableReminder	A Boolean indicating whether to send email reminders for this location (true) or not (false). The default is false.									
WarningDays	An integer indicating the number of days before expiration to send the warning email.									
Recipients	An array of strings indicating the email addresses to which the email reminders should be sent.									
Dashboard	Body	<p>Required. An object indicating the configuration for display on the dashboard. Dashboard details are:</p>								

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>Show</td><td>Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.</td></tr><tr><td>WarningHours</td><td>Required*. An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i>. <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i>. If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.</td></tr></table>	Value	Description	Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.	WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.				
Value	Description											
Show	Required. A Boolean indicating whether to show this revocation monitoring location on the Revocation Monitoring dashboard (true) or not (false). The default is false.											
WarningHours	Required* . An integer indicating the number of hours prior to expiration when the location begins to appear in a warning state on the dashboard. <i>WarningHours</i> is required if <i>Show</i> is set to <i>true</i> and <i>EndpointType</i> is <i>CRL</i> . <i>WarningHours</i> is not supported for <i>EndpointType</i> <i>OCSP</i> . If the <i>Days</i> or <i>Weeks</i> value is selected in the Management Portal, it will be converted to hours when stored in the database.											
Schedule	Body	<p>An object containing the inventory schedule set for the revocation monitoring location. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description											
Off	Turn off a previously configured schedule.											
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.							
Name	Description											
Minutes	An integer indicating the number of minutes between each interval.											

Name	In	Description

For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>	AuthorityNameId	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>	AuthorityKeyId	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>	SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p>	FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>
Value	Description														
CertificateAuthorityId	<p>An integer indicating the Keyfactor Command reference ID of the CA in the database.</p> <p>This value will be null on a response if the endpoint was configured using the <i>FileName</i> option.</p>														
AuthorityName	<p>A string indicating the distinguished name of the CA. For example:</p> <pre>CN=CorpIssuingCA1, DC=keyexample, DC=com</pre>														
AuthorityNameId	<p>A string indicating the base 64 encoded SHA1 hash of the <i>AuthorityName</i>.</p>														
AuthorityKeyId	<p>A string indicating the base 64 encoded SHA1 hash of the CA certificate's public key. This value is found in the CA's certificate as the Subject Key Identifier (SKID).</p>														
SampleSerialNumber	<p>A string indicating the serial number of the certificate used to identify the CA.</p>														
FileName	<p>A string indicating a file name for the certificate used to identify the CA for the OCSP endpoint if <i>CertificateContents</i> is used.</p>														

Name	Description	
	Value	Description
		This value will be null on a response if the endpoint was configured using the <i>CertificateAuthorityId</i> option.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.6 POST Monitoring Resolve OSCP

The POST /Monitoring/ResolveOCSP method is used to resolve the given OCSP certificate authority. This method returns HTTP 200 OK on a success with details of the location.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 378: POST Monitoring Resolve OCSP Input Parameters

Name	In	Description
CertificateContents	Body	Required* . A string indicating the certificate contents of a base-64 encoded PEM issued by the CA that you wish to resolve. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.
CertificateAuthorityId	Body	Required* . An integer indicating the Keyfactor Command reference ID of the CA in the database. Use the <i>GET /CertificateAuthority</i> method (see GET Certificate Authority on page 358) to retrieve a list of all the CAs to determine the ID. One of either <i>CertificateContents</i> or <i>CertificateAuthorityId</i> is required, but not both.

Table 379: POST Monitoring Resolve OCSP Response Data

Name	Description
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the CA in the database.
AuthorityName	A string indicating the resolved certificate authority's name in X.500 format.
AuthorityNameId	A string indicating the hash of the certificate authority's name in hex format.
AuthorityKeyId	A string indicating the public key of the certificate authority's certificate.
SampleSerialNumber	A string indicating the serial number of the certificate authority's certificate.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.7 POST Monitoring Revocation Test

The POST /Monitoring/Revocation/Test method is used to test email alerts for a single configured revocation monitoring endpoint. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

 **Tip:** Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /monitoring/alerts/read/
- /monitoring/alerts/test/

Table 380: POST Monitoring Revocation Test Input Parameters

Name	Description
AlertId	Required. An integer indicating the reference ID of revocation monitoring alert to test.
EvaluationDate	Required. A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.
SendAlerts	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 381: POST Monitoring Revocation Test Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An array of objects containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An array of strings containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.23.8 POST Monitoring Revocation Test All

The POST /Monitoring/Revocation/Test method is used to test email alerts for all configured revocation monitoring endpoints. Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting or when an OCSP endpoint is unreachable. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. This method returns HTTP 200 OK on a success with details about the email message generated for each alert.

Tip: Alerts are generated when a CRL is expired or in the warning period as defined by the number of days configured in the *Email Reminder* setting. For example, if you had a CRL that expired on June 30 and configured the email reminder period to 15 days before expiration, the warning status would begin for that CRL on June 15 and CRL alerts would be generated. A warning will also appear for any CRL or OCSP locations that produced an error or couldn't be resolved.

When alerts are tested or sent on a schedule, corresponding message are also written to the system event log on the server where the Keyfactor Command service runs. For testing, this is true regardless of the setting of the *SendAlerts* flag. Information is logged to the event log for both locations that are in a good state (e.g. CRL resolves and is not in a warning or expired state or response from OCSP) and locations that are in an error state (e.g. CRL resolves but is in the warning period or expired, CRL is expired, CRL or OCSP location does not resolve).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 382: POST Monitoring Revocation Test All Input Parameters

Name	Description
EvaluationDate	<p>Required. A string indicating the evaluation date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p> <p>You can use the date to simulate running the alerts a month from now instead of today, for example, or put in a date far in the future to be sure you pick up some expiring CRLs for testing purposes.</p>
SendAlerts	<p>A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i>.</p>

Table 383: POST Monitoring Revocation Test All Response Data

Parameter	Description								
RevocationMonitoringAlerts	<p>An array of objects containing alert details resulting from the test. Revocation monitoring alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the email message subject for each alert. The content of this subject is not user configurable.</td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.</td></tr> <tr> <td>Recipients</td><td>An array of strings containing the recipient(s) for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.	Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.	Recipients	An array of strings containing the recipient(s) for the alert.
Name	Description								
Subject	A string indicating the email message subject for each alert. The content of this subject is not user configurable.								
Message	A string indicating the email message that will be delivered for each alert. The content of this message is not user configurable.								
Recipients	An array of strings containing the recipient(s) for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24 Orchestrator Jobs

The Orchestrator Jobs component of the Keyfactor API includes methods necessary to schedule orchestrator jobs and view the results of jobs.

Table 384: Orchestrator Jobs Endpoints

Endpoint	Method	Description	Link
/JobStatus/Data	GET	Retrieves the results of a custom job using the provided information.	GET Orchestrator Jobs Job Status Data on the next page
/JobHistory	GET	Returns the details of history records on orchestrator jobs, including in-process jobs.	GET Orchestrator Jobs Job History on page 960

Endpoint	Method	Description	Link
/ScheduledJobs	GET	Returns the details of active scheduled jobs, including in-process jobs.	GET Orchestrator Jobs Scheduled Jobs on page 966
/Custom	POST	Schedules a custom job on the orchestrator using the provided information.	POST Orchestrator Jobs Custom on page 970
/Reschedule	POST	Reschedules a failed orchestrator job.	POST Orchestrator Jobs Reschedule on page 975
/Unschedule	POST	Unschedules an active orchestrator job.	POST Orchestrator Jobs Unschedule on page 977
/Acknowledge	POST	Sets the status of a failed orchestrator job to acknowledged.	POST Orchestrator Jobs Acknowledge on page 979
/Custom/Bulk	POST	Schedules a custom job on multiple orchestrator using the provided information.	POST Orchestrator Jobs Reschedule on page 975

2.6.24.1 GET Orchestrator Jobs Job Status Data

The GET /OrchestratorJobs/JobStatus/Data method is used to return the data generated from a completed custom orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with up to 2 MB of data from the job results.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Tip: This method is used to return the log results from a Fetch Logs job initiated for the Keyfactor Universal Orchestrator. When used to return results for a Fetch Logs job, the last 2 MB of data from the orchestrator's log file are returned as a string in the Data field.

Tip: If jobs for the Keyfactor Universal Orchestrator fail with messages similar to the following:

```
2021-08-05 10:47:23.1940
```

```
Keyfactor.Orchestrators.JobExecutors.OrchestratorJobExecutor [Debug] - Response
```

status code does not indicate success: 413 (Request Entity Too Large).

```
at System.Net.Http.HttpResponseMessage.EnsureSuccessStatusCode() in /_
/src/System.Net.Http/src/System/Net/Http/HttpResponseMessage.cs:line 172
```

```
at Keyfactor.Orchestrators.Services.HttpService.SendPostAsync[T](String uri,
Object requestData, Dictionary`2 headers) in F:\BuildAgents\Default1\_
work\24\s\src\OrchestratorServices\HttpService.cs:line 38
```

This indicates that the amount of data being returned on the job is greater than IIS on the Keyfactor Command server is configured to accept. You will need to make modifications to the IIS settings on your Keyfactor Command server to allow it to accept larger incoming pieces of content. See *Orchestrator Management Operations: Fetch Logs* in the *Keyfactor Command Reference Guide* for more information.

Table 385: GET Orchestrator Jobs Job Status Data Input Parameters

Name	In	Description
jobHistoryId	Query	Required. The Keyfactor Command reference ID of the orchestrator job. Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History below) to retrieve a list of jobs to determine the job's history ID.

Table 386: GET Orchestrator Jobs Job Status Data Response Data

Name	Description
JobHistoryId	An integer indicate the Keyfactor Command reference ID used to track progress during orchestrator jobs.
Data	A string containing up to 2 MB of data returned from the custom job.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.2 GET Orchestrator Jobs Job History

The GET /OrchestratorJobs/JobHistory method is used to retrieve the status of an in progress or completed orchestrator (a.k.a. agent) job for a given job ID. This method returns HTTP 200 OK on a success with details of the requested orchestrator jobs.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/agents/management/read/`

Table 387: GET Orchestrator Jobs Job History Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Job History Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none">• AgentId (The GUID of the orchestrator. Run GET Agents on page 17 to find the ID.)• Agent (ClientMachine)• JobId• Result (Job result: 4-Failure, 3-Warning, 2-Success, 0-Unknown)• Status (Job status: 4-Acknowledged, 3-Completed, 2-InProcess, 1-Waiting, 0-Unknown, 5-CompletedWillRetry)• JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync)• Message• OperationStart (DateTime)• ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_(Monthly), O_(Once))• TargetPath
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>JobHistoryId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 388: GET Orchestrator Jobs Job History Response Data

Name	Description												
JobHistoryId	An integer indicating the Keyfactor Command reference ID used to track progress during orchestrator jobs.												
AgentMachine	A string indicating the name of the server on which the agent or orchestrator is installed. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.												
JobId	A string indicating the Keyfactor Command reference GUID assigned to the job.												
Schedule	<p>The inventory schedule for the most recently run instance of the orchestrator job. Possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
JobType	A string indicating the job type (e.g. IISInventory).																

Name	Description
OperationStart	The time, in UTC, at which the orchestrator job started.
OperationEnd	The time, in UTC, at which the orchestrator job finished.
Message	A string providing the error message for the operation, if any.
Result	A string indicating the result of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Success • Warning • Failure
Status	A string indicating the status of the orchestrator job. Possible values are: <ul style="list-style-type: none"> • Unknown • Waiting • In Process • Completed • Acknowledged • Completed Will Retry
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.3 GET Orchestrator Jobs Scheduled Jobs

The GET /OrchestratorJobs/ScheduledJobs method is used to retrieve orchestrator (a.k.a. agent) jobs that have active schedules. This includes jobs with ongoing schedules, such as inventory jobs that run periodically, and jobs that have been scheduled but have not yet been completed, such as management or discovery jobs. Both jobs that have not yet started and in-progress jobs are returned by this method. This method returns HTTP 200 OK on a success with details of the scheduled orchestrator jobs.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 389: GET Orchestrator Jobs Scheduled Jobs Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Job History Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AgentId (The GUID of the orchestrator. Run GET Agents on page 17 to find the ID.) • Agent Machine (ClientMachine) • AgentPlatform (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator) • JobType (Management, Inventory, Discovery, SslDiscovery, Reenrollment, Monitoring, Sync, SSHSync) • AgentType (Use -contains comparison) (see capabilities in GET Agents on page 17) • Requested (DateTime) • ScheduleType (Schedule: null (Immediately), I_(Interval), D_(Daily), W_(Weekly), M_(Monthly), O_(Once) • TargetPath
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Requested</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 390: GET Orchestrator Jobs Scheduled Jobs Response Data

Name	Description
Id	A string indicating the Keyfactor Command reference GUID assigned to the job.
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Target	A string indicating the server name and path to the certificate store on the target (e.g. appsrvr162.keyexample.com - /opt/app/store.cer). The server name included in the <i>Target</i> is the value from the <i>ClientMachine</i> . The format for the path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). Some types of jobs (e.g. discovery) have no path. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Name	Description
Schedule	

Name	Description
Requested	The time, in UTC, at which the orchestrator job was initiated and added to the job queue.
JobType	A string indicating the job type (e.g. IISInventory).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.4 POST Orchestrator Jobs Custom

The POST /OrchestratorJobs/Custom method is used to schedule a job with a custom job type on an orchestrator. This method returns HTTP 200 OK on a success with the GUID for the scheduled job.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

Tip: Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the *GET /OrchestratorJobs/JobHistory* method (see [GET Orchestrator Jobs Job History on page 960](#)) to determine the *JobHistoryId* of the completed job and then use the *GET /OrchestratorJobs/JobStatus/Data* method (see [GET Orchestrator Jobs Job Status Data on page 959](#)) to retrieve the data.

Table 391: POST Orchestrator Jobs Custom Input Parameters

Name	In	Description								
AgentId	Body	<p>Required. A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 17) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrator for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 17) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrator for which you want to schedule a custom job with your custom job type.</p>								
JobTypeName	Body	<p>Required. A string indicating the reference name for the custom job type for the job.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 722) to retrieve a list of your defined custom job types to determine the job type name to use.</p>								
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description							
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).							

 **Note:** Although the Keyfactor API Reference and Utility -

Name	In	Description
		<div>  <p>Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> </div> <p>The default is <i>Immediate</i>.</p>
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <div> <pre>"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> </div> <div>  <p>Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will be set automatically by Keyfactor Command. Submitting a value overrides the default value.</p> </div> <p>Use the GET /JobTypes/Custom method (see GET Custom Job Types on page 722) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <div>  <p>Tip: The built-in Fetch Logs job does not have any optional job fields.</p> </div>

Table 392: POST Orchestrator Jobs Custom Response Data

Name	Description
JobId	A string indicating the Keyfactor Command reference GUID for the job.
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
JobTypeName	A string indicating the reference name for the custom job type for the job.
Schedule	An object containing the schedule for the custom job.
JobFields	An array of objects that set the values for any optional job fields configured for the custom job type.
RequestTimestamp	A string containing the date, in UTC, when the custom job was submitted.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.5 POST Orchestrator Jobs Reschedule

The POST /OrchestratorJobs/Reschedule method is used to reschedule a failed orchestrator job to retry. Jobs must have a result of Failed and a status of Completed or Acknowledged to be eligible for rescheduling. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for rescheduling, including:

- Certificate Store Management
- Reenrollment
- Mac Auto-enrollment
- JKS, PEM and F5 Certificate Store Discovery
- SSH Synchronization
- Custom Jobs scheduled to run Weekly or Monthly

The following types of jobs cannot be rescheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule (see [POST Certificate Stores Schedule on page 603](#)).
- Custom Jobs scheduled to run Immediately or Exactly Once
A new custom job should be scheduled after the problem is resolved using POST

/OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 970](#)).

- **Fetch Logs**
A new fetch logs job should be scheduled after the problem is resolved using POST /OrchestratorJobs/Custom (see [POST Orchestrator Jobs Custom on page 970](#)).
- **SSL Discovery and Monitoring**
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1417](#)).
- **CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator**
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 404](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/modify/
/certificate_stores/schedule/

OR

/agents/management/modify/
/certificate_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being rescheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Tip: Be sure to resolve the problem that caused the job to fail before rescheduling it.

Table 393: POST Orchestrator Jobs Reschedule Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the failed jobs that should be scheduled to retry.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 960) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for rescheduling:</p> <pre>JobType -ne "Inventory" AND Result -eq "4" AND (Status -eq "4" OR Status -eq "3")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to reschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.6 POST Orchestrator Jobs Unschedule

The POST /OrchestratorJobs/Unschedule method is used to unschedule a scheduled orchestrator job. This endpoint returns 204 with no content upon success.

Only select types of jobs are eligible for unscheduling, including:

- Certificate Store Discovery and Management
- Reenrollment
- Mac Auto-enrollment
- Fetch Logs
- Custom Jobs

The following types of jobs cannot be unscheduled with this method:

- Certificate Store Inventory
Change the inventory schedule on certificate stores using POST /CertificateStores/Schedule

(see [POST Certificate Stores Schedule on page 603](#)).

- SSH Synchronization
Change the schedule on these using PUT /SSH/ServerGroups (see [PUT SSH Server Groups on page 1283](#)).
- SSL Discovery and Monitoring
Change the schedule on these using PUT /SSL/Networks (see [PUT SSL Networks on page 1417](#)).
- CA Synchronization for Remote CAs Managed with the Keyfactor Universal Orchestrator
Change the schedule on these using PUT /CertificateAuthority (see [PUT Certificate Authority on page 404](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/modify/
/certificate_stores/schedule/

OR

/agents/management/modify/
/certificate_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

The required permissions will vary depending on the job type being unscheduled. The permissions shown above are appropriate for a certificate store management job.

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 394: POST Orchestrator Jobs Unschedule Input Parameters

Name	In	Description
JobIds	Body	<p>Required*. An array of strings indicating the GUIDs for the job IDs of the jobs that should be unscheduled.</p> <p>Use the <i>GET /OrchestratorJobs/ScheduledJobs</i> method (see GET Orchestrator Jobs Scheduled Jobs on page 966) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for unscheduling:</p> <pre>JobType -notcontains "SslDiscovery" AND JobType -notcontains "Monitoring" AND JobType -notcontains "Sync" AND JobType -notcontains "SSHSync" AND JobType -notcontains "Inventory"</pre> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to unschedule (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobIds</i> or a <i>Query</i> is required, but not both.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.7 POST Orchestrator Jobs Acknowledge

The POST */OrchestratorJobs/Acknowledge* method is used to set an orchestrator job to a status of acknowledged. Jobs must have a result of Failed or Warning and a status of Completed or CompletedWillRetry to be eligible for acknowledgment. Jobs that are in process or that have completed successfully cannot be set to a status of acknowledged. Setting a job to a status of acknowledged removes it from the count on the job history tab in the Keyfactor Command Management Portal (if the job falls within the count period defined by the *Job Failures and Warnings Age Out (days)* application setting—see *Application Settings: Agents Tab* in the *Keyfactor Command Reference Guide*). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

Table 395: POST Orchestrator Jobs Acknowledge Input Parameters

Name	In	Description
JobAuditIds	Body	<p>Required*. An array of integers indicating the job IDs of the jobs that should be set to a status of acknowledged.</p> <p>Use the GET /OrchestratorJobs/JobHistory method (see GET Orchestrator Jobs Job History on page 960) with a query similar to the following to retrieve a list of all orchestrator jobs potentially eligible for acknowledgment:</p> <pre>(Result -eq "4" OR Result -eq "3") AND (Status -eq "3" OR Status -eq "5")</pre> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>
Query	Body	<p>Required*. A string containing a query to identify the jobs to acknowledge (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, see to <i>Orchestrator Scheduled Job Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>.</p> <p>Either a list of one or more <i>JobAuditIds</i> or a <i>Query</i> is required, but not both.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.24.8 POST Orchestrator Jobs Custom Bulk

The POST /OrchestratorJobs/Custom/Bulk method is used to schedule a job with a specified custom job type on multiple orchestrators at once. This method returns HTTP 200 OK on a success with the GUIDs for the scheduled jobs.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/modify/

 **Tip:** Data returned from a custom job once the job completes (e.g. a FetchLogs job) is stored in the Keyfactor Command database. To retrieve the data, use the [GET /OrchestratorJobs/JobHistory](#) method (see [GET Orchestrator Jobs Job History on page 960](#)) to determine the *JobHistoryId* of the completed job and then use the [GET](#)

/OrchestratorJobs/JobStatus/Data method (see [GET Orchestrator Jobs Job Status Data on page 959](#)) to retrieve the data.

