

Keyfactor Web APIs 11.0

Reference Guide

Table of Contents

1.0 Introduction	1
2.0 Keyfactor API Reference	2
2.1 Overview	2
2.2 Authenticating to the Keyfactor API	3
2.3 Transaction Security	8
2.4 Endpoint Common Features	8
2.5 Versioning	11
2.6 Keyfactor API Endpoints	11
2.6.1 Agents	12
2.6.1.1 GET Agents ID	13
2.6.1.2 GET Agents	17
2.6.1.3 POST Agents Reset	23
2.6.1.4 POST Agents Approve	23
2.6.1.5 POST Agents Disapprove	24
2.6.1.6 POST Agents ID Reset	25
2.6.1.7 POST Agents ID FetchLogs	25
2.6.1.8 POST Agents Set Auth Certificate Reenrollment	26
2.6.2 Agent Blueprint	28
2.6.2.1 DELETE Agent Blueprint ID	29
2.6.2.2 GET Agent Blueprint ID	30
2.6.2.3 GET Agent Blueprint	31
2.6.2.4 GET Agent Blueprint ID Jobs	32
2.6.2.5 GET Agent Blueprint ID Stores	37
2.6.2.6 POST AgentBlueprint ApplyBlueprint	40
2.6.2.7 POST AgentBlueprint GenerateBlueprint	41
2.6.3 Agent Pools	42
2.6.3.1 DELETE Agent Pools ID	42
2.6.3.2 GET Agent Pools ID	43
2.6.3.3 GET Agent Pools	45
2.6.3.4 POST Agent Pools	48
2.6.3.5 PUT Agent Pools	50
2.6.3.6 GET Agent Pools Agents	53
2.6.4 Alerts	55
2.6.4.1 Alerts Denied	55
2.6.4.2 Alerts Expiration	86
2.6.4.3 Alerts Issued	125
2.6.4.4 Alerts Key Rotation	161
2.6.4.5 Alerts Pending	194
2.6.5 AppSetting	235
2.6.5.1 GET AppSetting	235
2.6.5.2 GET AppSetting ID	237
2.6.5.3 PUT AppSetting	239
2.6.5.4 PUT AppSetting ID Set	241
2.6.5.5 PUT AppSetting Name Set	243
2.6.6 Audit	245
2.6.6.1 GET Audit ID	245
2.6.6.2 GET Audit ID Validate	250
2.6.6.3 GET Audit	251
2.6.6.4 GET Audit Download	257
2.6.6.5 GET Audit Related Entities	261
2.6.7 Certificates	267
2.6.7.1 GET Certificates ID Security	269
2.6.7.2 GET Certificates ID Validate	271
2.6.7.3 GET Certificates Locations ID	276
2.6.7.4 GET Certificates Identity Audit ID	279
2.6.7.5 DELETE Certificates ID	281

2.6.7.6	GET Certificates ID	282
2.6.7.7	GET Certificates Metadata Compare	294
2.6.7.8	GET Certificates ID History	296
2.6.7.9	DELETE Certificates	298
2.6.7.10	GET Certificates	299
2.6.7.11	PUT Certificates Metadata	314
2.6.7.12	PUT Certificates Metadata All	316
2.6.7.13	POST Certificates Import	320
2.6.7.14	POST Certificates Revoke	324
2.6.7.15	POST Certificates Analyze	326
2.6.7.16	POST Certificates Recover	327
2.6.7.17	POST Certificates Download	331
2.6.7.18	POST Certificates Revoke All	334
2.6.7.19	DELETE Certificates Query	337
2.6.7.20	DELETE Certificates Private Key	338
2.6.7.21	DELETE Certificates Private Key ID	339
2.6.8	Certificate Authority	340
2.6.8.1	DELETE Certificate Authority ID	343
2.6.8.2	GET Certificate Authority ID	344
2.6.8.3	GET Certificate Authority	358
2.6.8.4	POST Certificate Authority	373
2.6.8.5	PUT Certificate Authority	404
2.6.8.6	POST Certificate Authority Test	435
2.6.8.7	POST Certificate Authority PublishCRL	440
2.6.8.8	GET Certificate Authority Source Count	440
2.6.8.9	GET Certificate Authority Available Forests	441
2.6.8.10	GET Certificate Authority Health Monitoring Schedule	442
2.6.8.11	GET Certificate Authority Alert Recipients CA Health Recipients	442
2.6.8.12	POST Certificate Authority Alert Recipients CA Health Recipients	443
2.6.8.13	GET Certificate Authority Alert Recipients CA Health Recipients ID	444
2.6.8.14	DELETE Certificate Authority Alert Recipients CA Health Recipients ID	445
2.6.8.15	PUT Certificate Authority Alert Recipients CA Health Recipients ID	446
2.6.8.16	DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID	446
2.6.8.17	GET Certificate Authority Alert Recipients CA Threshold Recipients	447
2.6.8.18	GET Certificate Authority Alert Recipients CA Threshold Recipients ID	448
2.6.8.19	POST Certificate Authority Alert Recipients CA Threshold Recipients	448
2.6.8.20	PUT Certificate Authority Alert Recipients CA Threshold Recipients ID	449
2.6.8.21	POST Certificate Authority Import	450
2.6.9	Certificate Collections	451
2.6.9.1	GET Certificate Collections	452
2.6.9.2	POST Certificate Collections	455
2.6.9.3	PUT Certificate Collections	461
2.6.9.4	GET Certificate Collections ID	465
2.6.9.5	DELETE Certificate Collection ID	467
2.6.9.6	GET Certificate Collections Name	467
2.6.9.7	POST Certificate Collections Copy	470
2.6.9.8	GET Certificate Collection Nav Items	476
2.6.9.9	PUT Certificate Collection ID Favorite	476
2.6.9.10	GET Certificate Collections List	477
2.6.10	Certificate Stores	480
2.6.10.1	DELETE Certificate Stores	482
2.6.10.2	GET Certificate Stores	482
2.6.10.3	POST Certificate Stores	495
2.6.10.4	PUT Certificate Stores	523
2.6.10.5	DELETE Certificate Stores ID	552
2.6.10.6	GET Certificate Stores ID	553
2.6.10.7	GET Certificate Stores ID Inventory	571
2.6.10.8	PUT Certificate Stores Password	573
2.6.10.9	PUT Certificate Stores Discovery Job	575
2.6.10.10	PUT Certificate Stores Assign Container	581
2.6.10.11	POST Certificate Stores Approve	592
2.6.10.12	POST Certificate Stores Schedule	603

2.6.10.13	POST Certificate Stores Reenrollment	606
2.6.10.14	POST Certificate Stores Certificates Add	608
2.6.10.15	POST Certificate Stores Certificates Remove	615
2.6.11	Certificate Store Containers	618
2.6.11.1	GET Certificate Store Containers	619
2.6.11.2	POST Certificate Store Containers	622
2.6.11.3	PUT Certificate Store Containers	627
2.6.11.4	DELETE Certificate Store Containers ID	632
2.6.11.5	GET Certificate Store Containers ID	633
2.6.12	Certificate Store Types	654
2.6.12.1	DELETE Certificate Store Types ID	655
2.6.12.2	GET Certificate Store Types ID	655
2.6.12.3	GET CertificateStoreTypes Name Name	662
2.6.12.4	DELETE Certificate Store Types	669
2.6.12.5	GET Certificate Store Types	670
2.6.12.6	POST Certificate Store Types	676
2.6.12.7	PUT Certificate Store Types	690
2.6.13	Component Installation	706
2.6.13.1	DELETE Component Installation ID	707
2.6.13.2	GET Component Installation	707
2.6.14	CSR Generation	709
2.6.14.1	DELETE CSR Generation Pending ID	710
2.6.14.2	GET CSR Generation Pending ID	711
2.6.14.3	DELETE CSR Generation Pending	711
2.6.14.4	GET CSR Generation Pending	712
2.6.14.5	POST CSR Generation Generate	713
2.6.15	Custom Job Types	718
2.6.15.1	DELETE Custom Job Types ID	719
2.6.15.2	GET Custom Job Types ID	720
2.6.15.3	GET Custom Job Types	722
2.6.15.4	POST Custom Job Types	724
2.6.15.5	PUT Custom Job Types	728
2.6.16	Enrollment	732
2.6.16.1	GET Enrollment Settings ID	733
2.6.16.2	GET Enrollment CSR Content My	740
2.6.16.3	GET Enrollment PFX Content My	758
2.6.16.4	GET Enrollment Available Renewal ID	777
2.6.16.5	GET Enrollment Available Renewal Thumbprint	780
2.6.16.6	POST Enrollment CSR	782
2.6.16.7	POST Enrollment PFX	789
2.6.16.8	POST Enrollment CSR Parse	807
2.6.16.9	POST Enrollment PFX Deploy	809
2.6.16.10	POST Enrollment PFX Replace	815
2.6.16.11	POST Enrollment Renew	818
2.6.17	Event Handler Registration	820
2.6.17.1	GET Event Handler Registration	821
2.6.17.2	POST Event Handler Registration	823
2.6.17.3	GET Event Handler Registration ID	824
2.6.17.4	PUT Event Handler Registration ID	825
2.6.17.5	DELETE Event Handler Registration ID	827
2.6.18	Extensions Scripts	827
2.6.18.1	DELETE Extensions Scripts ID	828
2.6.18.2	GET Extensions Scripts ID	829
2.6.18.3	GET Extensions Scripts	830
2.6.18.4	POST Extensions Scripts	832
2.6.18.5	PUT Extensions Scripts	836
2.6.19	Identity Providers	838
2.6.19.1	GET Identity Providers ID	839
2.6.19.2	PUT Identity Providers ID	851
2.6.19.3	GET Identity Providers	878
2.6.19.4	GET Identity Providers Types	891
2.6.20	License	893

2.6.20.1	GET License	893
2.6.21	MacEnrollment	896
2.6.21.1	GET MacEnrollment	896
2.6.21.2	PUT MacEnrollment	897
2.6.22	MetadataFields	899
2.6.22.1	DELETE Metadata Fields ID	900
2.6.22.2	GET Metadata Fields ID	901
2.6.22.3	GET Metadata Fields Name	904
2.6.22.4	GET Metadata Fields ID In Use	908
2.6.22.5	DELETE Metadata Fields	909
2.6.22.6	GET Metadata Fields	910
2.6.22.7	POST Metadata Fields	914
2.6.22.8	PUT Metadata Fields	920
2.6.23	Monitoring	927
2.6.23.1	DELETE Monitoring Revocation ID	928
2.6.23.2	GET Monitoring Revocation ID	929
2.6.23.3	GET Monitoring Revocation	933
2.6.23.4	POST Monitoring Revocation	938
2.6.23.5	PUT Monitoring Revocation	946
2.6.23.6	POST Monitoring Resolve OSCP	954
2.6.23.7	POST Monitoring Revocation Test	955
2.6.23.8	POST Monitoring Revocation Test All	957
2.6.24	Orchestrator Jobs	958
2.6.24.1	GET Orchestrator Jobs Job Status Data	959
2.6.24.2	GET Orchestrator Jobs Job History	960
2.6.24.3	GET Orchestrator Jobs Scheduled Jobs	966
2.6.24.4	POST Orchestrator Jobs Custom	970
2.6.24.5	POST Orchestrator Jobs Reschedule	975
2.6.24.6	POST Orchestrator Jobs Unschedule	977
2.6.24.7	POST Orchestrator Jobs Acknowledge	979
2.6.24.8	POST Orchestrator Jobs Custom Bulk	980
2.6.25	PAM Providers	987
2.6.25.1	DELETE PAM Providers ID	987
2.6.25.2	GET PAM Providers ID	988
2.6.25.3	GET PAM Providers Types	996
2.6.25.4	POST PAM Providers Types	1000
2.6.25.5	GET PAM Providers	1003
2.6.25.6	POST PAM Providers	1012
2.6.25.7	PUT PAM Providers	1030
2.6.26	Permissions	1048
2.6.26.1	GET Permissions	1049
2.6.27	Permission Sets	1050
2.6.27.1	GET Permission Sets ID	1052
2.6.27.2	DELETE Permission Sets ID	1053
2.6.27.3	GET Permission Sets	1054
2.6.27.4	POST Permission Sets	1055
2.6.27.5	PUT Permission Sets	1056
2.6.28	Reports	1058
2.6.28.1	GET Reports ID	1059
2.6.28.2	DELETE Reports Custom ID	1067
2.6.28.3	GET Reports Custom ID	1068
2.6.28.4	DELETE Reports Schedules ID	1069
2.6.28.5	GET Reports Schedules ID	1070
2.6.28.6	GET Reports ID Parameters	1074
2.6.28.7	PUT Reports ID Parameters	1077
2.6.28.8	GET Reports	1079
2.6.28.9	PUT Reports	1082
2.6.28.10	GET Reports Custom	1085
2.6.28.11	POST Reports Custom	1087
2.6.28.12	PUT Reports Custom	1089
2.6.28.13	GET Reports ID Schedules	1090
2.6.28.14	POST Reports ID Schedules	1095

2.6.28.15	PUT Reports ID Schedules	1105
2.6.29	Scheduling	1115
2.6.29.1	POST Scheduling	1115
2.6.30	Security	1118
2.6.30.1	DELETE Security Identities ID	1119
2.6.30.2	GET Security Identities ID	1120
2.6.30.3	GET Security Identities Lookup	1124
2.6.30.4	GET Security Identities	1125
2.6.30.5	POST Security Identities	1129
2.6.30.6	GET Security Containers ID Roles	1130
2.6.30.7	POST Security Containers ID Roles	1131
2.6.30.8	GET Security Audit Collections ID	1133
2.6.30.9	GET Security My	1136
2.6.31	Security Claims	1136
2.6.31.1	GET Security Claims	1137
2.6.31.2	POST Security Claims	1140
2.6.31.3	PUT Security Claims	1144
2.6.31.4	GET Security Claims ID	1147
2.6.31.5	DELETE Security Claims ID	1149
2.6.31.6	GET Security Claims Roles	1149
2.6.32	Security Roles Permissions	1152
2.6.32.1	GET Security Roles ID Permissions	1154
2.6.32.2	GET Security Roles ID Permissions Global	1155
2.6.32.3	POST Security Roles ID Permissions Global	1156
2.6.32.4	PUT Security Roles ID Permissions Global	1158
2.6.32.5	GET Security Roles ID Permissions Containers	1160
2.6.32.6	POST Security Roles ID Permissions Containers	1161
2.6.32.7	PUT Security Roles ID Permissions Containers	1163
2.6.32.8	GET Security Roles ID Permissions Collections	1165
2.6.32.9	POST Security Roles ID Permissions Collections	1166
2.6.32.10	PUT Security Roles ID Permissions Collections	1168
2.6.32.11	GET Security Roles ID Permissions PAM Providers	1170
2.6.32.12	PUT Security Roles ID Permissions PAM Providers	1171
2.6.33	Security Roles	1172
2.6.33.1	DELETE Security Roles ID	1172
2.6.33.2	GET Security Roles ID	1173
2.6.33.3	GET Security Roles	1176
2.6.33.4	POST Security Roles	1178
2.6.33.5	PUT Security Roles	1186
2.6.34	SSH	1197
2.6.34.1	SSH Keys	1202

1.0 Introduction

The *Keyfactor Command Documentation Suite* includes:

- *Keyfactor Command Reference Guide*
- *Keyfactor API Reference Guide*
- *Keyfactor Command Server Installation Guide*
- *Keyfactor Orchestrators Installation and Configuration Guide*
- *Keyfactor Command Release Notes & Upgrading*

In addition, Keyfactor offers documentation for products that are not part of the *Keyfactor Command Documentation Suite*, including the *Keyfactor Command Upgrade Overview* and installation guides for third-party CA gateways that interface with Keyfactor, which are available upon request.

2.0 Keyfactor API Reference

The Keyfactor Command solution exposes an API to allow third-party software to integrate with the advanced certificate enrollment and management features of Keyfactor Command in a secure manner and to provide a mechanism for automating routine or bulk tasks that would be cumbersome to perform through the browser-based user interface. The API complements the web components of Keyfactor Command and offer a number of HTTP method calls that provide similar functionality to that available within the Management Portal's user interface, but which can be accessed programmatically by any system capable of making web requests. The API has the following goals and constraints:

- Provide a simple interface to make integration easy for third parties.
- Develop interoperability between different technology frameworks and operating systems.
- Support common certificate enrollment and management tasks.
- Deliver a securable interface.
- Preserve backward-compatibility so that existing clients continue to work, where possible.

Important: The Classic API, also known as the CMS API, was deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

2.1 Overview

In the current release, Keyfactor exposes one API for external use. The Keyfactor API was introduced in Keyfactor Command version 6.1 and as of Keyfactor Command 11.0 is the only supported API. The Keyfactor API allows for integration with other systems to automate certificate lifecycle management tasks. It will continue to be developed going forward to expose more core functionality that is built into the main product to allow for more in-depth integrations.

Documentation for the Keyfactor API is available as two companion pieces—this document (the *Keyfactor API Reference Guide*), which provides an overview of the API's endpoints, parameters to be provided in them, and data expected back from them, and the interactive code examples installed with your Keyfactor Command instance in the *Keyfactor API Reference and Utility*.

Important: The Classic API, also known as the CMS API, was deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

2.2 Authenticating to the Keyfactor API

When you make a connection to Keyfactor Command using the Keyfactor API, you need to provide authentication. If you're using Active Directory as an identity provider, you have the choice to authenticate to Keyfactor Command using Basic authentication or Windows integrated authentication. Any users who have already authenticated to Keyfactor Command before opening the Keyfactor API Reference and Utility in the same browser session will be seamlessly authenticated to Keyfactor Command automatically, and will not need to re-authenticate. The need to intentionally provide authentication for the Keyfactor API comes into play in situations such as:

- You are developing or running an application or script that leverages the Keyfactor API.
- You are running a workflow step of type *Invoke REST Request* with Active Directory Basic or Windows authentication.
- You are running a workflow step of type *Invoke REST Request with OAuth* with Keyfactor Identity Provider token authentication.
- You are using the Keyfactor API Reference and Utility and using Keyfactor Identity Provider as an identity provider (see [Acquire a Token to Authenticate to the Keyfactor API on the next page](#)).
- You are using the Keyfactor API Reference and Utility, using Active Directory as an identity provider, and have not authenticated to Keyfactor Command within the same browser session.

In many of these cases, you will probably want to make the API requests not as an individual user, but as a service account. The service account you use depends on the identity provider you're using:

- If you're using Active Directory as an identity provider, a standard Active Directory service account in the primary Keyfactor Command server forest can be used.
- If you're using Keyfactor Identity Provider as an identity provider, a client (not user) in Keyfactor Identity Provider is used. The client should be configured with a secret and have *Client authentication* and *Service account roles* enabled (see *Using Keyfactor Identity Provider: Service Accounts* in the *Keyfactor Command Server Installation Guide*). The user configuration the API will need the client ID and secret as well as the bearer token URL. This is the URL of the token endpoint for your Keyfactor Identity Provider instance. For example:

```
https://my-keyidp-server.keyexample.com/realms/Keyfactor/protocol/openid-connect/token
```

For Keyfactor Identity Provider, this is included among the information that can be found on the OpenID Endpoint Configuration page, a link to which can be found on the Realm Settings page (see *Gathering Keyfactor Identity Provider Data for the Keyfactor Command Installation* in the *Keyfactor Command Server Installation Guide*).

Keyfactor-API-Workflow-User OpenID Connect

Clients are applications and services that can be used for authentication of a user.

Settings Keys **Credentials** Roles Client scopes Service accounts roles Sessions Advanced

Client Authenticator Client Id and Secret

Client secret Copy your Client Secret. Regenerate

Registration access token Regenerate

Figure 1: Client Secret for Keyfactor API in Keyfactor Identity Provider

This service account needs to be granted appropriate permissions in Keyfactor Command to complete the API requests that will be run as this service account.

Acquire a Token to Authenticate to the Keyfactor API

If you're using the Keyfactor API Reference and Utility (Swagger) and using Keyfactor Identity Provider as an identity provider, you will need to acquire a token from the Keyfactor Identity Provider in order to authenticate to the Keyfactor API Reference and Utility. There are a number of approaches to doing this. Here we provide a couple of examples.

First, be sure that you have created a client in Keyfactor Identity Provider (see *Using Keyfactor Identity Provider: Service Accounts* in the *Keyfactor Command Server Installation Guide*) and that you know this information about the client:

- Client ID
- Client Secret
- Bearer Token URL for Keyfactor Identity Provider

To acquire a token to authenticate to the Keyfactor API in either via the Keyfactor API Reference and Utility or directly, from a Linux server execute a curl command similar to the following, referencing appropriate values for your client ID, client secret, and bearer token URL:

```
curl --request POST --url https://appsrvr18.keyexample.com:1443/realms/Keyfactor/protocol/openid-connect/token --header 'Content-Type: application/x-www-form-urlencoded' --data client_secret=o2mwI5LjZEAmcbC9dnhHq589B0f20qD4 --data client_id=Keyfactor-API-Workflow-User --data grant_type=client_credentials
```

To acquire a token to authenticate to the Keyfactor API in either via the Keyfactor API Reference and Utility or directly, in PowerShell execute a script similar to the following, referencing appropriate values for your client ID, client secret, and bearer token URL:

```
$Body = @{
    grant_type = "client_credentials"
    client_id = "Keyfactor-API-Workflow-User"
    client_secret = "o2mwI5LjZEAmcbC9dnhHq589B0f20qD4"
}

$Headers = @{
    'Content-Type' = 'application/x-www-form-urlencoded'
}

$TokenResults = Invoke-RestMethod -Method Post -Uri https://appsrvr18.keyexample.com:1443/realms/Key-
factor/protocol/openid-connect/token -Headers $Headers -Body $Body

# Output the token string to a file to avoid CR/LFs
$MyToken = $TokenResults.access_token
Set-Content -Value $MyToken -Path C:\Stuff\MyTokenOutFile.txt
```

In both cases, the results will include an `access_token` value in addition to other data, as shown in [Figure 2: Access Token for the Keyfactor API Reference and Utility](#). In the PowerShell case, this is output to a file to avoid introducing spaces or line wraps into the token value. You can open the output file, display the token without line wrapping, and copy the token value for pasting into the Keyfactor API Reference and Utility. Any line wraps that display on the screen in either the PowerShell window or text editor window will be interpreted by copy/paste as CR/LF, which will cause API commands to fail when the resulting token is submitted. Be sure to use a text editor to open the output file that can display the entire length of the token string as a single line. The built-in Windows Notepad application will display a maximum of 1024 characters on a line before wrapping even if word wrap is disabled. A tool such as the third-party Notepad++ is much less limited.

[illegible]

Figure 2: Access Token for the Keyfactor API Reference and Utility

To use the token in the Keyfactor API Reference and Utility:

1. Copy the access token value only with no spaces or CR/LFs. For example:

```
eyJhbGciOiJIUzI1NiIsInR5cCI6IkpzZW50b3R5Iiwia2lkIiA6ICJmYU04NjQ5UHAzRE1lNWNBWk4a3NYSV  
[portion removed for display ] KmIoPWfTu_APhMltlbXnn08NCic2TfaF_  
IrVjlc95EK4b6IaEbWcbCIg_  
896f5b0xrXedouGP12dbRH0qB2jffD1glDveTB2XL4WnbTVuSbgc2NsISoNzGZB-HGXIWllo41-  
PXX42nY5YUr7k0lf2W39HSojkyJRuwrbBjeVUmeDVQ_njCQ1rufxrDK1ZkAnbw3rYiJKGzsVJzAlNwTFiM6-  
9HPz68Nc1rPwviPyAmQ
```

2. In the Keyfactor API Reference and Utility click either the **Authorize** button at the top or one of the padlock authorization icons on each endpoint to open the authorization dialog.

