Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Issued

The PUT /Alerts/Issued method is used to update an issued certificate request alert. This method returns HTTP 200 OK on a success with details about the issued certificate request alert.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 168: PUT Alerts Issued Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	Body	Required. A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate inform- ation includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:Ap- pOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thum- bprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</t- d><td>Business Critical: {metadata:Busi- nessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System” </pre> <p>See Table 6: Substitutable Special Text for Issued Certificate Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>

Name	In	Description
		 Note: The <code>\$(requester:givenname)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider.
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> <code>{requester:mail}</code> The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.  Note: The <code>\$(requester:mail)</code> substitutable special text token is only supported in environments using Active Directory as an identity provider. <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to <code>{metadata:AppOwnerEmailAddress}</code>.
TemplateId	Body	<p>An integer indicating the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests.</p> <p>Use the GET /Templates method (see GET Templates on page 2422) to retrieve a list of all the templates to determine the template ID.</p>

Table 169: PUT Alerts Issued Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the issued request alert.
DisplayName	A string indicating the display name for the issued request alert. This name appears in the issued request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="581 598 1404 865" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello {requester:givenname},\n\nThe certificate you requested in the name {cn} was successfully issued on {certnotbefore}. You can download it from here:\n\n{dnldlink}\n\nCertificate information includes:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>Serial Number: {serial}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>Thumbprint: {thumbprint}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>DN: {dn}</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nThanks!\n\nYour Certificate Management System”</p> <p>See Table 6: Substitutable Special Text for Issued Certificate Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>
Recipients	An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special

Name	Description										
	<p>text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the issued request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all issued certificate requests. Possible values are:</p> <table border="1" data-bbox="581 705 1398 1446"> <thead> <tr> <th data-bbox="587 714 898 772">Value</th> <th data-bbox="898 714 1391 772">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="587 772 898 905">Id</td> <td data-bbox="898 772 1391 905">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for All Templates.</td> </tr> <tr> <td data-bbox="587 905 898 1064">DisplayName</td> <td data-bbox="898 905 1391 1064">A string containing the name of the template.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.4.4 Alerts Key Rotation

The Alerts Key Rotation component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for SSH keys approaching the end of the key lifetime. The default key lifetime is 365 days, but this setting is configurable (see [Application Settings: SSH Tab on page 620](#)). Key rotation alerts apply to both user keys (see [My SSH Key on page 531](#)) and

service account keys (see [Service Account Keys on page 542](#)) generated within Keyfactor Command.

Table 170: Alerts Key Rotation

Endpoint	Method	Description	Link
/Alerts/KeyRotation/{id}	DELETE	Deletes an SSH key rotation alert for the specified ID.	DELETE Alerts Key Rotation ID below
/Alerts/KeyRotation/{id}	GET	Retrieves details for the SSH key rotation alert for the specified ID.	GET Alerts Key Rotation ID on the next page
/Alerts/KeyRotation/Schedule	GET	Retrieves details of the schedule for delivery of SSH key rotation alerts.	GET Alerts Key Rotation Schedule on page 1006
/Alerts/KeyRotation/Schedule	PUT	Updates the schedule for delivery of SSH key rotation alerts.	PUT Alerts Key Rotation Schedule on page 1008
/Alerts/KeyRotation	GET	Retrieves details for all configured SSH key rotation alerts.	GET Alerts Key Rotation on page 1011
/Alerts/KeyRotation	POST	Creates a new SSH key rotation alert.	POST Alerts Key Rotation on page 1015
/Alerts/KeyRotation	PUT	Updates the SSH key rotation alert for a specified ID.	PUT Alerts Key Rotation on page 1022
/Alerts/KeyRotation/Test	POST	Used to test specific SSH key rotation alerts.	POST Alerts Key Rotation Test on page 1030
/Alerts/KeyRotation/TestAll	POST	Used to test all SSH key rotation alerts.	POST Alerts Key Rotation Test All on page 1032

DELETE Alerts Key Rotation ID

The DELETE /Alerts/KeyRotation/{id} method is used to delete the SSH key rotation alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 171: DELETE Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert to be deleted. Use the GET /Alerts/KeyRotation method (see GET Alerts Key Rotation on page 1011) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation ID

The GET /Alerts/KeyRotation/{id} method is used to retrieve details for the SSH key rotation alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alert.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 172: GET Alerts Key Rotation {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the SSH key rotation alert. Use the GET /Alerts/KeyRotation method (see GET Alerts Key Rotation on page 1011) to retrieve a list of all the SSH key rotation alerts to determine the alert ID.

Name	Description

	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see Extensions Scripts on page 1704). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See Table 8: Substitutable Special Text for Key Rotation Alerts for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation Schedule

The GET /Alerts/KeyRotation/Schedule method is used to retrieve the schedule for delivery of SSH key rotation alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for SSH key rotation alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Key Rotation

The GET /Alerts/KeyRotation method is used to retrieve details of all SSH key rotation alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified SSH key rotation alerts.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 177: GET Alerts Key Rotation Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Days • DisplayName • Message • RegisteredEventHandlerId • ScheduledTaskId • Subject • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1" data-bbox="521 359 1398 894"> <thead> <tr> <th data-bbox="521 359 797 422">Value</th> <th data-bbox="797 359 1398 422">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="521 422 797 737">Id</td> <td data-bbox="797 422 1398 737"> <p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 527 1373 726"> <thead> <tr> <th data-bbox="821 527 951 590">ID</th> <th data-bbox="951 527 1373 590">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 590 951 653">10</td> <td data-bbox="951 590 1373 653">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 653 951 716">11</td> <td data-bbox="951 653 1373 716">SSHKeyRotationPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td data-bbox="521 737 797 800">DisplayName</td> <td data-bbox="797 737 1398 800">A string containing the name of the event handler.</td> </tr> <tr> <td data-bbox="521 800 797 894">UseHandler</td> <td data-bbox="797 800 1398 894">A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see Using Event Handlers on page 218.</p>	Value	Description	Id	<p>An integer indicating the Keyfactor Command reference ID for the event handler.</p> <table border="1" data-bbox="821 527 1373 726"> <thead> <tr> <th data-bbox="821 527 951 590">ID</th> <th data-bbox="951 527 1373 590">Event Handler Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="821 590 951 653">10</td> <td data-bbox="951 590 1373 653">SSHKeyRotationLogger</td> </tr> <tr> <td data-bbox="821 653 951 716">11</td> <td data-bbox="951 653 1373 716">SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	DisplayName	A string containing the name of the event handler. ParameterType	<p>A string containing the parameter type. Supported types are:</p> <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 														

Name	Description	
	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see Extensions Scripts on page 1704). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See Table 8: Substitutable Special Text for Key Rotation Alerts for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation

The POST /Alerts/KeyRotation method is used to create a new SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 179: POST Alerts Key Rotation Input Parameters

Name	In	Description
DisplayName	Body	Required. A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; padding: 10px; margin: 10px 0;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n<table>\n<tr><th>Field</th><th>Value</th></tr>\n<tr><td>Username</td><td>{username}</td></tr>\n<tr><td>Fingerprint</td><td>{fingerprint}</td></tr>\n<tr><td>Comment</td><td>{comment}</td></tr>\n<tr><td>Key Length</td><td>{keylength}</td></tr>\n<tr><td>Key Type</td><td>{keytype}</td></tr>\n<tr><td>Number of Server Logons for Key</td><td>{serverlogons}</td></tr>\n</table>\n\nCorporate policy requires key rotation every year. Please visit the My SSH Key Portal for user keys or the Service Account Key Portal for service account keys and request a new key pair.\n\nThanks!”</p> <p>See Table 8: Substitutable Special Text for Key Rotation Alerts for a complete list of available substitutable special text strings.</p>
RotationWarningDays	Body	An integer indicating the number of days prior to the end of an SSH key’s lifetime the alert should be triggered.

Name	In	Description														
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler.</td> </tr> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see Using Event Handlers on page 218.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler.		<table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description															
Id	An integer indicating the Keyfactor Command reference ID for the event handler.															
	<table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>10</td> <td>SSHKeyRotationLogger</td> </tr> <tr> <td>11</td> <td>SSHKeyRotationPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	10	SSHKeyRotationLogger	11	SSHKeyRotationPowershell									
ID	Event Handler Type															
10	SSHKeyRotationLogger															
11	SSHKeyRotationPowershell															
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).															
EventHandlerParameters	Body	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Key Rotation

The PUT /Alerts/KeyRotation method is used to update a SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 181: PUT Alerts Key Rotation Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the SSH key rotation alert.
DisplayName	Body	Required. A string indicating the display name for the SSH key rotation alert. This name appears in the SSH key rotation alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the key record at processing time. For example, you can enter {comment} in the alert definition and each alert generated at processing time will contain the specific key comment of the given SSH key instead of the variable {comment}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nYou requested an SSH key pair almost a year ago with the following information:\n\n<table>\n<tr><th>Field</th><th>Value</th></tr>\n<tr><td>Username</td><td>{username}</td></tr>\n<tr><td>Fingerprint</td><td>{fingerprint}</td></tr>\n<tr><td>Comment</td><td>{comment}</td></tr>\n<tr><td>Key Length</td><td>{keylength}</td></tr>\n<tr><td>Key Type</td><td>{keytype}</td></tr>\n<tr><td>Number of Server Logons for Key</td><td>{serverlogons}</td></tr>\n</table>\n\nCorporate policy requires key rotation every year. Please visit the My SSH Key Portal for user keys or the Service Account Key Portal for service account keys and request a new key pair.\n\nThanks!”</p> <p>See Table 8: Substitutable Special Text for Key Rotation Alerts for a complete list of available substitutable special text strings.</p>

Name	In	Description																
RotationWarningDays	Body	An integer indicating the number of days prior to the end of an SSH key's lifetime the alert should be triggered.

		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see Extensions Scripts on page 1704). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See Table 8: Substitutable Special Text for Key Rotation Alerts for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation Test

The POST /Alerts/KeyRotation/Test method is used to test a specific SSH key rotation alert. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting).