Table 396: POST Orchestrator Jobs Custom Bulk Input Parameters

Name	In	Description												
Orches- tratorIds	Body	<p>Required. A string indicating the Keyfactor Command referenced GUIDs of the orchestrators what will execute the jobs.</p> <p>To schedule a Fetch Logs job, use the <i>GET /Agents</i> method (see GET Agents on page 17) with a query of <i>Status -eq 2</i> and <i>Capabilities -contains "LOGS"</i> to retrieve a list of your approved orchestrators with the LOGS capability to determine the ID of the orchestrators for which you want to retrieve logs.</p> <p>To schedule a job using your custom job type, use the <i>GET /Agents</i> method (see GET Agents on page 17) with a query of <i>Status -eq 2</i> to retrieve a list of your approved orchestrators to determine the ID of the orchestrators for which you want to schedule a custom job with your custom job type.</p>												
JobTypeNam- e	Body	<p>Required. A string indicating the reference name for the custom job type for the job. A single bulk operation can only execute one job type.</p> <p>Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 722) to retrieve a list of your defined custom job types to determine the job type name to use.</p>												
Schedule	Body	<p>An object containing the schedule for the custom job. The following schedule types are supported:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td><p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>

Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
JobFields	Body	<p>An object that set the values for any optional job fields configured for the custom job type. The <i>key</i> is the field name and the <i>value</i> is the value for the field.</p> <p>For example:</p> <pre>"JobFields": { "Favorite Type of Pet": "Rat", "Mother's Birthday": "1952-05-21" }</pre> <div> Note: If a job field has been configured with a default value and you wish to accept the default value, the field does not need to be submitted along with the POST /OrchestratorJobs/Custom request. The default value will</div>								

Name	In	Description
		<div>  be set automatically by Keyfactor Command. Submitting a value overrides the default value. </div> <p>Use the GET /JobTypes/Custom method (see GET Custom Job Types on page 722) to retrieve a list of your defined custom job types to determine the job fields defined for the job type.</p> <div>  Tip: The built-in Fetch Logs job does not have any optional job fields. </div>

Table 397: POST Orchestrator Jobs Custom Bulk Response Data

Name	Description						
OrchestratorJobPairs	<p>An array of objects containing identifying information for each orchestrator on which the job will be run. Orchestrator job pair parameters include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>JobId</td><td>A string indicating the Keyfactor Command reference GUID for the job.</td></tr> <tr> <td>OrchestratorId</td><td>A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.</td></tr> </table>	Value	Description	JobId	A string indicating the Keyfactor Command reference GUID for the job.	OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.
Value	Description						
JobId	A string indicating the Keyfactor Command reference GUID for the job.						
OrchestratorId	A string indicating the Keyfactor Command reference GUID of the orchestrator that will execute this job.						
JobTypeName	A string indicating the reference name for the custom job type for the job.						
Schedule	An object containing the schedule for the custom job.						
JobFields	An array of objects indicating the values for any optional job fields configured for the custom job type.						
RequestTimestamp	A string indicating the date, in UTC, when the custom job was submitted.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25 PAM Providers

Privileged Access Management (PAM) functionality in the Keyfactor API allows for configuration of third party PAM providers to secure certificate stores and provide access credentials for certificate authorities, workflows, and other functions. PAM functionality is provided using custom PAM extensions. Keyfactor provides several PAM extensions on the publicly-facing Keyfactor GitHub:

<https://keyfactor.github.io/integrations-catalog/content/pam>

The PAM component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list PAM providers and PAM provider types. PAM provider types must be created before PAM providers for them can be created.

Table 398: PamProviders Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a PAM provider.	DELETE PAM Providers ID below
/id}	GET	Returns information for the specified PAM provider.	GET PAM Providers ID on the next page
/Types	GET	Returns a list of all available PAM provider types.	GET PAM Providers Types on page 996
/Types	POST	Creates a new PAM provider type.	POST PAM Providers Types on page 1000
/	GET	Returns a list of all the configured PAM providers.	GET PAM Providers on page 1003
/	POST	Creates a new PAM provider.	POST PAM Providers on page 1012
/	PUT	Updates a PAM provider.	PUT PAM Providers on page 1030

2.6.25.1 DELETE PAM Providers ID

The DELETE /PamProviders/{id} method is used to delete a PAM provider by ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 399: DELETE PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID for the PAM provider to be deleted. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the PAM provider's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.2 GET PAM Providers ID

The GET /PamProviders/{id} method is used to return a PAM provider by ID. This method returns HTTP 200 OK on a success with details about the specified PAM provider.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/read/

OR

/pam/read/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 400: GET PamProviders {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the PAM provider to retrieve. Use the <i>GET /PAM/Providers</i> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the provider's ID.

Table 401: GET PamProviders {id} Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they can be used for certificate stores.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNa-me</td><td>A string indicating the display name for the PAM provider type parameter. 		Value	Description	
			Value	Description
				Provider-TypeParams
SecureAreald	An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any. This is considered deprecated and may be removed in a future release.			

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.3 GET PAM Providers Types

The GET /PamProviders/Types method returns a list of all the PAM provider types that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider type. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/read/

OR

/pam/read/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 402: GET PamProviders Types Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the PAM provider type.

DisplayName	A string indicating the display name for the PAM provider type. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).	DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> 1 = String 2 = Secret 	InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (True).
Value	Description																														
Id	<p>An integer indicating the ID of the type. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Private Ark Safe</td></tr> <tr> <td>2</td><td>PrivateArk Folder Name</td></tr> <tr> <td>3</td><td>PrivateArk Protected Password Name</td></tr> <tr> <td>4</td><td>Application ID</td></tr> <tr> <td>5</td><td>Secret Server Url</td></tr> <tr> <td>6</td><td>Rule Name</td></tr> <tr> <td>7</td><td>Thycotic Secret ID</td></tr> <tr> <td>8</td><td>Rule Key</td></tr> </table>	Value	Description	1	Private Ark Safe	2	PrivateArk Folder Name	3	PrivateArk Protected Password Name	4	Application ID	5	Secret Server Url	6	Rule Name	7	Thycotic Secret ID	8	Rule Key												
Value	Description																														
1	Private Ark Safe																														
2	PrivateArk Folder Name																														
3	PrivateArk Protected Password Name																														
4	Application ID																														
5	Secret Server Url																														
6	Rule Name																														
7	Thycotic Secret ID																														
8	Rule Key																														
Name	A string indicating the internal name for the PAM provider type.																														
DisplayName	A string indicating the display name for the PAM provider type. For provider types with an <i>InstanceLevel</i> of <i>False</i> , this name appears on the PAM provider dialog when a user creates a new PAM provider. For parameters with an <i>InstanceLevel</i> of <i>True</i> , this name appears on the dialog when a user creates a new record using the PAM provider (e.g. a new certificate store using PAM for authentication).																														
DataType	<p>An integer indicating the data type for the parameter. Possible values are:</p> <ul style="list-style-type: none"> 1 = String 2 = Secret 																														
InstanceLevel	A Boolean that sets whether the parameter is used to define the underlying PAM provider (False) or a field that needs to be set to a value when configuring a record (e.g. a certificate store) to use the PAM provider (True).																														

Example: For Delinea when defining a PAM provider, you configure two Delinea-specific fields:

- **Secret Server URL:** The URL to the Secret Server vault instance, including port number if applicable (e.g. `https://web-srvr38.keyexample.com/SecretServer`).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.4 POST PAM Providers Types

The POST /PamProviders/Types method creates a new PAM provider type. This method returns HTTP 200 OK on a success with details about the PAM provider type.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/modify/

OR

/pam/modify/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 403: POST PamProviders Types Input Parameters

Name	Description										
Name	A string containing the name of the PAM provider type.										
Parameters	<p>An array of objects containing parameters for the provider type. Parameter details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the display name for the PAM provider type. Name	Description	
	Value	Description
		 name of the object in Delinea where the password is stored) are stored in the <i>ProviderTypeParamValues</i> array.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.5 GET PAM Providers

The GET /PamProviders method returns a list of all the PAM providers that have been configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details about each PAM provider.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /pam/read/
- OR
- /pam/read/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 404: GET PamProviders Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Area • Name • ProviderType • SecuredAreald
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 405: GET PamProviders Response Data

Name	Description																
Id	An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.																
Area	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they can be used for certificate stores.																
ProviderType	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the name of the provider type.</td></tr> <tr> <td>Provider-TypeParams</td><td> <p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Provider type parameters values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td></tr> <tr> <td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr> <tr> <td>DisplayNa-me</td><td>A string indicating the display name for the PAM provider type parameter. SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>This is considered deprecated and may be removed in a future release.</p>												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.6 POST PAM Providers

The POST /PamProviders method creates a new PAM provider. This method returns HTTP 200 OK on a success with details for the new provider.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/modify/

OR

/pam/modify/#/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Table 406: POST PamProviders Input Parameters

Name	In	Description																
Name	Body	<p>Required. A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command.</p> <div> Important: The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see <i>Installing Custom PAM Provider Extensions</i> in the <i>Keyfactor Command Reference Guide</i>).</div>																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they can be used for certificate stores.																
ProviderType	Body	<p>An object containing details about the provider type for the provider. Provider type details include:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td><p>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers. Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.25.7 PUT PAM Providers

The PUT /PamProviders method updates an existing PAM provider. This method returns HTTP 200 OK on a success with details for the updated provider.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/pam/modify/

OR

/pam/modify/#!/ (where # is a reference to a specific PAM provider ID)

Permissions for PAM providers and certificate stores can be set at either the global or PAM provider level. See *PAM Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs PAM provider permissions.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 408: PUT PamProviders Input Parameters

Name	In	Description																
Id	Body	Required. An integer indicating the Keyfactor Command reference ID for the PAM provider. This ID is automatically set by Keyfactor Command.																
Name	Body	Required. A string indicating the name of the PAM provider. This name is used to identify the PAM provider throughout Keyfactor Command. <div> Important: The name you give to your PAM provider in Keyfactor Command must match the name of the PAM provider as referenced in the manifest.json file (see).</div>																
Area	Body	An integer indicating the area of Keyfactor Command the provider is used for. PAM providers generally have a value of 1, indicating they can be used for certificate stores.																
ProviderType	Body	<div>An object containing details about the provider type for the provider.<table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider type.</td></tr><tr><td>Name</td><td>A string indicating the name of the provider type.</td></tr><tr><td>Provider-TypeParams</td><td>An array of objects indicating parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider records and records using PAM providers.<table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the PAM provider type.</td></tr><tr><td>Name</td><td>A string indicating the internal name for the PAM provider type parameter.</td></tr><tr><td>DisplayName</td><td>A string indicating the display name for the PAM provider type parameter. Value	Description												
Provider-TypeParams	An array of parameters that the provider type uses for data input in Keyfactor Command when creating new PAM provider and certificate store records.												
SecureAreald	<p>An integer indicating the Keyfactor Command reference ID for the certificate store container the PAM provider is associated with, if any.</p> <p>This is considered deprecated and may be removed in a future release.</p>												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.26 Permissions

The Permissions component of the Keyfactor API includes the GET method to list all of the area/permissions that are available to use to configure security settings for access to Keyfactor Command. This is mostly used for reference when configuring security settings.

Table 410: Security Roles Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of all of the area/permissions that are available to use to configure security settings for access to Keyfactor Command. This is mostly used for reference when configuring security settings.	GET Permissions below

2.6.26.1 GET Permissions

The Permissions component of the Keyfactor API includes the GET method to list all area/permission available to use to control user access to all aspects of Keyfactor Command.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/read/`

Table 411: GET Permission Sets Response Data

Permissions
<p>An array of a list of strings of the full permissions list in Keyfactor Command.</p> <p>For example:</p> <pre>["/", "/agents/", "/agents/auto_registration/", "/agents/auto_registration/modify/", "/agents/auto_registration/read/", "/agents/management/", "/agents/management/mac/", "/agents/management/mac/auto-enrollment/", "/agents/management/mac/auto-enrollment/management/", "/agents/management/mac/auto-enrollment/management/modify/", "/agents/management/mac/auto-enrollment/management/read/", ... "/certificate_stores/", ... "/ssl/read/", "/system_settings/", "/system_settings/modify/", "/system_settings/read/", "/workflows/", "/workflows/definitions/", ...]</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.27 Permission Sets

The Permission Sets component of the Keyfactor API includes methods necessary to programmatically create, edit, retrieve, and delete permission sets within Keyfactor Command.

Permission sets are used to organize security roles (see [Security Roles on page 1172](#)) and provide compartmentalization on permissions. An unconfigured Keyfactor Command has one permission set—the *Global Permission Set*—that will contain all the security roles created in Keyfactor Command and allow users with administrative permissions to grant any of the possible permissions (see Security Role Permissions in the *Keyfactor Command Reference Guide*) in Keyfactor Command to other users. An implementation with two or more permission sets can be used to limit the actions that administrative users (or any users) can take.

Permission sets can only be managed with the Keyfactor API.

Example: An organization has a couple of administrators who should be allowed to make whatever changes are necessary to Keyfactor Command and a handful of other administrators who need full control to Keyfactor Command but should not be able to access certain sensitive features of the system. However, this second set of administrators do need to be able to change permissions of users on occasion. To meet this need, the organization decides to use permission sets:

- The *Global Permission Set* contains the following permission:

/

This is the base permission set that is created on installation. It allows any security roles created as part of the Global Permission Set to potentially contain any possible security permission within Keyfactor Command.

- The organization adds an *Operational Permission Set* which contains the following permissions:

```
/agents/  
/application_settings/  
/certificate_stores/  
/certificates/  
/certificate_authorities/
```

```
/certificate_templates/  
/dashboard/  
/metadata/  
/monitoring/  
/portal/  
/reports/  
/security/  
/scripts/  
/ssl/  
/workflows/
```

This allows any security roles created as part of the Operational Permission Set to potentially contain any of the permissions in the referenced areas of Keyfactor Command. Notice that security is among these areas. It does not allow security roles added to this permission set to be granted permissions in areas such as /auditing/ and /identity_providers/.

The organization creates these security roles:

- A Global Administrators security role in the Global Permission Set which grants full control to the system. This is created by default during the installation.
- An Operational Administrators security role in the Operational Permission Set which grants all the permissions in the Operational Permission Set.
- A Power Users security role in the Operational Permission Set which grants a large subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. /certificates/enrollment/csr/).
- A Viewers security role in the Operational Permission Set which grants a small subset of the permissions in the Operational Permission Set, more granularly than grants to the administrators (e.g. /certificates/collections/read/).

In this configuration, users who hold the Operational Administrators security role:

- Can edit the Power Users and Viewers security roles and change the permissions granted to those roles, but they cannot add any permissions that are not in the Operational Permission Set.
- Can edit the Operational Administrators security role, but can't add any permissions that aren't in the Operational Permission Set.
- Can add new claims for users, groups and other entities.
- Can add new security roles in the Operational Permission Set, referencing only permissions in that set.

- Can associate users, groups and other entities with the Power Users, Viewers and Operational Administrators security roles.
- Can remove role associations for users, groups and other entities for the Power Users, Viewers and Operational Administrators security roles.
- Cannot edit the Global Administrators role because it's not in the permission set to which their own security role belongs.
- Cannot add or edit permission sets.

Table 412: Permission Sets Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns the permission set with the specified GUID.	GET Permission Sets ID below
/ {id}	DELETE	Deletes the permission set with the specified GUID.	DELETE Permission Sets ID on the next page
/	GET	Returns a list of all the permission sets.	GET Permission Sets on page 1054
/	POST	Adds a new permission set into Keyfactor Command.	POST Permission Sets on page 1055
/	PUT	Updates a permission set.	PUT Permission Sets on page 1056

2.6.27.1 GET Permission Sets ID

The GET /PermissionSets/{id} method is used to return a permission set by GUID. This method returns HTTP 200 OK on a success with details for the specified permission set.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 413: GET Permission Sets{id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID of the permission set to retrieve. Use the <i>GET /PermissionSets</i> method (see GET Permission Sets on page 1054) to retrieve a list of all the permission sets to determine the permission set's ID.

Table 414: GET Permission Sets {id} Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.27.2 DELETE Permission Sets ID

The DELETE /PermissionSets/{id} method is used to delete the permission set with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 415: DELETE Permission Sets{id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID of the permission set to delete. Use the <i>GET /PermissionSets</i> method (see GET Permission Sets on the next page) to determine the ID of the permission set you wish to delete.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.27.3 GET Permission Sets

The GET /PermissionSets method is used to return a list of the permission sets defined in Keyfactor Command (see [Permission Sets on page 1050](#)). This method returns HTTP 200 OK on a success with details for the permission sets.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 416: GET Permission Sets Input Parameters

Name	In	Description
QueryString	Query	There are no query parsers for this endpoint..
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 417: GET Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.27.4 POST Permission Sets

The POST /PermissionSets method is used to create a new permission set in Keyfactor Command (see [Permission Sets on page 1050](#)). This method returns HTTP 200 OK on a success with the details of the new permission set.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 418: POST Permission Sets Input Parameters

Name	In	Description
Name	Body	Required. A string indicating the short name for the permission set.
Permissions	Body	Required. An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <div><pre>"Permissions": ["/agents/", "/certificate_stores/", "/certificates/", "/certificate_authorities/", "/certificate_templates/", "/dashboard/", "/metadata/", "/monitoring/", "/portal/", "/reports/", "/ssl/", "/workflows/",]</pre></div>

Table 419: POST Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.27.5 PUT Permission Sets

The PUT /PermissionSets method is used to update a permission set in Keyfactor Command (see [Permission Sets on page 1050](#)). This method returns HTTP 200 OK on a success with the details of the updated permission set.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 420: PUT Permission Sets Input Parameters

Name	Description
Id	Required. A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	<p>Required. An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["/agents/", "/certificate_stores/", "/certificates/", "/certificate_authorities/", "/certificate_templates/", "/dashboard/", "/metadata/", "/monitoring/", "/portal/", "/reports/", "/ssl/", "/workflows/",]</pre>

Table 421: PUT Permission Sets Response Data

Name	Description
Id	A string containing the Keyfactor Command reference GUID for the permission set.
Permissions	An array of strings containing the permissions assigned to the permission set. See <i>Security Role Operations: Version Two Permission Model</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28 Reports

The Reports component of the Keyfactor API includes methods necessary to list, update, and schedule built-in reports as well as methods to create, update, list and delete custom reports.

Table 422: Reports Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns the built-in report with the specified ID.	GET Reports ID on the next page
/Custom/{id}	DELETE	Deletes the custom report with the specified ID.	DELETE Reports Custom ID on page 1067
/Custom/{id}	GET	Returns the custom report with the specified ID.	GET Reports Custom ID on page 1068
/Schedules/{id}	DELETE	Deletes the schedule for the built-in report with the specified schedule ID.	DELETE Reports Schedules ID on page 1069
/Schedules/{id}	GET	Returns the schedule for the built-in report with the specified schedule ID.	GET Reports Schedules ID on page 1070
/ {id}/Parameters	GET	Returns the parameters for the built-in report with the specified report ID.	GET Reports ID Parameters on page 1074
/ {id}/Parameters	PUT	Updates the parameters for the built-in report with the specified report ID.	PUT Reports ID Parameters on page 1077
/	GET	Returns all built-in reports with filtering and output options.	GET Reports on page 1079
/	PUT	Updates the built-in report with the specified ID. Only some fields can be updated.	PUT Reports on page 1082
/Custom	GET	Returns all custom reports with filtering and output options.	GET Reports Custom on page 1085
/Custom	POST	Creates a custom report.	POST Reports Custom on page 1087
/Custom	PUT	Updates the custom report with the specified ID.	PUT Reports Custom on page 1089
/ {id}/Schedules	GET	Returns the schedule for the built-in	GET Reports ID

Endpoint	Method	Description	Link
		report with the specified report ID.	Schedules on page 1090
/{{id}}/Schedules	POST	Creates a schedule for the built-in report with the specified report ID.	POST Reports ID Schedules on page 1095
/{{id}}/Schedules	PUT	Updates a schedule for the built-in report with the specified report ID.	PUT Reports ID Schedules on page 1105

2.6.28.1 GET Reports ID

The GET /Reports/{{id}} method is used to return the built-in report with the specified ID. This method returns HTTP 200 OK on a success with the details of the report.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/read/

Table 423: GET Reports {{id}} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer containing the Keyfactor Command reference ID for the report that should be retrieved.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 424: GET Reports {id} Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplic-ates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certi- </div>

Name	Description								
	<p> ficate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 455). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p>								
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).								
ReportParameter	<p>An array of objects containing the parameters for the report. . Report parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the report parameter.</td></tr> <tr> <td>ParameterName</td><td>A string containing the short reference name for the report parameter (e.g. EvalDate).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates </td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the report parameter .	ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).	ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates
Name	Description								
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .								
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).								
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates 								

Name	Description														
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <ul style="list-style-type: none"> TimePeriod </td></tr> <tr> <td>DisplayName</td><td>A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).</td></tr> <tr> <td>Description</td><td>A string containing the description for the parameter.</td></tr> <tr> <td>DefaultValue</td><td> A string containing the default value for the parameter. <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div> </td></tr> <tr> <td>DisplayOrder</td><td>An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.</td></tr> <tr> <td>ParameterVisibility</td><td>A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i>. The alternative setting is <i>Hidden</i>.</td></tr> </table>	Name	Description		<ul style="list-style-type: none"> TimePeriod 	DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).	Description	A string containing the description for the parameter.	DefaultValue	A string containing the default value for the parameter. <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>	DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0. TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.				
Name	Description												
SSHKeyType	The SSH key type(s) selected to report on.												
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).												
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.												
AcceptedScheduleFormats	An array of strings containing the report formats supported for the report. Typically supported formats are PDF and Excel. Select reports support CSV format.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.2 DELETE Reports Custom ID

The DELETE /Reports/Custom/{id} method is used to delete the custom report link with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 425: DELETE Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer containing the Keyfactor Command reference ID for the report link to be deleted.</p> <p>Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1085) to retrieve a list of your custom report links to determine the report ID to use.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.3 GET Reports Custom ID

The *GET /Reports/Custom/{id}* method is used to return the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/read/

Table 426: GET Reports Custom {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer containing the Keyfactor Command reference ID for the report link that should be retrieved.</p> <p>Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1085) to retrieve a list of your custom reports to determine the report ID to use.</p>

Table 427: GET Reports Custom {id} Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.4 DELETE Reports Schedules ID

The DELETE /Reports/Schedules/{id} method is used to delete the schedule for the built-in report with the specified schedule ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 428: DELETE Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1059) to retrieve the details for that report to determine the schedule ID to use.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.5 GET Reports Schedules ID

The *GET /Reports/Schedules/{id}* method is used to return the schedule for the built-in report with the specified **schedule ID**. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the *GET /Reports/{id}/Schedules* method to return the schedule based on the **report ID** (see [GET Reports ID Schedules on page 1090](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/read/

Table 429: GET Reports Schedules {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the report schedule. Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID and then <i>GET /Reports/{id}</i> (see GET Reports ID on page 1059) to retrieve the details for that report to determine the schedule ID to use.