The screenshot shows the 'Keyfactor API Reference and Utility' page. At the top, there's a title 'Keyfactor API Reference and Utility' with version '1.0' and 'OAS3' tags. Below the title, a paragraph explains the page's purpose: 'This page provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API.' Another paragraph mentions viewing documentation. A green 'Authorize' button with a padlock icon is visible. Below this, the 'Agent' section is shown with three endpoints: 'POST /Agents/{id}/FetchLogs', 'GET /Agents', and 'GET /Agents/{id}'. Each endpoint has a padlock icon. A red box highlights the 'Authorize' button and the padlock icons, with a callout stating: 'Click the Authorize button to provide a token. If the padlock is open, authorization has not yet been provided.' Another callout points to the padlock icons, stating: 'Click any one of the authorization padlocks to provide a token. If the padlock is open, authorization has not yet been provided.'

Figure 3: Keyfactor API Reference and Utility Authorize Options

3. In the Available authorizations dialog, paste in your access token value and click **Authorize**.

Available authorizations

Command-OIDC (http, Bearer)

JWT Authorization Bearer Token (Prefixing with "Bearer" is not required).

Value:

eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXLTJ5In0=

Click **Authorize** after pasting in your token value.

Authorize

Close

4. If authorization is successful, the Authorize button will change to *Logout*, and the padlocks will change to locked.

Figure 5: Successful Authorization in the Keyfactor API Reference and Utility

Tip: When using a token in the Keyfactor API Reference and Utility, you use the token value only. When you use a token to authenticate to the Keyfactor API other than through the Keyfactor API Reference and Utility, you need to precede the token value with *Bearer*. For example:

```
# Build the headers for the API request
$headers = @{"Authorization"="Bearer " + $TokenValue.access_token
"Accept"="application/json"
"x-keyfactor-requested-with"="APIClient"
}
```

For an example script using a token to authenticate to Keyfactor Command, see *Workflow Definitions Configuration Parameters Example: Use Custom PowerShell with Embedded REST Request, Send Email, and Require Approval* in the *Keyfactor API Reference Guide*.

Important: Keyfactor highly recommends that you use strong passwords for any accounts or certificates related to Keyfactor Command and associated products, especially when these have elevated or administrative access. A strong password has at least 12 characters (more is better) and multiple character classes (lowercase letters, uppercase letters, numeral, and symbols). Ideally, each password would be randomly generated. Avoid password re-use.

2.3 Transaction Security

The Keyfactor API relies on SSL/TLS to protect the HTTP communications between the client and Keyfactor Command server. In a typical deployment, the API will be configured for Basic authentication, where client credentials are provided in an HTTP header, formatted as *DOMAIN\user:Password* and base-64-encoded. Basic Authentication itself is not a secure way to pass a set of user credentials. However, it is very interoperable and works well across all of the various technologies that use the API. SSL is used to protect the confidentiality of user credentials; therefore, SSL should be used with the Keyfactor API.

Keyfactor recommends that any device using the API already be configured to trust the SSL certificate presented by Keyfactor Command, allowing the SSL connection to be established without error. The process for this will depend on the platform and operating environment of the connecting client, but the appropriate documentation or support for your platform should outline the necessary steps for this.

Access to the API methods can be limited per client to a maximum request frequency. The amount of time required between calls can be configured in the Keyfactor Command Management Portal Application Settings for the API (see Application Settings: API Tab in the *Keyfactor Command Reference Guide*). Increasing this interval can mitigate certain threats such as denial of service or dictionary attacks against passwords and other sensitive data. However, setting this too high can negatively impact performance of client applications that need to make a large number of requests.

2.4 Endpoint Common Features

Some aspects of the Keyfactor API request and response formats are consistent across all endpoints. This includes a small set of HTTP headers, HTTP statuses returned by the server for successful requests, and various error conditions. Common request headers are given in [Table 1: Common Request Headers](#), common response headers (for successful requests and certain unsuccessful requests) are given in [Table 2: Common Response Headers](#), and HTTP statuses are given in [Table 3: HTTP Statuses](#).

By default, all Keyfactor API methods start with a base path, which corresponds to an application under IIS; this path is configurable at install time. The default base path is *KeyfactorApi*. The API component name and method name then comprise the parts of the URL, each separated by a forward slash. For example, */KeyfactorApi/Certificates/Import* would be the URL format for the Import method of the Certificates component.

Table 1: Common Request Headers

Header Name	API Version	Header Value	Description
Content-Type	Both	application/json OR application/xml	POST methods use application/json. When application/xml is needed, it is specifically indicated on the endpoint page.
Accept	Both	application/json; charset=utf-8	Most methods returning complex values will use this content type.
Authorization	Both	Basic <base-64 DOMAIN\user:pass>	In most cases, Web API clients will use Basic authentication over SSL/TLS.
Host	Both	<Keyfactor Command server hostname>	Address of Keyfactor Command server. Automatically generated in most clients.
Content-Length	Both	Request length in bytes	Optional, but automatically generated by most clients.
X-Keyfactor-Requested-With	Both	XMLHttpRequest	This is mandatory to send in a request to the Keyfactor API on POSTs, PUTs, and DELETEs, and the value is case sensitive. This is for security.
X-Keyfactor-API-Version	Keyfactor API	1 or 2	Desired version of the endpoint. If not provided, this defaults to version 1.

Table 2: Common Response Headers

Header Name	Header Value	Description
Cache-Control	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Pragma	no-cache	API requests are generally not cacheable. Note that this is not respected by all client systems.
Content-Length	<varies>	Length of the HTTP response.
Content-Type	application/json	Most calls return application/json, but occasionally text/-

Header Name	Header Value	Description
		plain or text/xml.
Expires	-1	Usually ignored.
Server	<varies>	Software version reported by IIS platform hosting Keyfactor Command.
X-Keyfactor-Product-Version	<varies>	Keyfactor Command platform version.
X-Total-Count	<varies>	Total number of elements returned.
X-AspNet-Version	<varies>	Version of ASP.NET supporting Keyfactor Command installation.
X-Powered-By	ASP.NET	Header added by underlying ASP.NET implementation.
Date	<varies>	Timestamp of the HTTP response.

Table 3: HTTP Statuses

Number/Name	Description
200 OK	Request successful; results in response body
204 No Content	Request successful; no content in response body
400 Bad Request	Malformed or invalid data; additional information may be available in the response body and/or Keyfactor Command server logs
401 Unauthorized	Invalid credentials (user unauthenticated)
403 Forbidden	Can often indicate that the credentials map to a user without permissions for this action in Keyfactor Command (user unauthorized)
404 Page not Found	Invalid request path
500 Internal Server Error	Keyfactor Command encountered an unexpected error attempting to handle the request. See response body and Keyfactor Command server logs for details.
502 Bad Gateway	Keyfactor Command attempted to contact a CA or other upstream server to process the request, but was unable to. See Keyfactor Command server logs for details.

2.5 Versioning

The Keyfactor API is versioned as a set and released in conjunction with Keyfactor Command at the same version level (e.g. version 11.0). In addition, the Keyfactor API may have multiple versions of select endpoints.

The current strategy is to increment the version of an API when changes are made that might break backwards compatibility for existing clients. New endpoints are generally implemented in the most recent version of their API.

Generally, updates to an existing version of an endpoint are restricted to updates that should not break existing clients. Updates may be made that add HTTP response headers or response body parameters, or that correct existing bugs, or must be made to conform to newer or more granular security constraints. When an update cannot be made without breaking existing clients, a new endpoint is added in a later API version.

Figure 6: Select a Version in the Keyfactor API Reference and Utility

Most Keyfactor API endpoints have only one version, though a second version has been released for a select few endpoints. The Keyfactor API uses the `x-keyfactor-api-version` request header to differentiate between versions 1 and 2 of a given endpoint. If a version isn't specified, version 1 is assumed.

Important: The Classic API, also known as the CMS API, was deprecated in Keyfactor Command version 11. All uses of the Classic API should be migrated to the Keyfactor API prior to upgrading to Keyfactor Command version 11.

2.6 Keyfactor API Endpoints

The documentation for the Keyfactor API endpoints in the following sections includes descriptions for all the parameters available for each endpoint and short examples of specific parameters where that has been deemed to be helpful. For complete usage examples, see the Keyfactor API Reference and Utility.

Tip: Click the help icon (?) at the top of the Keyfactor Command Management Portal page next to the **Logout** button to find the embedded web copies of the *Keyfactor Command*

Documentation Suite and the Keyfactor API Reference and Utility.

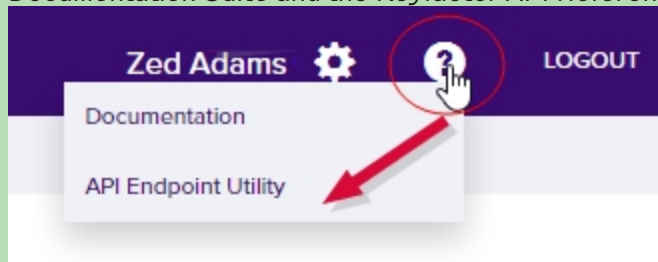

Figure 7: Documentation in the Help Dropdown

You can also browse to the *Keyfactor API Reference and Utility* directly using the following link (where *keyfactor.keyexample.com* is the fully qualified domain name of your Keyfactor Command server or the DNS alias you are using to reference your Keyfactor Command server, if applicable):

```
https://keyfactor.keyexample.com/KeyfactorAPI/ref/index#
```

```
https://keyfactor.keyexample.com/KeyfactorAPINET6/swagger
```

This link assumes that the Keyfactor API has been installed in the default IIS virtual directory (KeyfactorAPI). If you have installed in an alternate virtual directory, your path will be different.

2.6.1 Agents

The Agents component of the Keyfactor API includes methods necessary to list orchestrators and agents and schedule jobs to retrieve log files for orchestrators and agents that support that functionality.

Table 4: Agents Endpoints

Endpoint	Method	Description	Link
/ {id}	GET	Returns details for a single orchestrator or agent.	GET Agents ID on the next page
/	GET	Returns a list of all orchestrators and agents according to the provided filters and input parameters.	GET Agents on page 17
/Reset	POST	Resets one or more orchestrators or agents to a new state and clears jobs.	POST Agents Reset on page 23

Endpoint	Method	Description	Link
/Approve	POST	Approves an orchestrator.	POST Agents Approve on page 23
/Disapprove	POST	Disapproves an orchestrator.	POST Agents Disapprove on page 24
/id}/Reset	POST	Resets a single orchestrator or agent to a new state and clears jobs.	POST Agents ID Reset on page 25
/id}/FetchLogs	POST	Schedules a job on the orchestrator or agent to retrieve log files.	POST Agents ID FetchLogs on page 25
/SetAuthCertificateReenrollment	POST	Configures an orchestrator or agent to either request or require a new client authentication certificate on its next session registration.	POST Agents Set Auth Certificate Reenrollment on page 26

2.6.1.1 GET Agents ID

The GET /Agents/{id} method is used to retrieve a single orchestrator or agent registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 5: GET Agents{id} Input Parameters

Name	In	Description
id	Path	Required. The GUID of the orchestrator to retrieve. Use the <i>GET /Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

Table 6: GET Agent {id} Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.																		
AgentPlatform	<p>An integer indicating the platform for the orchestrator. Possible values are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Keyfactor Windows Orchestrator</td></tr> <tr> <td>2</td><td>Keyfactor Java Agent</td></tr> <tr> <td>3</td><td>Keyfactor Mac Auto-Enrollment Agent</td></tr> <tr> <td>4</td><td>Keyfactor Android Agent</td></tr> <tr> <td>5</td><td>Keyfactor Native Agent</td></tr> <tr> <td>6</td><td>Keyfactor Bash Orchestrator</td></tr> <tr> <td>7</td><td>Keyfactor Universal Orchestrator</td></tr> </table>	Value	Parameter Value	0	Unknown	1	Keyfactor Windows Orchestrator	2	Keyfactor Java Agent	3	Keyfactor Mac Auto-Enrollment Agent	4	Keyfactor Android Agent	5	Keyfactor Native Agent	6	Keyfactor Bash Orchestrator	7	Keyfactor Universal Orchestrator
Value	Parameter Value																		
0	Unknown																		
1	Keyfactor Windows Orchestrator																		
2	Keyfactor Java Agent																		
3	Keyfactor Mac Auto-Enrollment Agent																		
4	Keyfactor Android Agent																		
5	Keyfactor Native Agent																		
6	Keyfactor Bash Orchestrator																		
7	Keyfactor Universal Orchestrator																		
Version	A string indicating the version of the orchestrator.																		
Status	<p>An integer indicating the orchestrator status. Possible values are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>1</td><td>New</td></tr> <tr> <td>2</td><td>Approved</td></tr> <tr> <td>3</td><td>Disapproved</td></tr> </table>	Value	Parameter Value	1	New	2	Approved	3	Disapproved										
Value	Parameter Value																		
1	New																		
2	Approved																		
3	Disapproved																		
LastSeen	The time, in UTC, at which the orchestrator last contacted Keyfactor Command.

Name	Description								
Blueprint	A string indicating the name of the blueprint associated with the orchestrator.								
Thumbprint	A string indicating the thumbprint of the certificate that Keyfactor Command is expecting the orchestrator to use for client certificate authentication.								
LegacyThumbprint	A string indicating the thumbprint of the certificate previously used by the orchestrator for client certificate authentication before a certificate renewal operation took place (rotating the current thumbprint into the legacy thumbprint). The legacy thumbprint is cleared once the orchestrator successfully registers with the new thumbprint.								
AuthCertificateReenrollment	<p>An integer indicating the value of the orchestrator certificate reenrollment request or require status. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .								
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.								
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.2 GET Agents

The GET /Agents method is used to retrieve a list of orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all orchestrator details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/agents/management/read/`

Table 7: GET Agents Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Orchestrator Management Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AgentId • Blueprint • Capabilities (See Table 8: GET Agent Response Data Capabilities) • ClientMachine • ErrorCode • ErrorMessage (last error message) • Identity (Username) • LastSeen (DateTime) • Platform (Platform types: 0-Unknown, 1-.NET, 2-Java, 3-Mac, 4-Android, 5-Native, 6-Bash, 7-Universal Orchestrator) • Status (1-New, 2-Approved, 3-Disapproved) • Version <div>  <p>Tip: Use the following query to return only approved orchestrators:</p> <p style="text-align: center;">Status -eq "2"</p> <p>A value of 1 will return orchestrators with a status of <i>New</i> and a value of 3 will return orchestrators with a status of <i>Disapproved</i>.</p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Name	In	Description
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 8: GET Agent Response Data

Name	Description																		
AgentId	A string indicating the GUID of the orchestrator.																		
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																		
Username	A string indicating the Active Directory user or service account the orchestrator is using to connect to Keyfactor Command.

A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								
LastThumbprintUsed	A string indicating the thumbprint of the certificate that the orchestrator most recently used for client certificate authentication. In most cases, this will match the <i>Thumbprint</i> .								
LastErrorCode	An integer indicating the last error code, if any, reported from the orchestrator when trying to register a session. This code is cleared on successful session registration.								
LastErrorMessage	A string indicating the last error message, if any, reported from the orchestrator when trying to register a session. This message is cleared on successful session registration.								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.3 POST Agents Reset

The POST /Agents/Reset method is used to reset one or more orchestrators, including:

- Remove all current orchestrator jobs for the selected orchestrator(s).
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator(s) to allow them to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/
/agents/management/modify/

Table 9: POST Agents Reset Input Parameters

Name	In	Description
agentIds	Body	Required. An array of strings indicating the Keyfactor Command reference GUIDs of the orchestrators to reset. Use the <i>GET /Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.4 POST Agents Approve

The POST /Agents/Approve method is used to approve one or more orchestrators (a.k.a. agents). An orchestrator must be approved before jobs for it can be scheduled or carried out. This endpoint

returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/
/agents/management/modify/

Table 10: POST Agents Approve Input Parameters

Name	In	Description
agentIds	Body	Required. An array of strings indicating the GUIDs of the orchestrators to approve. Use the <i>GET Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.5 POST Agents Disapprove

The POST /Agents/Disapprove method is used to disapprove one or more orchestrators (a.k.a. agents). When an orchestrator is disapproved, operations with Keyfactor Command can no longer be carried out by this orchestrator. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/
/agents/management/modify/

Table 11: POST Agents Disapprove Input Parameters

Name	In	Description
agentIds	Body	Required. An array of strings indicating the orchestrator GUIDs to disapprove. Use the <i>GET Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.6 POST Agents ID Reset

The POST `/Agents/{id}/Reset` method is used to reset a single orchestrator, including:

- Remove all current orchestrator jobs for the selected orchestrator.
- Delete all associated certificate stores.
- Set the orchestrator status to new.
- For orchestrators configured to use client certificate authentication, clear the certificate thumbprints stored for the orchestrator to allow it to be reconfigured with a new certificate.

This endpoint returns 204 with no content upon success. On a failure, a 400 is returned with an error message.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/agents/management/read/`
`/agents/management/modify/`

Table 12: POST Agents {id} Reset Input Parameters

Name	In	Description
id	Path	Required. The GUID of the orchestrator to reset. Use the GET /Agents method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.7 POST Agents ID FetchLogs

The POST `/Agents/{id}/FetchLogs` method is used to schedule a job on a Native Agent to retrieve log files. The job will be scheduled to run immediately, which means it should complete within a few

minutes depending on other activity occurring at the same time. This method is currently only supported for the Native Agent. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/
/agents/management/modify/

Tip: To schedule a job to retrieve logs from a Keyfactor Universal Orchestrator, use the POST /OrchestratorJobs/Custom method (see [POST Orchestrator Jobs Custom on page 970](#)).

Table 13: POST Agents {id} FetchLogs Input Parameters

Name	In	Description
id	Path	Required. The GUID of the orchestrator to schedule the job for. Use the <i>GET /Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.1.8 POST Agents Set Auth Certificate Reenrollment

The POST /Agents/SetAuthCertificateReenrollment method is used to request or require that one or more orchestrators (a.k.a. agents) enroll for a new client authentication certificate on the orchestrator's next session registration. This method returns HTTP 200 OK on a success with information about any failed requests.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/
/agents/management/modify/

Table 14: POST Agents Set Auth Certificate Reenrollment Input Parameters

Name	In	Description								
OrchestratorIds	Body	<p>Required. An array of strings indicating the GUIDs of the orchestrators on which you want to change the AuthCertificateReenrollment value to request or require the orchestrator(s) to enroll for a new client authentication certificate on the next session registration. Use the <i>GET Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.</p>								
Status	Body	<p>An integer indicating the value that AuthCertificateReenrollment should be set to. Status options are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr><tr><td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr><tr><td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr></table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description									
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).									
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.									
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.									

Table 15: POST Agents Set Auth Certificate Reenrollment Response Data

Name	Description								
FailedOrchestratorIds	An array of strings indicating the GUIDs of orchestrators that failed to update.								
Status	<p>A string indicating the value for AuthCertificateReenrollment that was requested. Status options are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).</td></tr> <tr> <td>1</td><td>Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.</td></tr> <tr> <td>2</td><td>Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.</td></tr> </table>	Value	Description	0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).	1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.	2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.
Value	Description								
0	None—Unset the value so that the orchestrator will not request a new client authentication certificate (based on this value).								
1	Requested—The orchestrator will request a new client authentication certificate when it next registers for a session. Orchestrator activity will be allowed to continue as usual.								
2	Required—The orchestrator will request a new client authentication certificate when it next registers for a session. A new session will not be granted and orchestrator activity will not be allowed to continue until the orchestrator acquires a new certificate.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2 Agent BluePrint

The Agent BluePrint component of the Keyfactor API includes methods necessary to list, generate, and apply orchestrator and orchestrator blueprints for orchestrators and agents that support blueprint functionality.

Table 16: Agent BluePrint Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the orchestrator blueprint with the specified GUID.	DELETE Agent BluePrint ID on the

Endpoint	Method	Description	Link
			next page
/ {id}	GET	Returns details for the orchestrator blueprint with the specified GUID.	GET Agent Blueprint ID on the next page
/	GET	Returns details for all orchestrator blueprints.	GET Agent Blueprint on page 31
/ {id} /Jobs	GET	Returns details of the certificate store scheduled jobs for the orchestrator blueprint with the specified GUID.	GET Agent Blueprint ID Jobs on page 32
/ {id} /Stores	GET	Returns details of the certificate stores for the orchestrator blueprint with the specified GUID.	GET Agent Blueprint ID Stores on page 37
/ApplyBlueprint	POST	Applies an orchestrator blueprint to one or more orchestrators.	POST AgentBlueprint ApplyBlueprint on page 40
/GenerateBlueprint	POST	Creates a new orchestrator blueprint from an orchestrator.	POST AgentBlueprint GenerateBlueprint on page 41

2.6.2.1 DELETE Agent Blueprint ID

The DELETE /AgentBlueprint/{id} method is used to delete an existing orchestrator blueprint with the specified blueprint GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/agents/management/read/
/agents/management/modify/

Table 17: DELETE Agent Blueprint {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator blueprint that should be deleted. Use the <i>GET AgentBlueprint</i> method (see GET Agent Blueprint on page 31) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2.2 GET Agent Blueprint ID

The GET /AgentBlueprint/{id} method is used to retrieve information about the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with information about the blueprint.

Tip: To see the certificate stores or scheduled jobs associated with the blueprint, use the GET /AgentBlueprint/{id}/Jobs method (see [GET Agent Blueprint ID Jobs on page 32](#)) or GET /AgentBlueprint/{id}/Stores method (see [GET Agent Blueprint ID Stores on page 37](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 18: GET Agent Blueprint {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see GET Agent Blueprint on the next page) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.