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/monitoring/alerts/read/
/monitoring/alerts/test/

Table 183: POST Alerts Key Rotation Test Input Parameters

Parameter	In	Description
AlertId	Body	Required. An integer of the reference ID of the SSH key rotation alert to test. Use the GET /Alerts/KeyRotation method (see GET Alerts Key Rotation on page 1011) to retrieve a list of all your key rotation alerts to determine the alert Id.
EvaluationDate	Body	Required. A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	Required. A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 184: POST Alerts Key Rotation Test Response Data

Parameter	Description								
KeyRotationAlerts	<p>An object containing alert details resulting from the test. Expiration alert details are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Subject</td> <td>A string indicating the subject for the email message, including any replaced substitutable special text.</td> </tr> <tr> <td>Message</td> <td> <p>A string indicating the email message, including any replaced substitutable special text</p> <p>See Table 8: Substitutable Special Text for Key Rotation Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p> </td> </tr> <tr> <td>Recipient</td> <td>A string indicating the recipient for the alert.</td> </tr> </tbody> </table>	Name	Description	Subject	A string indicating the subject for the email message, including any replaced substitutable special text.	Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See Table 8: Substitutable Special Text for Key Rotation Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>	Recipient	A string indicating the recipient for the alert.
Name	Description								
Subject	A string indicating the subject for the email message, including any replaced substitutable special text.								
Message	<p>A string indicating the email message, including any replaced substitutable special text</p> <p>See Table 8: Substitutable Special Text for Key Rotation Alerts in the <i>Keyfactor Command Reference Guide</i> for a complete list of available substitutable special text strings.</p>								
Recipient	A string indicating the recipient for the alert.								
AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Key Rotation Test All

The POST /Alerts/KeyRotation/TestAll method is used to test all SSH key rotation alerts. This method returns HTTP 200 OK on a success with details about the SSH key rotation alert or a response of “NoActionTaken” if no keys match the test criteria entered.

 **Tip:** Alerts are generated when an SSH key is approaching or has reached its stale date as defined by the timeframe configured in the alert and the SSH key lifetime (the *Key Lifetime (days)* application setting).
By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Key Rotation Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If more than 100 alerts are generated, no email messages will be sent and you’ll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message written) when the test is run. This is true regardless of the setting of the *SendAlerts* flag.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /monitoring/alerts/read/
 /monitoring/alerts/test/

Table 185: POST Alerts Key Rotation Test All Input Parameters

Parameter	In	Description
EvaluationDate	Body	Required. A string indicating the start date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). You can use the date range to simulate running the alerts a month from now instead of today, for example, or put in a broad date range to be sure you pick up some expiring keys for testing purposes.
PreviousEvaluationDate	Body	Required. A string indicating the end date/time for the test. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true) or not (false). The default is <i>false</i> .

Table 186: POST Alerts Key Rotation Test All Response Data

AlertBuildResult	A string indicating the outcome of the test (e.g. Success).								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.4.5 Alerts Pending

The Alerts Pending component of the Keyfactor API includes methods necessary to create, update, retrieve, schedule, and delete alerts for certificate requests that require approval based on policy on the CA.

 **Important:** Pending alerts are **not** used to provide email alerts for certificate requests that require approval based on policies configured in Keyfactor Command workflows. These alerts are configured as steps within the workflow (see [Workflow Definitions on page 2487](#)). For more information about the difference between alerting for certificate requests that require manager approval at the CA level and alerting for certificate requests that require manager approval at the Keyfactor Command workflow level, see [Pending Certificate Request Alerts on page 178](#).

Table 187: Alerts Pending

Endpoint	Method	Description	Link
/Alerts/Pending/{id}	DELETE	Deletes a pending certificate request alert for the specified ID.	DELETE Alerts Pending ID below
/Alerts/Pending/{id}	GET	Retrieves details for a pending certificate request alert for the specified ID.	GET Alerts Pending ID on the next page
/Alerts/Pending	PUT	Updates a pending certificate request alert for a specified ID.	PUT Alerts Pending on page 1060
/Alerts/Pending/Schedule	GET	Retrieves details of the schedule for delivery of pending certificate request alerts.	GET Alerts Pending Schedule on page 1040
/Alerts/Pending/Schedule	PUT	Updates the schedule for delivery of pending certificate request alerts.	PUT Alerts Pending Schedule on page 1042
/Alerts/Pending	GET	Retrieves details for all configured pending certificate request alerts.	GET Alerts Pending on page 1045
/Alerts/Pending	POST	Creates a new pending certificate request alert.	POST Alerts Pending on page 1050
/Alerts/Pending/Test	POST	Tests all alerts	POST Alerts Pending TestAll on page 1073
/Alerts/Pending/Test/{id}	POST	Tests specific alerts	POST Alerts Pending Test on page 1071

DELETE Alerts Pending ID

The DELETE /Alerts/Pending/{id} method is used to delete the pending certificate request alert with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 188: DELETE Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the pending certificate request alert to be deleted. Use the GET /Alerts/Pending method (see GET Alerts Pending on page 1045) to retrieve a list of all the pending request alerts to determine the alert ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending ID

The GET /Alerts/Pending/{id} method is used to retrieve details for the pending certificate request alerts with the specified ID. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alert.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 189: GET Alerts Pending {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID for the pending certificate request alert. Use the GET /Alerts/Pending method (see GET Alerts Pending on page 1045) to retrieve a list of all the pending request alerts to determine the alert ID.

Table 190: GET Alerts Pending {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="548 600 1406 863" style="border: 1px solid #c8e6c9; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</p> <p>See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail}

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="548 632 1403 1373"> <thead> <tr> <th data-bbox="553 638 865 697">Value</th> <th data-bbox="865 638 1398 697">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 697 865 831">Id</td> <td data-bbox="865 697 1398 831">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="553 831 865 989">DisplayName</td> <td data-bbox="865 831 1398 989">A string containing the name of the template.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending Schedule

The GET /Alerts/Pending/Schedule method is used to retrieve the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 191: GET Alerts Pending Schedule Response Data

Name	Description														
Schedule	<p>An object indicating the schedule for delivery of the pending request alerts. Possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).										
Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Pending Schedule

The PUT /Alerts/Pending/Schedule method is used to create or update the schedule for delivery of pending certificate request alerts configured in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the schedule for pending certificate request alerts.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/modify/

Table 192: PUT Alerts Pending Schedule Input Parameters

Name	In	Description														
Schedule	Body	<p>An object indicating the schedule for delivery of the pending request alerts. Name	Description														
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

GET Alerts Pending

The GET /Alerts/Pending method is used to retrieve details of all pending certificate request alerts configured in Keyfactor Command. Results can be limited to selected alerts using filtering, and URL parameters can be used to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the specified pending certificate request alerts.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/

Table 194: GET Alerts Pending Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • DisplayName • Message • RegisteredEventHandlerId • ScheduledTaskId • Subject • Template_Id • UseHandler
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>DisplayName</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="548 632 1404 1375"> <thead> <tr> <th data-bbox="553 638 863 697">Value</th> <th data-bbox="863 638 1399 697">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 697 863 831">Id</td> <td data-bbox="863 697 1399 831">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="553 831 863 989">DisplayName</td> <td data-bbox="863 831 1399 989">A string containing the name of the template. DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div data-bbox="886 1094 1382 1262" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px;"> <p> Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</p> </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div data-bbox="886 1094 1382 1262" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px;"> <p> Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</p> </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see Using Event Handlers on page 218.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).</td> </tr> <tr> <td>ParameterType</td> <td>A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler </td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.	Key	A string indicating the reference name of the configured parameter.	DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).	ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 				
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID of the configured parameter.														
Key	A string indicating the reference name of the configured parameter.														
DefaultValue	A string indicating the value for the parameter. This value is related to the type of parameter (see <i>ParameterType</i>).														
ParameterType	A string containing the parameter type. Supported types are: <ul style="list-style-type: none"> LogTarget This type is used for the event logging handler 														

Name	Description	
	Value	Description
		<p>and is used to reference the fully qualified domain name of the target machine to which event should be logged.</p> <ul style="list-style-type: none"> • Script This type is used for the PowerShell handler and is used to reference the PowerShell script that should be run when the alert is triggered. It is referenced using the script name as stored in the Keyfactor Command database (see Extensions Scripts on page 1704). • Token This type is used for the PowerShell handler and is used to reference a substitutable special text value that should be passed to the PowerShell script. See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings. • Value This type is used for the PowerShell handler and is used to reference a static text string that should be passed to the PowerShell script.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending

The POST /Alerts/Pending method is used to create a new pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/monitoring/alerts/modify/

Table 196: POST Alerts Pending Input Parameters

Name	In	Description
DisplayName	Body	<p>Required. A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.</p>
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; padding: 10px; margin-top: 10px;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</p> <p>See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings.</p> <div style="border: 1px solid #bbdefb; padding: 10px; margin-top: 10px;"> <p> Note: The \$(requester:givenname) substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> </div>

Name	In	Description														
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. <div style="border: 1px solid #00aaff; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: The \$(requester:mail) substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> </div> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 														
TemplateId	Body	<p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET /Templates method (see GET Templates on page 2422) to retrieve a list of all the templates to determine the template ID.</p>														
RegisteredEventHandler	Body	<p>An object containing the event handler configuration for the alert, if applicable. Name	In	Description
CARequestId		A string containing the CA's reference ID for the certificate request.
CommonName		A string indicating the common name of the certificate.
LogicalName		A string indicating the logical name of the certificate authority.