Table 430: GET Reports Schedules {id} Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.6 GET Reports ID Parameters

The GET /Reports/{id}/Parameters method is used to return the parameters for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report parameters.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/read/

Table 431: GET Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 432: GET Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	<p>A string containing the default value for the parameter.</p> <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.7 PUT Reports ID Parameters

The PUT /Reports/{id}/Parameters method is used to update the parameters for the built-in report with the specified report ID. Only some fields can be updated. This method returns HTTP 200 OK on a success with the details of the report parameters.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 433: PUT Reports {id} Parameters Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the built-in report the parameter is associated with. Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.
Id	Body	Required. The Keyfactor Command reference ID of the report parameter . Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1059) to retrieve the details for the desired report to determine the parameter ID to use.
DisplayName	Body	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	Body	A string containing the description for the parameter.
DefaultValue	Body	A string containing the default value for the parameter. <div> Tip: Default values that are integers are also stored as strings in this parameter.</div>

Table 434: PUT Reports {id} Parameters Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the report parameter .
ParameterName	A string containing the short reference name for the report parameter (e.g. EvalDate).
ParameterType	<p>A string containing the type of the parameter. Possible values include:</p> <ul style="list-style-type: none"> • Bool • CertAuth (certificate authorities) • Int • Metadata • OrchestratorPool • RelativeDate • SingleCA • SingleMetadata • SSHKeyType • Templates • TimePeriod
DisplayName	A string containing the display name for the parameter (e.g. Evaluation Date (UTC)).
Description	A string containing the description for the parameter.
DefaultValue	<p>A string containing the default value for the parameter.</p> <div>  Tip: Default values that are integers are also stored as strings in this parameter. </div>
DisplayOrder	An integer indicating the order in which the parameters should be displayed on the scheduling page in Keyfactor Command, beginning with 0.
ParameterVisibility	A string indicating whether the parameter should be displayed in the Keyfactor Command Management Portal. The default value is <i>Visible</i> . The alternative setting is <i>Hidden</i> .

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.8 GET Reports

The GET /Reports method is used to return all built-in reports with filtering and output options. This method returns HTTP 200 OK on a success with selected details of the reports. To view details of schedules and parameters for a report, use the *GET /Reports/{id}* method (see [GET Reports ID on page 1059](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/reports/read/`

Table 435: GET Reports Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Categories (CertificateCounts, CertificateLifecycle, Certificate Locations, PKIOperations, SecurityVulnerability,SSHKeys) • Favorite (true, false) • InNavigator (true, false) • Scheduled (Number of schedules) <div>  <p>Tip: This method offers limited searchable fields. The most useful search is probably by category. For example, to return all the reports tagged with the PKI Operations category:</p> <p style="text-align: center;">Categories -contains "PKIOperations"</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 436: GET Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
Scheduled	An integer indicating the number of schedules configured for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).

Name	Description
	 Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 455). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.9 PUT Reports

The PUT /Reports method is used to update the built-in report with the specified report ID. Only some fields can be updated. To create or update a report schedule, use the *POST /Reports/{id}/Schedules* (see [POST Reports ID Schedules on page 1095](#)) or *PUT /Reports/{id}/Schedules* (see [PUT Reports ID Schedules on page 1105](#)) method. To update parameters for a built-in report, use the *PUT /Reports/{id}/Parameters* method (see [PUT Reports ID Parameters on page 1077](#)). This method returns HTTP 200 OK on a success with the details of the report.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 437: PUT Reports Input Parameters

Name	In	Description
Id	Body	<p>Required. The Keyfactor Command reference ID of the built-in report that should be updated.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	Body	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  <p>Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable.</p> <p>Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 455). This corresponds to the Keyfactor Command Management Portal “Ignore renewed certificate results by” option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.</p> </div>

Table 438: PUT Reports Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the report.
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page, at the top of the page for the generated report, and on the menu.</p> <div>  Tip: Exported reports use built-in names; modifying this value will not change the name that appears at the top of the exported version of a report (e.g. a PDF). </div>
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and at the top of the page for the generated report.
ReportPath	A string containing the name of the report as referenced when retrieving it via Logi Analytics.
VersionNumber	A string containing the version number for the report.
Categories	<p>A string containing the report category or categories in which the report is found on the report manager page in the Keyfactor Command Management Portal. The possible values are:</p> <ul style="list-style-type: none"> • CertificateCounts • CertificateLifecycle • CertificateLocations • PKIOperations • SecurityVulnerability • SSHKeys
ShortName	A string containing the short reference name for the report.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).
RemoveDuplicates	<p>A Boolean that indicates whether the report uses certificate de-duping logic in producing output (true) or not (false).</p> <div>  Tip: When de-duplication is enabled for a report, the report results will include only the most recently issued certificate if there is more than one </div>

Name	Description
	 certificate that matches the de-duplication criteria. De-duplication can only be enabled for reports that use certificate collections—the <i>UsesCollection</i> parameter. The <i>UsesCollection</i> parameter is not user-configurable. Certificate de-duping is configured on a certificate collection using the <i>DuplicationField</i> parameter (see POST Certificate Collections on page 455). This corresponds to the Keyfactor Command Management Portal <i>Ignore renewed certificate results by</i> option on a certificate collection. Certificate collections may be configured to be de-duplicated based on the certificate common name, distinguished name, or principal name (or not at all). Only certificates that share all the EKUs (e.g. Client Authentication and Server Authentication) as well as the same CN, DN or UPN will be eliminated as duplicates. If a certificate has more than one EKU and at least one EKU does not match an otherwise similar certificate with matching CN, DN or UPN, it will not be eliminated.
UsesCollection	A Boolean that indicates whether the report uses a certificate collection as input for reporting (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.10 GET Reports Custom

The GET /Reports/Custom method is used to return all custom report links with filtering and output options. This method returns HTTP 200 OK on a success with the details of the report linkages.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/read/

Table 439: GET Reports Custom Input Parameters

Name	In	Description
AmmendedQuery	Query	This parameter is not available for use and will be deprecated in version 12.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Favorite (true, false) • InNavigator (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 440: GET Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.11 POST Reports Custom

The POST /Reports/Custom method is used to add a link within Keyfactor Command to an externally hosted custom report. This method returns HTTP 200 OK on a success with the details of the report linkage.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 441: POST Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	<p>Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div>  Tip: Custom reports are automatically opened in a new browser tab. </div>
DisplayName	Body	<p>Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	Body	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	Body	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i>.</p>
Favorite	Body	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i>.</p>

Table 442: POST Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. https://my-webserver.keyexample.com/mycustomreport/).</p> <div>  Tip: Custom reports are automatically opened in a new browser tab. </div>
Id	<p>An integer containing the Keyfactor Command reference ID for the report link.</p>
DisplayName	<p>A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.</p>
Description	<p>A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.</p>
InNavigator	<p>A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).</p>
Favorite	<p>A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.12 PUT Reports Custom

The PUT /Reports/Custom method is used to update the custom report link with the specified ID. This method returns HTTP 200 OK on a success with the details of the report linkage.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 443: PUT Reports Custom Input Parameters

Name	In	Description
CustomURL	Body	Required. A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).  Tip: Custom reports are automatically opened in a new browser tab.
Id	Body	Required. An integer containing the Keyfactor Command reference ID for the report link. Use the <i>GET /Reports/Custom</i> method (see GET Reports Custom on page 1085) to retrieve a list of your custom report links to determine the report ID to use.
DisplayName	Body	Required. A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	Body	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	Body	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false). The default is <i>false</i> .

Table 444: PUT Reports Custom Response Data

Name	Description
CustomURL	<p>A string containing the URL users should click from within Keyfactor Command to display the custom report (e.g. <code>https://my-webserver.keyexample.com/mycustomreport/</code>).</p> <p> Tip: Custom reports are automatically opened in a new browser tab.</p>
Id	An integer containing the Keyfactor Command reference ID for the report link.
DisplayName	A string containing the display name for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page and on the menu.
Description	A string containing the description for the report. This appears in the Keyfactor Command Management Portal on the Report Manager page.
InNavigator	A Boolean that indicates whether the report has been configured to display on the Keyfactor Command Management Portal menu (true) or not (false).
Favorite	A Boolean that indicates whether the report has been marked as a favorite (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.13 GET Reports ID Schedules

The GET `/Reports/{id}/Schedules` method is used to return the schedule for the built-in report with the specified **report** ID. This method returns HTTP 200 OK on a success with the details of the report schedule. Use the `GET /Reports/Schedules/{id}` method to return the schedule based on the **schedule** ID (see [GET Reports Schedules ID on page 1070](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/reports/read/`

Table 445: GET Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>

Table 446: GET Reports {id} Schedules Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:
Name	Description												
Off	Turn off a previously configured schedule.												
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Weekly	A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:												

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. 	report on.														
PeriodSize	The selected reporting period (day, weeks or months).														
Requesters	The certificate requesters selected to include in the report.														
SSHKeyType	The SSH key type(s) selected to report on.														
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).														
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.14 POST Reports ID Schedules

The POST /Reports/{id}/Schedules method is used to create a schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 447: POST Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
SaveReportPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p>Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing “\” in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV
KeyfactorSchedule	Body	<p>Required. An object providing the schedule for the report. The schedule can be one of:</p>

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	<p>A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description														
	report on.														
PeriodSize	The selected reporting period (day, weeks or months).														
Requesters	The certificate requesters selected to include in the report.														
SSHKeyType	The SSH key type(s) selected to report on.														
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).														
Templatelds	The Keyfactor Command identifiers for the templates to include in the report.														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.28.15 PUT Reports ID Schedules

The PUT /Reports/{id}/Schedules method is used to update the schedule for the built-in report with the specified report ID. This method returns HTTP 200 OK on a success with the details of the report schedule.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/reports/modify/

Table 449: PUT Reports {id} Schedules Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the built-in report the schedule is associated with.</p> <p>Use the <i>GET /Reports</i> method (see GET Reports on page 1079) to retrieve a list of your built-in reports to determine the report ID to use.</p>
Id	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the report schedule.</p> <p>Use the <i>GET /Reports/{id}</i> (see GET Reports ID on page 1059) to retrieve the details for the desired report to determine the schedule ID to use.</p>
SendReport	Body	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false). The default is <i>false</i> .
SaveReport	Body	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false). The default is <i>false</i> .
SaveRe- portPath	Body	<p>Required*. A string containing the UNC path to which the report will be written, if configured.</p> <div>  <p>Note: The path for saved reports must be provided in UNC format (\\servername\sharename\path) and must be accessible from the Keyfactor Command administration server. In addition:</p> <ul style="list-style-type: none"> • Do not use a trailing “\” in the report path. • Ensure that the application pool service account has permission to write to the location where you want the outputted report to be saved. • When scheduling a report, schedule it for at least 10 minutes in advance of the current time if you wish it to run soon. If you want to run it faster than that, the Keyfactor Command Service will need to be restarted. </div> <p>This field is required if <i>SaveReport</i> is set to <i>true</i>.</p>
ReportFormat	Body	<p>Required. A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include:</p> <ul style="list-style-type: none"> • PDF • Excel • CSV
KeyfactorSche- dule	Body	Required. An object providing the schedule for the report.

Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Note: Although the Keyfactor API Reference and Utility - Swagger *Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.

For example:

```
"KeyfactorSchedule": {  
  "Monthly": {
```

Name	In	Description						
		<div><pre>"Day": 1, "Time": "2021-07-01T17:00:00Z" }, },</pre></div> <p>Or:</p> <div><pre>"KeyfactorSchedule": { "Weekly": { "Days": ["Monday", "Thursday"], "Time": "2021-07-01T17:00:00Z" } }, },</pre></div>						
EmailRecipients	Body	<p>Required*. An array of strings containing the email addresses of users configured as recipients of the scheduled report, if any. For example:</p> <div><pre>"EmailRecipients": ["pkiadmins@keyexample.com", "john.smith@keyexample.com"]</pre></div> <p>This field is required if <i>SendReport</i> is set to <i>true</i>.</p>						
RuntimeParameters	Body	<p>Required*. An object containing the parameters to be used at run time configured in the report schedule. Runtime parameters will vary depending on the report selected.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>CertAuth</td><td>The certificate authority or authorities selected to report on.</td></tr><tr><td>EndDate</td><td>The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).</td></tr></table>	Name	Description	CertAuth	The certificate authority or authorities selected to report on.	EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).
Name	Description							
CertAuth	The certificate authority or authorities selected to report on.							
EndDate	The end date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 0 days before today—meaning today).							

Name	In	Description																						
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>EvalDate</td><td>The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr><tr><td>Metadata</td><td>The custom metadata fields selected to include in the report.</td></tr><tr><td>MinCertCount</td><td>The minimum number of certificates that must have been issued for the given template before the template will be included in the report.</td></tr><tr><td>OrchestratorPool</td><td>The orchestrator pool selected to report on.</td></tr><tr><td>PeriodCount</td><td>The number of days, weeks or months selected to report on.</td></tr><tr><td>PeriodSize</td><td>The selected reporting period (day, weeks or months).</td></tr><tr><td>Requesters</td><td>The certificate requesters selected to include in the report.</td></tr><tr><td>SSHKeyType</td><td>The SSH key type(s) selected to report on.</td></tr><tr><td>StartDate</td><td>The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).</td></tr><tr><td>TemplateIds</td><td>The Keyfactor Command identifiers for the templates to include in the report.</td></tr></table>	Name	Description	EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	Metadata	The custom metadata fields selected to include in the report.	MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.	OrchestratorPool	The orchestrator pool selected to report on.	PeriodCount	The number of days, weeks or months selected to report on.	PeriodSize	The selected reporting period (day, weeks or months).	Requesters	The certificate requesters selected to include in the report.	SSHKeyType	The SSH key type(s) selected to report on.	StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).	TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.
Name	Description																							
EvalDate	The evaluation date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
Metadata	The custom metadata fields selected to include in the report.																							
MinCertCount	The minimum number of certificates that must have been issued for the given template before the template will be included in the report.																							
OrchestratorPool	The orchestrator pool selected to report on.																							
PeriodCount	The number of days, weeks or months selected to report on.																							
PeriodSize	The selected reporting period (day, weeks or months).																							
Requesters	The certificate requesters selected to include in the report.																							
SSHKeyType	The SSH key type(s) selected to report on.																							
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).																							
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.																							

For example:

```
"RuntimeParameters": {  
  "StartDate": "60-Day-Before",  
  "EndDate": "7-Day-Before",  
  "Metadata": "AppOwnerFirstName, AppOwnerLastName",  
  "Requesters": "jsmith"  
}
```

Name	In	Description
		This field is required for reports that have runtime parameters.

Table 450: PUT Reports {id} Schedules Response Data

Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of the report schedule .												
SendReport	A Boolean indicating whether the report will be sent to the email recipients configured in <i>EmailRecipients</i> (true) or not (false).												
SaveReport	A Boolean indicating whether the report will be saved to the UNC path defined by <i>SaveReportPath</i> (true) or not (false).												
SaveReportPath	A string containing the UNC path to which the report will be written, if configured.												
ReportFormat	A string containing the report format selected for the scheduled report run. Supported values vary depending on the selected report and include: <ul style="list-style-type: none"> • PDF • Excel • CSV 												
KeyfactorSchedule	<p>An object providing the schedule for the report. The schedule can be one of:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description														
	report on.														
PeriodSize	The selected reporting period (day, weeks or months).														
Requesters	The certificate requesters selected to include in the report.														
SSHKeyType	The SSH key type(s) selected to report on.														
StartDate	The start date selected for the reporting period to report on. This is configured as a certain number of days, weeks or months before or after the current date (e.g. 30 days before today).														
TemplateIds	The Keyfactor Command identifiers for the templates to include in the report.														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.29 Scheduling

The Scheduling component of the Keyfactor API includes a method necessary to programmatically create and edit scheduled tasks in Keyfactor Command for task management that is not otherwise covered by an individual endpoint (e.g. PUT /Alerts/Expiration/Schedule).

Table 451: Scheduling Endpoints

Endpoint	Method	Description	Link
/	POST	Create or update task management schedules.	

2.6.29.1 POST Scheduling

The POST /Scheduling method is used to add or update the schedule for a task in the Keyfactor Command database. This method returns HTTP 200 OK on a success with details of the scheduled task.

This method is intended primarily to be used for updating CA health monitoring schedules. Although it is possible to update issued, expiration, key rotation, and pending alert schedules using this method, each of these has an endpoint dedicated to this purpose (see [PUT Alerts Issued Schedule on page 133](#), [PUT Alerts Expiration Schedule on page 93](#), [PUT Alerts Key Rotation Schedule on page 168](#), and [PUT Alerts Pending Schedule on page 202](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Table 452: POST Scheduling Input Parameters

Name	In	Description												
Id	Body	<p>Required*. An integer indicating the Keyfactor Command reference ID of the schedule to create or update.</p> <p>This value is required if you're updating an existing schedule.</p> <p>Use a GET method to determine this ID. For example, use the GET /CertificateAuthority/HealthMonitoring/Schedule method (see GET Certificate Authority Health Monitoring Schedule on page 442) to retrieve the schedule for CA health monitoring to determine the health monitoring schedule ID.</p>												
ScheduleType	Body	<p>Required. An integer indicating the type of schedule to be updated. Supported schedule types are:</p> <table><tr><th>Code</th><th>Category Name</th></tr><tr><td>1</td><td>Expiration Alert</td></tr><tr><td>2</td><td>Pending Alert</td></tr><tr><td>10</td><td>CA Health Monitoring Alert</td></tr><tr><td>20</td><td>Issued Alert</td></tr><tr><td>22</td><td>SSH Key Rotation Alert</td></tr></table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name													
1	Expiration Alert													
2	Pending Alert													
10	CA Health Monitoring Alert													
20	Issued Alert													
22	SSH Key Rotation Alert													
Enabled	Body	A Boolean that indicates whether the schedule is enabled (true) or not (false). The default is <i>false</i> .												
Interval	Body	<p>Required*. An integer indicating a job scheduled to run every x minutes with x equal to the specified value.</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is required.</p>												
TimeOfDay	Body	<p>Required*. A string indicating a job scheduled to run daily at the specified time of day. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p> <p>One of either <i>Interval</i> or <i>TimeOfDay</i> is required.</p>												

Table 453: POST Scheduling Response Data

Name	Description												
id	An integer indicating the Keyfactor Command reference ID of the schedule.												
Schedule	A string indicating the schedule set for the item. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).												
ScheduleType	<p>An integer indicating the type of schedule. Supported schedule types are:</p> <table> <tr> <th>Code</th><th>Category Name</th></tr> <tr> <td>1</td><td>Expiration Alert</td></tr> <tr> <td>2</td><td>Pending Alert</td></tr> <tr> <td>10</td><td>CA Health Monitoring Alert</td></tr> <tr> <td>20</td><td>Issued Alert</td></tr> <tr> <td>22</td><td>SSH Key Rotation Alert</td></tr> </table>	Code	Category Name	1	Expiration Alert	2	Pending Alert	10	CA Health Monitoring Alert	20	Issued Alert	22	SSH Key Rotation Alert
Code	Category Name												
1	Expiration Alert												
2	Pending Alert												
10	CA Health Monitoring Alert												
20	Issued Alert												
22	SSH Key Rotation Alert												
Enabled	A Boolean that indicates whether the schedule is enabled (true) or not (false).												
Name	A string indicating the type of job.												
EntityId	This is considered deprecated and may be removed in a future release.												
LastRun	This is considered deprecated and may be removed in a future release.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30 Security

The Security component of the Keyfactor API includes methods necessary to list, add, and delete security identities and their permissions which are used to control access to aspects of Keyfactor Command.

Table 454: Security Endpoints

Endpoint	Method	Description	Link
/Identities	POST	Adds a new security identity into Keyfactor Command.	POST Security Identities on page 1129
/Identities	GET	Returns all security identities with with sorting and filter options.	GET Security Identities on page 1125
/Identities/Lookup	GET	Validates that the identity with the specified name exists.	GET Security Identities Lookup on page 1124
/Identities/{id}	DELETE	Deletes the security identity with the specified ID.	DELETE Security Identities ID below
/Identities/{id}	GET	Returns permission details for the security identity with the specified ID.	GET Security Identities ID on the next page
/Containers/{id}/Roles	GET	Returns permission details for the certificate store container with the specified ID.	GET Security Containers ID Roles on page 1130
/Containers/{id}/Roles	POST	Sets the permissions of the certificate store container with the specified ID.	POST Security Containers ID Roles on page 1131
/Audit/Collections/{id}	GET	Returns permission details for the certificate collection with the specified ID.	GET Security Audit Collections ID on page 1133
/My	GET	Returns permission details for the current user, including certificate collections and certificate store containers.	GET Security My on page 1136

2.6.30.1 DELETE Security Identities ID

The DELETE `/Security/Identities/{id}` method is used to delete the security identity with the specified ID from Keyfactor Command. Use the `GET /Security/Identities` method (see [GET Security Identities on page 1125](#)) to determine the ID of the security identity you wish to delete. The current user's identity may not be deleted. This endpoint returns 204 with no content upon success.

Note: This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1118](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/modify/`

Table 455: DELETE Security Identities {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer containing the Keyfactor Command reference ID of the security identity that should be deleted from Keyfactor Command.</p> <p>Use the <code>GET /Security/Identity</code> method (see GET Security Identities on page 1125) to retrieve a list of all the security identities to determine the identity's ID.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.2 GET Security Identities ID

The `GET /Security/Identities/{id}` method is used to return the security identities configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the security identity's permissions.

Note: This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1118](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/read/`

Table 456: GET Security Identities {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security identity to retrieve.</p> <p>Use the <i>GET /Security/Identities</i> method (see GET Security Identities on page 1125) to retrieve a list of all the security identities to determine the identity's ID.</p>

Table 457: GET Security Identities {id} Response Data

Name	Description						
Identity	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <pre>KEYEXAMPLE\PKI Administrators</pre>						
SecuredAreaPermissions	<p>An array of objects containing information about the global permissions granted to the security identity. Global permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.</td></tr> <tr> <td>GrantedByRoles</td><td>An object containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre>"SecuredAreaPermissions": [{ "Permission": "AdminPortal:Read", "GrantedByRoles": ["Read Only", "Staff"] }, { "Permission": "Reports:Read", "GrantedByRoles": ["Read Only"] },]</pre> <p>For more information about global permissions, see Security Roles and Claims in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.	GrantedByRoles	An object containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of global permissions, this is the name of the role followed by the level of permission granted, the choices for which vary depending on the role.						
GrantedByRoles	An object containing a list of roles that grant that permission.						
CollectionPermissions	<p>An array of objects containing information about the certificate collection permissions granted to the security identity. Collection permission information includes:</p>						

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table> <p>For example:</p> <pre>"CollectionPermissions": [{ "Permission": "Issued in the Last Week:Certificates_Read", "GrantedByRoles": ["Staff", "Power Users"] }, { "Permission": "Web Server Certs:Certificates_EditMetadata", "GrantedByRoles": ["Power Users"] },]</pre> <p>For more information about collection permissions, see Certificate Permissions in the <i>Keyfactor Command Reference Guide</i>.</p>	Name	Description	Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of collection permissions, this is the name of the certificate collection followed by the level of permission granted.						
GrantedByRoles	An array containing a list of roles that grant that permission.						
ContainerPermissions	<p>An array of objects containing information about the certificate store container permissions granted to the security identity. Container permission information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Permission</td><td>A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).</td></tr> <tr> <td>GrantedByRoles</td><td>An array containing a list of roles that grant that permission.</td></tr> </table>	Name	Description	Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).	GrantedByRoles	An array containing a list of roles that grant that permission.
Name	Description						
Permission	A string indicating the permission granted. In the case of container permissions, this is the name of the certificate store container followed by the level of permission granted (read, schedule or modify).						
GrantedByRoles	An array containing a list of roles that grant that permission.						