Table 19: GET Agent Blueprint {id} Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2.3 GET Agent Blueprint

The GET /AgentBlueprint method is used to retrieve a list of blueprints defined for the orchestrators and agents registered in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of all blueprint details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/agents/management/read/`

Table 20: GET Agent Blueprint Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 21: GET Agent Blueprint Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
LastModified	A string indicating the date and time the blueprint was created.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2.4 GET Agent Blueprint ID Jobs

The GET /AgentBlueprint/{id}/Jobs method is used to retrieve details of the scheduled certificate store jobs for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint scheduled job details, including certificate stores.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 22: GET Agent Blueprint {id} Jobs Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see GET Agent Blueprint on page 31) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 23: GET Agent Blueprint {id} Jobs Response Data

Name	Description
AgentBlueprintJobId	A string indicating the GUID of the certificate store job associated with the blueprint.
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
JobType	A string indicating the GUID of the certificate store job type.
JobTypeName	A string indicating the certificate store job type (e.g. JksInventory).
OperationType	An integer indicating the type of operation (e.g. 2 = add to certificate store, 3 = remove from certificate store).
Thumbprint	A string indicating the thumbprint of the certificate to add to or remove from the certificate store. This field is populated only for management jobs.
Contents	A string containing the certificate to be added to the certificate store. This field is populated only for management add to certificate store jobs.
Alias	A string indicating the alias to be used for the certificate upon entry into or removal from the certificate store. The function of the alias varies depending on the certificate store type. For example, for a Java keystore, it is user-generated and stored in the keystore associated with the certificate while for PEM stores it is the thumbprint of the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field is populated only for management jobs.
PrivateKeyEntry	A Boolean indicating whether the certificate store has a separate private key file. This field is populated only for management jobs.
Overwrite	A Boolean indicating whether the certificate already in the certificate store should be overwritten with the new certificate, if applicable. This field is populated only for management jobs.
HasEntryPassword	A Boolean indicating whether the certificate in the certificate store has a different password from the certificate store itself. This field is populated only for management jobs.
HasPfxPassword	A Boolean indicating whether the certificate being added to the certificate store has a private key. This field is populated only for management jobs.
RequestTimestamp	A string indicating the time at which the management job was requested. This

Name	Description						
	field is populated only for management jobs.						
KeyfactorSchedule	An object containing the schedule for the certificate store job. This field is populated only for inventory and discovery jobs.						
Subject	A string containing the reenrollment subject name using X.500 format. This field is populated only for reenrollment jobs.						
Directories	A string containing the directory or directories to search during a discovery job. This field is populated only for discovery jobs.						
IgnoredDirectories	A string containing the directories that should not be included in the search during discovery jobs. This field is populated only for discovery jobs.						
SymLinks	A Boolean indicating whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file during discovery jobs. This option is ignored on Windows. This field is populated only for discovery jobs.						
Compatibility	A Boolean indicating whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false) during Java keystore discovery jobs. This field is populated only for discovery jobs.						
FileExtensions	A string containing the file extensions for which to search during a discovery job. For example, search for files with the extension “jks” in order to exclude files with other extensions such as “txt”. This field is populated only for discovery jobs.						
FileNamePatterns	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. myjks) during discovery jobs. This field is populated only for discovery jobs.						
AgentBlueprintStores	<p>An object that includes the certificate store information of the job. The following certificate store details are included:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentBlueprintStoreId</td><td>A string indicating the GUID of the certificate store associated with the blueprint.</td></tr> <tr> <td>AgentBlueprintId</td><td>A string indicating the GUID of the blueprint.</td></tr> </table>	Name	Description	AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.	AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	Description						
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.						
AgentBlueprintId	A string indicating the GUID of the blueprint.						

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>StorePath</td><td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</td></tr> <tr> <td>ContainerId</td><td>An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).</td></tr> <tr> <td>CertStoreType</td><td>An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.</td></tr> <tr> <td>CertStoreTypeName</td><td>A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).</td></tr> <tr> <td>Approved</td><td>A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.</td></tr> </table>	Name	Description	StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.	ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).	CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.	CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).	Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
Name	Description												
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.												
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).												
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.												
CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).												
Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.												

Name	Description						
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CreateIfMissing</td><td>A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.</td></tr> <tr> <td>Properties</td><td>A string containing additional properties for the store. Only some types of certificate stores have additional properties that are stored in this parameter. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).
Name	Description						
CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.						
Properties	A string containing additional properties for the store. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.2.5 GET Agent BluePrint ID Stores

The GET /AgentBluePrint/{id}/Stores method is used to retrieve details of the certificate stores for the orchestrator blueprint with the specified blueprint GUID. This method returns HTTP 200 OK on a success with a list of all the blueprint certificate store details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/

Table 24: GET Agent Blueprint {id} Stores Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator blueprint that should be retrieved. Use the <i>GET AgentBlueprint</i> method (see GET Agent Blueprint on page 31) to retrieve a list of all the blueprints to determine the orchestrator blueprint GUID.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>StorePath</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 25: GET Agent Blueprint {id} Stores Response Data

Name	Description
AgentBlueprintStoreId	A string indicating the GUID of the certificate store associated with the blueprint.
AgentBlueprintId	A string indicating the GUID of the blueprint.
StorePath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
CertStoreTypeName	A string indicating a reference name for the certificate store type (e.g. Java Keystore, PEM File).
Approved	A Boolean indicating whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean indicating whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2.6 POST AgentBlueprint ApplyBlueprint

The POST /AgentBlueprint/ApplyBlueprint method is used to apply a blueprint with associated certificate stores and scheduled jobs to an orchestrator. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/
/agents/management/modify/

Table 26: POST Agent Blueprint Apply Blueprint Input Parameters

Name	In	Description
templateId	Query	A string indicating the Keyfactor Command GUID of the blueprint to apply to the orchestrator(s). Use the <i>GET AgentBlueprint</i> method (see GET Agent Blueprint on page 31) to retrieve a list of all the blueprints to determine the blueprint GUIDs.
	Query	Required. An array of strings indicating the GUIDs of the orchestrators to which the blueprint should be applied. Use the <i>GET Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.  Note: Orchestrators must be approved before a blueprint can be applied.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.2.7 POST AgentBlueprint GenerateBlueprint

The POST /AgentBlueprint/GenerateBlueprint method is used to create a new blueprint based on the certificate stores and scheduled jobs of one orchestrator. This method returns HTTP 200 OK on a success with details of the new blueprint.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/agents/management/read/
/agents/management/modify/

Table 27: POST Agent Blueprint Generate Input Parameters

Name	In	Description
agentIds	Body	Required. A string indicating the GUID of the orchestrator that should be used to generate the blueprint. Use the <i>GET Agents</i> method (see GET Agents on page 17) to retrieve a list of all the orchestrators to determine the orchestrator GUIDs and current status of the orchestrators.
name	Body	Required. A string indicating the name for the new blueprint.

Table 28: POST Agent Blueprint Generate Response Data

Name	Description
AgentBlueprintId	A string indicating the GUID of the blueprint.
Name	A string indicating the name of the blueprint.
RequiredCapabilities	An array of strings indicating the type of capabilities required by the orchestrators to which the blueprint will be applied (e.g. JKS, PEM).
lastModified	A string indicating the date the blueprint was generated in UTC time.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3 Agent Pools

The Agent Pools component of the Keyfactor API includes methods necessary to programmatically add, edit, get, and delete Agent Pools. An orchestrator (a.k.a. agent) pool is a group of Keyfactor Command Windows Orchestrators and/or Universal Orchestrators that have the SSL capability. Each pool is used to divide the work of scanning a network between all orchestrators that are members of it.

Table 29: Agent Pool Endpoints

Endpoint	Method	Description	Links
/ {id}	DELETE	Deletes the specified orchestrator pool.	DELETE Agent Pools ID below
/ {id}	GET	Returns limited information about the orchestrators in the specified pool.	GET Agent Pools ID on the next page
/	GET	Returns a list of all orchestrator pools with limited information about the orchestrators assigned to each pool.	GET Agent Pools on page 45
/	POST	Creates an orchestrator pool based on information in the request.	POST Agent Pools on page 48
/	PUT	Updates an orchestrator pool based on information in the request.	PUT Agent Pools on page 50
/Agents	GET	Returns a list of orchestrators associated with the Default Agent Pool.	GET Agent Pools Agents on page 53

2.6.3.1 DELETE Agent Pools ID

The DELETE /AgentPools/{id} method is used to delete an existing orchestrator (a.k.a. agent) pool. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/ssl/read/
/ssl/modify/

Table 30: DELETE Agent Pools {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator pool to delete. Use the <i>GET /AgentPools</i> method (see GET Agent Pools on page 45) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID. The Default Agent Pool cannot be deleted.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3.2 GET Agent Pools ID

The *GET /AgentPools/{id}* method is used to return information about a single orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with details about the requested orchestrator pool.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 31: GET Agent Pools {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the orchestrator pool to retrieve. Use the <i>GET /AgentPools</i> method (see GET Agent Pools on page 45) to retrieve a list of all the orchestrator pools to determine the orchestrator pool GUID.

Table 32: GET AgentPools {id} Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3.3 GET Agent Pools

The GET /AgentPools method is used to retrieve all orchestrator (a.k.a. agent) pools. This method returns HTTP 200 OK on a success with a list of all agent pool details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 33: GET Agent Pools Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • <i>Id</i> (AgentPoolID) • <i>Name</i>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 34: GET AgentPools Response Data

Name	Description																
AgentPoolId	A string indicating the GUID of the orchestrator pool.																
Name	A string indicating the name of the orchestrator pool.																
DiscoverAgentsCount	An integer specifying the number of orchestrators in the pool that can perform discovery jobs.																
MonitorAgentsCount	An integer specifying the number of orchestrators in the pool that can perform monitoring jobs.																
Agents	<p>An array of objects containing the orchestrators that are assigned to the orchestrator pool, with accompanying data about the orchestrators. Orchestrator details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>AgentId</td><td>A string indicating the GUID of the orchestrator.</td></tr> <tr> <td>EnableDiscover</td><td>A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>EnableMonitor</td><td>A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).</td></tr> <tr> <td>Version</td><td>A string indicating the version of the orchestrator.</td></tr> <tr> <td>AllowsDiscover</td><td>A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).</td></tr> <tr> <td>AllowsMonitor</td><td>A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).</td></tr> <tr> <td>ClientMachine</td><td>A string indicating the client machine on which the orchestrator is installed.</td></tr> </table>	Name	Description	AgentId	A string indicating the GUID of the orchestrator.	EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).	EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).	Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3.4 POST Agent Pools

The POST /AgentPools method is used to create a new orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/
/ssl/modify/

Table 35: POST Agent Pools Input Parameters

Name	In	Description								
Name	Body	Required. A string indicating the name of the orchestrator pool.								
Agents	Body	<p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators must not be assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AgentId</td><td>Required. A string indicating the GUID of the orchestrator being assigned.</td></tr><tr><td>EnableDiscover</td><td>Required*. A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is required.</td></tr><tr><td>EnableMonitor</td><td>Required*. A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is required.</td></tr></table>	Name	Description	AgentId	Required. A string indicating the GUID of the orchestrator being assigned.	EnableDiscover	Required* . A Boolean that sets whether a discovery job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is required .	EnableMonitor	Required* . A Boolean that sets whether a monitoring job can be sent to this orchestrator. One of <i>EnabledDiscover</i> or <i>EnableMonitor</i> is required .
Name	Description									
AgentId	Required. A string indicating the GUID of the orchestrator being assigned.

Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3.5 PUT Agent Pools

The PUT /AgentPools method is used to update an existing orchestrator (a.k.a. agent) pool. This method returns HTTP 200 OK on a success with information about the orchestrator pool.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/
/ssl/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 37: PUT Agent Pools Input Parameters

Name	In	Description								
AgentPoolId	Body	Required. A string indicating the GUID of the orchestrator pool that is to be updated.								
Name	Body	Required. A string indicating the name of the orchestrator pool.								
Agents	Body	<p>A list of orchestrators that will be part of this orchestrator pool. The orchestrators must not be assigned to a different orchestrator pool (except the Default Agent Pool). Per orchestrator data that can be provided includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>AgentId</td><td>Required. A string indicating the GUID of the orchestrator being assigned.</td></tr><tr><td>EnableDiscover</td><td>Required*. A Boolean that sets whether a discovery job can be sent to this orchestrator. Version	A string indicating the version of the orchestrator.	AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).	AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).	ClientMachine	A string indicating the client machine on which the orchestrator is installed.
Name	Description																
AgentId	A string indicating the GUID of the orchestrator.																
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).																
Version	A string indicating the version of the orchestrator.																
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).																
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).																
ClientMachine	A string indicating the client machine on which the orchestrator is installed.																

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.3.6 GET Agent Pools Agents

The GET /AgentPools/Agents method is used to retrieve the orchestrators (a.k.a. agents) associated with the Default Agent Pool. This method has no required input parameters. It returns HTTP 200 OK on a success with information about the Default Agent Pool orchestrators.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/ssl/read/

Table 39: GET Agent Pools Default Agent Pool Agents Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Collection Manager</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Id (Orchestrator ID, AgentID) • ClientMachine • EnableDiscover (true or false) • EnableMonitor (true or false) • Version
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>AgentId</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 40: GET Agent Pools Default Agent Pool Agents Response Data

Name	Description
AgentId	A string indicating the GUID of the orchestrator.
EnableDiscover	A Boolean that indicates whether this orchestrator is allowed to perform discovery jobs for the orchestrator pool to which it has been assigned (true) or not (false).
EnableMonitor	A Boolean that indicates whether this orchestrator is allowed to perform monitoring jobs for the orchestrator pool to which it has been assigned (true) or not (false).
Version	A string indicating the version of the orchestrator.
AllowsDiscover	A Boolean that indicates whether this orchestrator has the capability to perform discovery jobs (true) or not (false).
AllowsMonitor	A Boolean that indicates whether this orchestrator has the capability to perform monitoring jobs (true) or not (false).
ClientMachine	A string indicating the client machine on which the orchestrator is installed.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.4 Alerts

The Alerts component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, test and delete alerts for denied certificate requests, expired certificates, issued certificate requests, pending certificate requests and SSH Key Rotations.

- [Alerts Denied below](#)
- [Alerts Expiration on page 86](#)
- [Alerts Issued on page 125](#)
- [Alerts Key Rotation on page 161](#)
- [Alerts Pending on page 194](#)

2.6.4.1 Alerts Denied

The Alerts Denied component of the Keyfactor API includes methods necessary to create, update, retrieve, and delete alerts for denied certificate requests.

Table 41: Alerts Denied

Endpoint	Method	Description	Link
/Alerts/Denied/{id}	DELETE	Deletes a denied certificate request alert for the specified ID.	DELETE Alerts Denied ID below
/Alerts/Denied/{id}	GET	Retrieves details for a denied certificate request alert for the specified ID.	GET Alerts Denied ID on the next page
/Alerts/Denied	PUT	Updates a denied certificate request alert for the specified ID.	PUT Alerts Denied on page 76
/Alerts/Denied	GET	Retrieves details for all configured denied certificate request alerts.	GET Alerts Denied on page 61
/Alerts/Denied	POST	Creates a new denied certificate request alert.	POST Alerts Denied on page 66

DELETE Alerts Denied ID

The DELETE /Alerts/Denied/{id} method is used to delete the denied certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 42: DELETE Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the denied certificate request alert to be deleted. Use the <i>GET /Alerts/Denied</i> method (see GET Alerts Denied on page 61) to retrieve a list of all the issued request alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Denied ID

The GET /Alerts/Denied/{id} method is used to retrieve details for the denied certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 43: GET Alerts Denied {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the denied certificate request alert. Use the <i>GET /Alerts/Denied</i> method (see GET Alerts Denied on page 61) to retrieve a list of all the issued request alerts to determine the alert ID.

Table 44: GET Alerts Denied {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Template: {template}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>CA: {careqid}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description

Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 														

Name	Description	
	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Denied

The GET /Alerts/Denied method is used to retrieve details of all denied certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL

parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified denied certificate request alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 45: GET Alerts Denied Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• DisplayName• Message• RegisteredEventHandlerId• Subject• Template_Id• UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 46: GET Alerts Denied Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Template: {template}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>CA: {careqid}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>6</td><td>DeniedLogger</td></tr> <tr> <td>7</td><td>DeniedPowershell</td></tr> </table>	ID	Event Handler Type	6	DeniedLogger	7	DeniedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description

DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 														

Name	Description	
	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Denied

The PUT /Alerts/Denied method is used to update a denied certificate request alert. This method returns HTTP 200 OK on a success with details about the denied certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 49: PUT Alerts Denied Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the denied request alert.
DisplayName	Body	Required. A string indicating the display name for the denied request alert. This name appears in the denied request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p>Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nWe are sorry to report that the certificate you requested on {subdate} in the name {rcn} has not been issued for the following reason:\n\n{cmnt}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Template: {template}</td><td>App Owner First Name: {metadata:Ap- pOwnerFirstName}</td></tr>\n<tr><td>CA: {care- qid}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</t- d><td>Business Critical: {metadata:Busi- nessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	In	Description
		 Note: The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. <div>  Note: The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. </div> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.
TemplateId	Body	<p>An integer indicating the certificate template for which the denied request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all denied certificate requests.</p> <p>Use the GET /Templates method (see GET Templates on page 1493) to retrieve a list of all the templates to determine the template ID.</p>

See <i>Table: Substitutable Special Text for Denied Certificate Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.4.2 Alerts Expiration

The Alerts Expiration component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for expired certificates.

Table 51: Alerts Expiration

Endpoint	Method	Description	Link
/Alerts/Expiration/{id}	DELETE	Deletes an expired certificate alert for the specified ID.	DELETE Alerts Expiration ID below
/Alerts/Expiration/{id}	GET	Retrieves details for an expired certificate alert for the specified ID.	GET Alerts Expiration ID on the next page
/Alerts/Expiration/Schedule	GET	Retrieves details of the schedule for delivery of expired certificate alerts.	GET Alerts Expiration Schedule on page 92
/Alerts/Expiration/Schedule	PUT	Updates the schedule for delivery of expired certificate alerts.	PUT Alerts Expiration Schedule on page 93
/Alerts/Expiration	GET	Retrieves details for all configured expired certificate alerts.	GET Alerts Expiration on page 95
/Alerts/Expiration	POST	Creates a new expired certificate alert.	POST Alerts Expiration on page 100
/Alerts/Expiration	PUT	Updates an expired certificate for the specified ID.	PUT Alerts Expiration on page 110
/Alerts/Expiration/Test	POST	Test an Expiration Alert	POST Alerts Expiration Test on page 120
/Alerts/Expiration/TestAll	POST	Test All Expiration Alerts	POST Alerts Expiration Test All on page 123

DELETE Alerts Expiration ID

The DELETE /Alerts/Expiration/{id} method is used to delete the expiration alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 52: DELETE Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the expiration alert to be deleted. Use the <i>GET /Alerts/Expiration</i> method (see GET Alerts Expiration on page 95) to retrieve a list of all the expiration alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Expiration ID

The *GET /Alerts/Expiration/{id}* method is used to retrieve details for the expiration alert with the specified ID. This method returns HTTP 200 OK on a success with details about the specified alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 53: GET Alerts Expiration {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the expiration alert. Use the <i>GET /Alerts/Expiration</i> method (see GET Alerts Expiration on page 95) to retrieve a list of all the expiration alerts to determine the alert ID.

Table 54: GET Alerts Expiration {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	<p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p>Example: When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div>

Name	Description						
	 2nd at 12:00 am UTC would be alerted on.						
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 						
CertificateQuery	<p>An object indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.
Value	Description						
Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.						
Name	A string containing the name of the certificate collection.						

Name	Description																
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>1</td><td>ExpirationLogger</td></tr> <tr> <td>2</td><td>ExpirationPowershell</td></tr> <tr> <td>3</td><td>ExpirationRenewal</td></tr> </table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	DisplayName	A string containing the name of the event handler. Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Expiration Schedule

The GET /Alerts/Expiration/Schedule method is used to retrieve the schedule for delivery of expiration alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with

details of the schedule for expiration alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 55: GET Alerts Expiration Schedule Response Data

Name	Description								
Schedule	<div>An object indicating the schedule for delivery of the expiration alerts.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Expiration

The GET /Alerts/Expiration method is used to retrieve details of all expiration alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 58: GET Alerts Expiration Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CertificateQueryId • Days • DisplayName • Message • RegisteredEventHandlerId • ScheduledTaskId • Subject • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 59: GET Alerts Expiration Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	<p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p>Example: When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Expiration

The POST /Alerts/Expiration method is used to create a new expiration alert. This method returns HTTP 200 OK on a success with details about the expiration alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Table 60: POST Alerts Expiration Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}. </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> <div>  Note: The \$(requester:givenname) substitutable special text token is only supported in environments using Active </div>

Name	In	Description
		 Directory as an identity provider.
ExpirationWarningDays	Body	<p>Required. An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p>Example: When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.</p> </div>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> {requester:mail} <p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p>

Name	In	Description														
		<div><div></div><div>Note: The \$(requester:mail) substitutable special text token is only supported in environments using Active Directory as an identity provider.</div></div> <ul style="list-style-type: none">Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.														
CertificateQueryId	Body	<p>Required. An integer indicating the certificate collection on which to base the alert.</p> <p>Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to retrieve a list of all the certificate collections to determine the collection ID.</p>														
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the event handler.<table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>1</td><td>ExpirationLogger</td></tr><tr><td>2</td><td>ExpirationPowershell</td></tr><tr><td>3</td><td>ExpirationRenewal</td></tr></table></td></tr><tr><td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr></table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>1</td><td>ExpirationLogger</td></tr><tr><td>2</td><td>ExpirationPowershell</td></tr><tr><td>3</td><td>ExpirationRenewal</td></tr></table>	ID	Event Handler Type	1	ExpirationLogger	2	ExpirationPowershell	3	ExpirationRenewal	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).

		<ul style="list-style-type: none"> • LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged. • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Expiration

The PUT /Alerts/Expiration method is used to update an expiration alert. This method returns HTTP 200 OK on a success with details about the alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 62: PUT Alerts Expiration Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	Body	Required. A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p>Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {cn} in the alert definition and each alert generated at processing time will contain the specific common name of the given certificate instead of the variable {cn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nThe certificate in the name {cn} issued on {certnotbefore} from {CAreqID} using the {template} template will expire on {certnotafter}. If this certificate is still in use, please consider getting a new one.\n\nCertificate inform- ation includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:Ap- pOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thum- bprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</t- d><td>Business Critical: {metadata:Busi- nessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	In	Description
		 Note: The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.
ExpirationWarningDays	Body	<p>Required. An integer indicating the number of days prior to expiration to send the warning.</p> <p> Example: When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September 2nd at 12:00 am UTC would be alerted on.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester

Table 63: PUT Alerts Expiration Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the expiration alert.
DisplayName	A string indicating the display name for the expiration alert. This name appears in the Expiration Certificate Request Alerts grid in the Management Portal.
Subject	A string indicating the subject for the email message that will be delivered when the alert is triggered.
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
ExpirationWarningDays	<p>An integer indicating the number of days prior to expiration to send the warning.</p> <div>  <p>Example: When alerts run, the alert engine reports on all the certificates expiring within the next X days (e.g. 30 days) from the execution time that have not previously been reported on. This means that if the alerts run daily and have been running daily regularly for some time, only a single day of expiring certificates will be reported on by any given alert run.</p> <p>For example, say you create a new alert that has never run before for collection A and set it to 30 days. You configure it to run daily at 5:00 am. The alert runs for the first time at 5:00 am on July 1st. All the certificates in collection A that will expire between July 1st at 12:00 am UTC and July 31 at 12:00 am UTC will be alerted on. The next day when the alert runs again at 5:00 am on July 2nd, the certificates in collection A expiring between July 31st at 12:00 am UTC and August 1st at 12:00 am UTC will be alerted on.</p> <p>If alerts are missed for a period of time (due to an outage, for example), the next run of the alerts will check the previous successful run date for the alerts and report on certificates expiring X days from that outage window. For example, using the collection A alert referenced above, say an outage caused the alerts not to run on August 1 and August 2. On August 3, the alert would run again at 5:00 am, and the certificates in collection A expiring between August 30th at 12:00 am UTC and September</p> </div>

Name	Description						
	 2nd at 12:00 am UTC would be alerted on.						
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 						
CertificateQuery	<p>An object indicating the certificate collection on which the alert is based. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the certificate collection.</td></tr> <tr> <td>Name</td><td>A string containing the name of the certificate collection.</td></tr> </table> <p>For more information about certificate collections, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the certificate collection.	Name	A string containing the name of the certificate collection.