Table 197: POST Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="548 600 1406 863" style="border: 1px solid #c8e6c9; padding: 10px; margin: 10px 0;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</t- d><td>App Owner Last Name: {metadata:Ap- pOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail}

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="548 632 1403 1373"> <thead> <tr> <th data-bbox="553 638 862 697">Value</th> <th data-bbox="862 638 1398 697">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 697 862 829">Id</td> <td data-bbox="862 697 1398 829">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="553 829 862 989">DisplayName</td> <td data-bbox="862 829 1398 989">A string containing the name of the template.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

PUT Alerts Pending

The PUT /Alerts/Pending method is used to update a pending certificate request alert. This method returns HTTP 200 OK on a success with details about the pending certificate request alert.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/monitoring/alerts/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 198: PUT Alerts Pending Input Parameters

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	Body	Required. A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	Body	<p>Required. A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	Body	<p>Required. A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <p>“Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</td><td>App Owner Last Name: {metadata:AppOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:AppOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n</table>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n{apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n”</table></p> <p>See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings.</p> <div style="border: 1px solid #bbdefb; border-radius: 10px; padding: 10px; background-color: #e3f2fd;"> <p> Note: The \$(requester:givenname) substitutable special text</p> </div>

Name	In	Description
		<p> token is only supported in environments using Active Directory as an identity provider.</p>
Recipients	Body	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail} The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate. <p> Note: The \$(requester:mail) substitutable special text token is only supported in environments using Active Directory as an identity provider.</p> <ul style="list-style-type: none"> • Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}.
TemplateId	Body	<p>An integer indicating the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests.</p> <p>Use the GET /Templates method (see GET Templates on page 2422) to retrieve a list of all the templates to determine the template ID.</p>

Table 199: PUT Alerts Pending Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the pending request alert.
DisplayName	A string indicating the display name for the pending request alert. This name appears in the pending request alerts grid in the Management Portal.
Subject	<p>A string indicating the subject for the email message that will be delivered when the alert is triggered.</p> <div data-bbox="548 600 1406 863" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Substitutable special text may be used in the subject line. Substitutable special text uses a variable in the alert definition that is replaced by data from the certificate request or certificate metadata at processing time. For example, you can enter {rcn} in the alert definition and each alert generated at processing time will contain the specific requested common name of the given certificate request instead of the variable {rcn}.</p> </div>
Message	<p>A string indicating the email message that will be delivered when the alert is triggered. The email message is made up of regular text and substitutable special text. If desired, you can format the message body using HTML.</p> <p>For example:</p> <pre> “Hello,\n\nA certificate using the {template} template was requested by {requester:displayname} from {careqid} on {subdate}. The certificate details include:\n\n<table>\n<tr><th>Certificate Details</th><th>Metadata</th></tr>\n<tr><td>CN: {rcn}</td><td>App Owner First Name: {metadata:AppOwnerFirstName}</td></tr>\n<tr><td>DN: {rdn}</t- d><td>App Owner Last Name: {metadata:Ap- pOwnerLastName}</td></tr>\n<tr><td>SANs: {san}</td><td>App Owner Email Address: {metadata:Ap- pOwnerEmailAddress}</td></tr>\n<tr><td>&nbsp;</td><td>Business Critical: {metadata:BusinessCritical}</td></tr>\n\nPlease review this request and issue the certificate as appropriate by going here:\n\n {apprlink}\n\nThanks!\n\nYour Certificate Management Tool\n” </pre> <p>See Table 5: Substitutable Special Text for Pending Request Alerts for a complete list of available substitutable special text strings.</p>
Recipients	<p>An array of strings containing the recipients for the alert. Each alert can have multiple recipients. You can use specific email addresses and/or use substitutable special text to replace an email address variable with actual email addresses at processing time. Available email substitutable special text strings include:</p> <ul style="list-style-type: none"> • {requester:mail}

Name	Description										
	<p>The certificate requester, based on a lookup in Active Directory of the email address associated with the requester on the certificate.</p> <ul style="list-style-type: none"> Your custom email-based metadata field, which would be specified similarly to {metadata:AppOwnerEmailAddress}. 										
Template	<p>An object containing information about the certificate template for which the pending request alerts will be generated. A separate alert should be configured for each template. An alert may be configured with no template, if desired. Alerts configured in this way generate alerts for all pending certificate requests. Possible values are:</p> <table border="1" data-bbox="548 632 1403 1373"> <thead> <tr> <th data-bbox="553 638 865 697">Value</th> <th data-bbox="865 638 1398 697">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="553 697 865 829">Id</td> <td data-bbox="865 697 1398 829">An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.</td> </tr> <tr> <td data-bbox="553 829 865 989">DisplayName</td> <td data-bbox="865 829 1398 989">A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.</td> </tr> <tr> <td data-bbox="553 989 865 1276">ForestRoot</td> <td data-bbox="865 989 1398 1276"> <p>A string indicating the forest root of the template.</p> <div data-bbox="886 1094 1382 1262" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px;"> <p> Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</p> </div> </td> </tr> <tr> <td data-bbox="553 1276 865 1373">ConfigurationTenant</td> <td data-bbox="865 1276 1398 1373">A string indicating the configuration tenant of the template.</td> </tr> </tbody> </table>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.	DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.	ForestRoot	<p>A string indicating the forest root of the template.</p> <div data-bbox="886 1094 1382 1262" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px;"> <p> Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</p> </div>	ConfigurationTenant	A string indicating the configuration tenant of the template.
Value	Description										
Id	An integer indicating the Keyfactor Command reference ID for the template, or <i>null</i> for all templates.										
DisplayName	A string containing the name of the template. For a template created using a Microsoft management tool, this will be the Microsoft template display name.										
ForestRoot	<p>A string indicating the forest root of the template.</p> <div data-bbox="886 1094 1382 1262" style="border: 1px solid #add8e6; border-radius: 10px; padding: 5px;"> <p> Note: This field is retained for legacy purposes and will be replaced by ConfigurationTenant field.</p> </div>										
ConfigurationTenant	A string indicating the configuration tenant of the template.										

Name	Description														
RegisteredEventHandler	<p>An object containing the event handler configuration for the alert, if applicable. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table> </td> </tr> <tr> <td>DisplayName</td> <td>A string containing the name of the event handler.</td> </tr> <tr> <td>UseHandler</td> <td>A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).</td> </tr> </tbody> </table> <p>For more information about event handlers, see Using Event Handlers on page 218.</p>	Value	Description	Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell	DisplayName	A string containing the name of the event handler.	UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).
Value	Description														
Id	An integer indicating the Keyfactor Command reference ID for the event handler. <table border="1"> <thead> <tr> <th>ID</th> <th>Event Handler Type</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>PendingLogger</td> </tr> <tr> <td>9</td> <td>PendingPowershell</td> </tr> </tbody> </table>	ID	Event Handler Type	8	PendingLogger	9	PendingPowershell								
ID	Event Handler Type														
8	PendingLogger														
9	PendingPowershell														
DisplayName	A string containing the name of the event handler.														
UseHandler	A Boolean indicating whether event handler use is enabled for the alert (true) or not (false).														
EventHandlerParameters	<p>An array of objects containing the parameters configured for use by the event handler. The type of data will vary depending on the configured handler. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the configured parameter.</td> </tr> <tr> <td>Key</td> <td>A string indicating the reference name of the configured parameter.</td> </tr> <tr> <td>DefaultValue</td> <td>A string indicating the value for the parameter. CARequestId	A string containing the CA's reference ID for the certificate request.					
CommonName	A string indicating the common name of the certificate.					
LogicalName	A string indicating the logical name of the certificate authority.					

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending Test

The POST /Alerts/Pending/Test method is used to test individual pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting alerts generated.

 **Tip:** Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/monitoring/alerts/read/
/monitoring/alerts/test/

Table 200: POST Alerts Pending Test Input Parameters

Name	In	Description
AlertId	Body	An integer indicating the Keyfactor Command reference ID for the pending alert.
SendAlerts	Body	A Boolean indicating whether to send alert emails with the test (true), or not (false).

Table 201: POST Alerts Pending Test Response Data

Parameter	Description

The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

POST Alerts Pending TestAll

The POST /Alerts/Pending/TestAll method is used to test all pending certificate request alerts. This method returns HTTP 200 OK on a success with details about the resulting number of alerts generated.

Tip: Alerts are generated for all certificate requests that have not previously been alerted on, unless the system has been configured to send multiple alerts per request. By default, one alert is sent to each recipient for any given request. The number of alerts to send for a given request is configurable with the *Pending Alert Max Reminders* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If a certificate remains in a pending state after the configured number of alerts has been sent, no further alerts will be sent.

By default, a maximum of 100 alerts will be generated during a test. The maximum value is configurable with the *Pending Alert Test Result Limit* setting in Keyfactor Command application settings (see [Application Settings: Console Tab on page 602](#)). If more than 100 alerts are generated, no email messages will be sent and you'll have the opportunity to view the first 100 alerts generated.

If you're using an event handler, the event handler is run and the handler actions taken (PowerShell script run, event log message) when the test is run. This is true regardless of the setting of the *sendAlertsEmails* flag.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/monitoring/alerts/read/
/monitoring/alerts/test/

CommonName	<p>A string indicating the common name of the certificate request.</p>														
LogicalName	<p>A string indicating the logical name of the certificate authority from which the certificate was requested.</p>														
AlertBuildResult	<p>An integer indicating the number of pending alerts run by the test.</p>														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.5 AppSetting

The AppSetting component of the Keyfactor API includes methods necessary to list and update application settings that control the behavior of Keyfactor Command features. For a complete list of available application settings, see [Application Settings on page 601](#) in the *Keyfactor Command Reference Guide*.

Table 204: AppSetting Endpoints

Endpoint	Method	Description	Link
/	GET	Returns details for all the application settings.	GET AppSetting below
/	PUT	Updates values configured for multiple application settings in a single command.	PUT AppSetting on page 1079
/ {id}	GET	Returns details for a single application setting.	GET AppSetting ID on page 1077
/ {id}/Set	PUT	Updates the value configured for an application setting based on its reference ID.	PUT AppSetting ID Set on page 1081
/ {name}/Set	PUT	Updates the value configured for an application setting based on its reference name.	PUT AppSetting Name Set on page 1083

3.6.5.1 GET AppSetting

The GET /AppSetting method is used to retrieve the details for all the application settings in Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

Table 205: GET AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 955 1404 1627"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (RegEx)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (RegEx)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (RegEx)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.5.2 GET AppSetting ID

The GET /AppSetting/{id} method is used to retrieve a single application setting from Keyfactor Command. This method returns HTTP 200 OK on a success with a list of the application setting details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/application_settings/read/

Table 206: GET AppSetting {id} Input Parameters

Name	In	Description
id	Path	Required. Integer indicating the Keyfactor Command reference ID of the application setting to retrieve. Use the <i>GET /AppSetting</i> method (see GET Agents on page 858) to retrieve a list of all the application settings to determine the application setting ID.

Table 207: GET AppSetting {id} Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.5.3 PUT AppSetting

The PUT /AppSetting method is used to update the values of multiple application settings with a single command. This method returns HTTP 200 OK on a success with information about the updated application settings.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/application_settings/read/
/application_settings/modify/

Table 208: PUT AppSetting Input Parameters

Name	In	Description
Id	Body	Required. Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see GET AppSetting on page 1075) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 209: PUT AppSetting Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.5.4 PUT AppSetting ID Set

The PUT /AppSetting/{id}/Set method is used to update the value of an application setting specified by the reference ID. This method returns HTTP 200 OK on a success with information about the updated application setting.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/application_settings/read/
/application_settings/modify/

Table 210: PUT AppSetting {id} Set Input Parameters

Name	In	Description
id	Path	Required. Integer indicating the Keyfactor Command reference ID of the application setting. Use the GET /AppSetting method (see GET AppSetting on page 1075) to retrieve a list of all the application settings to determine the application setting ID.
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 211: PUT AppSetting {id} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.5.5 PUT AppSetting Name Set

The PUT /AppSetting/{name}/Set method is used to update the value of an application setting specified by the reference name. This method returns HTTP 200 OK on a success with information about the updated application settings.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/application_settings/read/
/application_settings/modify/

Table 212: PUT AppSetting {name} Set Input Parameters

Name	In	Description
name	Path	Required. A string indicating the Keyfactor Command internal reference name (<i>ShortName</i>) for the application setting. Use the GET /AppSetting method (see GET AppSetting on page 1075) to retrieve a list of all the application settings to determine the application setting reference name (<i>ShortName</i>).
Value	Body	Required. A field indicating the value for the application setting. May be a Boolean, integer, or string.