Name	Description
	<p>For example:</p> <pre> "ContainerPermissions": [{ "Permission": "IIS Personal:CertificateStoreManagement_ Read", "GrantedByRoles": ["Power Users", "Staff"] }, { "Permission": "F5 SSL Profiles REST:CertificateStoreManagement_Schedule", "GrantedByRoles": ["Power Users"] },] </pre> <p>For more information about container permissions, see Container Permissions in the <i>Keyfactor Command Reference Guide</i>.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.3 GET Security Identities Lookup

The GET `/Security/Identities/Lookup` method is used to confirm that the security identity specified is valid for the environment—the Active Directory forest in which Keyfactor Command is installed and any forests in a two-way trust (or one-way trust in a direction that allows the lookup to occur). It can be used to query an identity in the source identity store (Active Directory) to confirm its validity before using `POST /Security/Identities` (see [POST Security Identities on page 1129](#)) to create a new identity in Keyfactor Command with that user or group. This method returns HTTP 200 OK on a success with a response of true or false.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/read/`

Table 458: GET Security Identities Lookup Input Parameters

Name	In	Description
Name	Query	Required. The identity name in the source identity store. For Active Directory users and groups, this can be given either as DOMAIN\name or name@-domain.com. For users in the local domain (the domain in which the Keyfactor Command server is installed), the lookup may be done without a domain name.

Table 459: GET Security Identities Lookup Response Data

Name	Description
Valid	A Boolean that indicates whether the provided name is valid (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.4 GET Security Identities

The GET /Security/Identities method is used to return the list of security identities configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security identities.

Note: This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1118](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

Table 460: GET Security Identities Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> . <i>IdentityType</i> may be used as a sort order.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.
Validate	Query	A Boolean that specifies whether the optional parameter of <i>validate</i> is false , which allows the AuditXML validation to be skipped when loading records, or true (or not specified) in which case validation will occur. The default is true .

Table 461: GET Security Identities Response Data

Name	Description																					
Id	An integer containing the Keyfactor Command reference ID for the security identity.																					
AccountName	A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>																					
IdentityType	A string indicating the type of identity—User or Group.																					
Roles	<div>An array of objects containing information about the security roles assigned to the security identity. Role information includes:</div> <table><tr><th>Name</th><th>In</th><th>Description</th></tr><tr><td>Id</td><td>Body</td><td>Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.</td></tr><tr><td>Name</td><td>Body</td><td>Required. A string containing the short reference name for the security role.</td></tr><tr><td>Description</td><td>Body</td><td>Required. A string containing the description for the security role.</td></tr><tr><td>Enabled</td><td>Body</td><td>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>. This is considered deprecated and may be removed in a future release.</td></tr><tr><td>Immutable</td><td>Body</td><td>A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.</td></tr><tr><td>Valid</td><td>Body</td><td>A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it</td></tr></table>	Name	In	Description	Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.	Name	Body	Required. A string containing the short reference name for the security role.	Description	Body	Required. A string containing the description for the security role.	Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.	Immutable	Body	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.	Valid	Body	A Boolean that indicates whether the security role’s audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it
Name	In	Description																				
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.																				
Name	Body	Required. A string containing the short reference name for the security role.																				
Description	Body	Required. A string containing the description for the security role.

Name	In	Description							
		<p>the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <div><pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre></div>							
Valid	A Boolean indicating whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.5 POST Security Identities

The POST `/Security/Identities` method is used to create a new security identity in Keyfactor Command. Use the `GET /Security/Identities/Lookup` method (see [GET Security Identities Lookup on page 1124](#)) before creating the new identity to confirm that the identity you plan to create is valid. This method returns HTTP 200 OK on a success with the details of the new security identity.

 **Note:** This endpoint is for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the *Security Claims* set of endpoints for both Active Directory and other identity providers (see [Security on page 1118](#)).

 **Tip:** This method cannot be used to assign roles to an identity. Use the `PUT /Security/Roles` method (see [PUT Security Roles on page 1186](#)) to assign roles to an identity.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 462: POST Security Identities Input Parameters

Name	In	Description
AccountName	Body	Required. A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>

Table 463: POST Security Identities Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security identity.
AccountName	A string containing the account name for the security identity. For Active Directory user and groups, this will be in the form DOMAIN\user or group name. For example: <div>KEYEXAMPLE\PKI Administrators</div>
IdentityType	A string indicating the type of identity—User or Group.
Roles	An array of objects containing information about the security roles assigned to the security identity. For new security identities, this will be blank.
Valid	A Boolean that indicates whether the security identity's audit XML is valid (true) or not (false). A security identity may become invalid if Keyfactor Command determines that it appears to have been tampered with.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.6 GET Security Containers ID Roles

The GET /Security/Containers/{id}/Roles method is used to return the list of security roles and permissions defined for the specified certificate store container. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the container.

See also [GET Security Roles ID Permissions Containers on page 1160](#) to list permissions on certificate store containers for a specified security role.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/read/`

Table 464: GET Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate store container for which to retrieve permission information. Use the <code>GET /CertificateStoreContainers</code> method (see GET Certificate Store Containers on page 619) to determine the ID of the certificate store container you wish to evaluate.

Table 465: GET Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Security Role Operations: Certificate Store Management in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

**Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.30.7 POST Security Containers ID Roles

The POST `/Security/Containers/{id}/Roles` method is used to assign permissions for a security role to a certificate store container. This method returns HTTP 200 OK on a success with the details of the security role and permissions.

See also [POST Security Roles ID Permissions Containers on page 1161](#) to assign permissions for one or more certificate store containers to a security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 466: POST Security Containers {id} Roles Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate store container to update. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 619) to determine the ID of the certificate store container.
SecurityRoleId	Body	Required. An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to determine the ID of the security role.
Permissions	Body	Required. A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See <i>Security Role Operations: Certificate Store Management</i> in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": ["Read", "Modify"]</pre>

Table 467: POST Security Containers {id} Roles Response Data

Name	Description
SecurityRoleId	An integer indicating the Keyfactor Command reference ID of the security role granted permissions to the certificate store container.
Name	A string containing the short reference name for the security role granted permissions to the certificate store container.
Permissions	A comma-delimited array of strings indicating the permissions granted to the role for the certificate store container. See Security Role Operations: Certificate Store Management in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.8 GET Security Audit Collections ID

The GET /Security/Audit/Collections/{id} method is used to return the list of security roles and permissions defined for the specified certificate collection. This method returns HTTP 200 OK on a success with details of the security roles and permissions for the collection.

See also [GET Security Roles ID Permissions Collections on page 1165](#) to list permissions on certificate collections for a specified security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 468: GET Security Audit Collections {id} Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection for which to retrieve permission information. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to determine the ID of the certificate collection you wish to evaluate.

Table 469: GET Security Audit Collections {id} Response Data

Name	Description																		
QueryId	An integer indicating the Keyfactor Command reference ID of the certificate collection.																		
AccessControlList	<p>An array of objects containing the permissions granted to the user in a comma-separated list of arrays. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>RoleId</td><td>An integer indicating the Keyfactor Command reference ID for the security role.</td></tr> <tr> <td>AreaPermissions</td><td> <p>An array of comma-delimited integers indicating the collection permissions assigned to the role. 8	Collection Revoke																		
41	Collection Delete																		

Name	Description						
	<pre> 41] }, { "RoleId": "3", "AreaPermissions": [4, 8, 41] }], </pre>						
AssignableRoles	<p>An array of objects containing the security roles defined in Keyfactor Command. Role information includes:</p> <table border="1" data-bbox="509 779 1401 1041"> <thead> <tr> <th>Name</th><th>Description</th></tr> </thead> <tbody> <tr> <td>RoleId</td><td>An integer indicating the Keyfactor Command reference ID for the security role.</td></tr> <tr> <td>Name</td><td>A string containing the short reference name for the security role.</td></tr> </tbody> </table> <p>For example:</p> <pre> "AssignableRoles": [{ "RoleId": "1", "Name": "Administrator" }, { "RoleId": "2", "Name": "Reporting API Access" }], </pre>	Name	Description	RoleId	An integer indicating the Keyfactor Command reference ID for the security role.	Name	A string containing the short reference name for the security role.
Name	Description						
RoleId	An integer indicating the Keyfactor Command reference ID for the security role.						
Name	A string containing the short reference name for the security role.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.30.9 GET Security My

The GET /Security/My method is used to return the list of security roles and permissions configured in Keyfactor Command for the current user. This method returns HTTP 200 OK on a success with the details of the security roles and permissions. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
None

Table 470: GET Security My Roles Response Data

Name	Description
Roles	An array of strings indicating the roles that the user holds.
GlobalPermissions	<div>An array of objects containing the permissions granted to the user. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"GlobalPermissions": [{ "Area": "AdminPortal", "Permission": "Read" }, { "Area": "Dashboard", "Permission": "Read" }],</pre></div>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.31 Security Claims

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security claims which are used to control user access to all aspects of Keyfactor Command.

Table 471: Security Claims Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns details for the security claim with the specified ID, including permissions granted to the role and claims assigned the role.	GET Security Claims ID on page 1147
/	GET	Returns all security claims with filtering and output options.	GET Security Claims below
/	POST	Adds a new security claim.	POST Security Claims on page 1140
/	PUT	Updates the security claim with the specified ID.	PUT Security Claims on page 1144
/ {id}	DELETE	Deletes the security claim with the specified ID.	DELETE Security Claims ID on page 1149
/Roles	GET	Returns the security claim assigned to the security claim identified by the selected parameters.	GET Security Claims Roles on page 1149

2.6.31.1 GET Security Claims

The GET /Security/Claims method is used to return the list of security claims configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security claims.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 472: GET Security Claims Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Security Claim Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> ADClaimValue ClaimType ClaimValue Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Provider</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 473: GET Security Claims Response Data

Name	In	Description																								
Id		An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	Body	A string indicating a description for the security claim.																								
ClaimType	Body	<div>A string indicating the type of claim. Supported values are:<table><thead><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>User</td><td>Active Directory user account</td></tr><tr><td>1</td><td>Group</td><td>Active Directory group.</td></tr><tr><td>2</td><td>Computer</td><td>Active Directory machine account</td></tr><tr><td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr><tr><td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr><tr><td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr><tr><td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr></tbody></table></div>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	Body	<div>An object containing information about the provider assigned to the security claim.<table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor</td></tr></tbody></table></div>	Name	Description	Id	A string indicating the Keyfactor																				
Name	Description																									
Id	A string indicating the Keyfactor																									

Name	In	Description								
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td>Command reference GUID for the provider.</td></tr><tr><td>AuthenticationScheme</td><td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td></tr><tr><td>DisplayName</td><td>A string containing the short reference name for the provider (e.g. Active Directory).</td></tr></table>	Name	Description		Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).
Name	Description									
	Command reference GUID for the provider.									
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).									
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.31.2 POST Security Claims

The POST /Security/Claims method is used to create a new security claim in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the new security claim.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 474: POST Security Claims Input Parameters

Name	In	Description																								
Description	Body	Required. A string indicating a description for the security claim.																								
ClaimType	Body	Required. A string indicating the type of claim. Supported values are: <table> <tr> <th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr> <tr> <td>0</td><td>User</td><td>Active Directory user account</td></tr> <tr> <td>1</td><td>Group</td><td>Active Directory group.</td></tr> <tr> <td>2</td><td>Computer</td><td>Active Directory machine account</td></tr> <tr> <td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr> <tr> <td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr> <tr> <td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr> <tr> <td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	Required. A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								

Name	In	Description
ProviderAuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).

Table 475: POST Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	<div><p>A string indicating the type of claim. Supported values are:</p><table><thead><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>User</td><td>Active Directory user account</td></tr><tr><td>1</td><td>Group</td><td>Active Directory group.</td></tr><tr><td>2</td><td>Computer</td><td>Active Directory machine account</td></tr><tr><td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr><tr><td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr><tr><td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr><tr><td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr></tbody></table></div>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	An object containing information about the provider assigned to the security claim.																								

Name	Description								
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider.</td></tr> <tr> <td>AuthenticationScheme</td><td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td></tr> <tr> <td>DisplayName</td><td>A string containing the short reference name for the provider (e.g. Active Directory).</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).
Name	Description								
Id	A string indicating the Keyfactor Command reference GUID for the provider.								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).								
ProviderAuthenticationScheme	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.31.3 PUT Security Claims

The PUT /Security/Claims method is used to update a security claim in Keyfactor Command. Only the claim description is editable for an existing claim. This method returns HTTP 200 OK on a success with the details of the security claim.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 476: PUT Security Claims Input Parameters

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security claim.
Description	A string indicating a description for the security claim.

Table 477: PUT Security Claims Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	<div>A string indicating the type of claim. Supported values are:<table><thead><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>User</td><td>Active Directory user account</td></tr><tr><td>1</td><td>Group</td><td>Active Directory group.</td></tr><tr><td>2</td><td>Computer</td><td>Active Directory machine account</td></tr><tr><td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr><tr><td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr><tr><td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr><tr><td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr></tbody></table></div>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account

4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	<div>An object containing information about the provider assigned to the security claim.<table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider.</td></tr><tr><td>AuthenticationScheme</td><td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td></tr><tr><td>DisplayName</td><td>A string containing the short reference name for the provider (e.g. Active Directory).</td></tr></tbody></table></div>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.31.4 GET Security Claims ID

The GET /Security/Claims/{id} method is used to return a security claim by ID. This method returns HTTP 200 OK on a success with details for the specified security claim.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 478: GET Security Claims{id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security claim to retrieve. Use the <i>GET /Security/Claims</i> method (see GET Security Claims on page 1137) to retrieve a list of all the security claims to determine the claim's ID.

Table 479: GET Security Claims{id} Response Data

Name	Description																								
Id	An integer containing the Keyfactor Command reference ID for the security claim.																								
Description	A string indicating a description for the security claim.																								
ClaimType	<div>A string indicating the type of claim. Supported values are:<table><thead><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr></thead><tbody><tr><td>0</td><td>User</td><td>Active Directory user account</td></tr><tr><td>1</td><td>Group</td><td>Active Directory group.</td></tr><tr><td>2</td><td>Computer</td><td>Active Directory machine account</td></tr><tr><td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr><tr><td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr><tr><td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr><tr><td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr></tbody></table></div>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																							
0	User	Active Directory user account																							
1	Group	Active Directory group.																							
2	Computer	Active Directory machine account																							
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																							
4	OAuthRole	An open authorization group claim																							
5	OAuthSubject	An open authorization user claim																							
6	OAuthClientId	An open authorization client application claim																							
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																								
Provider	<div>An object containing information about the provider assigned to the security claim.<table><thead><tr><th>Name</th><th>Description</th></tr></thead><tbody><tr><td>Id</td><td>A string indicating the Keyfactor Command reference GUID for the provider.</td></tr><tr><td>AuthenticationScheme</td><td>A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).</td></tr><tr><td>DisplayName</td><td>A string containing the short reference name for the provider (e.g. Active Directory).</td></tr></tbody></table></div>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																
Name	Description																								
Id	A string indicating the Keyfactor Command reference GUID for the provider.																								
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																								
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.31.5 DELETE Security Claims ID

The DELETE /Security/Claims/{id} method is used to delete the security claim with the specified ID. This endpoint returns 204 with no content upon success.

Note: You cannot delete a claim that is used to grant permissions—via roles—to the user executing the delete command.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 480: DELETE Security Claims{id} Input Parameters

Name	In	Description
id	Path	<p>Required. The ID of the security claim that should be deleted from Keyfactor Command.</p> <p>Use the <i>GET /Security/Claims</i> method (see GET Security Claims on page 1137) to determine the ID of the security claim you wish to delete.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.31.6 GET Security Claims Roles

The GET /Security/Claims/Roles method is used to return the security roles assigned to the security claim identified by the selected parameters. Run [GET Security Claims ID on page 1147](#) to determine the parameter values. This method returns HTTP 200 OK on a success with the details of the roles assigned to the claim.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/read/`

Table 481: GET Security Claims Roles Input Parameters

Name	In	Description																								
ClaimType	Body	<p>Required. An integer indicating the type of claim. Supported values are:</p> <table> <tr> <th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr> <tr> <td>0</td><td>User</td><td>Active Directory user account</td></tr> <tr> <td>1</td><td>Group</td><td>Active Directory group.</td></tr> <tr> <td>2</td><td>Computer</td><td>Active Directory machine account</td></tr> <tr> <td>3</td><td>OAuthOid</td><td>An open authorization claim of a type not covered by client, role or subject</td></tr> <tr> <td>4</td><td>OAuthRole</td><td>An open authorization group claim</td></tr> <tr> <td>5</td><td>OAuthSubject</td><td>An open authorization user claim</td></tr> <tr> <td>6</td><td>OAuthClientId</td><td>An open authorization client application claim</td></tr> </table>	Claim Type Integer	Claim Type String	Description	0	User	Active Directory user account	1	Group	Active Directory group.	2	Computer	Active Directory machine account	3	OAuthOid	An open authorization claim of a type not covered by client, role or subject	4	OAuthRole	An open authorization group claim	5	OAuthSubject	An open authorization user claim	6	OAuthClientId	An open authorization client application claim
Claim Type Integer	Claim Type String	Description																								
0	User	Active Directory user account																								
1	Group	Active Directory group.																								
2	Computer	Active Directory machine account																								
3	OAuthOid	An open authorization claim of a type not covered by client, role or subject																								
4	OAuthRole	An open authorization group claim																								
5	OAuthSubject	An open authorization user claim																								
6	OAuthClientId	An open authorization client application claim																								
ClaimValue	Body	<p>Required. A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</p>																								
ProviderAuthenticationScheme	Body	<p>Required. A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate)</p>																								

Name	In	Description
		Authentication CA, or unknown). The value in the <i>Provider: AuthenticationScheme</i> : parameter from GET Security Claims on page 1137 or GET Security Claims ID on page 1147 .

Table 482: GET Security Claims Roles Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID for the security role.
Name	A string containing the short reference name of the security role.
Description	A string containing the description of the security role.
PermissionSetId	A string containing the Keyfactor Command reference GUID for the permission set assigned to the security role.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32 Security Roles Permissions

The Security Roles Permissions component of the Keyfactor API includes methods necessary to list, add, and update security roles permissions at the role, global, provider, container and collection-level.

Table 483: Security Roles Permissions Endpoints

Endpoint	Method	Description	Link
/ {id} /Permissions	GET	Returns all permissions associated with the security role that matches the id	GET Security Roles ID Permissions on the next page
/ {id} /Permissions/Global	GET	Returns all global permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Global on page 1155
/ {id} /Permissions/Global	POST	Adds global permissions to the security role that matches the id. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	POST Security Roles ID Permissions Global on page 1156
/ {id} /Permissions/Global	PUT	Sets global permissions of the security role that matches the ID. Note that the Areas <i>Certificates</i> and <i>CertificateStoreManagement</i> are reserved for collection and container permissions, respectively.	PUT Security Roles ID Permissions Global on page 1158
/ {id} /Permissions/Containers	GET	Returns all container permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Containers on page 1160
/ {id} /Permissions/Containers	POST	Adds container permissions to the security role that matches the ID.	POST Security Roles ID Permissions Containers on page 1161
/ {id} /Permissions/Containers	PUT	Sets container permissions to the security role that matches the ID.	PUT Security Roles ID Permissions

Endpoint	Method	Description	Link
			Containers on page 1163
/{{id}}/Permisssions/Collections	GET	Returns all collection permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions Collections on page 1165
/{{id}}/Permisssions/Collections	POST	Adds collection permissions to the security role that matches the ID.	POST Security Roles ID Permissions Collections on page 1166
/{{id}}/Permisssions/Collections	PUT	Sets collection permissions to the security role that matches the ID.	PUT Security Roles ID Permissions Collections on page 1168
/{{id}}/Permissions/PamProviders	GET	Returns all PAM provider permissions associated with the security role that matches the ID.	GET Security Roles ID Permissions PAM Providers on page 1170
/{{id}}/Permissions/PamProviders	PUT	Sets PAM provider permissions to the security role that matches the ID.	PUT Security Roles ID Permissions PAM Providers on page 1171

2.6.32.1 GET Security Roles ID Permissions

The GET /Security/Roles/{{id}}/Permissions method is used to return all permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 484: GET Security Roles {id} Permissions Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.

Table 485: GET Security Roles {id} Permissions Response Data

Name	Description								
	An object containing information about the permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Type</td><td>A string containing the area at which the permission is applied to (global, container, or collection).</td></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr></table>	Name	Description	Type	A string containing the area at which the permission is applied to (global, container, or collection).	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description								
Type	A string containing the area at which the permission is applied to (global, container, or collection).								
Area	A string containing the name of the permission (e.g. Certificates).								
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.2 GET Security Roles ID Permissions Global

The *GET /Security/Roles/{id}/Permissions/Global* method is used to return all global permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 486: GET Security Roles {id} Global Permissions Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve global permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.