Name	Description	
	Value	Description
		<ul style="list-style-type: none"> • LogTarget This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged. • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Expiration Test

The POST /Alerts/Expiration/Test method is used to test individual certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a

response of “NoActionTaken” if no certificates match the test criteria entered.

Tip: Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert.
By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you’re using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 64: POST Alerts Expiration Test Input Parameters

Name	In	Description
AlertId	Body	n integer indicating the reference ID of expiration alert to test. Use the GET /Alerts/Expiration method (see GET Alerts Expiration on page 95) to retrieve a list of all your expiration alerts to determine the alert Id.
EvaluationDate	Body	A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.
PreviousEvaluationDate	Body	A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 65: POST Alerts Expiration Test Response Data

Parameter	Description																		
ExpirationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CAName</td><td>A string indicating the certificate authority that issued the certificate in hostname\logical name format.</td></tr> <tr> <td>CARow</td><td>An integer containing the CA's reference ID for certificate.</td></tr> <tr> <td>IssuedCN</td><td>A string indicating the common name of the certificate.</td></tr> <tr> <td>Expiry</td><td>A string indicating the date and time when the certificate expires.</td></tr> <tr> <td>Subject</td><td>A string indicating the subject for the email message, including any replaced substitutable special text.</td></tr> <tr> <td>Message</td><td> <p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td></tr> <tr> <td>Recipients</td><td>An array of strings containing the recipients for the alert.</td></tr> <tr> <td>SendDate</td><td>A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).</td></tr> </table>	Name	Description	CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.	CARow	An integer containing the CA's reference ID for certificate.	IssuedCN	A string indicating the common name of the certificate.	Expiry	A string indicating the date and time when the certificate expires.	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipients	An array of strings containing the recipients for the alert.	SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).
Name	Description																		
CAName	A string indicating the certificate authority that issued the certificate in hostname\logical name format.

Message	<p>A string indicating the email message, including any replaced substitutable special text.</p> <p>See <i>Table: Substitutable Special Text for Expiration Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>																		
Recipients	An array of strings containing the recipients for the alert.																		
SendDate	A string indicating the date on which the alert will be sent, based on configuration of the <i>ExpirationWarningDays</i> in the alert (e.g. if the alert is configured for one month before expiration and the certificate expires on July 20, the alert will have a send date of June 20).																		
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Expiration Test All

The POST /Alerts/Expiration/TestAll method is used to test all certificate expiration alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated or a response of “NoActionTaken” if no certificates match the test criteria entered.

Tip: Alerts are generated when a certificate has expired or is approaching expiration as defined by the timeframe configured in the alert. By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Expiration Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you’re using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written, certificates renewed) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 66: POST Alerts Expiration Test All Input Parameters

Name	In	Description
EvaluationDate	Body	A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring certificates for testing purposes.
PreviousEvaluationDate	Body	A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

AlertBuildResult	A string indicating the outcome of the test (e.g. Success).																		

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.4.3 Alerts Issued

The Alerts Issued component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for issued certificate requests.

Table 68: Alerts Issued

Endpoint	Method	Description	Link
/Alerts/Issued/{id}	DELETE	Deletes an issued certificate request alert for the specified ID.	DELETE Alerts Issued ID below
/Alerts/Issued/{id}	GET	Retrieves details for an issued certificate request alert for the specified ID.	GET Alerts Issued ID on the next page
/Alerts/Issued/Schedule	GET	Retrieves details of the schedule for delivery of issued certificate request alerts.	GET Alerts Issued Schedule on page 130
/Alerts/Issued/Schedule	PUT	Updates the schedule for delivery of issued certificate request alerts.	PUT Alerts Issued Schedule on page 133
/Alerts/Issued	GET	Retrieves details for all configured issued certificate request alerts.	GET Alerts Issued on page 136
/Alerts/Issued	POST	Creates a new issued certificate request alert.	POST Alerts Issued on page 141
/Alerts/Issued	PUT	Updates an issued certificate request alert for the specified ID.	PUT Alerts Issued on page 151

DELETE Alerts Issued ID

The DELETE /Alerts/Issued/{id} method is used to delete the issued certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 69: DELETE Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the issued certificate request alert to be deleted. Use the <i>GET /Alerts/Issued</i> method (see GET Alerts Issued on page 136) to retrieve a list of all the issued request alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Issued ID

The *GET /Alerts/Issued/{id}* method is used to retrieve details for the issued certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 70: GET Alerts Issued {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the issued certificate request alert. Use the <i>GET /Alerts/Issued</i> method (see GET Alerts Issued on page 136) to retrieve a list of all the issued request alerts to determine the alert ID.

Table 71: GET Alerts Issued {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description

It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Issued Schedule

The GET /Alerts/Issued/Schedule method is used to retrieve the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a

success with details of the schedule for issued certificate request alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 72: GET Alerts Issued Schedule Response Data

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Issued Schedule

The PUT /Alerts/Issued/Schedule method is used to create or update the schedule for delivery of issued certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for issued certificate request alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 73: PUT Alerts Issued Schedule Input Parameters

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Issued

The GET /Alerts/Issued method is used to retrieve details of all issued certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified issued certificate request alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 75: GET Alerts Issued Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DisplayName • Message • RegisteredEventHandlerId • Subject • Template_Id • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 76: GET Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>4</td><td>IssuedLogger</td></tr> <tr> <td>5</td><td>IssuedPowershell</td></tr> </table>	ID	Event Handler Type	4	IssuedLogger	5	IssuedPowershell

DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 														

Name	Description	
	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Issued

The POST /Alerts/Issued method is used to create a new issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Table 77: POST Alerts Issued Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. Table 78: POST Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget 														

Name	Description	
	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Issued

The PUT /Alerts/Issued method is used to update an issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 79: PUT Alerts Issued Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	Body	Required. A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p>Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	In	Description
		 Note: The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. <div>  Note: The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. </div> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.
TemplateId	Body	<p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the GET /Templates method (see GET Templates on page 1493) to retrieve a list of all the templates to determine the template ID.</p>

	Value	Description
		<p>This type is used for the event logging handler and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Issued Certificate Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.4.4 Alerts Key Rotation

The Alerts Key Rotation component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for SSH keys approaching the end of the key lifetime.

The default key lifetime is 365 days, but this setting is configurable (see [Application Settings: SSH Tab](#) in the *Keyfactor Command Reference Guide*). Key rotation alerts apply to both user keys (see [My SSH Key](#) in the *Keyfactor Command Reference Guide*) and service account keys (see [Service Account Keys](#) in the *Keyfactor Command Reference Guide*) generated within Keyfactor Command.

Table 81: Alerts Key Rotation

Endpoint	Method	Description	Link
/Alerts/KeyRotation/{id}	DELETE	Deletes an SSH key rotation alert for the specified ID.	DELETE Alerts Key Rotation ID below
/Alerts/KeyRotation/{id}	GET	Retrieves details for the SSH key rotation alert for the specified ID.	GET Alerts Key Rotation ID on the next page
/Alerts/KeyRotation/Schedule	GET	Retrieves details of the schedule for delivery of SSH key rotation alerts.	GET Alerts Key Rotation Schedule on page 166
/Alerts/KeyRotation/Schedule	PUT	Updates the schedule for delivery of SSH key rotation alerts.	PUT Alerts Key Rotation Schedule on page 168
/Alerts/KeyRotation	GET	Retrieves details for all configured SSH key rotation alerts.	GET Alerts Key Rotation on page 171
/Alerts/KeyRotation	POST	Creates a new SSH key rotation alert.	POST Alerts Key Rotation on page 175
/Alerts/KeyRotation	PUT	Updates the SSH key rotation alert for a specified ID.	PUT Alerts Key Rotation on page 182
/Alerts/KeyRotation/Test	POST	Used to test specific SSH key rotation alerts.	POST Alerts Key Rotation Test on page 190
/Alerts/KeyRotation/TestAll	POST	Used to test all SSH key rotation alerts.	POST Alerts Key Rotation Test All on page 192

DELETE Alerts Key Rotation ID

The DELETE /Alerts/KeyRotation/{id} method is used to delete the SSH key rotation alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Table 82: DELETE Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert to be deleted. Use the GET <code>/Alerts/KeyRotation</code> method (see GET Alerts Key Rotation on page 171) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation ID

The GET `/Alerts/KeyRotation/{id}` method is used to retrieve details for the SSH key rotation alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 83: GET Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert. Use the GET <code>/Alerts/KeyRotation</code> method (see GET Alerts Key Rotation on page 171) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Table 84: GET Alerts Key Rotation {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n<table>\n<tr><th>Field</th><th>Value</th></tr>\n<tr><td>Username</td><td>{username}</td></tr>\n<tr><td>Fingerprint</td><td>{fingerprint}</td></tr>\n<tr><td>Comment</td><td>{comment}</td></tr>\n<tr><td>Key Length</td><td>{keylength}</td></tr>\n<tr><td>Key Type</td><td>{keytype}</td></tr>\n<tr><td>Number of Server Logons for Key</td><td>{serverlogons}</td></tr>\n</table>\n\nCorporate policy requires key rotation every year. Please visit the My SSH Key Portal for user keys or the Service Account Key Portal for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
RotationWarningDays	An integer indicating the number of days prior to the end of an SSH key’s life-time the alert should be triggered.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell								
ID	Event Handler Type														
10	SSHKeyRotationLogger														
11	SSHKeyRotationPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	<p>A string containing the parameter type. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation Schedule

The GET /Alerts/KeyRotation/Schedule method is used to retrieve the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 85: GET Alerts Key Rotation Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the SSH key rotation alerts. Possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. PUT Alerts Key Rotation Schedule

The PUT /Alerts/KeyRotation/Schedule method is used to create or update the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 86: PUT Alerts Key Rotation Schedule Input Parameters

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation

The GET /Alerts/KeyRotation method is used to retrieve details of all SSH key rotation alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 88: GET Alerts Key Rotation Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Days • DisplayName • Message • RegisteredEventHandlerId • ScheduledTaskId • Subject • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>10</td><td>SSHKeyRotationLogger</td></tr> <tr> <td>11</td><td>SSHKeyRotationPowershell</td></tr> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell								
ID	Event Handler Type														
10	SSHKeyRotationLogger														
11	SSHKeyRotationPowershell														
DisplayName	A string containing the name of the event handler.

		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation

The POST /Alerts/KeyRotation method is used to create a new SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 90: POST Alerts Key Rotation Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}. </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n<table>\n<tr><th>Field</th><th>Value</th></tr>\n<tr><td>Username</td><td>{username}</td></tr>\n<tr><td>Fingerprint</td><td>{fingerprint}</td></tr>\n<tr><td>Comment</td><td>{comment}</td></tr>\n<tr><td>Key Length</td><td>{keylength}</td></tr>\n<tr><td>Key Type</td><td>{keytype}</td></tr>\n<tr><td>Number of Server Logons for Key</td><td>{serverlogons}</td></tr>\n</table>\n\nCorporate policy requires key rotation every year. Please visit the My SSH Key Portal for user keys or the Service Account Key Portal for service account keys and request a new key pair.\n\nThanks!”</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

PUT Alerts Key Rotation

The PUT /Alerts/KeyRotation method is used to update a SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 92: PUT Alerts Key Rotation Input Parameters

		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation Test

The POST /Alerts/KeyRotation/Test method is used to test a specific SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime*

(days) application setting).

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/monitoring/alerts/read/
/monitoring/alerts/test/

Table 94: POST Alerts Key Rotation Test Input Parameters

Parameter	In	Description
AlertId	Body	Required. An integer of the reference ID of the SSH key rotation alert to test. Use the GET /Alerts/KeyRotation method (see GET Alerts Key Rotation on page 171) to retrieve a list of all your key rotation alerts to determine the alert Id.
EvaluationDate	Body	Required. A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	Required. A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 95: POST Alerts Key Rotation Test Response Data

Parameter	Description								
KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the subject for the email message, including any replaced substitutable special text.</td></tr> <tr> <td>Message</td><td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td></tr> <tr> <td>Recipient</td><td>A string indicating the recipient for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.

Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation Test All

The POST /Alerts/KeyRotation/TestAll method is used to test all SSH key rotation alerts. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting). By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 96: POST Alerts Key Rotation Test All Input Parameters

Parameter	In	Description
EvaluationDate	Body	Required. A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	Required. A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 97: POST Alerts Key Rotation Test All Response Data

KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td>A string indicating the subject for the email message, including any replaced substitutable special text.</td></tr> <tr> <td>Message</td><td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td></tr> <tr> <td>Recipient</td><td>A string indicating the recipient for the alert.</td></tr> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.								
Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See <i>Table: Substitutable Special Text for Key Rotation Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>								
Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.4.5 Alerts Pending

The Alerts Pending component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for certificate requests that require approval based on policy on the CA.

 **Important:** Pending alerts are **not** used to provide email alerts for certificate requests that require approval based on policies configured in Keyfactor Command workflows. These alerts are configured as steps within the workflow (see [Workflow Definitions on page 1559](#)). For more information about the difference between alerting for certificate requests that require manager approval at the CA level and alerting for certificate requests that require manager approval at the Keyfactor Command workflow level, see [Pending Certificate Request Alerts](#) in the *Keyfactor Command Reference Guide*.

Table 98: Alerts Pending

Endpoint	Method	Description	Link
/Alerts/Pending/{id}	DELETE	Deletes a pending certificate request alert for the specified ID.	DELETE Alerts Pending ID below
/Alerts/Pending/{id}	GET	Retrieves details for a pending certificate request alert for the specified ID.	GET Alerts Pending ID on the next page
/Alerts/Pending	PUT	Updates a pending certificate request alert for a specified ID.	PUT Alerts Pending on page 220
/Alerts/Pending/Schedule	GET	Retrieves details of the schedule for delivery of pending certificate request alerts.	GET Alerts Pending Schedule on page 200
/Alerts/Pending/Schedule	PUT	Updates the schedule for delivery of pending certificate request alerts.	PUT Alerts Pending Schedule on page 202
/Alerts/Pending	GET	Retrieves details for all configured pending certificate request alerts.	GET Alerts Pending on page 205
/Alerts/Pending	POST	Creates a new pending certificate request alert.	POST Alerts Pending on page 210
/Alerts/Pending/Test	POST	Tests all alerts	POST Alerts Pending TestAll on page 233
/Alerts/Pending/Test/{id}	POST	Tests specific alerts	POST Alerts Pending Test on page 231

DELETE Alerts Pending ID

The DELETE /Alerts/Pending/{id} method is used to delete the pending certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/modify/

Table 99: DELETE Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the pending certificate request alert to be deleted. Use the GET /Alerts/Pending method (see GET Alerts Pending on page 205) to retrieve a list of all the pending request alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending ID

The GET /Alerts/Pending/{id} method is used to retrieve details for the pending certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 100: GET Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the pending certificate request alert. Use the GET /Alerts/Pending method (see GET Alerts Pending on page 205) to retrieve a list of all the pending request alerts to determine the alert ID.

Table 101: GET Alerts Pending {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</t- d><td>App Owner Last Name: {metadata:Ap- pOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:

Name	Description										
	<ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell

Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 														

Name	Description	
	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending Schedule

The GET /Alerts/Pending/Schedule method is used to retrieve the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/read/`

Table 102: GET Alerts Pending Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the pending request alerts. Possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending

The GET /Alerts/Pending method is used to retrieve details of all pending certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alerts.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/

Table 105: GET Alerts Pending Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • DisplayName • Message • RegisteredEventHandlerId • ScheduledTaskId • Subject • Template_Id • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 106: GET Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</table></p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:

Name	Description										
	<ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> A string indicating the forest root of the template. <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	A string indicating the forest root of the template. <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	A string indicating the forest root of the template. <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 														

Name	Description	
	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending

The POST /Alerts/Pending method is used to create a new pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Table 107: POST Alerts Pending Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	Required. A string indicating the subject for the email message that will be delivered when the alert is triggered. <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	Body	Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML. <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> <div>  Note: The \$(requester:givenname) substitutable special text token is only supported in environments using Active Directory as an identity provider. </div>