Table 213: PUT AppSetting {name} Set Response Data

Name	Description																						
Id	Integer indicating the Keyfactor Command reference ID of the application setting.																						
DisplayName	A string indicating the name for the application setting in the Keyfactor Command Management Portal.																						
ShortName	A string indicating the Keyfactor Command internal reference name for the application setting.																						
Description	A string indicating the description for the application setting. This description appears in the Keyfactor Command Management Portal when you hover over the <i>DisplayName</i> for the application setting.																						
Value	A field indicating the value for the application setting. May be a Boolean, integer, or string.																						
ValueType	An integer indicating the type for the <i>Value</i> . Possible value types are: <table border="1" data-bbox="446 856 1404 1543"> <thead> <tr> <th>Value</th> <th>Parameter Value</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>String</td> </tr> <tr> <td>1</td> <td>Integer</td> </tr> <tr> <td>2</td> <td>Boolean</td> </tr> <tr> <td>4</td> <td>String (Regex)</td> </tr> <tr> <td>5</td> <td>String (URL)</td> </tr> <tr> <td>6</td> <td>String (Path)</td> </tr> <tr> <td>7</td> <td>String (CA Name)</td> </tr> <tr> <td>8</td> <td>No longer in use</td> </tr> <tr> <td>9</td> <td>String (Template Name)</td> </tr> <tr> <td>10</td> <td>String (Date)</td> </tr> </tbody> </table>	Value	Parameter Value	0	String	1	Integer	2	Boolean	4	String (Regex)	5	String (URL)	6	String (Path)	7	String (CA Name)	8	No longer in use	9	String (Template Name)	10	String (Date)
Value	Parameter Value																						
0	String																						
1	Integer																						
2	Boolean																						
4	String (Regex)																						
5	String (URL)																						
6	String (Path)																						
7	String (CA Name)																						
8	No longer in use																						
9	String (Template Name)																						
10	String (Date)																						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.6 Audit

The Audit component of the Keyfactor API is used to track changes to the Keyfactor Command operation and configuration.

Table 214: Audit Endpoints

Endpoint	Method	Description	Links
<code>/id</code>	GET	Returns information about the specified audit log entry.	GET Audit ID below
<code>/id/Validate</code>	GET	Validates the specified audit log entry.	GET Audit ID Validate on page 1090
<code>/</code>	GET	Returns a list of all audit log entries according to the provided filters and input parameters.	GET Audit on page 1091
<code>/Download</code>	GET	Returns a comma separated list of audit log entries according to the provided filters and input parameters.	GET Audit Download on page 1097
<code>/RelatedEntities</code>	GET	Returns a list of all audit log entries and entries related to this entry according to the provided filters and input parameters.	GET Audit Related Entities on page 1101

3.6.6.1 GET Audit ID

The GET `/Audit/{id}` method is used to retrieve details for a specified audit entry. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/auditing/read/`

Table 215: GET Audit {id} Input Parameters

Name	In	Description
<code>id</code>	Path	Required. The ID of the audit log entry to retrieve. Use the <code>GET /Audit</code> method (see GET Audit on page 1091) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 216: GET Audit {id} Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																										
Message	XML data on the audit event.																																										
Signature	The signature on the audit entry.																																										
Category	An integer identifying the category of the audit entry. Possible values are: <table border="1" data-bbox="483 655 1403 1696"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>Audit- ingCertificateScheduledReplacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateRequest</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>ExpirationAlertDefinitionContextModel</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlertDefinitionContextModel</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>IssuedAlertDefinitionContextModel</td> <td>Issued Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	Audit- ingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert

	22	Sent	
	23	Failed	
	24	Completed	
	25	Rejected	
	Level	The alert level of the audit log entry. Possible values are:	

Name	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Information</td> </tr> <tr> <td>1</td> <td>Warning</td> </tr> <tr> <td>2</td> <td>Failure</td> </tr> </tbody> </table>	Value	Description	0	Information	1	Warning	2	Failure
Value	Description								
0	Information								
1	Warning								
2	Failure								
User	The user who performed the audit event in DOMAIN\username format.								
EntityType	The category of the object being audited (e.g. Template, Certificate).								
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.6.2 GET Audit ID Validate

The GET /Audit/{id}/Validate method is used to return whether or not (true or false) the audit log entry is valid. An audit log might become invalidated if it is tampered with. This method returns HTTP 200 OK on a success with a value of true or false.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/auditing/read/

Table 217: GET Audit {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The ID of the audit log entry to validate. Use the <i>GET /Audit</i> method (see GET Audit on the next page) to retrieve a list of all the audit log entries to determine the audit log entry ID.

Table 218: GET Audit {id} Validate Response Data

Name	Description
	A Boolean that indicates whether the audit log entry is valid (true) or not (false). This value is returned without a parameter name.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.6.3 GET Audit

The GET /Audit method returns a list of all audit entries. This method returns HTTP 200 OK on a success with audit log details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/auditing/read/

Table 219: GET Audit Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Audit Log Search Feature on page 717. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Name (EntityIdentifier) • Category (EntityType) (see Table 220: GET Audit Response Data for codes) • ImmutableIdentifier • Level (see Table 220: GET Audit Response Data for codes) • Operation (see Table 220: GET Audit Response Data for codes) • PropertyChanged • Timestamp • ActingUser <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: To do a query by category, use the subcategory string (see <i>Category</i> in the response data). For example: <code>category -contains "Agent"</code></p> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 220: GET Audit Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.																																										
Message	XML data on the audit event.																																										
Signature	The signature on the audit entry.																																										
Category	An integer identifying the category of the audit entry. Possible values are: <table border="1" data-bbox="483 655 1403 1696"> <thead> <tr> <th>Value</th> <th>Subcategory Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>2001</td> <td>Certificate</td> <td>Certificate</td> </tr> <tr> <td>2001</td> <td>Audit- ingCertificateScheduledReplacement</td> <td>Auditing Certificate Scheduled Replacement</td> </tr> <tr> <td>2001</td> <td>AuditingCertificateRequest</td> <td>Certificate Request</td> </tr> <tr> <td>2002</td> <td>ApiApplication</td> <td>API Application</td> </tr> <tr> <td>2003</td> <td>Template</td> <td>Template</td> </tr> <tr> <td>2004</td> <td>CertificateQuery</td> <td>Certificate Collection/Query</td> </tr> <tr> <td>2005</td> <td>ExpirationAlert</td> <td>Expiration Alert</td> </tr> <tr> <td>2005</td> <td>ExpirationAlertDefinitionContextModel</td> <td>Expiration Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlert</td> <td>Pending Alert</td> </tr> <tr> <td>2006</td> <td>PendingAlertDefinitionContextModel</td> <td>Pending Alert</td> </tr> <tr> <td>2007</td> <td>ApplicationSetting</td> <td>Application Setting</td> </tr> <tr> <td>2008</td> <td>IssuedAlert</td> <td>Issued Alert</td> </tr> <tr> <td>2008</td> <td>IssuedAlertDefinitionContextModel</td> <td>Issued Alert</td> </tr> </tbody> </table>	Value	Subcategory Name	Description	2001	Certificate	Certificate	2001	Audit- ingCertificateScheduledReplacement	Auditing Certificate Scheduled Replacement	2001	AuditingCertificateRequest	Certificate Request	2002	ApiApplication	API Application	2003	Template	Template	2004	CertificateQuery	Certificate Collection/Query	2005	ExpirationAlert	Expiration Alert	2005	ExpirationAlertDefinitionContextModel	Expiration Alert	2006	PendingAlert	Pending Alert	2006	PendingAlertDefinitionContextModel	Pending Alert	2007	ApplicationSetting	Application Setting	2008	IssuedAlert	Issued Alert	2008	IssuedAlertDefinitionContextModel	Issued Alert

Name	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Information</td> </tr> <tr> <td>1</td> <td>Warning</td> </tr> <tr> <td>2</td> <td>Failure</td> </tr> </tbody> </table>	Value	Description	0	Information	1	Warning	2	Failure
Value	Description								
0	Information								
1	Warning								
2	Failure								
User	The user who performed the audit event in DOMAIN\username format.								
EntityType	The category of the object being audited (e.g. Template, Certificate).								
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.6.4 GET Audit Download

The GET /Audit/Download method returns a comma-delimited list of all audit entries matching the requested filters appropriate for output to a CSV file. This method returns HTTP 200 OK on a success with the information requested in comma-delimited form with the property names at the start of the list and then the values.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/auditing/read/

Table 221: GET Audit Download Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Audit Log Search Feature on page 717. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Name (EntityIdentifier) • Category (EntityType) (see Table 220: GET Audit Response Data for codes) • ImmutableIdentifier • Level (see Table 220: GET Audit Response Data for codes) • Operation (see Table 220: GET Audit Response Data for codes) • PropertyChanged • Timestamp • ActingUser
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 222: GET Audit Download Response Data

Also known as the <i>Name</i> in some interfaces.																				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.6.5 GET Audit Related Entities

The GET /Audit/RelatedEntities method returns a list of all audit entries and all audit entries related to those audit entries. This method returns HTTP 200 OK on a success with the information requested.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/auditing/read/

Table 223: GET Audit Related Entities Input Parameters

Name	In	Description
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Audit Log Search Feature on page 717. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • Name (EntityIdentifier) • Category (EntityType) (see Table 220: GET Audit Response Data for codes) • ImmutableIdentifier • Level (see Table 220: GET Audit Response Data for codes) • Operation (see Table 220: GET Audit Response Data for codes) • PropertyChanged • Timestamp • ActingUser <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: In order to return related entries, your queryString needs to query for the specific immutable identifier of the audit record for which you wish to see related entries. For example:</p> <pre style="text-align: center;">ImmutableIdentifier -eq 707662</pre> </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 224: GET Audit Related Entities Response Data

Name	Description																																										
Id	The ID of the specified audit log entry.																																										
TimeStamp	The timestamp (UTC) on the audit log entry indicating when the action performed occurred.