Table 487: GET Security Roles {id} Global Permissions Response Data

Name	Description						
	An object containing information about the global permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr></table>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.3 POST Security Roles ID Permissions Global

The POST */Security/Roles/{id}/Permissions/Global* method is used to add global permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility header displays a list of valid global Area and Permission combinations.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 488: POST Security Roles {id} Global Permissions Input Parameters

Name	In	Description						
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div> Note: See the API endpoint header for a list of all the valid Area and Permission combinations.</div> <p>Details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission level to grant (e.g. Read)</td></tr></table>	Name	Description	Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	Required. A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	Required. A string indicating the permission level to grant (e.g. Read)							

Table 489: POST Security Roles {id} Global Permissions Response Data

Name	Description						
	<div>An object containing information about the global permissions granted to the security role.</div> <div>Details include:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr></table></div>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.4 PUT Security Roles ID Permissions Global

The PUT `/Security/Roles/{id}/Permissions/Global` method is used to update the global permissions granted to the specified security role by ID. Note that the areas *Certificates* and *CertificateStoreManagement* are reserved for collection and container permissions. This method returns HTTP 200 OK on a success with global permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. global) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/security/modify/`

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 490: PUT Security Roles {id}Global Permissions Input Parameters

Name	In	Description						
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set global permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.						
globalPermissions	Body	<p>An object containing information about the global permissions granted for this security role.</p> <div> Note: See the API endpoint header for a list of all the valid Area and Permission combinations.</div> <p>Details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission level to grant (e.g. Read)</td></tr></table>	Name	Description	Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).	Permission	Required. A string indicating the permission level to grant (e.g. Read)
Name	Description							
Area	Required. A string indicating the name of the permissions to grant (e.g. AdminPortal).							
Permission	Required. A string indicating the permission level to grant (e.g. Read)							

Table 491: PUT Security Roles {id} Global Permissions Response Data

Name	Description						
	<div>An object containing information about the global permissions granted to the security role.</div> <div>Details include:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Area</td><td>A string containing the name of the permission (e.g. Certificates).</td></tr><tr><td>Permission</td><td>A string indicating the permission level granted in the area for this role (e.g. Read).</td></tr></table></div>	Name	Description	Area	A string containing the name of the permission (e.g. Certificates).	Permission	A string indicating the permission level granted in the area for this role (e.g. Read).
Name	Description						
Area	A string containing the name of the permission (e.g. Certificates).						
Permission	A string indicating the permission level granted in the area for this role (e.g. Read).						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.5 GET Security Roles ID Permissions Containers

The GET /Security/Roles/{id}/Permissions/Containers method is used to return all certificate store container permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 492: GET Security Roles {id} Permissions Containers Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate store container permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.

Table 493: GET Security Roles {id} Permissions Containers Response Data

Name	Description								
	An object containing information about the certificate store container permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td>An integer containing the container ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate store container.</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.6 POST Security Roles ID Permissions Containers

The POST /Security/Roles/{id}/Permissions/Containers method is used to add new container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 494: POST Security Roles {id} Permissions Containers Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate store container permissions.</p> <p>Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.</p>						
containerPermissions	Body	<p>An object containing information about the permissions granted to certificate store containers for this security role. Container details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td><p>Required. An integer containing the Keyfactor Command identifier for the certificate store container.</p></td></tr><tr><td>Permission</td><td><p>Required. A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p><div> Tip: Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</div></td></tr></table>	Name	Description	ContainerId	<p>Required. An integer containing the Keyfactor Command identifier for the certificate store container.</p>	Permission	<p>Required. A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p> <div> Tip: Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</div>
Name	Description							
ContainerId	<p>Required. An integer containing the Keyfactor Command identifier for the certificate store container.</p>							
Permission	<p>Required. A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p> <div> Tip: Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</div>							

Table 495: POST Security Roles {id} Permissions Containers Response Data

Name	Description								
	<p>An object containing information about the certificate store container permissions granted to the security role. Details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td>An integer containing the container ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate store container.</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	ContainerId	An integer containing the container ID.	Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.7 PUT Security Roles ID Permissions Containers

The PUT /Security/Roles/{id}/Permissions/Containers method is used to update container permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate store container permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. container) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 496: PUT Security Roles {id} Permissions Containers Input Parameters

Name	In	Description						
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate store container permissions.</p> <p>Use the <code>GET /Security/Roles</code> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.</p>						
containerPermissions	Body	<p>An object containing information about the permissions granted to certificate store containers for this security role. Container details include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>ContainerId</td><td><p>Required. An integer containing the Keyfactor Command identifier for the certificate store container.</p></td></tr><tr><td>Permission</td><td><p>Required. A string indicating the permission granted on the container for this role—<i>Read</i>, <i>Schedule</i>, or <i>Modify</i>.</p><div> Tip: Users with <i>Modify</i> permissions on a container inherit <i>Read</i> and <i>Schedule</i>; users with <i>Schedule</i> permissions on a container inherit <i>Read</i>.</div></td></tr></table>	Name	Description	ContainerId	<p>Required. Name	A string containing the name of the certificate store container.	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
ContainerId	An integer containing the container ID.								
Name	A string containing the name of the certificate store container.								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.8 GET Security Roles ID Permissions Collections

The GET /Security/Roles/{id}/Permissions/Collections method is used to return all certificate collection permissions associated with the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 498: GET Security Roles {id} Permissions Collections Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to retrieve certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.

Table 499: GET Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>An integer containing the collection ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate collection .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.9 POST Security Roles ID Permissions Collections

The POST/Security/Roles/{id}/Permissions/Collections method is used to add new collection permissions to the security role that matches the ID. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Important: Only the permission settings included in the command will be affected. Any other permissions settings will not be affected and remain as is.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 500: POST Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.						
collectionPermissions	Body	An object containing information about the permissions granted to certificate collection for this security role. Collection details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission granted on the collection for this role—<i>Read</i>, <i>EditMetadata</i>, <i>Recover</i>, <i>Revoke</i>, or <i>Delete</i>.</td></tr></table>	Name	Description	CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.	Permission	Required. A string indicating the permission granted on the collection for this role— <i>Read</i> , <i>EditMetadata</i> , <i>Recover</i> , <i>Revoke</i> , or <i>Delete</i> .
Name	Description							
CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.							
Permission	Required. A string indicating the permission granted on the collection for this role— <i>Read</i> , <i>EditMetadata</i> , <i>Recover</i> , <i>Revoke</i> , or <i>Delete</i> .							

Table 501: POST Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>An integer containing the collection ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate collection .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.10 PUT Security Roles ID Permissions Collections

The PUT /Security/Roles/{id}/Permissions/Collections method is used to update collection permissions to the security role that matches the ID. It replaces the deprecated endpoint: POST /CertificateCollections/{id}/Permissions. This method returns HTTP 200 OK on a success with certificate collection permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g. collection) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Note: The API Endpoint utility displays a list of valid global permissions on the endpoint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Table 502: PUT Security Roles {id} Permissions Collections Input Parameters

Name	In	Description						
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set certificate collection permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.						
collectionPermissions	Body	An object containing information about the permissions granted to certificate collection for this security role. Collection details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>Required. An integer containing the Keyfactor Command identifier for the certificate collection.</td></tr><tr><td>Permission</td><td>Required. A string indicating the permission granted on the collection for this role—<i>Read</i>, <i>EditMetadata</i>, <i>Recover</i>, <i>Revoke</i>, or <i>Delete</i>.</td></tr></table>	Name	Description	CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.	Permission	Required. A string indicating the permission granted on the collection for this role— <i>Read</i> , <i>EditMetadata</i> , <i>Recover</i> , <i>Revoke</i> , or <i>Delete</i> .
Name	Description							
CollectionId	Required. An integer containing the Keyfactor Command identifier for the certificate collection.							
Permission	Required. A string indicating the permission granted on the collection for this role— <i>Read</i> , <i>EditMetadata</i> , <i>Recover</i> , <i>Revoke</i> , or <i>Delete</i> .							

Table 503: PUT Security Roles {id} Permissions Collections Response Data

Name	Description								
	An object containing information about the certificate collection permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CollectionId</td><td>An integer containing the collection ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate collection .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	CollectionId	An integer containing the collection ID.	Name	A string containing the name of the certificate collection .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
CollectionId	An integer containing the collection ID.								
Name	A string containing the name of the certificate collection .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.11 GET Security Roles ID Permissions PAM Providers

The GET /Security/Roles/{id}/Permissions/PamProviders method is used to return all PAM provider permissions associated with the security role with the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

Table 504: GET Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role for which to retrieve PAM provider permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.

Table 505: GET Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.32.12 PUT Security Roles ID Permissions PAM Providers

The PUT /Security/Roles/{id}/Permissions/PamProviders method is used to update PAM provider permissions on the security role that matches the specified ID. This method returns HTTP 200 OK on a success with PAM provider permission details for the specified security role.

Important: Any previously defined permissions of the given type (e.g.) that are not submitted with their full existing data using this method will be cleared of their existing data. Existing data for other types will be retained. When using this method, you should first do a GET to retrieve all the permissions of the given type for the role you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing. If you just wish to add permissions without modifying existing permissions, use the POST method.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

Table 506: PUT Security Roles {id} Permissions PAM Providers Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the security role for which to set permissions. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role’s ID.

Table 507: PUT Security Roles {id} Permissions PAM Providers Response Data

Name	Description								
	An object containing information about the certificate permissions granted to the security role. Details include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer containing the ID.</td></tr><tr><td>Name</td><td>A string containing the name of the certificate .</td></tr><tr><td>Permission</td><td>A string indicating the permission granted on the entity for this role.</td></tr></table>	Name	Description	Id	An integer containing the ID.	Name	A string containing the name of the certificate .	Permission	A string indicating the permission granted on the entity for this role.
Name	Description								
Id	An integer containing the ID.								
Name	A string containing the name of the certificate .								
Permission	A string indicating the permission granted on the entity for this role.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.33 Security Roles

The Security Roles component of the Keyfactor API includes methods necessary to list, add, update, and delete security roles which are used to control access to all aspects of Keyfactor Command.

Table 508: Security Roles Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns details for the security role with the specified ID, including permissions granted to the role and claims assigned the role.	GET Security Roles ID on the next page
/	GET	Returns all security roles with filtering and output options.	GET Security Roles on page 1176
/	POST	Adds a new security role.	POST Security Roles on page 1178
/	PUT	Updates the security role with the specified ID.	PUT Security Roles on page 1186
/ {id}	DELETE	Deletes the security role with the specified ID.	DELETE Security Roles ID below

2.6.33.1 DELETE Security Roles ID

The DELETE /Security/Roles/{id} method is used to delete the security role with the specified ID. Use the *GET /Security/Roles* method (see [GET Security Roles on page 1176](#)) to determine the ID of the security role you wish to delete. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

This endpoint will be found by selecting V1 (Version 1) in the Keyfactor API Reference and Utility. See [Versioning on page 11](#).

Table 509: DELETE Security Roles {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the security role that should be deleted from Keyfactor Command.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.33.2 GET Security Roles ID

The GET /Security/Roles/{id} method is used to return a security role by ID. This method returns HTTP 200 OK on a success with details for the specified security roles.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

This endpoint will be found by selecting V2 (Version 2) in the Keyfactor API Reference and Utility. See [Versioning on page 11](#).

Version 2 of the GET /Security/Roles/{id} method has been redesigned to provide support for multiple identity providers and the newer claims-based authentication model that accompanies it. This version of the endpoint supports both Active Directory and other identity providers.

Table 510: GET Security Roles {id} v2 Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the security role to retrieve. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.

Table 511: GET Security Roles {id} v2 Response Data

Name	Description															
Id	An integer containing the Keyfactor Command identifier for the security role.															
Name	A string containing the short reference name for the security role.															
Description	A string containing the description for the security role.															
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.															
PermissionSetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1050).															
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example:</p> <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>															
Claims	<p>An array of objects containing the claims associated with the role.</p> <table><tr><th>Name</th><th>In</th><th>Description</th></tr><tr><td>Description</td><td>Body</td><td>A string indicating a description for the security claim.</td></tr><tr><td>ClaimType</td><td>Body</td><td><p>A string indicating the type of claim. Supported values are:</p><table><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr><tr><td>0</td><td>User</td><td>Active</td></tr></table></td></tr></table>	Name	In	Description	Description	Body	A string indicating a description for the security claim.	ClaimType	Body	<p>A string indicating the type of claim. Supported values are:</p> <table><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr><tr><td>0</td><td>User</td><td>Active</td></tr></table>	Claim Type Integer	Claim Type String	Description	0	User	Active
Name	In	Description														
Description	Body	A string indicating a description for the security claim.														
ClaimType	Body	<p>A string indicating the type of claim. Supported values are:</p> <table><tr><th>Claim Type Integer</th><th>Claim Type String</th><th>Description</th></tr><tr><td>0</td><td>User</td><td>Active</td></tr></table>	Claim Type Integer	Claim Type String	Description	0	User	Active								
Claim Type Integer	Claim Type String	Description														
0	User	Active														

Name	Description				
	Name	In	Description		
			Claim Type Integer	Claim Type String	Description
					Directory user account
			1	Group	Active Directory group.
			2	Computer	Active Directory machine account
			3	OAuthOid	An open authorization claim of a type not covered by client, role or subject
			4	OAuthRole	An open authorization group claim
			5	OAuthSubject	An open authorization user claim
			6	OAuthClientId	An open authorization client application claim

Name	Description		
	Name	In	Description
	ClaimValue	Body	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).
	Provider-AuthenticationScheme	Body	A string indicating the provider authentication scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).

Version 1

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.33.3 GET Security Roles

The GET /Security/Roles method is used to return the list of security roles configured in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security roles.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/read/

This endpoint will be found by selecting V2 (Version 2) in the Keyfactor API Reference and Utility. See [Versioning on page 11](#).

Version 2 of the GET /Security/Roles method has been redesigned to provide support for multiple identity providers and the newer claims-based authentication model that accompanies it. This version of the endpoint supports both Active Directory and other identity providers.

Table 512: GET Security Roles v2 Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Security Role Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> Name
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 513: GET Security Roles v2 Response Data

Name	Description
Id	An integer containing the Keyfactor Command identifier for the security role.
Name	A string containing the short reference name for the security role.
Immutable	A Boolean indicating if the role is immutable or not. Only the built-in <i>Administrators</i> role is considered immutable. The value of this parameter cannot be changed.
PermissionSetId	<p>A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1050).</p> <p> Tip: For details of the permissions associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see GET Security Roles ID on page 1173) for the desired role. For details of the permissions associated with the permission set to which the role belongs, use <i>GET /PermissionSets/{id}</i> method (see GET Permission Sets ID on page 1052) using this permission set GUID. A role may be only granted a subset of the permissions available in a permission set.</p>
ClaimsCount	<p>An integer indicating the number of claims mapped to the role.</p> <p> Tip: For details of the claims associated with the role, use the <i>GET /SecurityRoles/{id}</i> method (see GET Security Roles ID on page 1173) for the desired role.</p>

Version 1

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.33.4 POST Security Roles

The POST /Security/Roles method is used to create a new security role in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the security role.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

This endpoint will be found by selecting V2 (Version 2) in the Keyfactor API Reference and Utility. See [Versioning on page 11](#).

Version 2 of the POST /Security/Roles method has been redesigned to provide support for multiple identity providers and the newer claims-based authentication model that accompanies it. This version of the endpoint supports both Active Directory and other identity providers.

Table 514: POST Security Roles v2 Input Parameters

Name	Description																		
Name	Required. A string containing the short reference name for the security role.																		
Description	Required. A string containing the description for the security role.																		
PermissionSetId	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1050).																		
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example:</p> <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>

DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																		

Version 1

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.33.5 PUT Security Roles

The PUT /Security/Roles method is used to update a security role in Keyfactor Command including the permissions set for the role and the security identities mapped to the role. This method returns HTTP 200 OK on a success with the details of the security role.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/security/modify/

The user must hold a role containing this permission in the *Global Permission Set* (see [Permission Sets on page 1050](#)).

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

This endpoint will be found by selecting V2 (Version 2) in the Keyfactor API Reference and Utility. See [Versioning on page 11](#).

Version 2 of the PUT /Security/Roles method has been redesigned to provide support for multiple identity providers and the newer claims-based authentication model that accompanies it. This version of the endpoint supports both Active Directory and other identity providers.

Table 516: PUT Security Roles v2 Input Parameters

Name	In	Description									
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.									
Name	Body	Required. A string containing the short reference name for the security role.									
Description	Body	Required. A string containing the description for the security role.									
PermissionSetId	Body	A string containing the Keyfactor Command reference GUID of the permission set to which the role is assigned (see Permission Sets on page 1050).									
Permissions	Body	An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version Two Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": ["/portal/read/", "/dashboard/read/", "/certificates/collections/metadata/modify/6/", "/certificates/collections/private_key/read/6/"],</pre>									
Claims	Body	An array of objects containing the claims associated with the role. <table> <tr> <th>Name</th><th>In</th><th>Description</th></tr> <tr> <td>Description</td><td>Body</td><td>A string indicating a description for the security claim.</td></tr> <tr> <td>ClaimType</td><td>Body</td><td>A string indicating the type of claim. AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).	DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).									
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
AuthenticationScheme	A string indicating the provider auth scheme (e.g. Active Directory, or Client Certificate Authentication CA, or unknown).																		
DisplayName	A string containing the short reference name for the provider (e.g. Active Directory).																		

Version 1

Version 1 of the PUT /Security/Roles method includes the same capabilities as version 2, but offers support for managing legacy formatted Active Directory identities only and is retained for backwards compatibility. New applications should use the v2 endpoint, which supports both Active Directory and other identity providers.

Table 518: PUT Security Roles v1 Input Parameters

Name	In	Description				
Id	Body	Required. An integer containing the Keyfactor Command identifier for the security role. Use the <i>GET /Security/Roles</i> method (see GET Security Roles on page 1176) to retrieve a list of all the security roles to determine the role's ID.				
Name	Body	Required. A string containing the short reference name for the security role.				
Description	Body	Required. A string containing the description for the security role.				
Enabled	Body	A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i> . This is considered deprecated and may be removed in a future release.				
Private	Body	A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i> . This is considered deprecated and may be removed in a future release.				
PermissionSetId	Body	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1050).				
Permissions	Body	An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions. For example: <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				
Identities	Body	An array of objects containing one or more identifiers for each security identity to associate with the role. Supported identifiers include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>AccountName</td><td>Required*. A string containing the account name for the security identity. For Active</td></tr></table>	Name	Description	AccountName	Required* . A string containing the account name for the security identity. For Active
Name	Description

	Directory user and groups, this will be in the form DOMAIN\\user or group name. For example: <div>KEYEXAMPLE\\PKI Administrators</div> <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>							
SID	Required *. A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity. <p>* One of <i>AccountName</i> or <i>SID</i> is required in order to specify an identity, but not both.</p>							

Table 519: PUT Security Roles v1 Response Data

Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security role.								
Name	A string containing the short reference name for the security role.								
Description	A string containing the description for the security role.								
Enabled	<p>A Boolean that indicates whether the security role is enabled (true) or not (false). Security roles that have been disabled cannot be assigned to security identities. The default is <i>true</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>								
Immutable	A Boolean that indicates whether the security role has been marked as editable (false) or not (true). Internal Keyfactor Command roles are not editable. This setting is reserved for Keyfactor Command internal use.								
Valid	A Boolean that indicates whether the security role's audit XML is valid (true) or not (false). A security role may become invalid if Keyfactor Command determines that it appears to have been tampered with. This setting is not end-user configurable.								
Private	<p>A Boolean that indicates whether the security role has been marked private (true) or not (false). The default is <i>false</i>.</p> <p>This is considered deprecated and may be removed in a future release.</p>								
PermissionSetId	A string indicating the Keyfactor Command reference GUID of the permission set associated with the role (see Permission Sets on page 1050).								
Identities	<p>An array of objects containing information about the security identities assigned to the security role. Identity details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command identifier for the security identity.</td></tr> <tr> <td>AccountName</td><td> <p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p> </td></tr> <tr> <td>IdentityType</td><td>A string indicating the type of identity—User or Group.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command identifier for the security identity.	AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>	IdentityType	A string indicating the type of identity—User or Group.
Name	Description								
Id	An integer containing the Keyfactor Command identifier for the security identity.								
AccountName	<p>A string containing the account name for the security identity. For Active Directory users and groups, this will be in the form DOMAIN\user or group name. For example:</p> <p>KEYEXAMPLE\PKI Administrators</p>								
IdentityType	A string indicating the type of identity—User or Group.								

Name	Description				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SID</td><td>A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.</td></tr> </table>	Name	Description	SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.
Name	Description				
SID	A string containing the security identifier from the source identity store (e.g. Active Directory) for the security identity.				
Permissions	<p>An array of strings containing the permissions assigned to the role in a comma-separated list of Name:Value pairs. See Security Role Operations: Version One Permission Model in the <i>Keyfactor Command Reference Guide</i> for an overview of the possible permissions.</p> <p>For example:</p> <pre>"Permissions": ["AdminPortal:Read", "Dashboard:Read"],</pre>				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.34 SSH

The SSH component of the Keyfactor API includes methods necessary to create, update, and delete SSH keys, logons, servers, server groups, and service accounts within Keyfactor Command.

Table 520: SSH Endpoints

Endpoint	Method	Description	Link
/Keys/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID on page 1202
/Keys/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on page 1203

Endpoint	Method	Description	Link
/Keys/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 1205
/Keys/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 1207
/Keys/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 1211
/Keys/Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 1214
/Keys/Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1215
/Logons/{id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID on page 1218
/Logons/{id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on page 1219
/Logons/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1221
/Logons/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1223
/Logons/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1226
/Servers/{id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on

Endpoint	Method	Description	Link
			page 1228
/Servers/{id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 1229
/Servers/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 1233
/Servers/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 1236
/Servers/	POST	Creates a new SSH server.	POST SSH Servers on page 1241
/Servers/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1246
/Servers/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1251
/Servers/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1254
/ServerGroups/{id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on page 1258
/ServerGroups/{id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on page 1258
/ServerGroups/{name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups

Endpoint	Method	Description	Link
			Name on page 1263
/ServerGroups/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1267
/ServerGroups/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1270
/ServerGroups/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 1275
/ServerGroups/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1283
/ServerGroups/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1291
/ServerGroups/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1294
/ServiceAccounts/{id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID on page 1297
/ServiceAccounts/{id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1300
/ServiceAccounts/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 1307

Endpoint	Method	Description	Link
/ServiceAccounts/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1311
/ServiceAccounts/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1313
/ServiceAccounts/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 1321
/ServiceAccounts/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1331
/ServiceAccounts/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1339
/Users/{id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID on page 1343
/Users/{id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on page 1344
/Users/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1349
/Users/	POST	Creates a new SSH user.	POST SSH Users on page 1360
/Users/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1362

Endpoint	Method	Description	Link
/Users/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1363

2.6.34.1 SSH Keys

The SSH Keys component of the Keyfactor API includes methods necessary to allow a user with the *SSH User* Keyfactor Command role permission (see *SSH Permissions* in the *Keyfactor Command Reference Guide*) to generate an SSH key pair for himself or herself, retrieve that key, update it, or delete it. Methods are also included to list and delete unmanaged keys—keys discovered on servers configured in inventory only mode.