Name	In	Description												
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"><code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. <div> Note: The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.</div> <ul style="list-style-type: none">Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.												
TemplateId	Body	<p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET <code>/Templates</code> method (see GET Templates on page 1493) to retrieve a list of all the templates to determine the template ID.</p>												
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>Id</td><td><p>An integer indicating the Keyfactor Command reference ID for the event handler.</p><table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>8</td><td>PendingLogger</td></tr><tr><td>9</td><td>PendingPowershell</td></tr></table></td></tr><tr><td>UseHandler</td><td><p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p></td></tr></table>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table><tr><th>ID</th><th>Event Handler Type</th></tr><tr><td>8</td><td>PendingLogger</td></tr><tr><td>9</td><td>PendingPowershell</td></tr></table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	UseHandler	<p>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</p>

```

Name	In	Description
CARequestId		A string containing the CA's reference ID for the certificate request.
CommonName		A string indicating the common name of the certificate.
LogicalName		A string indicating the logical name of the certificate authority.

Table 108: POST Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</t- d><td>App Owner Last Name: {metadata:Ap- pOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:

Name	Description										
	<ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td></tr> <tr> <td>ForestRoot</td><td> <p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div> </td></tr> <tr> <td>ConfigurationTenant</td><td>A string indicating the configuration tenant of the template.</td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div>  Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field. </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table> </td></tr> <tr> <td>DisplayName</td><td>A string containing the name of the event handler.</td></tr> <tr> <td>UseHandler</td><td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td></tr> </table> <p>For more information about event handlers, see <i>Using Event Handlers</i> in the <i>Keyfactor Command Reference Guide</i>.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table> <tr> <th>ID</th><th>Event Handler Type</th></tr> <tr> <td>8</td><td>PendingLogger</td></tr> <tr> <td>9</td><td>PendingPowershell</td></tr> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td></tr> <tr> <td>Key</td><td>A string indicating the reference name of the configured parameter.</td></tr> <tr> <td>DefaultValue</td><td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td></tr> <tr> <td>ParameterType</td><td> <p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler </td></tr> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 														

Name	Description	
	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see <i>Extensions/Scripts</i> in the <i>Keyfactor API Reference Guide</i>). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/monitoring/alerts/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 109: PUT Alerts Pending Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	Body	Required. A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  <p>Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</table></p> <p>See <i>Table: Substitutable Special Text for Pending Request Alerts</i> in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	In	Description
		 Note: The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. CARequestId	A string containing the CA's reference ID for the certificate request.				
CommonName	A string indicating the common name of the certificate.				
LogicalName	A string indicating the logical name of the certificate authority.				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending Test

The POST /Alerts/Pending/Test method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

Tip: Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 111: POST Alerts Pending Test Input Parameters

Name	In	Description
AlertId	Body	An integer indicating the Keyfactor Command reference ID for the pending alert.
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true), or not (false).

Table 112: POST Alerts Pending Test Response Data

Parameter	Description														
PendingAlerts	<p>An object containing alert details resulting from the test. Pending alert details are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Subject</td><td> <p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div> </td></tr> <tr> <td>Message</td><td>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</td></tr> <tr> <td>Recipients</td><td>An array of strings containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.</td></tr> <tr> <td>CARequestId</td><td>An string containing the CA's reference ID for the certificate request.</td></tr> <tr> <td>CommonName</td><td>A string indicating the common name of the certificate request.</td></tr> <tr> <td>LogicalName</td><td>A string indicating the logical name of the certificate authority from which the certificate was requested.</td></tr> </table>	Name	Description	Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>	Message	A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.	Recipients	An array of strings containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.	CARequestId	An string containing the CA's reference ID for the certificate request.	CommonName	A string indicating the common name of the certificate request.	LogicalName	A string indicating the logical name of the certificate authority from which the certificate was requested.
Name	Description														
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div>  Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}. </div>														
Message	A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.														
Recipients	An array of strings containing a list of strings with the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time.														
CARequestId	An string containing the CA's reference ID for the certificate request.														
CommonName	A string indicating the common name of the certificate request.														
LogicalName	A string indicating the logical name of the certificate authority from which the certificate was requested.														
AlertBuildResult	A string indicating the result of pending alerts test (e.g. Success).														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending TestAll

The POST /Alerts/Pending/TestAll method is used to test all pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting number of alerts generated.

Tip: Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/monitoring/alerts/read/
/monitoring/alerts/test/

Table 113: POST Alerts Pending Test All Input Parameters

Name	In	Description

CommonName	<p>A string indicating the common name of the certificate request.</p>														
LogicalName	<p>A string indicating the logical name of the certificate authority from which the certificate was requested.</p>														
AlertBuildResult	<p>An integer indicating the number of pending alerts run by the test.</p>														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.5 AppSetting

The AppSetting component of the Keyfactor API includes methods necessary to list and update application settings that control the behavior of Keyfactor Command features. For a complete list of available application settings, see Application Settings in the *Keyfactor Command Reference Guide*.

Table 115: AppSetting Endpoints

Endpoint	Method	Description	Link
/	GET	Returns details for all the application settings.	GET AppSetting below
/	PUT	Updates values configured for multiple application settings in a single command.	PUT AppSetting on page 239
/ {id}	GET	Returns details for a single application setting.	GET AppSetting ID on page 237
/ {id} /Set	PUT	Updates the value configured for an application setting based on its reference ID.	PUT AppSetting ID Set on page 241
/ {name} /Set	PUT	Updates the value configured for an application setting based on its reference name.	PUT AppSetting Name Set on page 243

2.6.5.1 GET AppSetting

The GET /AppSetting method is used to retrieve the details for all the application settings in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/application_settings/read/

Table 116: GET AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	<p>An integer indicating the type for the <i>Value</i>. Possible value types are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>String</td></tr> <tr> <td>1</td><td>Integer</td></tr> <tr> <td>2</td><td>Boolean</td></tr> <tr> <td>4</td><td>String (Regex)</td></tr> <tr> <td>5</td><td>String (URL)</td></tr> <tr> <td>6</td><td>String (Path)</td></tr> <tr> <td>7</td><td>String (CA Name)</td></tr> <tr> <td>8</td><td>No longer in use</td></tr> <tr> <td>9</td><td>String (Template Name)</td></tr> <tr> <td>10</td><td>String (Date)</td></tr> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.5.2 GET AppSetting ID

The GET /AppSetting/{id} method is used to retrieve a single application setting from Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/application_settings/read/

Table 117: GET AppSetting {id} Input Parameters

Name	In	Description
id	Path	Required. Integer indicating the Keyfactor Command reference ID of the application setting to retrieve. Use the <i>GET /AppSetting</i> method (see GET Agents on page 17) to retrieve a list of all the application settings to determine the application setting ID.

Table 118: GET AppSetting {id} Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	<p>An integer indicating the type for the <i>Value</i>. Possible value types are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>String</td></tr> <tr> <td>1</td><td>Integer</td></tr> <tr> <td>2</td><td>Boolean</td></tr> <tr> <td>4</td><td>String (Regex)</td></tr> <tr> <td>5</td><td>String (URL)</td></tr> <tr> <td>6</td><td>String (Path)</td></tr> <tr> <td>7</td><td>String (CA Name)</td></tr> <tr> <td>8</td><td>No longer in use</td></tr> <tr> <td>9</td><td>String (Template Name)</td></tr> <tr> <td>10</td><td>String (Date)</td></tr> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value

1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.5.3 PUT AppSetting

The PUT /AppSetting method is used to update the values of multiple application settings with a single command. This method returns HTTP 200 OK on a success with information about the updated application settings.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/application_settings/read/
/application_settings/modify/

Table 119: PUT AppSetting Input Parameters

Name	In	Description
Id	Body	Required. Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see GET AppSetting on page 235) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 120: PUT AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	<p>An integer indicating the type for the <i>Value</i>. Possible value types are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>String</td></tr> <tr> <td>1</td><td>Integer</td></tr> <tr> <td>2</td><td>Boolean</td></tr> <tr> <td>4</td><td>String (Regex)</td></tr> <tr> <td>5</td><td>String (URL)</td></tr> <tr> <td>6</td><td>String (Path)</td></tr> <tr> <td>7</td><td>String (CA Name)</td></tr> <tr> <td>8</td><td>No longer in use</td></tr> <tr> <td>9</td><td>String (Template Name)</td></tr> <tr> <td>10</td><td>String (Date)</td></tr> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.5.4 PUT AppSetting ID Set

The PUT /AppSetting/{id}/Set method is used to update the value of an application setting specified by the reference ID. This method returns HTTP 200 OK on a success with information about the updated application setting.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/application_settings/read/
/application_settings/modify/

Table 121: PUT AppSetting {id} Set Input Parameters

Name	In	Description
id	Path	Required. Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see GET AppSetting on page 235) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 122: PUT AppSetting {id} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	<p>An integer indicating the type for the <i>Value</i>. Possible value types are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>String</td></tr> <tr> <td>1</td><td>Integer</td></tr> <tr> <td>2</td><td>Boolean</td></tr> <tr> <td>4</td><td>String (Regex)</td></tr> <tr> <td>5</td><td>String (URL)</td></tr> <tr> <td>6</td><td>String (Path)</td></tr> <tr> <td>7</td><td>String (CA Name)</td></tr> <tr> <td>8</td><td>No longer in use</td></tr> <tr> <td>9</td><td>String (Template Name)</td></tr> <tr> <td>10</td><td>String (Date)</td></tr> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.5.5 PUT AppSetting Name Set

The PUT /AppSetting/{name}/Set method is used to update the value of an application setting specified by the reference name. This method returns HTTP 200 OK on a success with information about the updated application settings.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/application_settings/read/
/application_settings/modify/

Table 123: PUT AppSetting {name} Set Input Parameters

Name	In	Description
name	Path	Required. A string indicating the Keyfactor Command internal reference name (<i>ShortName</i>) for the application setting. Use the GET /AppSetting method (see GET AppSetting on page 235) to retrieve a list of all the application settings to determine the application setting reference name (<i>ShortName</i>).
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 124: PUT AppSetting {name} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	<p>An integer indicating the type for the <i>Value</i>. Possible value types are:</p> <table> <tr> <th>Value</th><th>Parameter Value</th></tr> <tr> <td>0</td><td>String</td></tr> <tr> <td>1</td><td>Integer</td></tr> <tr> <td>2</td><td>Boolean</td></tr> <tr> <td>4</td><td>String (Regex)</td></tr> <tr> <td>5</td><td>String (URL)</td></tr> <tr> <td>6</td><td>String (Path)</td></tr> <tr> <td>7</td><td>String (CA Name)</td></tr> <tr> <td>8</td><td>No longer in use</td></tr> <tr> <td>9</td><td>String (Template Name)</td></tr> <tr> <td>10</td><td>String (Date)</td></tr> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.6 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 125: Audit Endpoints

Endpoint	Method	Description	Links
/ {id}	GET	Returns information about the specified audit log entry.	GET Audit ID below
/ {id}/Validate	GET	Validates the specified audit log entry.	GET Audit ID Validate on page 250
/	GET	Returns a list of all audit log entries according to the provided filters and input parameters.	GET Audit on page 251
/Download	GET	Returns a comma separated list of audit log entries according to the provided filters and input parameters.	GET Audit Download on page 257
/RelatedEntities	GET	Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters.	GET Audit Related Entities on page 261

2.6.6.1 GET Audit ID

The GET /Audit/{id} method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/auditing/read/

Table 126: GET Audit {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the audit log entry to retrieve. Use the <i>GET /Audit</i> method (see GET Audit on page 251) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 127: GET Audit {id} Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																										
Message	XML data on the audit event.																																										
Signature	The signature on the audit entry.																																										
Category	<div>An integer identifying the category of the audit entry. Possible values are:<table><tr><th>Value</th><th>Subcategory Name</th><th>Description</th></tr><tr><td>2001</td><td>Certificate</td><td>Certificate</td></tr><tr><td>2001</td><td>Audit-ingCertificateScheduledReplacement</td><td>Auditing Certificate Scheduled Replacement</td></tr><tr><td>2001</td><td>AuditingCertificateRequest</td><td>Certificate Request</td></tr><tr><td>2002</td><td>ApiApplication</td><td>API Application</td></tr><tr><td>2003</td><td>Template</td><td>Template</td></tr><tr><td>2004</td><td>CertificateQuery</td><td>Certificate Collection/Query</td></tr><tr><td>2005</td><td>ExpirationAlert</td><td>Expiration Alert</td></tr><tr><td>2005</td><td>ExpirationAlertDefinitionContextModel</td><td>Expiration Alert</td></tr><tr><td>2006</td><td>PendingAlert</td><td>Pending Alert</td></tr><tr><td>2006</td><td>PendingAlertDefinitionContextModel</td><td>Pending Alert</td></tr><tr><td>2007</td><td>ApplicationSetting</td><td>Application Setting</td></tr><tr><td>2008</td><td>IssuedAlert</td><td>Issued Alert</td></tr><tr><td>2008</td><td>IssuedAlertDefinitionContextModel</td><td>Issued Alert</td></tr></table></div>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	Audit-ingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert

	Value	Description
	0	Information

Name	Description						
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>Warning</td></tr> <tr> <td>2</td><td>Failure</td></tr> </table>	Value	Description	1	Warning	2	Failure
Value	Description						
1	Warning						
2	Failure						
User	The user who performed the audit event in DOMAIN\username format.						
EntityType	The category of the object being audited (e.g. Template, Certificate).						
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.						
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.6.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a value of true or false.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/auditing/read/

Table 128: GET Audit {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The ID of the audit log entry to validate. Use the <i>GET /Audit</i> method (see GET Audit on the next page) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 129: GET Audit {id} Validate Response Data

Name	Description
	A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.6.3 GET Audit

The GET /Audit method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/auditing/read/

Table 130: GET Audit Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Audit Log Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Name (EntityIdentifier) • Category (EntityType) (see Table 131: GET Audit Response Data for codes) • ImmutableIdentifier • Level (see Table 131: GET Audit Response Data for codes) • Operation (see Table 131: GET Audit Response Data for codes) • PropertyChanged • Timestamp • ActingUser <div>  Tip: To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example: category -contains "Agent" </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 131: GET Audit Response Data

Name	Description

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.6.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information requested in comma-delimited form with the property names at the start of the list and then the values.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/auditing/read/

Table 132: GET Audit Download Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. Value	Description						
1	Warning						
2	Failure						
User	The user who performed the audit event in DOMAIN\username format.						
EntityType	The category of the object being audited (e.g. Template, Certificate).						
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.						
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 136: Certificates Endpoints

Endpoint	Method	Description	Link
/id/Security	GET	Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are.	GET Certificates ID Security on page 269
/id/Validate	GET	Validates that a certificate chain can be built for the specified certificate.	GET Certificates ID Validate on page 271

Endpoint	Method	Description	Link
/Locations/{id}	GET	Returns details about the certificates stores in which the certificate is located.	GET Certificates Locations ID on page 276
/IdentityAudit/{id}	GET	Returns audit identity permissions for certificate.	GET Certificates Identity Audit ID on page 279
/CSV	GET	Returns content, in a CSV format, of certificates from Keyfactor Command that match the query criteria provided in the body.	GET Certificates CSV
/ {id}	DELETE	Deletes a certificate from the Keyfactor Command database by its ID.	DELETE Certificates ID on page 281
/ {id}	GET	Returns certificate details for a specified certificate.	GET Certificates ID on page 282
/Metadata/Compare	GET	Compares the metadata value provided with the metadata value associated with the specified certificate.	GET Certificates Metadata Compare on page 294
/ {id}/History	GET	Returns the certificate operations history for a specified certificate.	GET Certificates ID History on page 296
/	DELETE	Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.	DELETE Certificates on page 298
/	GET	Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level.	GET Certificates on page 299
/Metadata	PUT	Updates the metadata for a specified certificate.	PUT Certificates Metadata on page 314
/Metadata/All	PUT	Updates the metadata for an array of certificate IDs.	PUT Certificates Metadata All on page 316

Endpoint	Method	Description	Link
/Import	POST	Imports a certificate into Keyfactor Command.	POST Certificates Import on page 320
/Revoke	POST	Revokes a certificate.	POST Certificates Revoke on page 324
/Analyze	POST	Reads a base-64 encoded PEM certificates and returns it in human-readable form.	POST Certificates Analyze on page 326
/Recover	POST	Returns a recovered certificate as a PFX.	POST Certificates Recover on page 327
/Download	POST	Downloads a certificate.	POST Certificates Download on page 331
/RevokeAll	POST	Revokes all the certificates in the provided query.	POST Certificates Revoke All on page 334
/Query	DELETE	Deletes multiple certificates from the Keyfactor Command database based on search query.	DELETE Certificates Query on page 337
/PrivateKey	DELETE	Deletes the stored private keys of multiple certificates within the Keyfactor Command database.	DELETE Certificates Private Key on page 338
/PrivateKey/{id}	DELETE	Deletes the stored private key(s) of a certificate within the Keyfactor Command database.	DELETE Certificates Private Key ID on page 339

2.6.7.1 GET Certificates ID Security

The GET /Certificates/{id}/Security method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/read/
- /security/read/
- OR
- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/security/read/

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 137: GET Certificates {id} Security Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to check security permissions.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 138: GET Certificates {id} Security Response Data

Name	Description						
Roles	<p>An array of objects containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>A string containing the short reference name for the security role.</td></tr><tr><td>Permissions</td><td>An array of strings containing the permissions assigned to the role.</td></tr></table> <p>For example, the following return snippet shows the response for the <i>Power Users</i> security role:</p> <pre>{ "Name": "Power Users", "Permissions": ["Read", "EditMetadata", "Recover"] }</pre>	Name	Description	Name	A string containing the short reference name for the security role.	Permissions	An array of strings containing the permissions assigned to the role.
Name	Description						
Name	A string containing the short reference name for the security role.						
Permissions	An array of strings containing the permissions assigned to the role.						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 139: GET Certificates {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to be validated.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 140: GET Certificates {id} Validate Response Data

Name	Description
Valid	A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false).
Results	An object containing the X509 certificate chain validity fields. The included validity fields are:

Name	Description		
	Name	Portal Equivalent	Description
			certificate signature.
	NotValidForUsage	Usage	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid key usage.
	UntrustedRoot	Trusted Root	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an untrusted root certificate.
	RevocationStatusUnknown	Revocation Status	A value of <i>Pass</i> indicates that the revocation status can successfully be determined for the certificate. This may be the result of successful access to online certificate revocation lists (CRLs).
	Cyclic	Chain Built	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built.
	InvalidExtension	Extensions	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid extension.
	InvalidPolicyConstraints	Policy Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid policy constraint.

Name	Description		
	Name	Portal Equivalent	Description
	InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.
	InvalidNameConstraints	Valid Name Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.
	HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.
	HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.
	HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.
	HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.
	PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.

Name	Description		
	Name	Portal Equivalent	Description
	CtlNotTimeValid	CTL Time Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired).
	CtlNotSignatureValid	CTL Signature Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) contains an invalid signature.
	CtlNotValidForUsage	CTL Usage Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.
	HasWeakSignature	Strong Signature	A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate.
	OfflineRevocation	CRL online	A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.
	NoIssuanceChainPolicy	Chain Policy	A value of <i>Pass</i> indicates that there is either no certificate policy by design in the certificate or that if a group policy has specified that all certificates must have a

Name	Description		
	Name	Portal Equivalent	Description
			certificate policy, the certificate policy exists in the certificate.
	ExplicitDistrust	No Explicit Distrust	A value of <i>Pass</i> indicates that the certificate is not explicitly distrusted.
	HasNotSupportedCriticalExtension	Critical Extensions	A value of <i>Pass</i> indicates that the certificate has a critical extension that is supported or has no critical extensions.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.3 GET Certificates Locations ID

The GET `/Certificates/Locations/{id}` method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificates/collections/read/`
 OR
`/certificates/collections/read/{#}/` (where `#` is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 141: GET Certificates Locations {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 142: GET Certificates Locations {id} Response Data

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/{#}/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Note: This API endpoint is available in both the V1 and V2 definitions in the Keyfactor API Reference and Utility and acts exactly the same in both.

Table 143: GET Certificates Identity Audit {id} Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 144: GET Certificates Identity Audit {id} Response Data

Name	Description						
Id	An integer containing the Keyfactor Command reference ID of the identity.						
AccountName	A string containing the name of the identity.						
IdentityType	A string that specifies the type of identity the entity is. For Active Directory, this will be a user or a group.						
SID	A string containing the SID of the identity.						
Permissions	An array of objects containing the permissions granted to the certificate. <table> <tr> <th>Parameter</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td></tr> <tr> <td>GrantedBy</td><td>A string containing the list of roles or collections that grant the given permission to the entity.</td></tr> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)	GrantedBy	A string containing the list of roles or collections that grant the given permission to the entity.
Parameter	Description						
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)						
GrantedBy	A string containing the list of roles or collections that grant the given permission to the entity.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.5 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this private key is also removed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificates/collections/delete/
 OR
 /certificates/collections/delete/{#}/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Tip: Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 145: DELETE Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to delete. Use the <i>GET /Certificates</i> method (see GET Certificates on page 299) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.6 GET Certificates ID

The *GET /Certificates/{id}* method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR

/certificates/collections/read/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 146: GET Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate. Use the <i>GET /Certificates</i> method (see GET Certificates on page 299) to retrieve a list of multiple certificates to determine the desired certificate's ID.
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Table 147: GET Certificates {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is																		

Name	Description																																	
	<p>stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																																	
CertStateString	A string containing the certificate state. The possible values are: <ul style="list-style-type: none">Unknown (0)																																	

Name	Description																		
	<ul style="list-style-type: none"> • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8) 																		
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation Of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the display name of the template that was used when issuing the certificate.																		

Name	Description								
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).								
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)								
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).								
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.								
RequesterName	A string containing the name of the identity that requested the certificate.								
ContentBytes	A string containing the certificate as bytes.								
ExtendedKeyUsages	<p>An array of objects containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr> <tr> <td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the SAN Element.</td></tr> <tr> <td>Type</td><td> <p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table> </td></tr> <tr> <td>ValueHash</td><td>A string indicating a hash of the SAN value.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Other Name</td></tr> <tr> <td>1</td><td>RFC 822 Name</td></tr> <tr> <td>2</td><td>DNS Name</td></tr> <tr> <td>3</td><td>X400 Address</td></tr> <tr> <td>4</td><td>Directory Name</td></tr> <tr> <td>5</td><td>Ediparty Name</td></tr> <tr> <td>6</td><td>Uniform Resource Identifier</td></tr> <tr> <td>7</td><td>IP Address</td></tr> <tr> <td>8</td><td>Registered Id</td></tr> <tr> <td>100</td><td>MS_NTPrincipalName</td></tr> <tr> <td>101</td><td>MS_NTDSReplication</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. 101	File Transfer Protocol																																						
1xx	User-defined certificate stores will be given a type ID over 101.																																						
Alias	A string indicating the alias of the certificate in the certificate store.																																						
ChainLevel	An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																						

Name	Description														
Metadata	An object containing the metadata fields populated for the certificate.														
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.														
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div>  Note: The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>														
CARecordId	A string containing the CA's reference ID for certificate.														
DetailedKeyUsage	<p>An object containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>CrlSign</td><td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DataEncipherment</td><td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>DecipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td></tr> <tr> <td>DigitalSignature</td><td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td></tr> <tr> <td>EncipherOnly</td><td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td></tr> <tr> <td>KeyAgreement</td><td>A Boolean that indicates whether the certificate is configured for key agree-</td></tr> </table>	Name	Description	CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-
Name	Description														
CrlSign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).														
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).														
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).														
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).														
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).														
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-														

Name	Description												
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td>ment.</td></tr> <tr> <td>KeyCertSign</td><td>A Boolean that indicates whether the certificate is configured for certificate signing.</td></tr> <tr> <td>KeyEncipherment</td><td>A Boolean that indicates whether the certificate is configured for key encipherment.</td></tr> <tr> <td>NonRepudiation</td><td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td></tr> <tr> <td>HexCode</td><td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td></tr> </table>	Name	Description		ment.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.7 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent

exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 148: GET Certificates Metadata Compare Input Parameters

Name	In	Description
certificateId	Query	Required. An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.
metadataFieldName	Query	Required. A string containing the name of the metadata field whose value should be compared.
value	Query	Required. A string containing the value for comparison.
collectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.8 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see *Certificate Details* in the *Keyfactor Command Reference Guide*. This method returns HTTP 200 OK on a success with certificate history details in the message body.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 149: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 150: GET Certificates {id} History Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID of the certificate.
OperationStart	The date, in UTC, on which the operation begin.
OperationEnd	The date, in UTC, on which the operation completed.
Username	The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.
Comment	A string containing a comment that provides more information about the history record. For example (for a metadata field): <pre>"AppOwnerEmailAddress has been updated from 'john.smith@keyexample.com' to 'martha.jones@keyexample.com'"</pre>
Action	A string naming the action that was taken. For example: <pre>Metadata Updated</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.9 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

Whenever a certificate is deleted that is a part of a certificate renewal chain. The certificates on either end of the deleted cert(s) will have their certificate histories updated to show that either a certificate before or after the certificate was deleted in the renewal chain of that certificate.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/delete/
OR

/certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Tip: Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 151: DELETE Certificates Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers containing the Keyfactor Command certificate IDs for certificates that should be deleted in the form:</p> <pre>[123, 789, 567]</pre> <p>Use the <i>GET /Certificates</i> method (see GET Certificates below) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.10 GET Certificates

The GET /Certificates method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging

and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 152: GET Certificates Input Parameters

Name	In	Description
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
includeHasPrivateKey	Query	A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
includeRevoked	Query	A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .
includeExpired	Query	A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none"> ArchivedKey CertId CA

Name	In	Description
		<ul style="list-style-type: none"> • CertState • CertStoreContainer • CertStoreFQDN (alias: JavaKeystoreFQDN) • CertStorePath (alias: JavaKeystorePath) • CN (alias: IssuedCN) • DN (alias: IssuedDN) • ExpirationDate (alias: NotAfter) • EKU • EKUName • HasPrivateKey • ImportDate • IssuedDate (aliases: NotBefore and EffectiveDate) • IssuerDN • KeySize (alias: KeySizeInBits) • KeyType • KeyUsage • OU • NetBIOSPrincipal (alias: PrincipalName) • PublicKey • NetBIOSRequester (alias: RequesterName) • RevocationDate (alias: RevocationEffDate) • Revoker • RFC2818Compliant • SelfSigned • SerialNumber • SigningAlgorithm • SSLDNSName • SSLIPAddress (alias: SslHostName) • SSLNetworkName • SSLPort • SAN • TemplateDisplayName (alias: TemplateName) • TemplateShortName • Thumbprint <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> • <i>CAResultID</i>

Name	In	Description
		<ul style="list-style-type: none"> <i>CertRequestId</i> <i>IsPfx</i> <i>RequestResolutionDate</i> <div>  Note: Queries may be done using either the primary field name or the field alias(es). </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 153: GET Certificates Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>Active</td></tr> <tr> <td>2</td><td>Revoked</td></tr> <tr> <td>3</td><td>Denied</td></tr> <tr> <td>4</td><td>Failed</td></tr> <tr> <td>5</td><td>Pending</td></tr> <tr> <td>6</td><td>Certificate Authority</td></tr> <tr> <td>7</td><td>Parent Certificate Authority</td></tr> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unknown</td></tr> <tr> <td>1</td><td>RSA</td></tr> <tr> <td>2</td><td>DSA</td></tr> <tr> <td>3</td><td>ECC</td></tr> <tr> <td>4</td><td>DH</td></tr> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is																		

Name	Description																																	