	Level	The alert level of the audit log entry. Possible values are:	

Name	Description								
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Information</td> </tr> <tr> <td>1</td> <td>Warning</td> </tr> <tr> <td>2</td> <td>Failure</td> </tr> </tbody> </table>	Value	Description	0	Information	1	Warning	2	Failure
Value	Description								
0	Information								
1	Warning								
2	Failure								
User	The user who performed the audit event in DOMAIN\username format.								
EntityType	The category of the object being audited (e.g. Template, Certificate).								
AuditIdentifier	An identifier of the object being audited (e.g. the template name for a template, the CN for a certificate). It is important to note that this is a value that is typically used for easy identification of an object, but is not necessarily unique, and is subject to change.								
ImmutableIdentifier	The fixed ID of the auditable event in the Keyfactor database.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.7 Certificates

The Certificates component of the Keyfactor API supports certificate lifecycle and management tasks, apart from enrollment.

Table 225: Certificates Endpoints

Endpoint	Method	Description	Link
/id/Security	GET	Returns details of the security identities that have been granted permissions to the specified certificate including what the specific permissions are.	GET Certificates ID Security on page 1109
/id/Validate	GET	Validates that a certificate chain can be built for the specified certificate.	GET Certificates ID Validate on page 1111

Endpoint	Method	Description	Link
/Locations/{id}	GET	Returns details about the certificates stores in which the certificate is located.	GET Certificates Locations ID on page 1116
/IdentityAudit/{id}	GET	Returns audit identity permissions for certificate.	GET Certificates Identity Audit ID on page 1119
{id}	DELETE	Deletes a certificate from the Keyfactor Command database by its ID.	DELETE Certificates ID on page 1123
{id}	GET	Returns certificate details for a specified certificate.	GET Certificates ID on page 1124
/Metadata/Compare	GET	Compares the metadata value provided with the metadata value associated with the specified certificate.	GET Certificates Metadata Compare on page 1136
{id}/History	GET	Returns the certificate operations history for a specified certificate.	GET Certificates ID History on page 1138
/	DELETE	Deletes multiple certificates from the Keyfactor Command database, as specified by the IDs in the request body.	DELETE Certificates on page 1140
/	GET	Returns all certificates with paging (number of pages to return and number of results per page) and verbosity option to specify detail level.	GET Certificates on page 1141
/Metadata	PUT	Updates the metadata for a specified certificate.	PUT Certificates Metadata on page 1156
/Metadata/All	PUT	Updates the metadata for an array of certificate IDs.	PUT Certificates Metadata All on page 1158
/Import	POST	Imports a certificate into Keyfactor Command.	POST Certificates Import on page 1162
/Revoke	POST	Revokes a certificate.	POST Certificates

Endpoint	Method	Description	Link
			Revoke on page 1166
/Analyze	POST	Reads a base-64 encoded PEM certificates and returns it in human-readable form.	POST Certificates Analyze on page 1168
/Recover	POST	Returns a recovered certificate as a PFX.	POST Certificates Recover on page 1169
/Download	POST	Downloads a certificate.	POST Certificates Download on page 1173
/RevokeAll	POST	Revokes all the certificates in the provided query.	POST Certificates Revoke All on page 1176
/Query	DELETE	Deletes multiple certificates from the Keyfactor Command database based on search query.	DELETE Certificates Query on page 1179
/PrivateKey	DELETE	Deletes the stored private keys of multiple certificates within the Keyfactor Command database.	DELETE Certificates Private Key on page 1180
/PrivateKey/{id}	DELETE	Deletes the stored private key(s) of a certificate within the Keyfactor Command database.	DELETE Certificates Private Key ID on page 1181

3.6.7.1 GET Certificates ID Security

The GET /Certificates/{id}/Security method is used to return details of permission granted to a specific certificate with the specified ID. This method returns HTTP 200 OK on a success with security details in the message body. Both global and collection-level permissions are included in the response.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

/security/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/security/read/

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 226: GET Certificates {id} Security Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to check security permissions.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 227: GET Certificates {id} Security Response Data

Name	Description						
Roles	<p>An array of objects containing the certificate-specific permissions granted to the named security identity broken down by permission and defined by role. All roles are returned, including those that have no permissions. Role information includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short reference name for the security role.</td> </tr> <tr> <td>Permissions</td> <td>An array of strings containing the permissions assigned to the role.</td> </tr> </tbody> </table> <p>For example, the following return snippet shows the response for the <i>Power Users</i> security role:</p> <pre> { "Name": "Power Users", "Permissions": ["Read", "EditMetadata", "Recover"] } </pre>	Name	Description	Name	A string containing the short reference name for the security role.	Permissions	An array of strings containing the permissions assigned to the role.
Name	Description						
Name	A string containing the short reference name for the security role.						
Permissions	An array of strings containing the permissions assigned to the role.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation

for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.2 GET Certificates ID Validate

The GET /Certificates/{id}/Validate method is used to return details for the validity of the X509 certificate chain for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate chain validity details in the message body.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificates/collections/read/
 OR
 /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 228: GET Certificates {id} Validate Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to be validated.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 229: GET Certificates {id} Validate Response Data

Name	Description															
Valid	A Boolean that indicates whether all the validity tests are in a passing state (true) or not (false).															
Results	<p>An object containing the X509 certificate chain validity fields. The included validity fields are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Portal Equivalent</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>NotTimeValid</td> <td>Time Valid</td> <td>A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.</td> </tr> <tr> <td>NotTimeNested</td> <td>n/a</td> <td>A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.</td> </tr> <tr> <td>Revoked</td> <td>Active</td> <td>A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.</td> </tr> <tr> <td>NotSignatureValid</td> <td>Signature</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid</td> </tr> </tbody> </table>	Name	Portal Equivalent	Description	NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.	NotTimeNested	n/a	A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.	Revoked	Active	A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.	NotSignatureValid	Signature	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid
Name	Portal Equivalent	Description														
NotTimeValid	Time Valid	A value of <i>Pass</i> indicates that the certificate time value is valid. A time can appear invalid (<i>Fail</i>) for a certificate that has expired.														
NotTimeNested	n/a	A value of <i>Pass</i> indicates that the CA certificate and issued certificate have nested validity periods. A value of <i>Fail</i> can occur if the CA certificate expires before the issued certificate. This is considered deprecated and may be removed in a future release.														
Revoked	Active	A value of <i>Pass</i> indicates that the X509 certificate chain is valid for the certificate and contains no revoked certificates or errors.														
NotSignatureValid	Signature	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid														

Name	Description	
		certificate signature.
NotValidForUsage	Usage	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid key usage.
UntrustedRoot	Trusted Root	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an untrusted root certificate.
RevocationStatusUnknown	Revocation Status	A value of <i>Pass</i> indicates that the revocation status can successfully be determined for the certificate. This may be the result of successful access to online certificate revocation lists (CRLs).
Cyclic	Chain Built	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built.
InvalidExtension	Extensions	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid extension.
InvalidPolicyConstraints	Policy Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid policy constraint.

Name	Description																									
	<table border="1"> <thead> <tr> <th>Name</th> <th>Portal Equivalent</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>InvalidBasicConstraints</td> <td>Basic Constraints</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.</td> </tr> <tr> <td>InvalidNameConstraints</td> <td>Valid Name Constraints</td> <td>A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.</td> </tr> <tr> <td>HasNotSupportedNameConstraint</td> <td>Supported Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.</td> </tr> <tr> <td>HasNotDefinedNameConstraint</td> <td>Defined Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.</td> </tr> <tr> <td>HasNotPermittedNameConstraint</td> <td>Permitted Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.</td> </tr> <tr> <td>HasExcludedNameConstraint</td> <td>Excluded Name Constraints</td> <td>A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.</td> </tr> <tr> <td>PartialChain</td> <td>Full Chain</td> <td>A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.</td> </tr> </tbody> </table>	Name	Portal Equivalent	Description	InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint. HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.	HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.	HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.	HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.	PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.	
Name	Portal Equivalent	Description																								
InvalidBasicConstraints	Basic Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid basic constraint.																								
InvalidNameConstraints	Valid Name Constraints	A value of <i>Fail</i> indicates that the X509 certificate chain is invalid as a result of an invalid name constraint.																								
HasNotSupportedNameConstraint	Supported Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is unsupported or that the certificate has no supported name constraints.																								
HasNotDefinedNameConstraint	Defined Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is undefined.																								
HasNotPermittedNameConstraint	Permitted Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate is impermissible.																								
HasExcludedNameConstraint	Excluded Name Constraints	A value of <i>Fail</i> indicates that a name constraint for the certificate has been excluded.																								
PartialChain	Full Chain	A value of <i>Pass</i> indicates that the certificate chain for the certificate could successfully be built up to the root certificate.																								

Name	Description		
	Name	Portal Equivalent	Description
	CtIInvalidTimeValid	CTL Time Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is invalid because of an invalid time value (e.g. the CTL has expired).
	CtIInvalidSignatureValid	CTL Signature Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) contains an invalid signature.
	CtIInvalidForUsage	CTL Usage Valid	A value of <i>Fail</i> indicates that the certificate trust list (CTL) is not valid for this use.
	HasWeakSignature	Strong Signature	A value of <i>Pass</i> indicates that the certificate has been signed with a secure hashing algorithm. A value of <i>Fail</i> can indicate that a hashing algorithm of MD2 or MD5 was used for the certificate.
	OfflineRevocation	CRL online	A value of <i>Pass</i> indicates that the online certificate revocation list (CRL) the chain relies on is available.
	NoIssuanceChainPolicy	Chain Policy	A value of <i>Pass</i> indicates that there is either no certificate policy by design in the certificate or that if a group policy has specified that all certificates must have a

Name	Description	
		certificate policy, the certificate policy exists in the certificate.
ExplicitDistrust	No Explicit Distrust	A value of <i>Pass</i> indicates that the certificate is not explicitly distrusted.
HasNotSupportedCriticalExtension	Critical Extensions	A value of <i>Pass</i> indicates that the certificate has a critical extension that is supported or has no critical extensions.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.3 GET Certificates Locations ID

The GET `/Certificates/Locations/{id}` method is used to return details for the certificate store locations in which the certificate with the specified ID is found. This method returns HTTP 200 OK on a success with certificate store location details in the message body.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/certificates/collections/read/`
 OR
`/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the `CollectionId` input parameter, below.