Table 521: SSH Keys Endpoints

Endpoint	Method	Description	Link
/Unmanaged/{id}	DELETE	Delete a discovered unmanaged SSH key for the specified ID.	DELETE SSH Keys Unmanaged ID below
/Unmanaged/{id}	GET	Retrieve details for a discovered unmanaged SSH key for the specified ID.	GET SSH Keys Unmanaged ID on the next page
/MyKey	GET	Retrieve details for a user's SSH key generated through Keyfactor Command.	GET SSH Keys My Key on page 1205
/MyKey	POST	Generate a new SSH key pair for a user through Keyfactor Command.	POST SSH Keys My Key on page 1207
/MyKey	PUT	Update an SSH key for a user through Keyfactor Command.	PUT SSH Keys My Key on page 1211
Unmanaged	DELETE	Delete one or more discovered unmanaged SSH keys based on a selection query.	DELETE SSH Keys Unmanaged on page 1214
Unmanaged	GET	Retrieve details for one or more discovered unmanaged SSH keys based on a selection query.	GET SSH Keys Unmanaged on page 1215

DELETE SSH Keys Unmanaged ID

The DELETE /SSH/Keys/Unmanaged/{id} method is used to delete an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This

endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 522: DELETE SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be deleted. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1215) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged ID

The GET /SSH/Keys/Unmanaged/{id} method is used to retrieve an unmanaged SSH key by ID. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This method returns HTTP 200 OK on a success with details for the requested SSH key.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 523: GET SSH Keys Unmanaged {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the unmanaged SSH key to be retrieved. Use the <i>GET /SSH/Keys/Unmanaged</i> method (see GET SSH Keys Unmanaged on page 1215) to retrieve a list of all the unmanaged keys to determine the unmanaged key's ID.

Table 524: GET SSH Keys Unmanaged {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none">• RSA• ECDSA• Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys My Key

The GET /SSH/Keys/MyKey method is used to retrieve the current user's SSH key generated in Keyfactor Command (see [POST SSH Keys My Key on page 1207](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Table 525: GET SSH Keys My Key Input Parameters

Name	In	Description
includePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (true) or not (false). If set to <i>true</i> , the <i>x-keyfactor-key-passphrase</i> header must be supplied. The default is <i>false</i> .
x-keyfactor-key-passphrase	Header	Required* A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>true</i> .  Tip: This password does not need to match the password entered to secure the private key when the SSH key pair was initially generated. The private key is encrypted at download time and a different password may be used for each download.

Table 526: GET SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	<p>A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are:</p> <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	<p>A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.</p> <p>The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Keys My Key

The POST /SSH/Keys/MyKey method is used to generate a new SSH key pair for the current user in Keyfactor Command. The user needs to download the private key as an encrypted file and store it locally and an administrator needs to use Keyfactor Command to associate the user's Keyfactor user account with his or her Linux logon account(s) on the target server(s) that the user wishes to access via SSH (see [POST SSH Logons Access on page 1226](#), [POST SSH Server Groups Access on page 1294](#), and [POST SSH Servers Access on page 1254](#)). This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Table 527: POST SSH Keys My Key Input Parameters

Name	In	Description								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm to use to generate the SSH key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table> <p>The <i>KeyType</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	ECDSA	2	Ed25519	3	RSA
Numeric Value	Text Value									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table><tr><th>Numeric Value</th><th>Text Value</th></tr><tr><td>1</td><td>OpenSSH</td></tr><tr><td>2</td><td>PKCS8</td></tr></table> <p>The <i>PrivateKeyFormat</i> may be specified using either the numeric value or text value.</p>	Numeric Value	Text Value	1	OpenSSH	2	PKCS8		
Numeric Value	Text Value									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required[*]. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p> <div> Tip: This password is used to secure the private key in the downloaded copy of the SSH key pair. You may later download the SSH key pair with private key (see GET SSH Keys My Key on page 1205) and encrypt it with a different pass-</div>								

Name	In	Description
		 word, if desired.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p> <p>  Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery. </p>

Table 528: POST SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
PrivateKey	A string indicating the private key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days. The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Keys My Key

The PUT /SSH/Keys/MyKey method is used to update the existing SSH key pair for the current user in Keyfactor Command. Most features of a key pair are fixed and cannot be changed. Only the email address and comment associated with the key may be changed with this option. This method returns HTTP 200 OK on a success with the key's details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/user/

OR

/ssh/server_admin/

OR

/ssh/enterprise_admin/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 529: PUT SSH Keys My Key Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH key.
Email	Body	Required. A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comment	Body	<p>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</p> <div>  Note: Although this field is actually an array, entry of only a single comment string is supported. The field is defined as an array to support multiple comments on existing SSH keys found on servers during inventory and discovery. </div>

Table 530: PUT SSH Keys My Key Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the user's SSH key pair.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	<p>A string indicating the cryptographic algorithm used to generate the SSH key pair. Possible values are:</p> <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	<p>A string indicating the date, in UTC, on which the SSH key pair will be considered to have reached the end of its lifetime. By default, the lifetime of an SSH key pair is 365 days.</p> <p>The SSH lifetime is defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>
Email	A string containing the email address of the user who requested the key. This email address is used to alert the user when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command My SSH Key portal or with the POST /SSH/Keys/MyKey method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Keys Unmanaged

The DELETE /SSH/Keys/Unmanaged method is used to delete one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting an unmanaged key when the associated server is still in inventory only mode will not delete the key on the target server. The next time the server is scanned, the key will re-appear in Keyfactor Command. See *Unmanaged SSH Keys* in the *Keyfactor Command Reference Guide* for more information.

Table 531: DELETE SSH Keys Unmanaged Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command reference IDs for the unmanaged SSH keys to be deleted provided in the request body in the following format (without parameter name):</p> <pre>[4, 27, 89]</pre> <p>Use the GET /SSH/Keys/Unmanaged method (see GET SSH Keys Unmanaged on the next page) to retrieve a list of all the unmanaged keys to determine the unmanaged key IDs.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Keys Unmanaged

The GET /SSH/Keys/Unmanaged method is used to retrieve one or more unmanaged SSH keys. Keys discovered on SSH servers during inventory and discovery are considered unmanaged. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH keys.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 532: GET SSH Keys Unmanaged Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Unmanaged Keys Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DiscoveredDate • KeyComments • KeyLength • KeyType • ServerId
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal.
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 533: GET SSH Keys Unmanaged Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH key.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
DiscoveredDate	A string indicating the date, in UTC, on which the SSH key was discovered.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. A key may appear with more than one comment if the originating authorized_keys file contained more than one comment.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.34.2 SSH Logons

The SSH Logons component of the Keyfactor API includes methods necessary to view and manage the Linux user accounts associated with authorized_keys files containing valid SSH public keys. The logons include both those discovered on SSH servers during the initial discovery phase using the orchestrator and those created in Keyfactor Command and published to the SSH servers using the orchestrator.

Table 534: SSH Logon Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a Linux logon from Keyfactor Command.	DELETE SSH Logons ID below
/id}	GET	Returns information about a Linux logons.	GET SSH Logons ID on the next page
/	GET	Returns information about one or more Linux logons.	GET SSH Logons on page 1221
/	POST	Creates a new Linux logon in Keyfactor Command and, for servers in <i>inventory</i> and <i>publish policy</i> mode, publishes it out to a Linux server.	POST SSH Logons on page 1223
/Access	POST	Maps users and service accounts with a Linux logon to associate the SSH keys of the users with the Linux logon.	POST SSH Logons Access on page 1226

DELETE SSH Logons ID

The DELETE /SSH/Logons/{id} method is used to delete a Linux logon in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Note: Deleting a logon in Keyfactor Command does not delete it on the Linux server. It must be manually removed from the Linux server at the same time. If this is not done, when the next inventory of the Linux server is performed, the logon will be recreated in Keyfactor Command. This method is intended primarily to be used to clean up logons in Keyfactor Command from SSH servers that have been retired.

Table 535: DELETE SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon to be deleted. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Logons ID

The *GET /SSH/Logons/{id}* method is used to retrieve a Linux logon by ID. This method returns HTTP 200 OK on a success with details for the requested SSH logon.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 536: GET SSH Logons {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon to retrieve. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID.

Table 537: GET SSH Keys Unmanaged {id} Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Logons

The GET /SSH/Logons method is used to retrieve one or more Linux logons. Results can be limited to selected logons using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH logons.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 538: GET SSH Logons Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Logons Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Id (Login ID) • LastLogon • Hostname (Logon Server Name) • LogonUserUsername • ServerId • UnmanagedKeyId • Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 539: GET SSH Logons Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.
Username	A string indicating the user's logon name on the Linux server.
ServerId	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.
ServerName	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
GroupName	A string indicating the server group to which the server referenced by <i>ServerName</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ServerUnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Logons

The POST /SSH/Logons method is used to create a new Linux logon in Keyfactor Command and, for servers in *inventory and publish policy* mode, publish it out to a Linux server. The logon can optionally be associated with one or more SSH keys by mapping the logon to one or more *users* or *service accounts* during creation. This method returns HTTP 200 OK on a success with details for the new SSH logon.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin (/ssh/server_admin/)* role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 540: POST SSH Logons Input Parameters

Name	In	Description
Username	Body	Required. A string indicating the user's logon name on the Linux server.
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon should be created. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1236) to retrieve a list of all the SSH servers to determine the server's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <div>[4,7,19]</div> See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1349) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID.

Table 541: POST SSH Logons Response Data

Name	Description										
ID	An integer indicating the Keyfactor Command reference ID for the SSH logon.										
Username	A string indicating the user's logon name on the Linux server.										
Server	<p>An object containing details about the server on which the SSH logon resides. Server information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.</td></tr> <tr> <td>Hostname</td><td>A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>UnderManagement</td><td>A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).</td></tr> <tr> <td>GroupName</td><td>A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.	Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).	GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the server on which the SSH logon resides.										
Hostname	A string indicating the hostname of the SSH server on which the SSH logon resides. See <i>SSH Servers</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
UnderManagement	A Boolean indicating whether the server on which the SSH logon resides is in <i>inventory only</i> mode (false) or <i>inventory and publish policy</i> mode (true).										
GroupName	A string indicating the server group to which the server referenced by <i>Hostname</i> belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logons.										
Access	<p>An array of objects providing information about the users mapped to the logon. Access information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Logons Access

The POST `/SSH/Logons/Access` method is used to associate one or more SSH keys with a Linux logon by mapping the logon to one or more *users* or *service accounts*. This method returns HTTP 200 OK on a success with a list of the users associated with the logon.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssh/server_admin/`
OR
`/ssh/enterprise_admin/`
SSH actions are affected by ownership on the server group to which the server on which the logon exists belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 542: POST SSH Logons Access Input Parameters

Name	In	Description
LogonId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH logon. Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID.
UserIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the users and/or service accounts with which the logon should be associated, provided in the following format: <div>[4,7,19]</div> Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1349) to retrieve a list of all the users (including service accounts) created in Keyfactor Command to determine a user's ID. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information about users and service accounts.

Table 543: POST SSH Logons Access Response Data

Name	Description						
LogonId	An integer indicating the Keyfactor Command reference ID for the SSH logon.						
LogonName	A string indicating the user's logon name on the Linux server.						
Users	<p>An array of objects providing information about the users mapped to the logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.34.3 SSH Servers

The SSH Servers component of the Keyfactor API includes methods necessary to create, update, and delete SSH servers within Keyfactor Command.

Table 544: SSH Servers Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH server with the specified ID.	DELETE SSH Servers ID on the next page
/id}	GET	Returns the SSH server with the specified ID.	GET SSH Servers ID on page 1229

Endpoint	Method	Description	Link
/Access/{id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server.	GET SSH Servers Access ID on page 1233
/	GET	Returns a list of a SSH servers configured in Keyfactor Command.	GET SSH Servers on page 1236
/	POST	Creates a new SSH server.	POST SSH Servers on page 1241
/	PUT	Updates an existing SSH server.	PUT SSH Servers on page 1246
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server.	DELETE SSH Servers Access on page 1251
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server.	POST SSH Servers Access on page 1254

DELETE SSH Servers ID

The DELETE /SSH/Servers/{id} method is used to delete an SSH server in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 545: DELETE SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server to be deleted. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1236) to retrieve a list of all the SSH servers to determine the server's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers ID

The *GET /SSH/Servers/{id}* method is used to retrieve an SSH server with the specified ID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 546: GET SSH Servers {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server to be retrieved. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1236) to retrieve a list of all the SSH servers to determine the server's ID.

Table 547: GET SSH Servers {id} Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table>	Name	Description		<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory</i> and <i>publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers Access ID

The GET /SSH/Servers/Access/{id} method is used to retrieve Linux logons for an SSH server, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server ID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 548: GET SSH Servers Access {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH server for which to retrieve logon and user mappings. Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1236) to retrieve a list of all the SSH servers to determine the server's ID.

Table 549: GET SSH Servers Access {id} Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

GET SSH Servers

The GET /SSH/Servers method is used to retrieve one or more SSH servers defined in Keyfactor Command. Results can be limited to selected servers using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH servers.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 550: GET SSH Servers Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the SSH Server Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Agent (Agent ID) • Hostname • Orchestrator (ClientMachine) • ServerGroup (Server Group Id) • ServerGroupName • ServerGroupOwner (Username) • EnforcePublishPolicy (UnderManagement) (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Hostname</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 551: GET SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").
Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr> </table> <p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").										
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description										
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Monthly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p> <p>For example:</p> <pre>"SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } }</pre>	Name	Description	Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Servers

The POST /SSH/Servers method is used to create a new SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server.

Before adding a new SSH server, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1275](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 17](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 552: POST SSH Servers Input Parameters

Name	In	Description
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.
Hostname	Body	Required. A string indicating the hostname of the SSH server.
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). <div>Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.</div>
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 553: POST SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Servers

The PUT /SSH/Servers method is used to update an existing SSH server in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH server.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 554: PUT SSH Servers Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.
UnderManagement	Body	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).  Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.
Port	Body	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.

Table 555: PUT SSH Servers Response Data

Name	Description												
ID	An integer indicating the Keyfactor Command reference ID for the SSH server. This ID is automatically set by Keyfactor Command.												
AgentId	A string indicating the Keyfactor Command reference GUID for the SSH orchestrator controlling the SSH server.												
Hostname	A string indicating the hostname of the SSH server.												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group to which the server belongs.												
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group to which the SSH server belongs. Inventory schedules cannot be set on an individual SSH server basis. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description										
Monthly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> <tr> <td>Day</td><td>The number of the day, in the month, to run the job.</td></tr> </table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.				
Name	Description										
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Day	The number of the day, in the month, to run the job.										
Under-Management	A Boolean indicating whether the SSH server is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).										

Name	Description						
	 Tip: If the server group associated with the SSH server is in <i>inventory and publish policy</i> mode, you will not be able to configure the server in <i>inventory only</i> mode.						
Owner	<p>An object that indicates the Active Directory user who owns the server group to which the server belongs. The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.
Name	Description						
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group to which the SSH server belongs.						
Username	A string indicating the username of the <i>user</i> (in DOMAIN\\user-name format) who holds the owner role on the SSH server group to which the SSH server belongs.						
GroupName	A string indicating the SSH server group to which the SSH server belongs. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.						
Orchestrator	<p>A string indicating the name the SSH orchestrator provided to Keyfactor Command when it registered. This value is configurable when the orchestrator is installed.</p> <p>For more information about the orchestrator, see <i>Bash Orchestrator</i> in the <i>Keyfactor Orchestrators Installation and Configuration Guide</i>.</p>						
Port	An integer indicating the port that is configured for SSH on the SSH server. The default is 22.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Servers Access

The DELETE /SSH/Servers/Access method is used to remove a mapping of Keyfactor Command users or service accounts to one or more Linux logons on one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and remaining associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server from which you will removing your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be removed from the server. If the server is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the server.

Table 556: DELETE SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	Required. An array of objects containing information for the Linux logon(s) to update. The following information should be included: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.</td></tr></table></div> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be removed from association with the logon.							

Table 557: DELETE SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

POST SSH Servers Access

The POST `/SSH/Servers/Access` method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH servers. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server(s).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

`/ssh/server_admin/`

OR

`/ssh/enterprise_admin/`

SSH actions are affected by ownership on the server group to which the server belongs and limited for users with only the *Server Admin* (`/ssh/server_admin/`) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 558: POST SSH Servers Access Input Parameters

Name	In	Description						
ServerId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server.						
LogonUsers	Body	Required. An array of objects containing information for the Linux logon(s) to update. The following information should be included: <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in username@hostname format) to be associated with the logon.							

Table 559: POST SSH Servers Access Response Data

Name	Description														
ServerId	An integer indicating the Keyfactor Command reference ID for the SSH server.														
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonId</td><td>An integer indicating the Keyfactor Command reference ID of the Linux logon.</td></tr> <tr> <td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr> <tr> <td>Users</td><td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table> </td></tr> </table>	Name	Description	LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.	LogonName	A string indicating the name of the Linux logon.	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.
Name	Description														
LogonId	An integer indicating the Keyfactor Command reference ID of the Linux logon.														
LogonName	A string indicating the name of the Linux logon.														
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that have been mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.								
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that has been associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.														
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in username@hostname format) that has been associated with the logon.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

2.6.34.4 SSH Server Groups

The SSH Server Groups component of the Keyfactor API includes methods necessary to create, update and delete SSH server groups within Keyfactor Command.

Table 560: SSH Server Groups Endpoints

Endpoint	Method	Description	Link
/ {id}	DELETE	Deletes the SSH server group with the specified ID.	DELETE SSH Server Groups ID on the next page
/ {id}	GET	Returns the SSH server group with the specified ID.	GET SSH Server Groups ID on the next page
/ {name}	GET	Returns the SSH server group with the specified name.	GET SSH Server Groups Name on page 1263
/Access/ {id}	GET	Retrieves Linux logons along with users and service accounts granted access to those logons for the specified SSH server group.	GET SSH Server Groups Access ID on page 1267
/	GET	Returns a list of a SSH server groups configured in Keyfactor Command.	GET SSH Server Groups on page 1270
/	POST	Creates a new SSH server group.	POST SSH Server Groups on page 1275
/	PUT	Updates an existing SSH server group.	PUT SSH Server Groups on page 1283
/Access	DELETE	Deletes Linux logon to user and service account mappings for an SSH server group.	DELETE SSH Server Groups Access on page 1291
/Access	POST	Creates Linux logon to user and service account mappings for an SSH server group.	POST SSH Server Groups Access on page 1294

DELETE SSH Server Groups ID

The DELETE /SSH/ServerGroups/{id} method is used to delete an SSH server group in Keyfactor Command. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/enterprise_admin/

Table 561: DELETE SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be deleted. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1270) to retrieve a list of all the SSH server groups to determine the server group's GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups ID

The GET /SSH/ServerGroups/{id} method is used to retrieve an SSH server group with the specified GUID from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 562: GET SSH Server Groups {id} Input Parameters

Name	In	Description
id	Path	<p>Required. A string indicating the Keyfactor Command reference GUID for the SSH server group to be retrieved.</p> <p>Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1270) to retrieve a list of all the SSH server groups to determine the server group's GUID.</p>

Table 563: GET SSH Server Groups {id} Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<div>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr><tr><td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<div>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div><div>For example, every hour:<pre>"Interval": { "Minutes": 60 }</pre></div></td></tr></table></div>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups Name

The GET /SSH/ServerGroups/{name} method is used to retrieve an SSH server group with the specified name from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the specified SSH server group.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.
Name	Description														
	<p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p> <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>														
Monthly		<p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr><tr><td>Day</td><td>The number of the day, in the month, to run the job.</td></tr></table> <p>For example, on the first of every month at 5:30 pm:</p> <pre>"Monthly": { "Day": 1 "Time": "2022-02-27T17:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.							
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Name	In	Description
		<pre> "SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } } </pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups Access ID

The GET /SSH/ServerGroups/Access/{id} method is used to retrieve Linux logons for an SSH server group, along with any users or service accounts mapped to those logons, from Keyfactor Command for the specified server group GUID. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 566: GET SSH Server Groups Access {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group for which to retrieve logon and user mappings. Use the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1270) to retrieve a list of all the SSH server groups to determine the server group's ID.

Table 567: GET SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Server Groups

The GET /SSH/ServerGroups method is used to retrieve one or more SSH server groups defined in Keyfactor Command. Results can be limited to selected server groups using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH server groups.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 568: GET SSH Server Groups Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Server Group Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • GroupId • GroupName • Owner (Owner ID) • OwnerName (Username) • EnforcePublishPolicy (Under Management) (true, false)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>GroupName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 569: GET SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Off	Turn off a previously configured schedule.										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.						
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Server Groups

The POST /SSH/ServerGroups method is used to create an SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH server group.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/enterprise_admin/

Table 570: POST SSH Server Groups Input Parameters

Name	In	Description												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>												
GroupName	Body	<p>Required. A string indicating the name of the SSH server group.</p>												
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description													
Off	Turn off a previously configured schedule.													
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.									
Name	Description													
Minutes	An integer indicating the number of minutes between each interval.													
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:													

Name	In	Description																	
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.							
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Note: Although the Keyfactor API Reference and Utility - Swagger *Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.

For example:

```
"SyncSchedule": {  
  "Weekly": {  
    "Days": [  
      "Monday",  
      "Wednesday",  
      "Friday"  
    ],  
    "Time": "2022-11-20T14:00:00Z"  
  }  
}
```

Name	In	Description
		<pre>} }</pre> <p>The default is unset.</p>
Under- Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True). The default is False.

Table 571: POST SSH Server Groups Response Data

Name	Description										
ID	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.										
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Owner parameters are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> <tr> <td>Username</td><td>A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.				
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Username	A string indicating the username of the <i>user</i> (in DOMAIN\user-name format) who holds the owner role on the SSH server group.										
GroupName	A string indicating the name of the SSH server group.										
SyncSchedule	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.						
Name	Description												
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Day	The number of the day, in the month, to run the job.												