	<p>stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table><tr><th>Value</th><th>Function</th><th>Description</th></tr><tr><td>0</td><td>None</td><td>No key usage parameters.</td></tr><tr><td>1</td><td>Encipherment Only</td><td>The key can be used for encryption only.</td></tr><tr><td>2</td><td>CRL Signing</td><td>The key can be used to sign a certificate revocation list (CRL).</td></tr><tr><td>4</td><td>Key Certificate Signing</td><td>The key can be used to sign certificates.</td></tr><tr><td>8</td><td>Key Agreement</td><td>The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td></tr><tr><td>16</td><td>Data Encipherment</td><td>The key can be used for data encryption.</td></tr><tr><td>32</td><td>Key Encipherment</td><td>The key can be used for key encryption.</td></tr><tr><td>64</td><td>Nonrepudiation</td><td>The key can be used for authentication.</td></tr><tr><td>128</td><td>Digital Signature</td><td>The key can be used as a digital signature.</td></tr><tr><td>32768</td><td>Decipherment Only</td><td>The key can be used for decryption only.</td></tr></table> <p>For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																																	
CertStateString	A string containing the certificate state. The possible values are: <ul style="list-style-type: none">Unknown (0)																																	

Name	Description																		
	<ul style="list-style-type: none"> • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8) 																		
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Unspecified</td></tr> <tr> <td>1</td><td>Key Compromised</td></tr> <tr> <td>2</td><td>CA Compromised</td></tr> <tr> <td>3</td><td>Affiliation Changed</td></tr> <tr> <td>4</td><td>Superseded</td></tr> <tr> <td>5</td><td>Cessation Of Operation</td></tr> <tr> <td>6</td><td>Certificate Hold</td></tr> <tr> <td>999</td><td>Unknown</td></tr> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown

1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the display name of the template that was used when issuing the certificate.																		

Name	Description								
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).								
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)								
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).								
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.								
RequesterName	A string containing the name of the identity that requested the certificate.								
ContentBytes	A string containing the certificate as bytes.								
ExtendedKeyUsages	<p>An array of objects containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td></tr> <tr> <td>Oid</td><td>A string indicating the OID of the extended key usage.</td></tr> <tr> <td>DisplayName</td><td>A string indicating the name of the extended key usage.</td></tr> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td></tr> <tr> <td>Value</td><td>A string indicating the value of the SAN Element.</td></tr> <tr> <td>Type</td><td> <p>An integer containing the type of SAN element. KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 1.3.132.0.34 = P-384/secp384r1 1.3.132.0.35 = P-521/secp521r1 												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.11 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be

overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the *PUT /Certificates/Metadata/All* method (see [PUT Certificates Metadata All on the next page](#)). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificates/collections/metadata/modify/
 OR
 /certificates/collections/metadata/modify/#/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 154: PUT Certificates Metadata Input Parameters

Name	In	Description
Id	Body	Required. An integer specifying the Keyfactor Command reference ID for the certificate to update.
Metadata	Body	Required. An object containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example: <pre> "Metadata": { "AppOwnerEmailAddress": "john.smith@keyexample.com", // String field "SiteCode": 23, // Integer field "BusinessCritical": true, // Boolean field "Notes": "Here are some notes about this certificate.", // BigText field "BusinessUnit": "E-Business", // Multiple Choice field "TicketResolutionDate": "2021-07-23" // Date field in yyyy-mm-dd format }</pre>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.12 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of certificates. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/metadata/modify/
OR
/certificates/collections/metadata/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 155: PUT Certificates Metadata All Input Parameters

Name	In	Description
Query	Body	<p>Required*. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to the <i>Keyfactor Command Reference Guide</i> Certificate Search Page section. A value for one of <i>CertificateId</i>s, <i>Query</i>, or <i>CollectionId</i> is required.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none">• ArchivedKey• CertId• CA• CertState• CertStoreContainer• CertStoreFQDN (alias: JavaKeystoreFQDN)• CertStorePath (alias: JavaKeystorePath)• CN (alias: IssuedCN)• DN (alias: IssuedDN)

Name	In	Description
		<ul style="list-style-type: none"> ExpirationDate (alias: NotAfter) EKU EKUName HasPrivateKey ImportDate IssuedDate (aliases: NotBefore and EffectiveDate) IssuerDN KeySize (alias: KeySizeInBits) KeyType KeyUsage OU NetBIOSPrincipal (alias: PrincipalName) PublicKey NetBIOSRequester (alias: RequesterName) RevocationDate (alias: RevocationEffDate) Revoker RFC2818Compliant SelfSigned SerialNumber SigningAlgorithm SSLDNSName SSLIPAddress (alias: SslHostName) SSLNetworkName SSLPort SAN TemplateDisplayName (alias: TemplateName) TemplateShortName Thumbprint <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> <i>CARequestID</i> <i>CertRequestId</i> <i>IsPfx</i> <i>RequestResolutionDate</i> <div>  Note: Queries may be done using either the primary field name or the field alias(es). </div>

Name	In	Description								
		<div> Tip: To exclude revoked certificates from the update, include a query of: <pre>CertState -ne \"2\"</pre> To exclude expired certificates from the update, include a query of: <pre>ExpirationDate -ge \"%TODAY%\"</pre></div>								
CertificateIds	Body	Required* . An array of integers indicating the Keyfactor Command certificate IDs to update. A value for one of <i>CertificateIds</i> , <i>Query</i> , or <i>CollectionId</i> is required .								
Metadata	Body	Required . An array of objects containing information about the metadata field(s) to update. The parameters are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Value</td><td>Required. A string indicating the value that should be set for the metadata field.</td></tr><tr><td>MetadataName</td><td>Required. A string indicating the name of the metadata field that should be updated for the certificates.</td></tr><tr><td>OverwriteExisting</td><td>A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td></tr></table> <p>For example:</p> <pre>"Metadata": [{</pre>	Name	Description	Value	Required . A string indicating the value that should be set for the metadata field.	MetadataName	Required . A string indicating the name of the metadata field that should be updated for the certificates.	OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .
Name	Description									
Value	Required . A string indicating the value that should be set for the metadata field.									
MetadataName	Required . A string indicating the name of the metadata field that should be updated for the certificates.									
OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .									

Name	In	Description
		<pre> "MetadataName": "AppOwnerEmailAddress", // This is a String field. "Value": "john.smith@keyexample.com", "OverwriteExisting": true }, { "MetadataName": "SiteCode", // This is an Integer field. "Value": 5, "OverwriteExisting": true }, { "MetadataName": "BusinessCritical", // This is a Boolean field. "Value": true, "OverwriteExisting": true }, { "MetadataName": "Notes", // This is a BigText field. "Value": "Here are some notes about this certificate.", "OverwriteExisting": true }, { "MetadataName": "BusinessUnit", // This is a Multiple Choice field. "Value": "E-Business", // This is a value pre-defined for the field. "OverwriteExisting": true }, { "MetadataName": "TicketResolutionDate", // This is a Date field in yyyy-mm-dd format. "Value": "2021-07-23", "OverwriteExisting": true }] </pre>
CollectionId	Query	<p>Required*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is required.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.13 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/import/

Table 156: POST Certificates Import Input Parameters

Name	In	Description
Certificate	Body	Required. A string containing the base-64 encoded contents of the certificate that is to be imported into Keyfactor Command.
Password	Body	Required* . A string containing the password used to decrypt the imported PFX. This field is required if a PFX certificate is provided in the <i>Certificate</i> field.
Metadata	Body	An object containing the certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example: <pre> "Metadata": { "AppOwnerFirstName": "John", "AppOwnerLastName": "Smith" } </pre>
StoreIds	Body	An array of strings indicating the certificate store GUIDs that the imported certificate will be installed into.

Name	In	Description																																						
StoreTypes	Body	<table><tr><th>Name</th><th>Description</th></tr><tr><td>StoreTypeId</td><td><p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Java Keystore</td></tr><tr><td>2</td><td>PEM File</td></tr><tr><td>3</td><td>F5 SSL Profiles</td></tr><tr><td>4</td><td>IIS Roots</td></tr><tr><td>5</td><td>NetScaler</td></tr><tr><td>6</td><td>IIS Personal</td></tr><tr><td>7</td><td>F5 Web Server</td></tr><tr><td>8</td><td>IIS Revoked</td></tr><tr><td>9</td><td>F5 Web Server REST</td></tr><tr><td>10</td><td>F5 SSL Profiles REST</td></tr><tr><td>11</td><td>F5 CA Bundles REST</td></tr><tr><td>100</td><td>Amazon Web Services</td></tr><tr><td>101</td><td>File Transfer Protocol</td></tr><tr><td>1xx</td><td>User-defined certificate stores will be given a type ID over 101.</td></tr></table></td></tr><tr><td>Alias</td><td><p>Required[*]. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Alias	A string indicating the alias for the certificate in the store that failed.	Reason	An integer indicating the simple reason why it failed.	Explanation	A string indicating a more specific reason for the failure.
Name	Description														
KeystoreId	A string indicating the ID of the store that failed.														
ClientMachine	A string indicating the client machine of the store that failed.														
StorePath	A string indicating the path to the location of the certificate store that failed.														
Alias	A string indicating the alias for the certificate in the store that failed.														
Reason	An integer indicating the simple reason why it failed.														
Explanation	A string indicating a more specific reason for the failure.														
JobStatus	An integer indicating the state of all certificate store jobs.														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.14 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/revoke/

OR

/certificates/collections/revoke/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 158: POST Certificates Revoke Input Parameters

Name	In	Description																				
CertificateIDs	Body	Required. An array of integers containing the list of Keyfactor Command reference IDs for certificates that should be revoked.																				
Reason	Body	<p>An integer containing the specific reason that the certificate is being revoked. Available values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-1</td><td>Remove from Hold</td></tr><tr><td>0</td><td>Unspecified</td></tr><tr><td>1</td><td>Key Compromised</td></tr><tr><td>2</td><td>CA Compromised</td></tr><tr><td>3</td><td>Affiliation Changed</td></tr><tr><td>4</td><td>Superseded</td></tr><tr><td>5</td><td>Cessation of Operation</td></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td></tr></table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																					
Comment	Body	Required. A string containing a freeform reason or comment on why the certificate is being revoked.																				
EffectiveDate	Body	A string containing the date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.15 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. For input data supplied with chain certificates, the output will include analysis of the primary certificate and the chain certificates. This method returns HTTP 200 OK on a success with a list of the contents of the certificate and the certificates in the chain, if applicable.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
OR
/certificates/import/
Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 159: POST Certificates Analyze Input Parameters

Name	In	Description
Certificate	Body	Required. A string containing either the PEM-encoded string of the certificate not including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----) or the base-64 encoded contents of the certificate. Both certificates with and without private keys are supported for analysis.
Password	Body	A string containing the password used to encrypt the private key of the certificate, if applicable.

Table 160: POST Certificates Analyze Response Data

Name	Description
IssuedDN	A string containing the distinguished name of the certificate.
IssuerDN	A string containing the distinguished name of the issuer of the certificate.
Thumbprint	A string containing the thumbprint of the certificate.
NotAfter	A string containing the date/time, in UTC, on which the certificate expires.
NotBefore	A string containing the date/time, in UTC, on which the certificate was issued by the certificate authority.
Metadata	An object containing the metadata fields populated for the certificate.
IsEndEntity	A Boolean indicating whether the certificate is the end entity of the chain (true) or not (false).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.16 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in JKS, PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 331](#)).

Tip: CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see [Details Tab](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/private_key/read/

OR

/certificates/collections/private_key/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 161: POST Certificates Recover Input Parameters

Name	In	Description
Password	Body	Required . The password to set on the certificate.
CertID	Body	Required* . An integer indicating the Keyfactor Command reference ID of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	Required* . A string indicating the serial number of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	Required* . A string indicating the distinguished name of the issuer of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	Required* . A string indicating the thumbprint of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user

Name	In	Description
		must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	<p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> • JKS Selecting the JKS option allows you to create a Java keystore with the returned PFX value. • PEM Output the certificate in base-64 encoded PEM format along with the private key and any optional chain certificates in a single file. • PFX Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PFX value.

Table 162: POST Certificates Recover Response Data

Name	Description
PFX	<p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content ConvertFrom-Json \$targetFile = 'C:\path_to_target_file\' + \$ResponseContent.FileName \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p>
FileName	The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.17 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the *POST /Certificates/Recover* method (see [POST Certificates Recover on page 327](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 163: POST Certificates Download Input Parameters

Name	In	Description
CertID	Body	<p>Required*. An integer indicating the Keyfactor Command reference ID of the certificate to retrieve.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	<p>Required*. A string indicating the serial number of the certificate to retrieve.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	<p>Required*. A string indicating the distinguished name of the issuer of the certificate to retrieve.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	<p>Required*. A string indicating the thumbprint of the certificate to retrieve.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (true) or not (false). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate

Name	In	Description
		collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
x-certificateformat	Header	<p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> DER DER is not supported if IncludeChain is set to <i>true</i>. PEM Output the certificate in base-64 encoded PEM format along with any optional chain certificates in a single file. P7B This option is only supported if IncludeChain is set to <i>true</i>

Table 164: POST Certificates Download Response Data

Name	Description
Content	The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.18 POST Certificates Revoke All

The POST /Certificates/RevokeAll method is used to revoke all the certificates in the specified query and/or collection ID. The endpoint makes use of the *Revoke All Enabled* application setting (see Application Settings: Console Tab in the *Keyfactor Command Reference Guide*). If *Revoke All Enabled* is set to *False*, the endpoint will return an error indicating revoke all is not allowed and not complete the request. This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/revoke/
OR

/certificates/collections/revoke/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see *Workflow Definitions* in the *Keyfactor Command Reference Guide*).

Table 165: POST Certificates Revoke All Input Parameters

Name	In	Description																				
Query	Body	Required* . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to Certificate Search Page in the <i>Keyfactor Command Reference Guide</i> . A value for either <i>Query</i> or <i>CollectionId</i> is required . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.																				
Reason	Body	<p>An integer containing the specific reason that the certificates are being revoked. Available values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>-1</td><td>Remove from Hold</td></tr><tr><td>0</td><td>Unspecified</td></tr><tr><td>1</td><td>Key Compromised</td></tr><tr><td>2</td><td>CA Compromised</td></tr><tr><td>3</td><td>Affiliation Changed</td></tr><tr><td>4</td><td>Superseded</td></tr><tr><td>5</td><td>Cessation of Operation</td></tr><tr><td>6</td><td>Certificate Hold</td></tr><tr><td>7</td><td>Remove from CRL</td></tr></table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL																					
Comment	Body	Required . A string containing a freeform reason or comment indicating why the certificates are being revoked.																				
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
IncludeRe-voked	Body	A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																				

Name	In	Description
IncludeExpired	Body	A Boolean that indicates whether expired certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .
CollectionId	Query	<p>Required*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is required. If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.</p> <p>For example:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/RevokeAll?CollectionId=14</pre>

Note: This endpoint is not exposed in the Keyfactor API Reference and Utility to reduce accidental usage. You may still make use of it by calling it from your own tool.

2.6.7.19 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/delete/
- OR
- /certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 166: DELETE Certificates Query Input Parameters

Name	In	Description
sq	Body	<p>Required. Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>CN -contains "mycertificate.keyexample.com"</pre> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines to build your body query.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.20 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/delete/
OR
/certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 167: DELETE Certificates Private Key Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers containing the Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form:</p> <pre>[123, 789, 567]</pre> <p>Use the <i>GET /Certificates</i> method (see GET Certificates on page 299) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.7.21 DELETE Certificates Private Key ID

The DELETE */Certificates/PrivateKey/{id}* method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/delete/
OR
/certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 168: DELETE Certificates Private Key {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate whose private key should be deleted. Use the <i>GET /Certificates</i> method (see GET Certificates on page 299) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 169: Certificate Authority Endpoints

Endpoint	Method	Description	Link
/PublishCRL	POST	Publishes the Certificate Revocation List of the given certificate authority.	POST Certificate Authority PublishCRL on page 440
/	GET	Returns a list of all certificate author-	GET Certificate Authority on

Endpoint	Method	Description	Link
		ities.	page 358
/	POST	Creates a new certificate authority record.	POST Certificate Authority on page 373
/	PUT	Updates an existing certificate authority record.	PUT Certificate Authority on page 404
/ {id}	GET	Returns details for the certificate authority identified by the specified ID.	GET Certificate Authority ID on page 344
/ {id}	DELETE	Deletes the certificate authority record for the specified ID.	DELETE Certificate Authority ID on page 343
/Test	POST	Validates that the certificate authority with the provided information can be reached.	POST Certificate Authority Test on page 435
/SourceCount	GET	Retrieve the count of certificate authorities with full or incremental synchronization scans configured.	GET Certificate Authority Source Count on page 440
/AvailableForests	GET	Retrieve the list of forests in Active Directory Keyfactor Command	GET Certificate Authority Available Forests on page 441
/Import	POST	Import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix	POST Certificate Authority Import on page 450

Endpoint	Method	Description	Link
		(e.g. keyexample.com).	
/HealthMonitoring/Schedule	GET	Retrieve the current schedule for the CA health monitoring job.	GET Certificate Authority Health Monitoring Schedule on page 442
/AlertRecipients/CAHealthRecipients	POST	Create new recipients to receive CA health monitoring alerts in Keyfactor Command	POST Certificate Authority Alert Recipients CA Health Recipients on page 443
/AlertRecipients/CAHealthRecipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts.	GET Certificate Authority Alert Recipients CA Health Recipients on page 442
/AlertRecipients/CAHealthRecipients/{id}	GET	Retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID.	GET Certificate Authority Alert Recipients CA Health Recipients ID on page 444
/AlertRecipients/CAHealthRecipients/{id}	PUT	Update the CA health monitoring alert recipient with the specified ID.	PUT Certificate Authority Alert Recipients CA Health Recipients ID on page 446
/AlertRecipients/CAHealthRecipients/{id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	DELETE Certificate Authority Alert Recipients CA Health Recipients ID on page 445
/AlertRecipients/CAThresholdRecipients	POST	Create new recipients to receive CA	POST Certificate Authority Alert Recip-

Endpoint	Method	Description	Link
		threshold alerts in Keyfactor Command.	ients CA Threshold Recipients on page 448
/AlertRecipients/CAThresholdRecipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts.	GET Certificate Authority Alert Recipients CA Threshold Recipients on page 447
/AlertRecipients/CAThresholdRecipients/{id}	GET	Retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID.	GET Certificate Authority Alert Recipients CA Threshold Recipients ID on page 448
/AlertRecipients/CAThresholdRecipients/{id}	PUT	Update the CA threshold alert recipient with the specified ID.	PUT Certificate Authority Alert Recipients CA Threshold Recipients ID on page 449
/AlertRecipients/CAThresholdRecipients/{id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID on page 446

2.6.8.1 DELETE Certificate Authority ID

The DELETE /CertificateAuthority/{id} endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Note: A CA that has active records associated with it (e.g. certificates, certificate requests) cannot be deleted from Keyfactor Command.

Table 170: DELETE Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.2 GET Certificate Authority ID

The POST /CertificateAuthority method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/read/

Table 171: GET Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve.

Table 172: GET Certificate Authority {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <p>Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <p>Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	Description
	 Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div>  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command. </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<div data-bbox="506 285 1406 709">  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="506 741 1406 993">  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	<p data-bbox="496 1031 1406 1094">An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="506 1125 1406 1283"> <pre data-bbox="522 1146 782 1262">"AllowedRequesters": ["Power Users", "Read Only"]</pre> </div> <p data-bbox="496 1314 1406 1409">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1419 1406 1755">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:
Name	Description												
Off	Turn off a previously configured schedule.												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												
Daily	A dictionary that indicates a job scheduled to run every day at the same time with the parameter:												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>Weekly</td><td> <p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").																

Name	Description				
	<div data-bbox="509 285 1406 436">  Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <div data-bbox="509 468 1406 1066">  Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA. </div>				
IncrementalScan	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. CAType	An integer indicating the type of CA: <ul style="list-style-type: none">0—DCOM																		

Name	Description								
	<ul style="list-style-type: none"> 1–HTTPS 								
AuthCertificatePassword	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> <tr> <td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.</td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td> A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>				
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>								

Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.								
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.								
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>								
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/read/`

Table 173: GET Certificate Authority Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 174: GET Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal\":"true"} OR {"syncExternal\":"false"}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <p>Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <p>Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	Description
	 Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p>  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p>  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<div data-bbox="506 285 1406 709">  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="506 741 1406 993">  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	<p data-bbox="496 1031 1406 1094">An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="506 1125 1406 1283"> <pre data-bbox="522 1146 782 1262">"AllowedRequesters": ["Power Users", "Read Only"]</pre> </div> <p data-bbox="496 1314 1406 1409">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1419 1406 1755">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule. 	<div data-bbox="509 285 1406 436">  Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <div data-bbox="509 468 1406 1066">  Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA. </div>

AuthCertificatePassword	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> <tr> <td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.</td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td> A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>				
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>								

Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.								
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.								
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>								
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/modify/`

Table 175: POST Certificate Authority Input Parameters

Name	In	Description
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	Body	<p>Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	In	Description
		 Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value

Name	In	Description
		is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>
Properties	Body	<p>Required. A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>
AllowedEnrollmentTypes	Body	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Key Retention Disabled</td></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>Expli-</i></p>										

Name	In	Description
		<p><i>citPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div>  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor </div>

Name	In	Description
		 Command. This overrides the existing AD security policy used by Keyfactor Command.
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div>  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	Body	An array of strings indicating Keyfactor Command security roles that are

Name	In	Description
		<p>allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>
FullScan	Body	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p>

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job.</p><p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job.</p><p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job.</p> <p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p>
Name	Description																			
Off	Turn off a previously configured schedule.																			
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.															
Name	Description																			
Minutes	An integer indicating the number of minutes between each interval.																			
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job.</p><p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job.</p> <p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>															
Name	Description																			
Time	<p>The date and time to next run the job.</p> <p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>																			
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p>																			

Name	In	Description												
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr><tr><td>Days</td><td>An array of values representing the days of the week on which to run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").							
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").													
For example, every Monday, Wednesday and Friday at 5:30 pm: <pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre>														

Name	In	Description
		<p>Or:</p> <pre> "FullScan": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-05-27T17:30:00Z" } } </pre> <div>  <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>
IncrementalScan	Body	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p>

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre></td></tr><tr><td>Weekly</td><td>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job. Name	Description																	
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>																	

 **Note:** Although the Keyfactor API Reference and Utility - Swagger *Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management

Name	In	Description								
		<div> Portal for this functionality—are valid for this endpoint.</div>								
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none">• 0—DCOM• 1—HTTPS								
AuthCertificatePassword	Body	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none">• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <table><tr><th>Value</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr><tr><td>Parameters</td><td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr><tr><td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.</td></tr></table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre>{ "SecretValue": "MySuperSecretPassword"}</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <code>Id</code> value from GET PAM Providers on page 1003 and the Folder and Object reference the folder name and object name in the CyberArk safe):</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<pre> { "Provider": "1", "Parameters":{ "Folder": "MyFolderName", "Object": "MyEJBAClientAuthPassword" } } </pre> <p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1003 and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre> { "Provider": "1", "Parameters":{ "SecretId": "MyEJBAPasswordId" } } </pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	Body	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i>).</p>

Name	In	Description
		in the <i>Keyfactor Command Reference Guide</i>).
LastScan	Body	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

Table 176: POST Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal\":"true"} OR {"syncExternal\":"false"}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	Description
ExplicitUser	<div data-bbox="505 275 1406 401">  Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div> <p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="505 590 1406 1041">  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div data-bbox="505 1062 1406 1230">  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command. </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<div data-bbox="506 285 1406 709">  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="506 741 1406 993">  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	<p data-bbox="496 1031 1406 1094">An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="506 1125 1406 1283"> <pre data-bbox="522 1146 782 1262">"AllowedRequesters": ["Power Users", "Read Only"]</pre> </div> <p data-bbox="496 1314 1406 1409">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1419 1406 1755">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule. 	<div data-bbox="509 285 1406 436">  Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <div data-bbox="509 468 1406 1066">  Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA. </div>

A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr> <tr> <td>Parameters</td><td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr> <tr> <td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.</td></tr> </table> <p>Due to its sensitive nature, this value is not returned in responses.</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.
Value	Description								
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.								
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.								
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.								
AuthCertificate	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>Authentication certificate values include:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuedDN</td><td> A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre> </td></tr> </table>	Value	Description	IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>				
Value	Description								
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>								

Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.								
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.								
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>								
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/modify/`

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 177: PUT Certificate Authority Input Parameters

Name	In	Description
Id	Body	Required. An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	Body	Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).

Name	In	Description
		<p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div>  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>

Name	In	Description
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>
Properties	Body	<p>Required. A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal":true} OR {"syncExternal":false}</pre>
AllowedEnrollmentTypes	Body	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>PFX Enrollment</td></tr><tr><td>2</td><td>CSR Enrollment</td></tr><tr><td>3</td><td>PFX and CSR Enrollment</td></tr></table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Key Retention Disabled</td></tr><tr><td>1</td><td>Indefinite</td></tr><tr><td>2</td><td>After Expiration</td></tr><tr><td>3</td><td>From Issuance</td></tr></table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>Expli-</i></p>										

Name	In	Description
		<p><i>citPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div>  Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option. </div> <div>  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor </div>

Name	In	Description
		 Command. This overrides the existing AD security policy used by Keyfactor Command.
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div>  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div>  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	Body	An array of strings indicating Keyfactor Command security roles that are

Name	In	Description
		<p>allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre>"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>
FullScan	Body	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p>

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>	Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p>
Name	Description																			
Off	Turn off a previously configured schedule.																			
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.															
Name	Description																			
Minutes	An integer indicating the number of minutes between each interval.																			
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>															
Name	Description																			
Time	<p>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p>																			
Weekly	<p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p>																			

Name	In	Description										