Table 230: GET Certificates Locations {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate for which to retrieve certificate store location details.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

See Adding or Modifying a Certificate Store on page 413 for more information.	Alias	A string containing the alias of the certificate in the certificate store. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a user-provided string, but for an IIS Personal store, this will be the thumbprint of the certificate. See PFX Enrollment on page 146 for more information.				
Name	Description										
	ificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information.										
Alias	A string containing the alias of the certificate in the certificate store. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a user-provided string, but for an IIS Personal store, this will be the thumbprint of the certificate. See PFX Enrollment on page 146 for more information.										

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.4 GET Certificates Identity Audit ID

The GET /Certificates/IdentityAudit/{id} method is used to return a list of all the users or groups defined in the system that have permission to the certificate ID entered. This method returns HTTP 200 OK on a success with certificate identity audit details in the message body.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/read/
OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

This method has two available versions. Keyfactor recommends using the newer method when possible. For more information about versioning, see [Versioning on page 852](#).

Version 2

Version 2 of the GET /Certificates/IdentityAudit/{id} method redesigns the response to support security claims and environments with either an OAuth identity provider or Active Directory as an identity provider.

Table 232: GET Certificates Identity Audit {id} v2 Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 233: GET Certificates Identity Audit {id} v2 Response Data

Name	Description																		
Identity	<p>An object containing information about the identity. Identity details include:</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID for the security claim.</td> </tr> <tr> <td>Description</td> <td>A string indicating a description for the security claim.</td> </tr> <tr> <td>ClaimType</td> <td>A string indicating the type of claim.</td> </tr> <tr> <td>ClaimValue</td> <td>A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).</td> </tr> <tr> <td>Provider</td> <td> <p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Parameter	Description	Id	An integer containing the Keyfactor Command reference ID for the security claim.	Description	A string indicating a description for the security claim.	ClaimType	A string indicating the type of claim.	ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).	Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Name	A string containing the short reference name for the provider (e.g. Active Directory).
Parameter	Description																		
Id	An integer containing the Keyfactor Command reference ID for the security claim.																		
Description	A string indicating a description for the security claim.																		
ClaimType	A string indicating the type of claim.																		
ClaimValue	A string containing the identifying information for the entity specified in the claim. For Active Directory users and groups, this will be in the form DOMAIN\user or group name (e.g. KEYEXAMPLE\PKI Administrators). For Active Directory computers, this will be in the form of a machine account (e.g. KEYEXAMPLE\MyServer\$).																		
Provider	<p>An object containing information about the provider assigned to the security claim.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the Keyfactor Command reference GUID for the provider.</td> </tr> <tr> <td>Name</td> <td>A string containing the short reference name for the provider (e.g. Active Directory).</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the Keyfactor Command reference GUID for the provider.	Name	A string containing the short reference name for the provider (e.g. Active Directory).												
Name	Description																		
Id	A string indicating the Keyfactor Command reference GUID for the provider.																		
Name	A string containing the short reference name for the provider (e.g. Active Directory).																		
Permissions	<p>An array of objects containing the permissions granted to the certificate.</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td> </tr> </tbody> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)														
Parameter	Description																		
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)																		

Name	Description				
	<table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>GrantedBy</td> <td>A array of strings containing the list of roles or collections that grant the given permission to the entity.</td> </tr> </tbody> </table>	Parameter	Description	GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.
Parameter	Description				
GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.				

Version 1

Version 1 of the GET /Certificates/IdentityAudit/{id} method includes the same functionality as version 2 with similar data in the response but supports only environments using Active Directory as an identity provider.

Table 234: GET Certificates Identity Audit {id} V1 Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 235: GET Certificates Identity Audit {id} v1 Response Data

Name	Description						
Id	An integer containing the Keyfactor Command reference ID of the identity.						
AccountName	A string containing the name of the identity.						
IdentityType	A string that specifies the type of identity the entity is. For Active Directory, this will be a user or a group.						
SID	A string containing the SID of the identity.						
Permissions	An array of objects containing the permissions granted to the certificate. <table border="1" data-bbox="451 653 1404 919"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)</td> </tr> <tr> <td>GrantedBy</td> <td>A array of strings containing the list of roles or collections that grant the given permission to the entity.</td> </tr> </tbody> </table>	Parameter	Description	Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)	GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.
Parameter	Description						
Name	A string containing the name of the permission (for example: Read, EditMetadata, Import, Recover, etc...)						
GrantedBy	A array of strings containing the list of roles or collections that grant the given permission to the entity.						

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.5 DELETE Certificates ID

The DELETE /Certificates/{id} method is used to delete an existing certificate with the specified ID from the Keyfactor Command database. If the specified certificate has an associated private key stored in the database, this private key is also removed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/delete/
OR
/certificates/collections/delte/#!/ (where # is a reference to a specific certificate collection ID)
Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Tip: Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 236: DELETE Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate to delete. Use the <i>GET /Certificates</i> method (see GET Certificates on page 1141) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.6 GET Certificates ID

The *GET /Certificates/{id}* method is used to return details for the certificate with the specified ID. This method returns HTTP 200 OK on a success with certificate details in the message body.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/read/
OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 237: GET Certificates {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate. Use the <i>GET /Certificates</i> method (see GET Certificates on page 1141) to retrieve a list of multiple certificates to determine the desired certificate's ID.
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Table 238: GET Certificates {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority
Value	Description																		
0	Unknown																		
1	Active																		
2	Revoked																		
3	Denied																		
4	Failed																		
5	Pending																		
6	Certificate Authority																		
7	Parent Certificate Authority																		
KeySizeInBits	An integer specifying the key size in bits.																		
KeyType	<p>An integer specifying the key type of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>RSA</td> </tr> <tr> <td>2</td> <td>DSA</td> </tr> <tr> <td>3</td> <td>ECC</td> </tr> <tr> <td>4</td> <td>DH</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	RSA	2	DSA	3	ECC	4	DH						
Value	Description																		
0	Unknown																		
1	RSA																		
2	DSA																		
3	ECC																		
4	DH																		
RequesterId	An integer indicating the Keyfactor Command reference ID of the identity that requested the certificate. See also <i>RequesterName</i> .																		
IssuedOU	A string indicating the organizational unit of the certificate.																		
IssuedEmail	A string indicating the email address of the certificate.																		
KeyUsage	An integer indicating the total key usage of the certificate. Key usage is																		

Name	Description																																	
	<p>stored in Active Directory as a single value made of a combination of values. The values that make up the key usage value include:</p> <table border="1" data-bbox="609 359 1403 1486"> <thead> <tr> <th data-bbox="615 367 771 430">Value</th> <th data-bbox="777 367 1024 430">Function</th> <th data-bbox="1031 367 1396 430">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="615 438 771 491">0</td> <td data-bbox="777 438 1024 491">None</td> <td data-bbox="1031 438 1396 491">No key usage parameters.</td> </tr> <tr> <td data-bbox="615 499 771 583">1</td> <td data-bbox="777 499 1024 583">Encipherment Only</td> <td data-bbox="1031 499 1396 583">The key can be used for encryption only.</td> </tr> <tr> <td data-bbox="615 592 771 718">2</td> <td data-bbox="777 592 1024 718">CRL Signing</td> <td data-bbox="1031 592 1396 718">The key can be used to sign a certificate revocation list (CRL).</td> </tr> <tr> <td data-bbox="615 726 771 810">4</td> <td data-bbox="777 726 1024 810">Key Certificate Signing</td> <td data-bbox="1031 726 1396 810">The key can be used to sign certificates.</td> </tr> <tr> <td data-bbox="615 819 771 1008">8</td> <td data-bbox="777 819 1024 1008">Key Agreement</td> <td data-bbox="1031 819 1396 1008">The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.</td> </tr> <tr> <td data-bbox="615 1016 771 1100">16</td> <td data-bbox="777 1016 1024 1100">Data Encipherment</td> <td data-bbox="1031 1016 1396 1100">The key can be used for data encryption.</td> </tr> <tr> <td data-bbox="615 1108 771 1192">32</td> <td data-bbox="777 1108 1024 1192">Key Encipherment</td> <td data-bbox="1031 1108 1396 1192">The key can be used for key encryption.</td> </tr> <tr> <td data-bbox="615 1201 771 1285">64</td> <td data-bbox="777 1201 1024 1285">Nonrepudiation</td> <td data-bbox="1031 1201 1396 1285">The key can be used for authentication.</td> </tr> <tr> <td data-bbox="615 1293 771 1377">128</td> <td data-bbox="777 1293 1024 1377">Digital Signature</td> <td data-bbox="1031 1293 1396 1377">The key can be used as a digital signature.</td> </tr> <tr> <td data-bbox="615 1386 771 1470">32768</td> <td data-bbox="777 1386 1024 1470">Decipherment Only</td> <td data-bbox="1031 1386 1396 1470">The key can be used for decryption only.</td> </tr> </tbody> </table> <p data-bbox="609 1522 1403 1612">For example, a value of 160 would represent a key usage of <i>digital signature</i> with <i>key encipherment</i>. A value of 224 would add <i>nonrepudiation</i> to those.</p>	Value	Function	Description	0	None	No key usage parameters.	1	Encipherment Only	The key can be used for encryption only.	2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).	4	Key Certificate Signing	The key can be used to sign certificates.	8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.	16	Data Encipherment	The key can be used for data encryption.	32	Key Encipherment	The key can be used for key encryption.	64	Nonrepudiation	The key can be used for authentication.	128	Digital Signature	The key can be used as a digital signature.	32768	Decipherment Only	The key can be used for decryption only.
Value	Function	Description																																
0	None	No key usage parameters.																																
1	Encipherment Only	The key can be used for encryption only.																																
2	CRL Signing	The key can be used to sign a certificate revocation list (CRL).																																
4	Key Certificate Signing	The key can be used to sign certificates.																																
8	Key Agreement	The key can be used to determine key agreement, such as a key created using the Diffie-Hellman key agreement algorithm.																																
16	Data Encipherment	The key can be used for data encryption.																																
32	Key Encipherment	The key can be used for key encryption.																																
64	Nonrepudiation	The key can be used for authentication.																																
128	Digital Signature	The key can be used as a digital signature.																																
32768	Decipherment Only	The key can be used for decryption only.																																
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																																	
CertStateString	A string containing the certificate state. The possible values are: <ul style="list-style-type: none"> • Unknown (0) 																																	

Name	Description																		
	<ul style="list-style-type: none"> • Active (1) • Revoked (2) • Denied (3) • Failed (4) • Pending (5) • Certificate Authority (6) • Parent Certificate Authority (7) • External Validation (8) 																		
KeyTypeString	A string containing the key type description (e.g. RSA) as per the types and descriptions shown for <i>KeyType</i> .																		
RevocationEffDate	The date, in UTC, on which the certificate was revoked, if applicable.																		
RevocationReason	<p>An integer indicating the reason the certificate was revoked. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation Of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation Of Operation	6	Certificate Hold	999	Unknown
Value	Description																		
0	Unspecified																		
1	Key Compromised																		
2	CA Compromised																		
3	Affiliation Changed																		
4	Superseded																		
5	Cessation Of Operation																		
6	Certificate Hold																		
999	Unknown																		
RevocationComment	An internally used Keyfactor Command field.																		
CertificateAuthorityId	An integer indicating the Keyfactor Command reference ID of the certificate authority that issued the certificate.																		
CertificateAuthorityName	A string indicating the certificate authority that issued the certificate.																		
TemplateName	A string indicating the display name of the template that was used when issuing the certificate.																		