Name	Description
Under-Management	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	An integer indicating the number of SSH servers that belong to the server group.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Server Groups

The PUT /SSH/ServerGroups method is used to update an existing SSH server groups defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the updated SSH server group.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 572: PUT SSH Server Groups Input Parameters

Name	In	Description												
ID	Body	A string indicating the Keyfactor Command reference GUID for the SSH server group. This GUID is automatically set by Keyfactor Command.												
OwnerName	Body	<p>Required. A string indicating the Active Directory user who owns the server group (in DOMAIN\username format). The owner can only be set by a Keyfactor Command user with the <i>SSH Enterprise Admin</i> role. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <div> Tip: Notice that the field name and structure returned on a GET is not the same as that used on a POST and PUT for the server group owner.</div>												
GroupName	Body	Required. A string indicating the name of the SSH server group.												
SyncSchedule	Body	<p>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table></div><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Day	The number of the day, in the month, to run the job.							
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														
Day	The number of the day, in the month, to run the job.														

Name	In	Description
		<pre> "SyncSchedule": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-11-20T14:00:00Z" } } </pre>
Under-Management	Body	A Boolean indicating whether the SSH server group is in <i>inventory only</i> mode (False) or <i>inventory and publish policy</i> mode (True).
ServerCount	Body	An integer indicating the number of SSH servers that belong to the server group.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Server Groups Access

The DELETE /SSH/ServerGroups/Access method is used to remove a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /ssh/server_admin/
 OR
 /ssh/enterprise_admin/
 SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before deleting a logon to user mapping, be sure that you have switched the server group from which you will removing your mapping to *inventory and publish policy* mode so that the key for the user will be removed from the servers in the server group. If the server group

is in *inventory only* mode and you remove a mapping for it in Keyfactor Command, the mapping will be removed in Keyfactor Command only and the key for the user will not be removed from the servers.

Table 574: DELETE SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. An integer indicating the Keyfactor Command reference ID for the SSH server group.						
LogonUsers	Body	<p>An array of objects containing information for the Linux logon(s) to update. The following information should be included:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.</td></tr></table> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be removed from association with the logon.							

Table 575: DELETE SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<div>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td><div>A string indicating the name of the Linux logon.<div> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</div></div></td></tr><tr><td>Users</td><td><div>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.<div> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</div></td></tr></table></div></td></tr></table></div>	Name	Description	LogonName	<div>A string indicating the name of the Linux logon.<div> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</div></div>	Users	<div>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon. <div> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</div>
Name	Description												
LogonName	<div>A string indicating the name of the Linux logon.<div> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</div></div>												
Users	<div>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr><tr><td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.<div> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</div></td></tr></table></div>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon. <div> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</div>						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon. <div> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</div>												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Server Groups Access

The POST /SSH/ServerGroups/Access method is used to create a mapping of one or more Linux logons to Keyfactor Command users or service accounts for one or more SSH server groups. This method returns HTTP 200 OK on a success with details of the logons and associated users, if applicable, for the specified SSH server group(s).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Tip: Before creating a logon to user mapping, be sure that you have switched the server group to which you will add your mapping to *inventory and publish policy* mode so that the key for the user will be published to the servers in the group. If the server group is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the servers.

Table 576: POST SSH Server Groups Access Input Parameters

Name	In	Description						
ServerGroupId	Body	Required. A string indicating the Keyfactor Command reference GUID for the SSH server group.						
LogonUsers	Body	Required. An array of objects containing information for the Linux logon (s) to update. The following information should be included: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>LogonName</td><td>A string indicating the name of the Linux logon.</td></tr><tr><td>Users</td><td>An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.</td></tr></table></div> <p>For example:</p> <pre>"LogonUsers": [{ "LogonName": "johns", "Users": ["KEYEXAMPLE\\jsmith"] }]</pre>	Name	Description	LogonName	A string indicating the name of the Linux logon.	Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.
Name	Description							
LogonName	A string indicating the name of the Linux logon.							
Users	An array of strings indicating the user names of one or more <i>users</i> (in DOMAIN\username format) or <i>service accounts</i> (in user-name@hostname format) to be associated with the logon.							

Table 577: POST SSH Server Groups Access {id} Response Data

Name	Description												
ServerGroupId	A string indicating the Keyfactor Command reference GUID for the SSH server group.												
LogonUsers	<p>An array of objects containing information for the Linux logons from the Linux server that have been stored in Keyfactor Command. Possible information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>LogonName</td><td> <p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p> </td></tr> <tr> <td>Users</td><td> <p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p> </td></tr> </table>	Name	Description	LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>	Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.
Name	Description												
LogonName	<p>A string indicating the name of the Linux logon.</p> <p> Tip: Logons only appear in the results if they exist with the same spelling on all servers in the server group.</p>												
Users	<p>An array of objects containing information about the users and/or service accounts defined in Keyfactor Command that are mapped to the Linux logon. User information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Username</td><td>A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.</td></tr> </table> <p> Tip: Users only appear in the results if they have been mapped to the same logon on all servers in the server group.</p>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.						
Name	Description												
Id	An integer indicating the Keyfactor Command reference ID of a <i>user</i> or <i>service account</i> that is associated with the logon. See <i>SSH</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
Username	A string indicating the username of a <i>user</i> (in DOMAIN\username format) or <i>service account</i> (in user-name@hostname format) that is associated with the logon.												

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.34.5 SSH Service Accounts

The SSH Service Accounts component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate and delete service accounts and associated keys in Keyfactor Command.

Table 578: SSH Service Accounts Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH service account with the specified ID.	DELETE SSH Service Accounts ID below
/id}	GET	Returns the SSH service account with the specified ID.	GET SSH Service Accounts ID on page 1300
/Key/{id}	GET	Returns the public key and optional private key of an SSH service account with the specified ID.	GET SSH Service Accounts Key ID on page 1307
/	DELETE	Deletes one or more SSH service accounts with the specified IDs.	DELETE SSH Service Accounts on page 1311
/	GET	Returns a list of SSH service accounts based on the specified filters.	GET SSH Service Accounts on page 1313
/	POST	Creates a new SSH service account.	POST SSH Service Accounts on page 1321
/	PUT	Updates an existing SSH service account.	PUT SSH Service Accounts on page 1331
/Rotate/{id}	POST	Generates a new key pair for an existing service account.	POST SSH Service Accounts Rotate ID on page 1339

DELETE SSH Service Accounts ID

The DELETE /SSH/ServiceAccounts/{id} method is used to delete an SSH service account in Keyfactor Command, including its SSH key pair. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 579: DELETE SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be deleted.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1313) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p> <div> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</div> <div><pre>{ "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx- t2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2023-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } }</pre></div> <p>It contains three IDs:</p> <ul style="list-style-type: none">• ID 2: The service account's ID. Use this one for delete requests.• ID 7: The service account user's ID.• ID 36: The ID of the service account user's key.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts ID

The GET /SSH/ServiceAccounts/{id} method is used to retrieve an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account and its public key. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1307](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 580: GET SSH Service Accounts {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH service account to be retrieved. Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1313) to retrieve a list of all the SSH service accounts to determine the service account's ID.

Table 581: GET SSH Service Accounts {id} Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST <code>/SSH/ServiceAccounts</code> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts Key ID

The GET /SSH/ServiceAccounts/Key/{id} method is used to retrieve the key information for an SSH service account from Keyfactor Command. This method returns HTTP 200 OK on a success with details for the requested SSH service account key, including optional private key.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 582: GET SSH Service Accounts Key {id} Input Parameters

Name	In	Description
id	Path	<p>Required. An integer indicating the Keyfactor Command reference ID for the SSH service account key for which to retrieve key information.</p> <p>Use the <i>GET /SSH/ServiceAccounts</i> method (see GET SSH Service Accounts on page 1313) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  <p>Tip: Be sure to use the ID of the service account's key and not the ID of the service account itself or the service account user. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx-t2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2023-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsr- vr80.keyexample.com" } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. • ID 7: The service account user's ID. </div>

Name	In	Description
		 <ul style="list-style-type: none"> ID 36: The ID of the service account user's key. Use this one to request the key.
IncludePrivateKey	Query	A Boolean that sets whether to include the private key of the SSH key pair in the response (True) or not (False). The default is <i>False</i> . If set to True, the X-Keyfactor-Key-Passphrase header must be supplied.
X-Keyfactor-Key-Passphrase	Header	Required *. A string that sets a password used to secure the private key of the SSH key pair for download. This field is required if <i>IncludePrivateKey</i> is set to <i>True</i> .

Table 583: GET SSH Service Accounts Key {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
CreationDate	A string indicating the date, in UTC, on which the SSH key pair was created.
StaleDate	A string indicating the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

DELETE SSH Service Accounts

The DELETE /SSH/ServiceAccounts method is used to delete one or more SSH service accounts in Keyfactor Command, including their SSH key pairs. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 584: DELETE SSH Service Accounts Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command reference IDs for the SSH service accounts to be deleted provided in the request body in the following format:</p> <pre>[4,12,17]</pre> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on the next page) to retrieve a list of all the SSH service accounts to determine the service accounts IDs.</p> <p> Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a <code>GET /SSH/ServiceAccounts</code>:</p> <pre>{ "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rxt2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsrvr80.keyexample.com" } }</pre>

Name	In	Description
		 } <p>It contains three IDs:</p> <ul style="list-style-type: none"> • ID 2: The service account's ID. Use this one for delete requests. • ID 7: The service account user's ID. • ID 36: The ID of the service account user's key.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Service Accounts

The GET /SSH/ServiceAccounts method is used to retrieve one or more SSH service accounts defined in Keyfactor Command. Results can be limited to selected service accounts using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH service accounts and their public keys. To return the SSH private key, use the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1307](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 585: GET SSH Service Accounts Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Service Account Key Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Comments (Key comments) • CreationDate • Id • KeyLength • KeyType • ServerGroup (Server Group ID) • ServerGroupName • Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 586: GET SSH Service Accounts Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetost).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Service Accounts

The POST /SSH/ServiceAccounts method is used to create a new SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the new SSH service account.

Before adding a new SSH service account, be sure that you have added at least one server group (see [POST SSH Server Groups on page 1275](#)) and that your Keyfactor Bash Orchestrator has been registered and approved in Keyfactor Command (see [GET Agents on page 17](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Keys created through the Keyfactor Command Management Portal or with the POST <code>/SSH/ServiceAccounts</code> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST <code>/SSH/ServiceAccounts</code> method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Service Accounts

The PUT /SSH/ServiceAccounts method is used to update an existing SSH service account in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the SSH service account.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 589: PUT SSH Service Accounts Input Parameters

Name	In	Description								
KeyUpdateRequest	Body	<p>Required. An object that sets the information to include in the SSH service account key update request. Key update request information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Id</td><td>Required. An integer indicating the Keyfactor Command reference ID for the service account's key.</td></tr><tr><td>Email</td><td>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.</td></tr><tr><td>Comment</td><td>A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.</td></tr></table>	Name	Description	Id	Required. An integer indicating the Keyfactor Command reference ID for the service account's key.	Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.	Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.
Name	Description									
Id	Required. An integer indicating the Keyfactor Command reference ID for the service account's key.									
Email	Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its life-time.									
Comment	A string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks.									
Id	Body	<p>Required. An integer indicating the Keyfactor Command reference ID for the service account.</p> <p>Use the <code>GET /SSH/ServiceAccounts</code> method (see GET SSH Service Accounts on page 1313) to retrieve a list of all the SSH service accounts to determine the service account's ID.</p>								

Table 590: PUT SSH Service Accounts Response Data

Name	Description														
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account. This ID is automatically set by Keyfactor Command.														
ClientHost-name	A string indicating the client hostname reference for the service account key. This field is used for reference only and does not need to match an actual client hostname. It is used when building the full user name of the service account key for mapping to Linux logons for publishing to Linux servers (e.g. username@client_hostname). The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsvr12), but you can put anything you like in this field (e.g. cheesetoast).														
Server-Group	<p>An object that indicates the SSH server group for the service account. The server group is used to control who has access in Keyfactor Command to the service account key. It does not limit where the key can be published. See <i>SSH Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. Server group information includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>A string indicating the Keyfactor Command reference GUID of the SSH server group.</td></tr> <tr> <td>Owner</td><td> <p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table> </td></tr> <tr> <td>GroupName</td><td>A string indicating the name of the SSH server group.</td></tr> <tr> <td>SyncSchedule</td><td>An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</td></tr> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.	Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.	GroupName	A string indicating the name of the SSH server group.	SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:
Name	Description														
Id	A string indicating the Keyfactor Command reference GUID of the SSH server group.														
Owner	<p>An object indicating the Active Directory user who owns the server group. See <i>SSH Server Groups</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.										
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the <i>user</i> who holds the owner role on the SSH server group.														
GroupName	A string indicating the name of the SSH server group.														
SyncSchedule	An object providing the inventory schedule for the SSH server group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:

Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Nam-e</th><th>Description</th></tr> <tr> <td>Month-ly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every month at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description										
	the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
Email	A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.										
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.										
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.										
Username	A string indicating the full username of the service account. The username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).										
LogonIds	An array of integers indicating the Keyfactor Command reference IDs of Linux logons that are associated with the service account in order to publish the service account's public key to the servers on which the logons are located.										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Service Accounts Rotate ID

The POST /SSH/ServiceAccounts/Rotate/{id} method is used to generate a new key pair in Keyfactor Command for an existing SSH service account. This method returns HTTP 200 OK on a success with details for the new key pair of the SSH service account, including the private key.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which the key is associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 591: GET SSH Service Accounts Rotate {id} Input Parameters

Name	In	Description
id	Path	<p>Required. The Keyfactor Command reference ID for the SSH service account key for which to retrieve key information. Use the GET /SSH/ServiceAccounts method (see GET SSH Service Accounts on page 1313) to retrieve a list of all the SSH service accounts to determine the service account's key ID.</p> <div>  <p>Tip: Be sure to use the ID of the service account itself and not the ID of the service account user or service account's key within the service account. For example, notice the following record returned from a GET /SSH/ServiceAccounts:</p> <pre> { "Id": 2, "ClientHostname": "appsrvr80.keyexample.com", "ServerGroup": { "Id": "603d3d4c-89dd-4ab8-92e1-8e83db3d5546", "GroupName": "Server Group Two", "UnderManagement": false }, "User": { "Id": 7, "Key": { "Id": 36, "Fingerprint": "kwuo2k3Ej7wFVMLhI3g+rx-t2qXwGp7qcvzdBjVTDHNg=", "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQCAIn+t [truncated for display]", "KeyType": "RSA", "KeyLength": 2048, "CreationDate": "2020-11-17T17:53:55.68", "Email": "pkiadmins@keyexample.com", "Comments": ["Access App Two"], "LogonCount": 3 }, "Username": "svc_access2@appsr- vr80.keyexample.com" } }</pre> <p>It contains three IDs:</p> <ul style="list-style-type: none"> ID 2: The service account's ID. Use this one to rotate the key. </div>

Name	In	Description								
		<div><ul style="list-style-type: none">ID 7: The service account user's ID.ID 36: The ID of the service account user's key.</div>								
KeyType	Body	<p>Required. A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>ECDSA</td></tr><tr><td>2</td><td>Ed25519</td></tr><tr><td>3</td><td>RSA</td></tr></table>	Value	Description	1	ECDSA	2	Ed25519	3	RSA
Value	Description									
1	ECDSA									
2	Ed25519									
3	RSA									
PrivateKeyFormat	Body	<p>Required. A string indicating the format to use for the downloadable private key. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>OpenSSH</td></tr><tr><td>2</td><td>PKCS8</td></tr></table>	Value	Description	1	OpenSSH	2	PKCS8		
Value	Description									
1	OpenSSH									
2	PKCS8									
KeyLength	Body	<p>Required*. An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA. This field is optional if the <i>KeyType</i> is set to ECDSA or Ed25519 and required if the <i>KeyType</i> is set to RSA.</p>								
Email	Body	<p>Required. A string containing the email address of the administrator or group of administrators responsible for managing the key. This email address is used to alert the administrator or group of administrators when the key pair is approaching the end of its lifetime.</p>								
Password	Body	<p>Required. A string that sets a password used to secure the private key of the SSH key pair for download.</p>								
Comment	Body	<p>An string containing the user-defined descriptive comment, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may can contain any characters supported for string fields, including spaces and most punctuation marks.</p>								

Table 592: GET SSH Service Accounts Rotate {id} Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the SSH service account key. This ID is automatically set by Keyfactor Command.
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.
PublicKey	A string indicating the public key of the key pair for the SSH service account.
PrivateKey	A string indicating the private key of the key pair for the SSH service account.
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the POST /SSH/ServiceAccounts method will contain only one string in the array.
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.34.6 SSH Users

The SSH Users component of the Keyfactor API includes methods necessary to retrieve, create, update, rotate, and delete users and associated keys in Keyfactor Command.

Table 593: SSH Users Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the SSH user with the specified ID.	DELETE SSH Users ID below
/id}	GET	Returns the SSH user with the specified ID.	GET SSH Users ID on the next page
/	GET	Returns a list of SSH users based on the specified filters.	GET SSH Users on page 1349
/	POST	Creates a new SSH user.	POST SSH Users on page 1360
/	PUT	Updates an existing SSH user.	PUT SSH Users on page 1362
/Access	POST	Creates a mapping from the SSH user to one or more Linux logons.	POST SSH Users Access on page 1363

DELETE SSH Users ID

The DELETE /SSH/Users/{id} method is used to delete an SSH user in Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/

Table 594: DELETE SSH Users {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be deleted. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1349) to retrieve a list of all the SSH users to determine the user's ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Users ID

The GET /SSH/Users/{id} method is used to retrieve an SSH user defined in Keyfactor Command. The method can return either a *user* or a *service account*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. This method returns HTTP 200 OK on a success with details for the requested SSH user and its public key. To return an SSH private key, use the GET /SSH/Keys/MyKey method (see [GET SSH Keys My Key on page 1205](#)) for a user account or the GET /SSH/ServiceAccounts/Key/{id} method (see [GET SSH Service Accounts Key ID on page 1307](#)) for a service account.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

Version 2

Version 2 of the GET /SSH/Users/{id} method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 595: GET SSH Users {id} v2 Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH user (user or service account) to be retrieved. Use the <i>GET /SSH/Users</i> method (see GET SSH Users on page 1349) to retrieve a list of all the SSH users to determine the user's ID.

Table 596: GET SSH Users {id} v2 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	<p>An object containing information about the key for the user. Key details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td></tr> <tr> <td>Fingerprint</td><td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td></tr> <tr> <td>PublicKey</td><td>A string indicating the public key of the key pair for the SSH user.</td></tr> <tr> <td>KeyType</td><td> A string indicating the cryptographic algorithm used to generate the SSH key. LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
Name	Description						
Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <code>POST /SSH/Keys/MyKey</code> or <code>POST /SSH/ServiceAccounts</code> method will contain only one string in the array.						
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET SSH Users

The GET `/SSH/Users` method is used to retrieve one or more SSH users defined in Keyfactor Command. The method returns both *users* and *service accounts*. See *SSH* in the *Keyfactor Command Reference Guide* for more information on the difference between *users* and *service accounts*. Results can be limited to selected users using filtering, and URL parameters can be used to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details for the requested SSH users and their public keys. To return the SSH private key, use the GET `/SSH/Keys/MyKey` method (see [GET SSH Keys My Key on page 1205](#)) for user accounts and the GET `/SSH/ServiceAccounts/Key/{id}` method (see [GET SSH Service Accounts Key ID on page 1307](#)) for service accounts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssh/server_admin/

OR

/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 11](#).

Version 2

Version 2 of the GET /SSH/Users method redesigns how logon information for the user is returned, providing a greater level of detail in the returned data.

Table 599: GET SSH Users v2 Input Parameters

Name	In	Description
showOwnedAccess	Query	<p>A Boolean that specifies whether to return only users that have logons on servers that the requesting user owns (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <p>This option applies only to requesting users with <i>SSH User</i> or <i>SSH Server Admin</i> permissions; users with <i>SSH Enterprise Admin</i> permissions will see all users regardless of the configuration of this setting.</p> <p>Use the <i>GET /SSH/Servers</i> method (see GET SSH Servers on page 1236) or the <i>GET /SSH/ServerGroups</i> method (see GET SSH Server Groups on page 1270) to determine ownership of a server or server group.</p> <div>  <p>Example: Example Scenario One</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B but not on server A. <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record, but sees no specific logon information for Dave (other than the LogonCount), because all Dave's logons are on servers that Gina does not own.</p> <p>Gina does a <i>GET /SSH/Users</i> with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. Dave's user record does not appear.</p> <p>The presence or absence of Dave's user record is controlled by <i>showOwnedAccess</i>. The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p> </div> <div>  <p>Example: Example Scenario Two</p> <ul style="list-style-type: none"> • Server A is owned by Gina and server B is owned by John. • Gina is an <i>SSH Server Admin</i> but not an <i>SSH Enterprise Admin</i>. • Dave has a logon on server B and a logon on server A. </div>

Name	In	Description
		<p> Gina does a GET /SSH/Users with <i>showOwnedAccess=false</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Using the SSH Server Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Email • Fingerprint • IsServiceAccount • KeyLength • KeyType • LogonCount • LogonServerGroupId • LogonServerId • ServiceAccountId • StaleDate

Name	In	Description
		<ul style="list-style-type: none"> Username
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 600: GET SSH Users v2 Response Data

Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Gina does a GET /SSH/Users with <i>showOwnedAccess=true</i> and looks at the results for Dave's user record. She sees Dave's user record and she sees logon information for server A, but no logon information for server B. Because Gina does not own server B, logon information for that server is not visible to her.</p> <p>Notice there is no difference here in the results whether you choose <i>true</i> or <i>false</i> because at least one logon for Dave is present on a server owned by Gina. The <i>showOwnedAccess</i> option only comes into play when a user has no logons on a server owned by the requesting user.</p> <p>The presence or absence of logon information associated with Dave's user record is controlled by Gina's level of SSH permissions—with <i>SSH Server Admin</i> permissions, Gina will always see only logons for servers that she owns.</p>
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Using the SSH Server Search</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Email • Fingerprint • IsServiceAccount • KeyLength • KeyType • LogonCount • LogonServerGroupId • LogonServerId • ServiceAccountId • StaleDate

Name	In	Description
		<ul style="list-style-type: none"> Username
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Username</i> .
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 602: GET SSH Users v1 Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	<p>An object containing information about the key for the user. Key details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td></tr> <tr> <td>Fingerprint</td><td>A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.</td></tr> <tr> <td>PublicKey</td><td>A string indicating the public key of the key pair for the SSH user.</td></tr> <tr> <td>KeyType</td><td> A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 </td></tr> <tr> <td>KeyLength</td><td>An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.</td></tr> <tr> <td>CreationDate</td><td>A string containing the date, in UTC, on which the SSH key pair was created.</td></tr> <tr> <td>StaleDate</td><td>A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>Email</td><td>A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.	Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.	PublicKey	A string indicating the public key of the key pair for the SSH user.	KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 	KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.	CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.	StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.
Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user's key.																		
Fingerprint	A string indicating the fingerprint of the public key. Each SSH public key has a single cryptographic fingerprint that can be used to uniquely identify the key.																		
PublicKey	A string indicating the public key of the key pair for the SSH user.																		
KeyType	A string indicating the cryptographic algorithm used to generate the SSH key. Possible values are: <ul style="list-style-type: none"> • RSA • ECDSA • Ed25519 																		
KeyLength	An integer indicating the key length for the SSH key. The key length supported depends on the key type selected. Keyfactor Command supports 256 bits for Ed25519 and ECDSA and 2048 or 4096 bits for RSA.																		
CreationDate	A string containing the date, in UTC, on which the SSH key pair was created.																		
StaleDate	A string containing the date, in UTC, after which the SSH key pair is considered to be out of date based on the key lifetime defined by the <i>Key Lifetime (days)</i> application setting. See <i>Application Settings: SSH Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																		
Email	A string containing the email address of the user, for user accounts, or administrator or group of administrators responsible for managing the key, for service accounts. This email address is used to alert the user or administrator when the key pair is approaching the end of its lifetime.																		