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr><tr><td>Days</td><td>An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").</td></tr></table><p>For example, every Monday, Wednesday and Friday at 5:30 pm:</p><pre>"Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-02-27T17:30:00Z" }</pre></td></tr></table> <div> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</div> <p>For example:</p> <pre>"FullScan": { "Daily": { "Time": "2022-05-27T17:30:00Z" } }</pre>	Name	Description		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).	Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").					
Name	Description											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).											
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").											

Name	In	Description
		<p>Or:</p> <pre> "FullScan": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-05-27T17:30:00Z" } } </pre> <div>  <p>Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p> </div>
IncrementalScan	Body	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p>

Name	In	Description																		
		<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td><p>The date and time to next run the job.</p><p>The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</p></td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre></td></tr><tr><td>Weekly</td><td><p>A dictionary that indicates a job scheduled to run on a specific day or days every week at the same time with the parameters:</p></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																	
<div> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management</div>																		

Name	In	Description								
		<div> Portal for this functionality—are valid for this endpoint.</div>								
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none">• 0—DCOM• 1—HTTPS								
AuthCertificatePassword	Body	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none">• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>SecretValue</td><td>A string containing the password used to security the EJBCA CA client authentication certificate.</td></tr><tr><td>Parameters</td><td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td></tr><tr><td>Provider</td><td>A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.</td></tr></tbody></table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre>{ "SecretValue": "MySuperSecretPassword"}</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1003 and the Folder and Object reference the folder name and object name in the CyberArk safe):</p>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <code>GET /PamProviders</code> method (see GET PAM Providers on page 1003) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<pre> { "Provider": "1", "Parameters": { "Folder": "MyFolderName", "Object": "MyEJBAClientAuthPassword" } } </pre> <p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1003 and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre> { "Provider": "1", "Parameters": { "SecretId": "MyEJBAPasswordId" } } </pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i>.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClick-Renewals	Body	<p>A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i></p>

Name	In	Description
		in the <i>Keyfactor Command Reference Guide</i>).
LastScan	Body	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

Table 178: PUT Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div>  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div>  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	 Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i> , so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.
Remote	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero.</p> <p>Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div>  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See <i>Certificate Authority Monitoring</i> in the <i>Keyfactor Command Reference Guide</i> for more information. </div>
IssuanceMax	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will

Name	Description								
	be included in the threshold monitoring email. This value is unset by default.								
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.								
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div>  Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). </div>								
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <pre>{"syncExternal\":"true"} OR {"syncExternal\":"false"}</pre>								
AllowedEnrollmentTypes	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>1</td><td>PFX Enrollment</td></tr> <tr> <td>2</td><td>CSR Enrollment</td></tr> <tr> <td>3</td><td>PFX and CSR Enrollment</td></tr> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment
Value	Description								
1	PFX Enrollment								
2	CSR Enrollment								
3	PFX and CSR Enrollment								
KeyRetention	An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:								

Name	Description										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Key Retention Disabled</td></tr> <tr> <td>1</td><td>Indefinite</td></tr> <tr> <td>2</td><td>After Expiration</td></tr> <tr> <td>3</td><td>From Issuance</td></tr> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div>  <p>Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 1506). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See <i>Certificate Authority Operations: Adding or Modifying a CA Record</i> in the <i>Keyfactor Command Reference Guide</i> for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div>  <p>Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>										
SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i> .										

Name	Description
	 Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See <i>Application Settings: Enrollment Tab</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p>  Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example: <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see <i>Security Roles and Claims</i> in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p>  Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.
ExplicitPassword	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p>

Name	Description
	<div data-bbox="506 285 1406 709">  Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA. </div> <div data-bbox="506 741 1406 993">  Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see <i>Configuring Template Options</i> in the <i>Keyfactor Command Reference Guide</i> and see PUT Templates on page 1506). </div>
AllowedRequesters	<p data-bbox="496 1031 1406 1094">An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="506 1125 1406 1283"> <pre data-bbox="522 1146 782 1262">"AllowedRequesters": ["Power Users", "Read Only"]</pre> </div> <p data-bbox="496 1314 1406 1409">The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p data-bbox="496 1419 1406 1755">This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p>

Name	Description												
	<p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 1506).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>												
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule. 	<div data-bbox="509 285 1406 436">  Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint. </div> <div data-bbox="509 468 1406 1066">  Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA. </div>

For example:</p> <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>				
Value	Description								
IssuedDN	<p>A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example:</p> <pre>"IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>								

Name	Description								
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the EJBCA CA in X.500 format.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.</td></tr> <tr> <td>ExpirationDate</td><td>A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.</td></tr> </table>	Value	Description	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description								
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.								
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.								
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.								
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>								
AllowOneClick-Renewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see <i>Certificate Template Operations</i> and <i>Certificate Authority Operations</i> in the <i>Keyfactor Command Reference Guide</i>).</p>								
LastScan	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>								

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.6 POST Certificate Authority Test

The POST /CertificateAuthority/Test method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/read/`

Table 179: POST Certificate Authority Test Input Parameters

Name	In	Description
id	Body	Required. An integer indicating the CA id in the Keyfactor database.
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> • 0—DCOM Use this option for Microsoft CAs and CA gateways. • 1—HTTPS Use this option for EJBCA CAs. The default is 0.
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <div>  Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. </div>
ExplicitPassword	Body	A string containing either <i>null</i> , or the password for the <i>ExplicitUser</i> , including: SecretValue, parameters, and provider if applicable. <div> <pre> "ExplicitPassword": { "secretValue": "string", "parameters": { "additionalProp1": "string", "additionalProp2": "string", "additionalProp3": "string" }, "provider": 0 </pre> </div>
ExplicitUser	Body	A string indicating the username, in the format DOMAIN\user-name, for a service account user in the forest in which the

Name	In	Description
		<p>Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div>  <p>Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims in the <i>Keyfactor Command Reference Guide</i>) and the <i>AllowedRequesters</i> option.</p> </div> <div>  <p>Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
AuthCertificate	Body	<p>Required*. An object indicating the PKCS#12 client certificate to use to authenticate to the CA using the following format. This certificate is used to authenticate to the CA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format:</p> <pre> "AuthCertificate": { "secretValue": "string", "parameters": { "IssuedDN": "CN=superadmincert", "IssuerDN": "CN=CorpIssuingCA1, DC=keyexample, DC=com", "Thumbprint": "913D80B33517DD6F42428664883DA43BB64D0EEE", "ExpirationDate": "2025-07-17T18:24:23Z" }, "provider": 0 </pre>

Name	In	Description
		This parameter is required for EJBCA CAs.
AuthCertificatePassword	Body	<p>Required*. An object containing password for the client certificate used to provide authentication to the CA.</p> <pre> "authCertificatePassword": { "secretValue": "string", "parameters": { "additionalProp1": "string", "additionalProp2": "string", "additionalProp3": "string" }, "provider": 0 </pre> <p>This parameter is required for EJBCA CAs.</p>
LogicalName	Body	Required . A string indicating the logical name of the certificate authority.
HostName	Body	Required . A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
ConfigurationTenant	Body	<p>Required*. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>This parameter is required for Microsoft CAs.</p>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p>

Table 180: POST Certificate Authority Test Response Data

Name	Description
Success	A Boolean that indicates whether the CA could successfully be reached (True) or not (False).
Message	A string indicating a message about the validation test of the certificate authority.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/revoke/

OR

/certificates/collections/revoke/#/ (where # is a reference to a specific certificate collectionPAM provider ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 181: POST Certificate Authority PublishCRL Input Parameters

Name	In	Description
CertificateAuthorityHostName	Body	The host name of the machine hosting the CA. This field is optional, but is recommended.
CertificateAuthorityLogicalName	Body	Required. The logical name of the CA.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.8 GET Certificate Authority Source Count

The GET /CertificateAuthority/SourceCount method is used to retrieve the count of certificate authorities with full or incremental synchronization scans configured. This method returns HTTP 200 OK on a success with a count. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/read/`

Table 182: GET Certificate Authority Source Count Response Body

Name	Description
n/a	An integer indicating the number of CAs with with full or incremental synchronization scans configured in the Keyfactor Command database.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.9 GET Certificate Authority Available Forests

The GET `/CertificateAuthority/AvailableForests` method is used to retrieve the list of Active Directory forests that are available to Keyfactor Command (the current forest and any forests in a two-way trust with this forest). This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/read/`

Table 183: GET Certificate Authority Available Forests Response Body

Name	Description
n/a	An array of strings containing the list of the available Active Directory forests.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.10 GET Certificate Authority Health Monitoring Schedule

The GET /CertificateAuthority/HealthMonitoring/Schedule method is used to retrieve the current schedule for the CA health monitoring job. This method returns HTTP 200 OK on a success with the list of schedule settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/read/

Table 184: GET Certificate Authority Health Monitoring Schedule Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the schedule.
Schedule	A string indicating the schedule for the health monitoring job. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).
ScheduleType	An integer indicating the type of schedule. Health monitoring schedules have type 10.
Enabled	A Boolean that indicates whether health monitoring is enabled (true) or not (false).
Name	A string indicating the Keyfactor Command reference name of the health monitoring job. This is the name that appears in log output for the job.
EntityId	An internally used Keyfactor Command field.
LastRun	A string indicating the last run time of the job in ISO 8601 UTC time format (e.g. 2023-05-19T16:23:01Z).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.11 GET Certificate Authority Alert Recipients CA Health Recipients

The GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method is used to retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts. This method

returns HTTP 200 OK on a success with the list of CA health recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/read/`

Table 185: GET Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

**Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.12 POST Certificate Authority Alert Recipients CA Health Recipients

The POST `/CertificateAuthority/AlertRecipients/CAHealthRecipients` method is used to create new recipients to receive CA health monitoring alerts in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the health monitoring recipients.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_authorities/modify/`

Table 186: POST Certificate Authority Alert Recipients CA Health Recipients Input Body

Name	In	Description
Emails	Body	Required. An object containing a set of strings with the email address of each recipient. For example: <div><pre>{ "Emails": ["Recipient1@keyexample.com", "Recipient3@keyexample.com"]}</pre></div>

Table 187: POST Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

Note: Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.13 GET Certificate Authority Alert Recipients CA Health Recipients ID

The GET /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} method is used to retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details for the recipient.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/read/

Table 188: GET Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to retrieve. Use the <i>GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</i> method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 442) to retrieve the ID.

Table 189: GET Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.14 DELETE Certificate Authority Alert Recipients CA Health Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} endpoint is used to delete the CA health monitoring recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Table 190: DELETE Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to delete. Use the GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 442) to retrieve the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.15 PUT Certificate Authority Alert Recipients CA Health Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} method is used to update the CA health monitoring alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Table 191: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Input Body

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the CA health monitoring recipient. Use the GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 442) to retrieve the ID.
Email	Body	Required. A string indicating the updated email address of the recipient.

Table 192: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the new email address of the recipient.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.16 DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} endpoint is used to delete the CA threshold recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

 /certificate_authorities/modify/

Table 193: DELETE Certificate Authority Alert Recipients CA Threshold Recipient {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority threshold recipient record to delete. Use the <i>GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</i> method (see GET Certificate Authority Alert Recipients CA Threshold Recipients below) to retrieve the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.8.17 GET Certificate Authority Alert Recipients CA Threshold Recipients

The *GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients* method is used to retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts. This method returns HTTP 200 OK on a success with the list of threshold alert recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/read/

Table 194: GET Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.8.18 GET Certificate Authority Alert Recipients CA Threshold Recipients ID

The GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} method is used to retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the CA threshold recipient.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/read/

Table 195: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the reference ID of the certificate authority threshold recipient record to retrieve. Use the <i>GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</i> method (see GET Certificate Authority Alert Recipients CA Threshold Recipients on the previous page) to retrieve the ID.

Table 196: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the email address of the CA threshold recipient.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.19 POST Certificate Authority Alert Recipients CA Threshold Recipients

The POST /CertificateAuthority/AlertRecipients/CAThresholdRecipients method is used to create new recipients to receive CA threshold alerts in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the threshold recipients.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Table 197: POST Certificate Authority Alert Recipients CA Threshold Recipients Input Body

Name	In	Description
Emails	Body	<p>Required. An object containing a set of strings with the email address of each recipient. For example:</p> <pre>{ "Emails": ["Recipient1@keyexample.com", "Recipient3@keyexample.com"] }</pre>

Table 198: POST Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	<p>A string indicating the email address of the recipient.</p> <p> Note: Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.8.20 PUT Certificate Authority Alert Recipients CA Threshold Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} method is used to update the CA threshold alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Table 199: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Body

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the CA threshold recipient. Use the GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients method (see GET Certificate Authority Alert Recipients CA Threshold Recipients on page 447) to retrieve the ID.
Email	Body	Required. A string indicating the updated email address of the recipient.

Table 200: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the new email address of the CA threshold recipient.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.8.21 POST Certificate Authority Import

The POST /CertificateAuthority/Import method is used to import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix (e.g. keyexample.com). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_authorities/modify/

Table 201: POST Certificate Authority Import Input Parameters

Name	In	Description
dns	Query	Required. The DNS suffix of the configuration tenant to query for CAs to import. For example:

Name	In	Description
		<code>https://keyfactor.keyexample.com/KeyfactorAPI/CertificateAuthority/Import?dns=keyother.com</code>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, edit, list, and set permissions on certificate collections.

Table 202: Certificate Collections Endpoints

Endpoint	Method	Description	Link
/	GET	Returns all certificate collections with details about the collection configuration.	GET Certificate Collections on the next page
/	POST	Creates a new certificate collection.	POST Certificate Collections on page 455
/	PUT	Updates an existing certificate collection.	PUT Certificate Collections on page 461
/ {id}	GET	Returns the certificate collection with the specified ID.	GET Certificate Collections ID on page 465
/ {id}	DELETE	Deletes the certificate collection with the specified ID.	DELETE Certificate Collection ID on page 467
/ {name}	GET	Returns the certificate collection with the specified name.	GET Certificate Collections Name on page 467
/Copy	POST	Creates a new certificate collection	POST Certificate

Endpoint	Method	Description	Link
		based on an existing collection.	Collections Copy on page 470
/NavItems	GET	Returns the list of <i>favorite</i> certificate collections (that have been set to <i>Show in Navigator</i>).	GET Certificate Collection Nav Items on page 476
/[{id}]/Favorite	PUT	Updates the <i>favorite</i> setting for the collection specified.	PUT Certificate Collection ID Favorite on page 476
/CollectionList	GET	Returns information about the definitions for all collections, including the de-duplication setting.	GET Certificate Collections List on page 477

2.6.9.1 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificates/collections/read/
 OR
 /certificates/collections/read/#{/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 203: GET Certificate Collections Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Name • Query • Favorite
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 204: GET Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<div>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table></div>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.2 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/
/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 205: POST Certificate Collections Input Parameters

Name	In	Description												
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	Required. A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p> <p>See also <i>CopyFromId</i>.</p>												
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													

Name	In	Description
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div> <p>Q Example: Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre>{ "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p> </div>

Name	In	Description
		<p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{ "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{ "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The</p>

Name	In	Description
		<p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{ "Id": 16, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 206: POST Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> <tr> <td>4</td><td>Keyfactor Renewal</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.3 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

Note: Certificate collections that are configured for *Certificate Entered Collection* or *Certificate Left Collection* workflows (see Workflow Definition Operations in the *Keyfactor Command Reference Guide*) cannot be edited. This is done to prevent triggering a large number of entered/left workflows.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/
/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 207: PUT Certificate Collections Input Parameters

Name	In	Description				
ID	Body	Required. The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to locate the ID of the collection you wish to update.				
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.				
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.				
Query	Body	Required. A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p>				
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr></table>	Value	Description	0	None
Value	Description					
0	None					

Name	In	Description										
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table>	Value	Description	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal

4	Keyfactor Renewal											
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .										
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .										

Table 208: PUT Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> <tr> <td>4</td><td>Keyfactor Renewal</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.4 GET Certificate Collections ID

The GET /CertificateCollections/{id} method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 209: GET Certificate Collections {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to retrieve a list of all the certificate collections to determine the certificate collection ID.

Table 210: GET Certificate Collections {id} Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<div><p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table></div>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.5 DELETE Certificate Collection ID

The DELETE /CertificateCollections/{id} method is used to delete the certificate collection with the specified ID from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/modify/
OR
/certificates/collections/modify/{id} (where {id} is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 211: DELETE Certificate Collection {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate collection to delete. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to retrieve a list of certificate collections to determine the collection ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.6 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 212: GET Certificate Collections Name Input Parameters

Name	In	Description
name	Path	<p>Required. A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificates on page 299) to retrieve a list of all the certificate collections to determine the certificate collection name.</p> <div> Tip: When using the Keyfactor API Reference and Utility, provide this name without quotation marks.</div>

Table 213: GET Certificate Collections ID Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> <tr> <td>4</td><td>Keyfactor Renewal</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.7 POST Certificate Collections Copy

The POST /CertificateCollections/Copy method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/
/certificates/collections/modify/
OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 214: POST Certificate Collections Copy Input Parameters

Name	In	Description												
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	Required. A string containing the search criteria for the collection. For example: <div><pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre></div> <p>See <i>Certificate Search Page</i> in the <i>Keyfactor Command Reference Guide</i> for querying guidelines.</p> <p>See also <i>CopyFromId</i>.</p>												
DuplicationField	Body	An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i> . The default is 0. Possible values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													

Name	In	Description
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div> <p>Q Example: Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre>{ "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p> </div>

Name	In	Description
		<p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses POST /CertificateCollections/Copy (or POST /CertificateCollections—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre>{ "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>In the response, Gina sees the following:</p> <pre>{ "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Notice that Gina has not achieved her desired goal. The</p>

Name	In	Description
		<p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre>{ "Id": 16, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 215: POST Certificate Collections Copy Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>None</td></tr><tr><td>1</td><td>Common Name</td></tr><tr><td>2</td><td>Distinguished Name</td></tr><tr><td>3</td><td>Principal Name</td></tr><tr><td>4</td><td>Keyfactor Renewal</td></tr></table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.8 GET Certificate Collection Nav Items

The GET /CertificateCollection/NavItems method is used to return a list of the collections that have been set as favorites to *Show in Navigator*. This method returns HTTP 200 OK on a success with the collection names and IDs. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 8](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Table 216: GET Certificate Collection Nav Items Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate collection.
Name	A string indicating the name of the certificate collection.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.9 PUT Certificate Collection ID Favorite

The PUT /CertificateCollection/{id}/Favorite method is used to update the *Favorite / Show in Navigator* setting for a collection. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/modify/

OR

/certificates/collections/modify/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 217: PUT Certificate Collection{id} Favorite Input Body

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 452) to retrieve a list of certificate collections to determine the collection ID.
ShowInNavigator	Body	A Boolean indicating whether the certificate collection should appear on the menu (true) or not(false). For example: <pre>{ "ShowInNavigator": true }</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.9.10 GET Certificate Collections List

The GET /CertificateCollections/CollectionList method is used to return the definitions for all certificate collections. This method returns HTTP 200 OK on a success with details for each certificate collection, including the de-duplication setting.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See *Certificate Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection permissions.

Table 218: GET Certificate Collections List Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Collection Manager Search Feature</i> in the <i>Keyfactor Command Reference Guide</i> . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Name• Query
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 219: GET Certificate Collections List Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
DuplicationField	<p>A string indicating the type of de-duplication (a.k.a. <i>ignore renewed certificate results by</i>) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see <i>Saving Search Criteria as a Collection</i> in the <i>Keyfactor Command Reference Guide</i>. Possible values are:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>None</td></tr> <tr> <td>1</td><td>Common Name</td></tr> <tr> <td>2</td><td>Distinguished Name</td></tr> <tr> <td>3</td><td>Principal Name</td></tr> <tr> <td>4</td><td>Keyfactor Renewal</td></tr> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
Favorite	A Boolean that indicates whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												
ShowOnDashboard	A Boolean that indicates whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
HasQueryPermissions	A Boolean that indicates whether the user has query permissions (true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the *Keyfactor Command Reference Guide* and *Keyfactor Command Orchestrator Installation and Configuration Guide*, or contact your Keyfactor representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 220: Certificate Stores Endpoints](#).

Table 220: Certificate Stores Endpoints

Endpoint	Method	Description	
/	DELETE	Deletes multiple certificate stores specified in the request body.	DELETE Certificate Stores on page 482
/	GET	Returns all certificate stores with paging and option to specify detail level.	GET Certificate Stores on page 482
/	POST	Creates a new certificate store if valid parameters are supplied.	POST Certificate Stores on page 495
/	PUT	Updates an existing certificate store.	PUT Certificate Stores on page 523
/ {id}	DELETE	Deletes a certificate store by its GUID.	DELETE Certificate Stores ID on page 552
/ {id}	GET	Returns certificate store details for the specified certificate store.	GET Certificate Stores ID on page 553
/ {id}/Inventory	GET	Returns certificate inventory for the specified certificate store.	GET Certificate Stores ID Inventory

Endpoint	Method	Description	
			on page 571
/Server (*deprecated)	GET	Returns a list of certificate store servers.	GET Certificate Stores Server
/Server (*deprecated)	POST	Creates a new certificate store server.	POST Certificate Stores Server
/Server (*deprecated)	PUT	Updates an existing certificate store server.	PUT Certificate Stores Server
/Password	PUT	Updates the password for a certificate store.	PUT Certificate Stores Password on page 573
/DiscoveryJob	PUT	Creates a job to find certificate stores.	PUT Certificate Stores Discovery Job on page 575
/AssignContainer	PUT	Assigns a certificate store to a container.	PUT Certificate Stores Assign Container on page 581
/Approve	POST	Approves an array of pending certificate stores.	POST Certificate Stores Approve on page 592
/Schedule	POST	Creates an inventory schedule for a certificate store.	POST Certificate Stores Schedule on page 603
/Reenrollment	POST	Schedules a reenrollment of a certificate into a certificate store.	POST Certificate Stores Reenrollment on page 606
/Certificates/Add	POST	Configures a management job to add a certificate to one or more stores with the provided schedule.	POST Certificate Stores Certificates Add on page 608
/Certificates/Remove	POST	Configures a management job to remove a certificate from one or more stores with the provided schedule.	POST Certificate Stores Certificates Remove on page 615

2.6.10.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

**Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/
OR
/certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 221: DELETE Certificate Stores Input Parameters

Name	In	Description
IDs	Body	<p>Required. An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <div>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</div> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores below) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p>

**Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 222: GET Certificate Stores Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Certificate Store Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AddSupported (True, False) • AgentAvailable (True, False) • AgentId • Approved (True, False) • Category (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) • CertificateId • ClientMachine • Container (ContainerName) • ContainerId • HasInventoryScheduled (True, False) • PrivateKeyAllowed (0-Forbidden, 1-Optional, 2-Required) • RemoveSupported (True, False) • StorePath <div>  Tip: Use the following query to limit the results to only active certificate stores and not include discovery results: <code>approved -eq true</code> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .

Name	In	Description
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 223: GET Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more

Name	Description
	<p>information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 541 1015 646">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 856 1156 961">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="479 1140 1377 1302">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre data-bbox="479 1543 1273 1732">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description												
	<div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.												

Name	Description																
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> <tr> <td>ExactlyOnce</td><td> <p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 224: POST Certificate Stores Input Parameters

Name	In	Description
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	Body	Required. A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).

Name	In	Description
		<p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{ \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre>"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre>"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																				

Table 225: POST Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more

Name	Description
	<p>information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 541 1015 646">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 856 1156 961">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="479 1140 1377 1302">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre data-bbox="479 1543 1273 1732">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description												
	<div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should

first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 226: PUT Certificate Stores Input Parameters

Name	In	Description
Id	Body	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	Body	Required. A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmaonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are

Name	In	Description
	dy	<p>stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>"{ \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre>"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre>"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\":</pre>

Name	In	Description						
		<div><pre>{\"SecretId\": \"MyUserID\"}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }</pre></div> <div><div></div><div><p>Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p><ul style="list-style-type: none">• ServerUsername• ServerPassword• ServerUseSsl<p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p></div></div>						