Name	Description								
ArchivedKey	A Boolean that indicates whether the certificate has a key archived in the issuing CA (true) or not (false).								
HasPrivateKey	A Boolean that indicates whether the certificate has a private key stored in Keyfactor Command (true) or not (false)								
PrincipalName	A string containing the name of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates).								
CertRequestId	An integer containing the Keyfactor Command reference ID of the certificate request.								
RequesterName	A string containing the name of the identity that requested the certificate.								
ContentBytes	A string containing the certificate as bytes.								
ExtendedKeyUsages	<p>An array of objects containing the extended key usages associated with the certificate. Extended Key data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the extended key usage.</td> </tr> <tr> <td>Oid</td> <td>A string indicating the OID of the extended key usage.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the name of the extended key usage.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the extended key usage.	Oid	A string indicating the OID of the extended key usage.	DisplayName	A string indicating the name of the extended key usage.
Name	Description								
Id	An integer containing the Keyfactor Command reference ID of the extended key usage.								
Oid	A string indicating the OID of the extended key usage.								
DisplayName	A string indicating the name of the extended key usage.								

Name	Description																																				
SubjectAltNameElements	<p>An array of objects containing the subject alternative name elements of the certificate. SAN data includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer containing the Keyfactor Command reference ID of the SAN Element.</td> </tr> <tr> <td>Value</td> <td>A string indicating the value of the SAN Element.</td> </tr> <tr> <td>Type</td> <td> <p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table> </td> </tr> <tr> <td>ValueHash</td> <td>A string indicating a hash of the SAN value.</td> </tr> </tbody> </table>	Name	Description	Id	An integer containing the Keyfactor Command reference ID of the SAN Element.	Value	A string indicating the value of the SAN Element.	Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown	ValueHash	A string indicating a hash of the SAN value.
Name	Description																																				
Id	An integer containing the Keyfactor Command reference ID of the SAN Element.																																				
Value	A string indicating the value of the SAN Element.																																				
Type	<p>An integer containing the type of SAN element. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Other Name</td> </tr> <tr> <td>1</td> <td>RFC 822 Name</td> </tr> <tr> <td>2</td> <td>DNS Name</td> </tr> <tr> <td>3</td> <td>X400 Address</td> </tr> <tr> <td>4</td> <td>Directory Name</td> </tr> <tr> <td>5</td> <td>Ediparty Name</td> </tr> <tr> <td>6</td> <td>Uniform Resource Identifier</td> </tr> <tr> <td>7</td> <td>IP Address</td> </tr> <tr> <td>8</td> <td>Registered Id</td> </tr> <tr> <td>100</td> <td>MS_NTPrincipalName</td> </tr> <tr> <td>101</td> <td>MS_NTDSReplication</td> </tr> <tr> <td>999</td> <td>Unknown</td> </tr> </tbody> </table>	Value	Description	0	Other Name	1	RFC 822 Name	2	DNS Name	3	X400 Address	4	Directory Name	5	Ediparty Name	6	Uniform Resource Identifier	7	IP Address	8	Registered Id	100	MS_NTPrincipalName	101	MS_NTDSReplication	999	Unknown										
Value	Description																																				
0	Other Name																																				
1	RFC 822 Name																																				
2	DNS Name																																				
3	X400 Address

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>ment.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td> </tr> </tbody> </table>	Name	Description		ment.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.7 GET Certificates Metadata Compare

The GET /Certificates/Metadata/Compare method is used to compare the value of a metadata field in a certificate stored in Keyfactor Command with a provided value. This can be used to prevent

exposing sensitive data while still providing functionality. For example, with this method, a metadata attribute can be used along with the certificate itself as a second authentication factor to a third-party application. This method returns HTTP 200 OK on a success with a response of *true* if the compared values match or *false* if they do not.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificates/collections/read/
 OR
 /certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 239: GET Certificates Metadata Compare Input Parameters

Name	In	Description
certificateId	Query	Required. An integer containing the Keyfactor Command reference ID of the certificate containing the metadata value to be compared.
metadataFieldName	Query	Required. A string containing the name of the metadata field whose value should be compared.
value	Query	Required. A string containing the value for comparison.
collectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.8 GET Certificates ID History

The GET /Certificates/{id}/History method is used to return details for the history of transactions for a certificate with the specified ID. History records are stored for a certificate for a variety of activities including initial import or enrollment, revocation, key recovery, additions or removals from certificate stores, renewals, and certificate discoveries in various certificate stores. For more information about certificate history records, see [Certificate Details on page 19](#). This method returns HTTP 200 OK on a success with certificate history details in the message body.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 240: GET Certificates {id} History Input Parameters

Name	In	Description
id	Path	Required. An integer containing the Keyfactor Command reference ID of the certificate.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>OperationStart</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 241: GET Certificates {id} History Response Data

Name	Description
Id	An integer containing the Keyfactor Command reference ID of the certificate.
OperationStart	The date, in UTC, on which the operation begin.
OperationEnd	The date, in UTC, on which the operation completed.
Username	The name of the user who initiated the transaction that created the history record (e.g. enrolled for the certificate, revoked the certificate), in DOMAIN\username format.
Comment	A string containing a comment that provides more information about the history record. For example (for a metadata field): <pre>"AppOwnerEmailAddress has been updated from 'john.smith@keyexample.com' to 'martha.jones@keyexample.com'"</pre>
Action	A string naming the action that was taken. For example: <pre>Metadata Updated</pre>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.9 DELETE Certificates

The DELETE /Certificates method is used to delete multiple certificates from the Keyfactor Command database in one request. The certificate IDs should be supplied in the request body as a JSON array of integers. If the specified certificate(s) have associated private key(s) stored in the database, these private keys are also removed. This endpoint returns 204 with no content upon success. IDs of any certificates that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed.

Whenever a certificate is deleted that is a part of a certificate renewal chain. The certificates on either end of the deleted cert(s) will have their certificate histories updated to show that either a certificate before or after the certificate was deleted in the renewal chain of that certificate.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/delete/
OR

 `/certificates/collections/delete/#/` (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the `CollectionId` input parameter, below.

 **Tip:** Deleting a certificate with this method does not necessarily delete it permanently. The certificate will be returned to the Keyfactor Command database on the next full synchronization if synchronization for the certificate source (certificate authority, SSL endpoint, etc.) is still configured. Certificate history, metadata, and private keys do not return when certificates re-synchronize. The certificate will be assigned a different Keyfactor Command reference ID when re-added to Keyfactor Command.

Table 242: DELETE Certificates Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers containing the Keyfactor Command certificate IDs for certificates that should be deleted in the form:</p> <pre>[123, 789, 567]</pre> <p>Use the <code>GET /Certificates</code> method (see GET Certificates below) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.10 GET Certificates

The `GET /Certificates` method is used to return a list of certificates with certificate details. Results can be limited to selected keys using filtering, and URL parameters can be used to specify paging

and the level of information detail. This method returns HTTP 200 OK on a success with the requested certificates, as determined by filtering, and their certificate details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 243: GET Certificates Input Parameters

Name	In	Description
includeLocations	Query	A Boolean that sets whether to include the <i>Locations</i> data in the response (true) or not (false). If false is selected, the <i>LocationsCount</i> and <i>Locations</i> fields will still appear in the response, but they will contain no data. The default is <i>false</i> .
includeMetadata	Query	A Boolean that sets whether to include the <i>Metadata</i> data in the response (true) or not (false). If false is selected, the <i>Metadata</i> field will still appear in the response, but it will contain no data. The default is <i>false</i> .
includeHasPrivateKey	Query	A Boolean that sets whether to include the correct value for <i>HasPrivateKey</i> in the response (true) or not (false). If false is selected, the <i>HasPrivateKey</i> field will appear in the response with a value of <i>false</i> regardless of whether the certificate actually has a stored private key or not. The default is <i>false</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.
includeRevoked	Query	A Boolean that sets whether to include revoked certificates in the results (true) or not (false). The default is <i>false</i> .
includeExpired	Query	A Boolean that sets whether to include expired certificates in the results (true) or not (false). The default is <i>false</i> .
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • ArchivedKey • CertId • CA • CertState

Name	In	Description
		<ul style="list-style-type: none"> • CertStoreContainer • CertStoreFQDN (alias: JavaKeystoreFQDN) • CertStorePath (alias: JavaKeystorePath) • CN (alias: IssuedCN) • DN (alias: IssuedDN) • ExpirationDate (alias: NotAfter) • EKU • EKUName • HasPrivateKey • ImportDate • IssuedDate (aliases: NotBefore and EffectiveDate) • IssuerDN • KeySize (alias: KeySizeInBits) • KeyType • KeyUsage • OU • NetBIOSPrincipal (alias: PrincipalName) • PublicKey • NetBIOSRequester (alias: RequesterName) • RevocationDate (alias: RevocationEffDate) • Revoker • RFC2818Compliant • SelfSigned • SerialNumber • SigningAlgorithm • SSLDNSName • SSLIPAddress (alias: SslHostName) • SSLNetworkName • SSLPort • SAN • TemplateDisplayName (alias: TemplateName) • TemplateShortName • Thumbprint <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> • <i>CARequestID</i> • <i>CertRequestID</i>

Name	In	Description
		<ul style="list-style-type: none"> • <i>IsPfx</i> • <i>RequestResolutionDate</i> <div style="border: 1px solid #007bff; border-radius: 10px; padding: 5px; background-color: #e6f2ff;">  Note: Queries may be done using either the primary field name or the field alias(es). </div>
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 244: GET Certificates Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate.
Thumbprint	A string indicating the thumbprint of the certificate.
SerialNumber	A string indicating the serial number of the certificate.
IssuedDN	A string indicating the distinguished name of the certificate.
IssuedCN	A string indicating the common name of the certificate.
ImportDate	The date, in UTC, on which the certificate was imported into Keyfactor Command.
NotBefore	The date, in UTC, on which the certificate was issued by the certificate authority.
NotAfter	The date, in UTC, on which the certificate expires.
IssuerDN	A string indicating the distinguished name of the issuer.
PrincipalId	An integer indicating the Keyfactor Command reference ID of the principal (UPN) that requested the certificate. Typically, this field is only populated for end user certificates requested through Keyfactor Command (e.g. Mac auto-enrollment certificates). See also <i>PrincipalName</i> .
TemplateId	An integer indicating the Keyfactor Command reference ID of the template associated with the certificate.