Name	Description						
	<table><tr><th>Name</th><th>Description</th></tr><tr><td>Comments</td><td>An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.</td></tr><tr><td>LogonCount</td><td>An integer indicating the number of Linux logons associated with the SSH key pair.</td></tr></table>	Name	Description	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.	LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.
	Name	Description					
	Comments	An array of strings containing one or more strings with the user-defined descriptive comments, if any, on the key. Although entry of an email address in the comment field of an SSH key is traditional, this is not a required format. The comment may contain any characters supported for string fields, including spaces and most punctuation marks. Keys created through the Keyfactor Command Management Portal or with the <i>POST /SSH/Keys/MyKey</i> or <i>POST /SSH/ServiceAccounts</i> method will contain only one string in the array.					
LogonCount	An integer indicating the number of Linux logons associated with the SSH key pair.						
Username	A string indicating the full username of the user or service account. For a user account, the username appears in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a service account, the username is made up of the user name and <i>ClientHostname</i> entered when the service account is created (e.g. myapp@appsrvr75).						
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons mapped to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Users

The `POST /SSH/Users` method is used to create a new SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons during creation to allow the public key for the user to be published out to a Linux server—for servers in *inventory* and *publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /ssh/server_admin/
- OR
- /ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to login mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 603: POST SSH Users Input Parameters

Name	In	Description
Username	Body	<p>Required. A string indicating the full username of the <i>user</i> or <i>service account</i>.</p> <p>For a <i>user</i> account, the username is given in DOMAIN\username format (e.g. KEYEXAMPLE\jsmith). For a <i>service account</i>, the username is made up of a user name (e.g. svc_myapp) and client hostname reference for the service account. The client hostname is used for reference only and does not need to match an actual client hostname. The naming convention is to enter the hostname of the server on which the application that will use the private key resides (e.g. appsrvr12), but you can put anything you like in this field (e.g. cheesetoast). The full service account name is given in the form username@clienthostname (e.g. svc_myapp@appsrvr75).</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <div>[12, 27, 39]</div> <p>Use the <i>GET /SSH/Logons</i> method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p>

Table 604: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

✧ for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT SSH Users

The PUT /SSH/Users method is used to update an existing SSH user in Keyfactor Command and, optionally, associate the user with one or more Linux logons to allow the public key for the user to be published out to a Linux server—for servers in *inventory and publish policy* mode. This method returns HTTP 200 OK on a success with the details of the user to login mapping, if any.

✧ **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/

SSH actions are affected by ownership on the server group with which user to login mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

Table 605: PUT SSH Users Input Parameters

Name	In	Description
ID	Body	Required. An integer indicating the Keyfactor Command reference ID of the SSH user. Use the GET /SSH/Users method (see GET SSH Users on page 1349) to retrieve a list of all the SSH users to determine the user's ID.
LogonIds	Body	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside. These are provided in the following format: <div>[12, 27, 39]</div> Use the GET /SSH/Logons method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID(s). <div> Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1349) before updating and provide both existing and new logon IDs.</div>

Table 606: POST SSH Users Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID of the SSH user.
Username	A string indicating the full username of the <i>user</i> or <i>service account</i> .
LogonIds	An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST SSH Users Access

The POST /SSH/Users/Access method is used to create a mapping of one or more Linux logons to a Keyfactor Command user or service account. This method returns HTTP 200 OK on a success with the details of the user to logon mapping, if any.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssh/server_admin/
OR
/ssh/enterprise_admin/
SSH actions are affected by ownership on the server group with which user to logon mappings are associated and limited for users with only the *Server Admin* (/ssh/server_admin/) role. For more information, see *SSH Permissions* in the *Keyfactor Command Reference Guide*.

 **Tip:** Before creating a logon to user mapping, be sure that you have switched the server to which you will add your mapping (or its server group) to *inventory and publish policy* mode so that the key for the user will be published to the server. If the server is in *inventory only* mode and you add a mapping for it in Keyfactor Command, the mapping will appear in Keyfactor Command only and the key for the user will not be published out to the server.

Table 607: POST SSH Users Access Input Parameters

Name	In	Description
ID	Body	<p>Required. An integer indicating the Keyfactor Command reference ID of the SSH user.</p> <p>Use the GET /SSH/Users method (see GET SSH Users on page 1349) to retrieve a list of all the SSH users to determine the user's ID.</p>
LogonIds	Body	<p>An array of integers indicating the Keyfactor Command reference IDs for the Linux logons to map to the user to cause the user's SSH public key to be published out to the Linux servers on which those logons reside.</p> <p>These are provided in the following format:</p> <pre>[12, 27, 39]</pre> <p>Use the GET /SSH/Logons method (see GET SSH Logons on page 1221) to retrieve a list of all the SSH logons to determine the logon's ID(s).</p> <div>  <p>Important: Logon IDs you provide here replace any existing logon IDs associated with the user. To avoid accidentally removing access for users, check existing logons for the user (see GET SSH Users on page 1349) before updating and provide both existing and new logon IDs.</p> </div>

Table 608: POST SSH Users Access Response Data

Name	Description																		
Id	An integer indicating the Keyfactor Command reference ID of the SSH user.																		
Key	<p>An object containing information about the key for the user. Key details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the SSH user's key.</td></tr> <tr> <td>Fingerprint</td><td>A string indicating the fingerprint of the public key. Access	An object containing information about the users mapped to the Linux logon.
Name	Description										
Id	An integer indicating the Keyfactor Command reference ID of the Linux logon.										
Username	A string indicating the user's logon name on the Linux server.										
KeyCount	An integer indicating the number of SSH keys associated with the Linux logon.										
Access	An object containing information about the users mapped to the Linux logon.										
IsGroup	A Boolean indicating whether the user is an Active Directory group (true) or not (false).										

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.35 SMTP

The SMTP component of the Keyfactor API includes methods necessary to programmatically edit and retrieve the SMTP configuration profile and send a test email message. Editing the SMTP configuration profile in Keyfactor Command will only apply within the software. Only one SMTP profile may be configured.

Table 609: SMTP Endpoints

Endpoint	Method	Description	Link
/	GET	Returns information about the SMTP configuration profile.	GET SMTP below
/	PUT	Updates settings for the SMTP configuration profile.	PUT SMTP on page 1369
/Test	POST	Sends a test email message to confirm SMTP configuration.	POST SMTP Test on page 1372

2.6.35.1 GET SMTP

The GET /SMTP method is used to retrieve the SMTP configuration profile from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SMTP profile. Only one profile may be configured. There are no input parameters for this method.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/system_settings/read/`

Table 610: GET SMTP Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future release.</p>						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.35.2 PUT SMTP

The PUT /SMTP method is used to update the SMTP configuration profile information. This method returns HTTP 200 OK on a success with details about the SMTP configuration profile.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/system_setting/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 611: PUT SMTP Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	Required. An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Anonymous</td></tr><tr><td>2</td><td>Explicit Credentials</td></tr></table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<p>Required*. A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>No data is output in this field on a GET.</p>						
RelayUsername	Body	<p>Required*. A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	Body	Required. A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthentic-</i>						

Name	In	Description
		<i>ationType</i> .
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 612: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.35.3 POST SMTP Test

The POST /SMTP/Test method is used to test the SMTP settings by sending a test email message. This method returns HTTP 200 OK on a success with details about the SMTP profile.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/system_setting/modify/

Table 613: POST SMTP Test Input Parameters

Name	In	Description						
Host	Body	Required. A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	Body	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	Body	Required. An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	Body	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Anonymous</td></tr><tr><td>2</td><td>Explicit Credentials</td></tr></table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description							
0	Anonymous							
2	Explicit Credentials							
RelayPassword	Body	<p>Required[*]. A string indicating the password of the user specified by <i>RelayUsername</i> if <i>RelayAuthenticationType</i> is set to 2. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>No data is output in this field on a GET.</p>						
RelayUsername	Body	<p>Required[*]. A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\\username format. This field is required if <i>RelayAuthenticationType</i> is set to 2.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	Body	Required. A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderAddress	Body	<p>A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com).</p> <p>This is considered deprecated and may be removed in a future</p>						

Name	In	Description
		release.
SenderName	Body	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .
TestRecipient	Body	Required. A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.
UseSSL	Body	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.

Table 614: POST SMTP Test Response Data

Name	Description						
Host	A string indicating the fully qualified domain name of your SMTP host (e.g. corpexch02.keyexample.com).						
Id	An integer indicating the Keyfactor Command reference ID of the SMTP record. This will be 1 in most environments.						
Port	An integer indicating the SMTP port (e.g. 25).						
RelayAuthenticationType	<p>An integer indicating the type of authentication used to connect to the mail server. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Anonymous</td></tr> <tr> <td>2</td><td>Explicit Credentials</td></tr> </table>	Value	Description	0	Anonymous	2	Explicit Credentials
Value	Description						
0	Anonymous						
2	Explicit Credentials						
RelayUsername	<p>A string indicating the username of the account providing authentication to the mail server if <i>RelayAuthenticationType</i> is set to 2. The username should be provided in DOMAIN\username format.</p> <p>For most mail server configurations, the username provided must have as a valid email address the email address you set in the <i>SenderAccount</i> parameter.</p>						
SenderAccount	A string indicating the sender for email messages delivered from Keyfactor Command, in the form of an email address (e.g. jsmith@keyexample.com). Depending on the email configuration in your environment, the sender account may need to be a valid user on your mail server or you may be able to put anything in this field.						
SenderName	A string indicating the name that appears as the “from” in the user’s mail client (e.g. Keyfactor Command). This value is used for both configurations of <i>RelayAuthenticationType</i> .						
TestRecipient	A string indicating the recipient name, in email format (e.g. mjones@keyexample.com), for a test message to be sent using the SMTP configuration to confirm functionality.						
UseSSL	A Boolean indicating that mail should be delivered over TLS/SSL. Not all mail servers support this.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36 SSL

The SSL component of the Keyfactor API includes methods necessary to programmatically create, delete, edit, and list SSL networks, network ranges, and endpoints found in an SSL scan.

Table 615: SSL Endpoints

Endpoint	Method	Description	Link
/Parts/{id}	GET	Returns detailed information about a scan job for SSL discovery or monitoring.	GET SSL Parts ID on page 1378
/Endpoints/{id}	GET	Returns the details about a single endpoint discovered during SSL scanning.	GET SSL Endpoints ID on page 1380
/NetworkRanges/{id}	DELETE	Removes all network ranges from the specified SSL network.	DELETE SSL NetworkRanges ID on page 1381
/NetworkRanges/{id}	GET	Returns network range information about the specified SSL network.	GET SSL NetworkRanges ID on page 1382
/Networks/{identifier}	GET	Returns information about the specified SSL network.	GET SSL Networks Identifier on page 1383
/	GET	Returns the results of an SSL scan based on query information.	GET SSL on page 1392
/Networks	GET	Returns information about all SSL networks in Keyfactor Command.	GET SSL Networks on page 1394
/Networks	POST	Creates a new SSL network.	POST SSL Networks on page 1404
/Networks	PUT	Updates an existing SSL network.	PUT SSL Networks on page 1417

Endpoint	Method	Description	Link
/Endpoints/{id}/History	GET	Returns a list of all the SSL scanning endpoint histories for an endpoint with the given ID.	GET SSL Endpoints ID History on page 1431
/Networks/{id}/Parts	GET	Returns the scan job information for SSL discovery or monitoring.	GET SSL Networks ID Parts on page 1437
/NetworkRanges	POST	Adds network ranges to the specified SSL network.	POST SSL NetworkRanges on page 1439
/NetworkRanges	PUT	Updates network range information on the specified SSL network.	PUT SSL NetworkRanges on page 1440
/Endpoints/ReviewStatus	PUT	Used to change the <i>reviewed</i> status for a given SSL endpoint.	PUT SSL Endpoints Review Status on page 1441
/Endpoints/MonitorStatus	PUT	Used to change the <i>monitoring</i> status for a given SSL endpoint.	PUT SSL Endpoints Monitor Status on page 1442
/Endpoints/ReviewAll	PUT	Used to change the <i>reviewed</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Review All on page 1442
/Endpoints/MonitorAll	PUT	Used to change the <i>monitoring</i> status for all given SSL endpoints to true.	PUT SSL Endpoints Monitor All on page 1443
/Networks/{id}/Scan	POST	Starts an SSL discovery or monitoring scan job manually.	POST SSL Networks ID Scan on page 1444
/NetworkRanges/Validate	POST	Validates all SSL networks given.	POST SSL NetworkRanges Validate on page 1445
/Networks/{id}	DELETE	Removes an SSL network from Keyfactor Command.	DELETE SSL Networks ID on page 1446

2.6.36.1 GET SSL Parts ID

The GET /SSL/Parts/{id} method retrieves information for a specific job scan segment (see [GET SSL Networks ID Parts on page 1437](#)). This method returns HTTP 200 OK on a success with details about the specified scan job segment.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 616: GET SSL Parts {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL scan job segment to be retrieved. Use the <i>GET /SSL/Networks/{id}/Parts</i> method (see GET SSL Networks ID Parts on page 1437) to retrieve a list of all the scan job segments in an SSL network to determine the SSL scan job segment's GUID.

Table 617: GET SSL Parts {id} Response Data

Parameter Name	Description								
ScanJobPartId	A string indicating the Keyfactor Command reference GUID for the scan job segment.								
LogicalScanJobId	A string indicating the Keyfactor Command reference GUID for the scan job as a whole.								
AgentJobId	A string indicating the Keyfactor Command reference GUID for the orchestrator that ran the job segment, if applicable. If the segment has not yet started scanning, this will show all zeros.								
EstimatedEndpointCount	<p>An integer indicating the number of endpoints that will be scanned for the segment estimated in preparation for scanning.</p> <p>The number of endpoints per segment is configurable (see the <i>SSL Maximum Scan Job Size</i> setting on the agents tab in <i>Application Settings: Agents Tab</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
Status	<p>An integer indicating the status of the scan job segment. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Not Started</td></tr> <tr> <td>2</td><td>In Progress</td></tr> <tr> <td>3</td><td>Complete</td></tr> </table>	Value	Description	1	Not Started	2	In Progress	3	Complete
Value	Description								
1	Not Started								
2	In Progress								
3	Complete								
StatTotalEndpointCount	An integer indicating the number of endpoints that were scanned for the segment. This value will be null if the scan is not yet complete.								
StatTimedOutConnectingCount	An integer indicating the number of endpoints that timed out while attempting connections. This value will be null if the scan is not yet complete.								
StatConnectionRefusedCount	An integer indicating the number of endpoints that received a connection refused while attempting connections. This value will be null if the scan is not yet complete.								
StatTimedOutDownloadingCount	An integer indicating the number of endpoints that timed out while downloading while attempting connections. This value will be null if the scan is not yet complete.								

Parameter Name	Description
StatExceptionDownloadingCount	An integer indicating the number of endpoints that encountered an exception while attempting connections. This value will be null if the scan is not yet complete.
StatNotSslCount	An integer indicating the number of endpoints that made a connection and were considered not SSL (connection on a non-SSL port such as 22 or 636). This value will be null if the scan is not yet complete.
StatBadSslHandshakeCount	An integer indicating the number of endpoints that had a bad handshake while attempting connections. This value will be null if the scan is not yet complete.
StatCertificateFoundCount	An integer indicating the number of endpoints where a certificate was found. This value will be null if the scan is not yet complete.
StatNoCertificateCount	An integer indicating the number of endpoints where the handshake got to the part of the TLS where a certificate should be returned, but did not find a certificate. This is an uncommon occurrence, so will usually be zero.
ScanJobPartsDefinitions	This is no longer in use and will always return "null".
StartTime	A string indicating the date and time at which the scan job segment started in UTC. For jobs that have not yet started, this value will be null.
EndTime	A string indicating the date and time at which the scan job segment finished in UTC. For jobs that have not yet started, this value will be null.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.2 GET SSL Endpoints ID

The GET /SSL/Endpoints/{id} method is used to retrieve information about an endpoint found in an SSL discover or monitor scan using the EndpointId. This method returns HTTP 200 OK on a success with details of the SSL endpoints.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/read/`

Table 618: GET SSL Endpoints {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the Keyfactor Command reference GUID for the SSL endpoint to be retrieved. Use the <i>GET /SSL</i> method (see GET SSL on page 1392) to retrieve a list of all the SSL endpoints to determine the SSL endpoint's GUID.

Table 619: GET SSL Endpoints {id} Response Data

Name	Description
EndpointId	A string indicating the Keyfactor Command reference GUID for the endpoint.
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network that scanned the endpoint.
LastHistoryId	A string indicating the Keyfactor Command reference GUID for the last history entry on the endpoint.
IpAddressBytes	A string indicating the IP address for the endpoint as bytes.
Port	An integer indicating the port on which this endpoint was found.
SNIName	A string indicating the server name indication (SNI) of the endpoint, if found.
EnableMonitor	A Boolean indicating whether monitoring is enabled on this endpoint (true) or not (false).
Reviewed	A Boolean indicating whether the endpoint has been reviewed (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.3 DELETE SSL NetworkRanges ID

The *DELETE /SSL/NetworkRanges/{id}* method is used to delete all the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no

content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/modify/`

Tip: To delete some but not all of the network ranges for a network, use the `PUT /SSL/Networks` method to update the network and submit the request with only those network ranges you wish to retain (see [PUT SSL Networks on page 1417](#)).

Table 620: DELETE SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to delete network ranges. Use the <code>GET /SSL/Networks</code> method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.4 GET SSL NetworkRanges ID

The `GET /SSL/NetworkRanges/{id}` method is used to retrieve the network ranges for an SSL network with the specified GUID from Keyfactor Command. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/ssl/read/`

Table 621: GET SSL Network Ranges {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network for which to retrieve network ranges. Use the <code>GET /SSL/Networks</code> method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 622: GET SSL Network Ranges {id} Response Data

Name	Description										
ItemType	An integer indicating the type of network range. Possible values are: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>IP Address</td></tr> <tr> <td>2</td><td>Host Name</td></tr> <tr> <td>3</td><td>Network Notation</td></tr> </table>	Value	Description	0	Unknown	1	IP Address	2	Host Name	3	Network Notation
Value	Description										
0	Unknown										
1	IP Address										
2	Host Name										
3	Network Notation										
Value	A string indicating the value for the network range, including the IP address, network notation or host name followed by the port or ports for scanning (e.g. 192.168.12.0/24:443).										

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.36.5 GET SSL Networks Identifier

The GET /SSL/Networks/{identifier} method is used to retrieve a defined SSL network according to the provided name from Keyfactor Command. This method returns HTTP 200 OK on a success with details about the SSL network.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 623: GET SSL Networks {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID for the SSL network to be retrieved. Use the <i>GET /SSL/Networks</i> method (see GET SSL Networks on page 1394) to retrieve a list of all the SSL networks to determine the SSL network's GUID.

Table 624: GET SSL Networks {id} Response Data

Name	Description										
NetworkId	A string indicating the Keyfactor Command reference GUID for the SSL network. This GUID is automatically set by Keyfactor Command.										
Name	A string indicating the name for the SSL network.										
AgentPoolName	A string indicating the name of the orchestrator pool assigned to the SSL network. See <i>Orchestrator Pools Definition</i> in the <i>Keyfactor Command Reference Guide</i> for more information.										
AgentPoolId	A string indicating the Keyfactor Command reference GUID for the orchestrator pool assigned to the SSL network.										
Description	A string indicating the description of the SSL network.										
Enabled	A Boolean that indicates whether scanning is enabled for the SSL network (true) or not (false). If this is set to false, no new network scans will be scheduled but any current scan will finish if one was in progress when the status was changed from true to false.										
DiscoverSchedule	<p>An object providing the discovery schedule for the SSL network group. The schedule can be off (unset) or one of the supported values. Supported schedule values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description										
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>										
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.						
Name	Description										
Minutes	An integer indicating the number of minutes between each interval.										

Name	Description																		
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description								
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).								
DiscoverPercentComplete	An integer indicating the percentage complete for a discovery job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
MonitorPercentComplete	An integer indicating the percentage complete for a monitoring job. The percentage complete will be zero for small jobs for the entire duration of the job because this value is updated upon completion of each segment of a scan job (and small jobs generally consist of only one segment). All jobs will show 100% at completion. The counter resets when a new job begins.								
DiscoverStatus	<p>An integer indicating the status of the discovery job. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Not Scheduled</td></tr> </table>	Value	Description	0	Unknown	1	Not Scheduled