AgentId	Body	Required. A string indicating the Keyfactor Command GUID of the orchestrator for this store.						
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .						
ContainerName	Body	A string indicating the name of the certificate store’s associated container, if applicable.						
InventorySchedule	Body	<div>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td></tr></table><div><div></div><div><p>Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p></div></div></div>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).

SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .				

Name	In	Description						
Password	Body	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores Server).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none">• Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).• Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.• Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> Tip: To set the no password option on a store, submit the password with a null value. 					ence GUID for the PAM provider type parameter.																											
			Name	A string indicating the internal name for the PAM provider type parameter.																												
		Provider-TypeParams	Unused field																													
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.																															
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																															

Table 227: PUT Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more

Name	Description
	<p>information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 541 1015 646">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 856 1156 961">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="479 1140 1377 1302">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre data-bbox="479 1543 1273 1732">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description												
	<div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. JobProperties	<p>An array containing the unique entry parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific entry parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for CitrixAdc, the key name that is optionally used to associate the certificate with a virtual server is <i>virtualServerName</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["sniCert", "virtualServerName"]</pre>
Name	Description										
Data	A Boolean that indicates whether the certificate store can use the re-enrollment function (true) or not (false).										
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator that can re-enroll the certificate store.										
Message	A string indicating the reason the certificate store cannot re-enroll, if applicable.										
JobProperties	<p>An array containing the unique entry parameters defined for the certificate store type that need to be populated for the certificate. The <i>key</i> is the name of the specific entry parameter from the certificate store type definition as returned in the JobProperties on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on the certificate in the certificate store. For example, for CitrixAdc, the key name that is optionally used to associate the certificate with a virtual server is <i>virtualServerName</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["sniCert", "virtualServerName"]</pre>

Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.5 DELETE Certificate Stores ID

The DELETE /CertificateStores/{id} method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 228: DELETE Certificate Stores Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store to delete. Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 482) to retrieve a list of all the certificate stores to determine the certificate store GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.6 GET Certificate Stores ID

The *GET /CertificateStores/{id}* method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/read/
 OR
 /certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 229: GET Certificate Stores {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command. Use the <i>GET /CertificateStore</i> method (see GET Certificate Stores on page 482) to retrieve a list of all the certificate stores to determine the certificate store GUID.

Table 230: GET Certificate Stores {id} Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more

Name	Description
	<p>information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 541 1003 646">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="467 856 1141 961">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="467 1140 1377 1276">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre data-bbox="467 1486 1263 1675">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description												
	<div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	<p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>												
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.

	<p>ificate job. The default is <i>false</i>.</p> <ul style="list-style-type: none"> • OnReenrollment: If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. The default is <i>false</i>. 														
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.														
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> . This value is unset by default.														
Options	A string containing a comma-separated list of multiple choice options for this entry parameter. This field should only be populated if <i>Type</i> is set to <i>MultipleChoice</i> . This value is unset by default.

	 user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores Server).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <p>The possible values are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>SecretValue</td><td>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</td></tr> </table> <div>  Tip: To set the no password option on a store, submit the password with a null value. For example: </div>	Name	Description	SecretValue	A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.

	ating the internal name for the PAM provider type parameter.														
Provider-TypeParams	Unused field														
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.														
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.														
<div>  Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses. </div>															

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/{#}/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 231: GET Certificate Stores {id} Inventory Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 232: GET Certificate Stores {id} Inventory Response Data

Name	Description																				
Name	A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See <i>PFX Enrollment</i> in the <i>Keyfactor Command Reference Guide</i> for more information.																				
Certificates	<p>An array of objects indicating the certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Id</td><td>An integer indicating the Keyfactor Command reference ID of the certificate.</td></tr> <tr> <td>IssuedDN</td><td>A string indicating the distinguished name of the certificate.</td></tr> <tr> <td>SerialNumber</td><td>A string indicating the serial number of the certificate.</td></tr> <tr> <td>NotBefore</td><td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td></tr> <tr> <td>NotAfter</td><td>A string indicating the date, in UTC, on which the certificate expires.</td></tr> <tr> <td>SigningAlgorithm</td><td>A string indicating the algorithm used to sign the certificate.</td></tr> <tr> <td>IssuerDN</td><td>A string indicating the distinguished name of the issuer.</td></tr> <tr> <td>Thumbprint</td><td>A string indicating the thumbprint of the certificate.</td></tr> <tr> <td>CertStoreInventoryItemId</td><td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td></tr> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	A string indicating the date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	Thumbprint	A string indicating the thumbprint of the certificate.	CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																				
IssuedDN	A string indicating the distinguished name of the certificate.																				
SerialNumber	A string indicating the serial number of the certificate.																				
NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.																				
NotAfter	A string indicating the date, in UTC, on which the certificate expires.																				
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																				
IssuerDN	A string indicating the distinguished name of the issuer.																				
Thumbprint	A string indicating the thumbprint of the certificate.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.																				
Parameters	An object containing the entry parameters associated with the certificate																				

Name	Description
	in the certificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See POST Certificate Store Types on page 676 for more information about entry parameters.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.8 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 233: PUT Certificate Stores Password Input Parameters

Name	Type	Description								
CertStoreID	Body	Required. A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see GET Certificate Stores on page 482) to retrieve a list of all your certificate stores to determine the GUID of the store.								
NewPassword	Body	Required. A object that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command’s definition of it. Password settings include: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td>A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.</td></tr><tr><td>Provider</td><td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.</td></tr><tr><td>Parameters</td><td>An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be:<pre>"NewPassword": { "Provider": 2, "Parameters": {</pre></td></tr></table></div>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.	Parameters	An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": { "Provider": 2, "Parameters": {</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.									
Parameters	An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": { "Provider": 2, "Parameters": {</pre>									

Name	Type	Description							
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>"SecretId": 5 } },</pre><p>For CyberArk, this might be:</p><pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre></td></tr><tr><td></td><td></td><td><p>For a password stored in the Keyfactor Command database, this might be:</p><pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre></td></tr></table>	Name	Description		<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>			<p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre>
Name	Description								
	<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>								
		<p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre>							

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.9 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.

- PEM, Java, F5, F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with an appropriate custom extension. For more information about the Keyfactor Universal Orchestrator and custom extensions, see *Universal Orchestrator* in the *Keyfactor Orchestrators Installation and Configuration Guide*.
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 592](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/modify/

OR

/certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 234: PUT Certificate Stores Discovery Job Input Parameters

Name	In	Description
ClientMachine	Body	Required. A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.
Type	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+. The default is 0 for a JKS discovery using the Keyfactor Java Agent.
JobExecutionTimestamp	Body	The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Dirs	Body	Required. A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas. <ul style="list-style-type: none"> • Java For Java discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server. • PEM For PEM discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server. • F5 For F5 discovery, enter “/”.
IgnoredDirs	Body	A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.
Extensions	Body	A string containing the file extensions for which to search. For

Name	In	Description
		example, search for files with the extension <i>jks</i> in order to exclude files with other extensions such as <i>txt</i> . Use <i>noext</i> to search file files without extensions. The dot should not be included when specifying extensions.
NamePatterns	Body	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. <i>myjks</i>).
SymLinks	Body	A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows.
Compatibility	Body	A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.

Name	In	Description								
ServerUsername	Body	<table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string containing the username.</p><p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p></td></tr><tr><td>Provider</td><td><p>An integer that identifies the PAM provider used to store the username. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre>"Password": { "Provider": 2, "Parameters": { "SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"Password": { "Provider": 5,</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you're storing your password in the Keyfactor Command database.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use.									
Parameters	<p>The parameters required by your PAM provider, containing the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1003) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request.</p> <p>For example, for Delinea, this might be:</p> <pre>"Password": { "Provider": 2, "Parameters": { "SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"Password": { "Provider": 5,</pre>									

Name	In	Description				
		<table><tr><th>Name</th><th>Description</th></tr><tr><td></td><td><pre>"Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre></td></tr></table> <div> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</div> <p>This field is required only for select certificate store types that require authentication at the server level. These include F5, Citrix/NetScaler, IIS, and any custom method you've defined to support this.</p>	Name	Description		<pre>"Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>
Name	Description					
	<pre>"Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>					
ServerUseSsl	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.10 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/modify/

OR

/certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 235: PUT Certificate Stores Assign Container Input Parameters

Name	In	Description
CertStoreContainerId	Body	<p>Required*. An integer that identifies the container into which you want to place the certificate store or stores.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>
KeystoreIds	Body	<p>Required. An array of strings indicating the certificate store GUIDs for the stores you want to place into the container.</p>
NewContainerName	Body	<p>Required*. A string that sets the name of the container if you would like to create a new container while assigning store(s) to it.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>
NewContainerType	Body	<p>Required*. An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types.</p> <p>Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype -eq 7</i>) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i>.</p> <p>One of the following is required:</p> <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>

Table 236: PUT Certificate Stores Assign Container Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 619).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See <i>Certificate Store Operations: Adding or Modifying a Certificate Store</i> in the <i>Keyfactor Command Reference Guide</i> for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more

Name	Description
	<p>information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 541 1015 646">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="479 856 1156 961">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="479 1140 1377 1302">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1003):</p> <pre data-bbox="479 1543 1273 1732">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	Description												
	<div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Immediate</td><td> <p>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</p> <div>  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule. Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.11 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores Discovery Job on page 575](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 237: POST Certificate Stores Approve Input Parameters

Name	In	Description
Id	Body	<p>Required. The GUID of the pending certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 482) with a query of “Approved -eq false” to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.</p>
ContainerId	Body	<p>An integer that identifies the container in which the certificate store should be placed on approval. Use the <i>GET /CertificateStores/Containers</i> method (see GET Certificate Store Containers on page 619) to retrieve a list of your defined certificate store containers to determine the container ID to use.</p>
CertStoreType	Body	<p>Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.</p>
Properties	Body	<p>Required*. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 670 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{ "privateKeyPath": "/opt/app/mystore.key", "separatePrivateKey": "true" }</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre>{ "privateKeyPath": { "value": "/opt/app/mystore.key" }, "separatePrivateKey": { "value": "true" } }</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p>

Name	In	Description
		<pre>"{ \"ServerUsername\":{\"value\":{\"SecretValue\":\"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\":{\"value\":{\"SecretValue\":\"MySuperSecretPassword\"}}, \"ServerUseSsl\":{\"value\":\"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1003):</p> <pre>"{ \"ServerUsername\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":\"MyUserID\"}}}, \"ServerPassword\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":\"MyPasswordID\"}}}, \"ServerUseSsl\":{\"value\":\"true\"} }"</pre> <div>  Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5): <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <p>This field is required for certificate store types that store additional properties in this parameter.</p>
Pass- word	Bo- dy	<p>Required. An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores in Windows certificate stores and on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level.</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password.

Name	In	Description										
		<p>This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</p> <ul style="list-style-type: none">Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database.Load the credential information from a PAM provider. See <i>Privileged Access Management (PAM)</i> in the <i>Keyfactor Command Reference Guide</i> and PAM Providers on page 987 for more information. <p>The possible values are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>SecretValue</td><td><p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p><div> Tip: To set the no password option on a store, submit the password with a null value. 	parameter.																							
Name	A string indicating the internal name for the PAM provider type parameter.																							
Provider-TypeParameters	Unused field																							
Provider		An integer indicating the Keyfactor Command reference ID for the PAM provider.																						
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.12 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/schedule/

OR

/certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 238: POST Certificate Stores Schedule Input Parameters

Name	In	Description																		
Storelds	Body	Required. An array of strings providing the certificate store GUIDs to schedule.																		
Schedule	Body	Required. An object indicating the inventory schedule for the certificate store(s). Supported schedules are: <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>Interval</td><td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).											
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.13 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.
- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 960](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/enrollment/csr/

/certificate_stores/modify/

OR

/certificates/enrollment/csr/

/certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

In addition, either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see *Authorization Methods* Tab in the *Keyfactor Command Reference Guide*) must have enrollment permissions configured on the CA and template.

Table 239: POST Certificates Stores Reenrollment Input Parameters

Name	In	Description
KeystoreId	Body	<p>Required. The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 482) to retrieve a list of your certificate stores to determine the GUID of the store.</p>
SubjectName	Body	<p>Required. A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>
AgentGuid	Body	<p>Required. The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 482) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>
Alias	Body	<p>Required. The alias of the certificate in the certificate store.</p>
JobProperties	Body	<p>An object indicating the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the <i>JobProperties</i> on the store type using the <i>GET CertificateStoreTypes</i> method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by <i>GET CertificateStoreTypes</i> like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-</p>

Name	In	Description
		 certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.
CertificateAuthority	Body	A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab in the <i>Keyfactor Command Reference Guide</i>).
CertificateTemplate	Body	A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab in the <i>Keyfactor Command Reference Guide</i>).

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.14 POST Certificate Stores Certificates Add

The POST /CertificateStores/Certificates/Add method is used to add a certificate to one or more certificate stores. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 960](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificates/collections/read/
- /certificate_stores/schedule/

OR

- /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
- /certificate_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See *Certi-*

ificate Permissions and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 240: POST Certificate Stores Certificates Add Input Parameters

Name	In	Description										
CertificateId	Body	Required. An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).										
CertificateStores	Body	Required. An array of objects indicating the certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include: <table><tr><th>Name</th><th>Description</th></tr><tr><td>CertificateStoreIds</td><td>Required. A string containing the GUID for the certificate store to which the certificate should be added.</td></tr><tr><td>Alias</td><td>Required* A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See <i>Add Certificate</i> in the <i>Keyfactor Command Reference Guide</i> for more information. This field may be required depending on the store type selected.</td></tr><tr><td>JobFields</td><td>An object that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td></tr><tr><td>Overwrite</td><td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>. Use the <i>GET /Certificates/Locations/{id}</i> method (see GET Certificates Locations ID on page 276) to retrieve a list of the locations an</td></tr></table>	Name	Description	CertificateStoreIds	Required. Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.10.15 POST Certificate Stores Certificates Remove

The POST /CertificateStores/Certificates/Remove method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 960](#)).

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificates/collections/read/

/certificate_stores/schedule/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificate_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See *Certificate Permissions* and *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs collection and container permissions.

Table 241: POST Certificate Stores Certificates Remove Input Parameters

Name	In	Description

Name	In	Description												
		<pre>c4ad4569b4e7" }]</pre>												
Schedule	Body	<p>Required. An object indicating the inventory schedule for the removal job. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Immediate</td><td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).<div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div></td></tr><tr><td>ExactlyOnce</td><td>A dictionary that indicates a job scheduled to run at the time specified with the parameter:<div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table><p>For example, exactly once at 11:45 am:</p><pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div></div></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>	ExactlyOnce	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table><p>For example, exactly once at 11:45 am:</p><pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div></div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description													
Off	Turn off a previously configured schedule.													
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</div>													
ExactlyOnce	A dictionary that indicates a job scheduled to run at the time specified with the parameter: <div><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table><p>For example, exactly once at 11:45 am:</p><pre>"ExactlyOnce": { "Time": "2022-02-27T11:45:00Z" }</pre><div> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</div></div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
Name	Description													
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).													

Name	In	Description
		 Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See <i>Certificate Permissions</i> in the <i>Keyfactor Command Reference Guide</i> for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.11 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 242: Certificate Store Containers Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of certificate store containers.	GET Certificate Store Containers on the next page
/	POST	Adds a certificate store container.	POST Certificate Store Containers on page 622
/ {id}	DELETE	Deletes a certificate store container.	DELETE Certificate Store Containers ID on page 632
/ {id}	GET	Returns details for the specified certificate store container.	GET Certificate Store Containers ID on page 633

Endpoint	Method	Description	Link
/id}	PUT	Edits a certificate store container.	PUT Certificate Store Containers on page 627

2.6.11.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 243: GET Certificate Store Containers Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: <i>Using the Containers Search Feature</i> in the <i>Keyfactor Command Reference Guide</i>. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CertStoreType (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmaonWebServices, 101-FileTransferProtocol) • HasSchedule (True, False) • Id • Name (Short Name)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 244: GET Certificate Stores Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Over-writeSchedules	A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).																
Schedule	<p>An object containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td></tr> <tr> <td>Daily</td><td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> </td></tr> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>
Name	Description				
	<pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>				
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.				
StoreCount	An integer indicating the number of stores of the type referenced by CertStoreType in the container.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.11.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 245: POST Certificate Stores Containers Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<p>An object containing the inventory schedule set for the container. Supported schedules are:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><p>For example, every hour:</p><pre>"Interval": { "Minutes": 60 }</pre></td></tr><tr><td>Daily</td><td><p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p><table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table><p>For example, daily at 11:30 pm:</p><pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre></td></tr></table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2022-02-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																	

Name	In	Description
		 Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	Body	<p>An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+. The default is 0 for a JKS keystore.</p>

Table 246: POST Certificate Stores Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>An object containing the inventory schedule set for the container. Supported schedules are:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Off</td><td>Turn off a previously configured schedule.</td></tr> <tr> <td>Interval</td><td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description				
	<table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td></td><td> <pre>"Time": "2022-02-25T23:30:00Z" }</pre> </td></tr> </table> <p> Note: Although the Keyfactor API Reference and Utility - Swagger <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Time": "2022-02-25T23:30:00Z" }</pre>
Name	Description				
	<pre>"Time": "2022-02-25T23:30:00Z" }</pre>				
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakey-store, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.11.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate_stores/modify/
- OR
- /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 247: PUT Certificate Store Containers Input Parameters

Name	In	Description																
Id	Path	Required. An integer indicating the ID of the container.																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<div>An object containing the inventory schedule set for the container. Supported schedules are:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Off</td><td>Turn off a previously configured schedule.</td></tr><tr><td>Interval</td><td><div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.<table><tr><th>Name</th><th>Description</th></tr><tr><td>Minutes</td><td>An integer indicating the number of minutes between each interval.</td></tr></table><div>For example, every hour:<pre>"Interval": { "Minutes": 60 }</pre></div></div></td></tr><tr><td>Daily</td><td><div>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:<table><tr><th>Name</th><th>Description</th></tr><tr><td>Time</td><td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td></tr></table><div>For example, daily at 11:30 pm:</div></div></td></tr></table></div>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<div>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description				
	<pre>"Time": "2022-02-25T23:30:00Z" }</pre>				
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakey-store, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.11.4 DELETE Certificate Store Containers ID

The DELETE /CertificateStoreContainers/{id} method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:

- /certificate_stores/modify/
- OR
- /certificate_stores/modify/{#}/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 249: DELETE Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container to delete. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 619) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.11.5 GET Certificate Store Containers ID

The *GET /CertificateStoreContainers/{id}* method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
 /certificate_stores/read/
 OR
 /certificate_stores/read/{#}/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See *Container Permissions* in the *Keyfactor Command Reference Guide* for more information about global vs container permissions.

Table 250: GET Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 619) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Table 251: GET Certificate Stores Containers {id} Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>An object containing the inventory schedule set for the container. Name	Description								
	in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.12 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 252: Certificate Store Type Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a certificate store type using StoreType number.	DELETE Certificate Store Types ID on the next page
/id}	GET	Returns certificate store type details for the specified certificate store type using StoreType number.	GET Certificate Store Types ID on the next page
/Name/{name}	GET	Returns certificate store type details for the specified certificate store type using ShortName.	GET CertificateStoreTypes Name Name on page 662
/	DELETE	Delete multiple certificate store types using StoreType number.	DELETE Certificate Store Types on page 669

Endpoint	Method	Description	Link
/	GET	Returns all certificate store types with paging and options to the specified detail level.	GET Certificate Store Types on page 670
/	POST	Creates a new certificate store type.	POST Certificate Store Types on page 676
/	PUT	Updates a certificate store type using StoreType number.	PUT Certificate Store Types on page 690

2.6.12.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/

Table 253: DELETE Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type to delete. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 670) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.12.2 GET Certificate Store Types ID

The GET /CertificateStoreTypes/{id} method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/read/ OR container permission

Table 254: GET Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 670) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Table 255: GET Certificate Store Types {id} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> • String • Bool </td></tr> </table>	Name	Description	Name	A string containing the short name of the property. Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every 										

Name	Description
	 use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.12.3 GET CertificateStoreTypes Name Name

The GET `/CertificateStoreTypes/Name/{name}` method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
`/certificate_stores/read/`

Table 256: GET Certificate Store Types Name {Name} Input Parameters

Name	In	Description
name	Path	<p>Required. The short name of the certificate store type.</p> <p>Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 670) to retrieve a list of all the certificate store types to determine the certificate store type short name.</p>

Table 257: GET Certificate Store Types Name {Name} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. 	 use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.12.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/

Table 258: DELETE Certificate Store Types Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name):</p> <pre>[106,108,109]</pre> <p>Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types below) to retrieve a list of all the certificate store types to determine the certificate store type IDs.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

2.6.12.5 GET Certificate Store Types

The GET /CertificateStoreTypes method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

Tip: The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/read/ OR container permission

Table 259: GET Certificate Store Types Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 260: GET Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.

If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description										
	<p>for this field when configuring an add certificate job.</p> <ul style="list-style-type: none"> • OnRemove: If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job. • OnReenrollment: If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. 										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every 										

Name	Description
	 use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

2.6.12.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see *Security Roles and Claims* in the *Keyfactor Command Reference Guide*) are required to use this feature:
/certificate_stores/modify/

Table 261: POST Certificate Store Types Input Parameters

Name	In	Description								
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.								
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.								
Capability	Body	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .								
SupportedOperations	Body	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none">• Add• Create• Discovery• Enrollment• Remove <p>The default for each value is <i>false</i>.</p>								
Properties	Body	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>Name</td><td>Required. A string containing the short name of the property. If you choose to define a property, this field is required.</td></tr><tr><td>DisplayName</td><td>Required. A string containing the full display name of the property. For example, to set a multiple choice entry parameter:												

Name	In	Description
		<pre> "EntryParameter": [{ "Name": "ZooAnimal", "DisplayName": "Favorite Zoo Animal", "Type": "MultipleChoice", "RequiredWhen": { "HasPrivateKey": false, "OnAdd": true, "OnRemove": true, "OnReenrollment": true }, "DefaultValue": "Penguin", "Options": "Tiger- ,Bear,Giraffe,Lion,Wolf,Penguin,Zebra" }] </pre> <p>This value is unset by default.</p> <div>  <p>Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </div>

Table 262: POST Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. Property parameters include:</p> <table> <tr> <th>Name</th><th>Description</th></tr> <tr> <td>Name</td><td>A string containing the short name of the property.</td></tr> <tr> <td>DisplayName</td><td>A string containing the full display name of the property.</td></tr> <tr> <td>Type</td><td> <p>A string containing the type of the property:</p> <ul style="list-style-type: none"> • String • Bool </td></tr> </table>	Name	Description	Name	A string containing the short name of the property.	DisplayName	A string containing the full display name of the property.	Type	<p>A string containing the type of the property:</p> <ul style="list-style-type: none"> • String • Bool