Name	Description																		
CertState	<p>An integer specifying the state of the certificate. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unknown</td> </tr> <tr> <td>1</td> <td>Active</td> </tr> <tr> <td>2</td> <td>Revoked</td> </tr> <tr> <td>3</td> <td>Denied</td> </tr> <tr> <td>4</td> <td>Failed</td> </tr> <tr> <td>5</td> <td>Pending</td> </tr> <tr> <td>6</td> <td>Certificate Authority</td> </tr> <tr> <td>7</td> <td>Parent Certificate Authority</td> </tr> </tbody> </table>	Value	Description	0	Unknown	1	Active	2	Revoked	3	Denied	4	Failed	5	Pending	6	Certificate Authority	7	Parent Certificate Authority

KEYFACTOR	Alias 11.1 Keyfactor Command Documentation Suite A string indicating the alias of the certificate in the certificate store.																																										
	ChainLevel An integer stating how many certificates are below this certificate in the certificate chain stored at the given location.																																										

Name	Description														
Metadata	An object containing the metadata fields populated for the certificate.														
CertificateKeyId	An integer indicating the Keyfactor Command reference ID for the private key, if one exists, and public key of the certificate.														
CARowIndex	<p>An integer containing the CA's reference ID for certificate.</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  Note: The <i>CARowIndex</i> has been replaced by <i>CARecordId</i>, but will remain for backward compatibility. It will only contain a non-zero value for certificates issued by Microsoft CAs. For Microsoft CA certificates, the <i>CARowIndex</i> will be equal to the <i>CARecordId</i> value parsed to an integer. </div>														
CARecordId	A string containing the CA's reference ID for certificate.														
DetailedKeyUsage	<p>An object containing details of the key usage configured for the certificate. Detailed key usage data includes:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CrISign</td> <td>A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DataEncipherment</td> <td>A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>DecipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).</td> </tr> <tr> <td>DigitalSignature</td> <td>A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).</td> </tr> <tr> <td>EncipherOnly</td> <td>A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).</td> </tr> <tr> <td>KeyAgreement</td> <td>A Boolean that indicates whether the certificate is configured for key agree-</td> </tr> </tbody> </table>	Name	Description	CrISign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).	DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).	DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).	DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).	EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).	KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-
Name	Description														
CrISign	A Boolean that indicates whether CRL signing is enabled for the certificate (true) or not (false).														
DataEncipherment	A Boolean that indicates whether data encipherment ("Allow encryption of user data" in a Microsoft template) is enabled for the certificate (true) or not (false).														
DecipherOnly	A Boolean that indicates whether the key of the certificate is intended for decipherment only (true) or not (false).														
DigitalSignature	A Boolean that indicates whether digital signature is enabled for the certificate (true) or not (false).														
EncipherOnly	A Boolean that indicates whether the key of the certificate is intended for encipherment only (true) or not (false).														
KeyAgreement	A Boolean that indicates whether the certificate is configured for key agree-														

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>ment.</td> </tr> <tr> <td>KeyCertSign</td> <td>A Boolean that indicates whether the certificate is configured for certificate signing.</td> </tr> <tr> <td>KeyEncipherment</td> <td>A Boolean that indicates whether the certificate is configured for key encipherment.</td> </tr> <tr> <td>NonRepudiation</td> <td>A Boolean that indicates whether the certificate is configured for non-repudiation.</td> </tr> <tr> <td>HexCode</td> <td>A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i>.</td> </tr> </tbody> </table>	Name	Description		ment.	KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.	KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.	NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.	HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .
Name	Description												
	ment.												
KeyCertSign	A Boolean that indicates whether the certificate is configured for certificate signing.												
KeyEncipherment	A Boolean that indicates whether the certificate is configured for key encipherment.												
NonRepudiation	A Boolean that indicates whether the certificate is configured for non-repudiation.												
HexCode	A string containing the hexadecimal code representing the total key usage. For example, a value of a0 would indicate <i>digital signature with key encipherment</i> .												
KeyRecoverable	A Boolean that indicates whether the certificate key is recoverable (true) or not (false).												
Curve	A string indicating the OID of the elliptic curve algorithm configured for the certificate, for ECC templates. Well-known OIDs include: <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 												
CertStoreTypeShortNames	An array of comma-separated strings indicating the certificate stores types associated with each certificate.												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.11 PUT Certificates Metadata

The PUT /Certificates/Metadata method is used to update one or more metadata values for a specified certificate. Any existing values for the metadata fields submitted with this update will be

overwritten with the new values provided. For more granular control over updating only metadata fields that do not already contain a value, use the `PUT /Certificates/Metadata/All` method (see [PUT Certificates Metadata All on the next page](#)). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/certificates/collections/metadata/modify/`
 OR
`/certificates/collections/metadata/modify/#/` (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the `CollectionId` input parameter, below.

Table 245: PUT Certificates Metadata Input Parameters

Name	In	Description
Id	Body	Required. An integer specifying the Keyfactor Command reference ID for the certificate to update.
Metadata	Body	Required. An object containing one or more metadata key value pairs to update for the certificate. These are submitted with the metadata field name in the key and the value in the value. For example: <pre> "Metadata": { "AppOwnerEmailAddress": "john.smith@keyexample.com", // String field "SiteCode": 23, // Integer field "BusinessCritical": true, // Boolean field "Notes": "Here are some notes about this certificate.", // BigText field "BusinessUnit": "E-Business", // Multiple Choice field pre-defined value "TicketResolutionDate": "2021-07-23" // Date field in yyyy-mm-dd format } </pre>
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.12 PUT Certificates Metadata All

The PUT /Certificates/Metadata/All method is used to update one or more metadata values for a specified set of certificates. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificates/collections/metadata/modify/
 OR
 /certificates/collections/metadata/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 246: PUT Certificates Metadata All Input Parameters

Name	In	Description
Query	Body	<p>Required*. A string containing a query to limit the certificates to update (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to: Certificate Search Page on page 34. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is required.</p> <p>The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • ArchivedKey • CertId • CA • CertState • CertStoreContainer • CertStoreFQDN (alias: JavaKeystoreFQDN) • CertStorePath (alias: JavaKeystorePath) • CN (alias: IssuedCN) • DN (alias: IssuedDN) • ExpirationDate (alias: NotAfter)

Name	In	Description
		<ul style="list-style-type: none"> • EKU • EKUName • HasPrivateKey • ImportDate • IssuedDate (aliases: NotBefore and EffectiveDate) • IssuerDN • KeySize (alias: KeySizeInBits) • KeyType • KeyUsage • OU • NetBIOSPrincipal (alias: PrincipalName) • PublicKey • NetBIOSRequester (alias: RequesterName) • RevocationDate (alias: RevocationEffDate) • Revoker • RFC2818Compliant • SelfSigned • SerialNumber • SigningAlgorithm • SSLDNSName • SSLIPAddress (alias: SslHostName) • SSLNetworkName • SSLPort • SAN • TemplateDisplayName (alias: TemplateName) • TemplateShortName • Thumbprint <p>The following fields have been deprecated and will be ignored if included in a request:</p> <ul style="list-style-type: none"> • <i>CARequestID</i> • <i>CertRequestId</i> • <i>IsPfx</i> • <i>RequestResolutionDate</i> <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 5px; margin-top: 10px;">  Note: Queries may be done using either the primary field name or the field alias(es). </div>

Name	In	Description								
		<p> Tip: To exclude revoked certificates from the update, include a query of:</p> <pre>CertState -ne \"2\"</pre> <p>To exclude expired certificates from the update, include a query of:</p> <pre>ExpirationDate -ge \"%TODAY%\"</pre>								
CertificateIds	Body	Required *. An array of integers indicating the Keyfactor Command certificate IDs to update. A value for one of <i>CertificateIds</i> , <i>Query</i> , or <i>CollectionId</i> is required .								
Metadata	Body	<p>Required. An array of objects containing information about the metadata field(s) to update. The parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Value</td> <td>Required. A string indicating the value that should be set for the metadata field.</td> </tr> <tr> <td>MetadataName</td> <td>Required. A string indicating the name of the metadata field that should be updated for the certificates.</td> </tr> <tr> <td>OverwriteExisting</td> <td>A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i>.</td> </tr> </tbody> </table> <p>For example:</p> <pre>"Metadata": [{</pre>	Name	Description	Value	Required. A string indicating the value that should be set for the metadata field.	MetadataName	Required. A string indicating the name of the metadata field that should be updated for the certificates.	OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .
Name	Description									
Value	Required. A string indicating the value that should be set for the metadata field.									
MetadataName	Required. A string indicating the name of the metadata field that should be updated for the certificates.									
OverwriteExisting	A Boolean that sets whether all the certificates being updated will have their metadata field overwritten to the value being provided, including those that already have a value in the given metadata field (true) or whether only the certificates that currently have no value in the given metadata field will be saved with the new value (false). The default is <i>false</i> .									

Name	In	Description
		<pre> "MetadataName": "AppOwnerEmailAddress", // This is a String field. "Value": "john.smith@keyexample.com", "OverwriteExisting": true }, { "MetadataName": "SiteCode", // This is an Integer field. "Value": 5, "OverwriteExisting": true }, { "MetadataName": "BusinessCritical", // This is a Boolean field. "Value": true, "OverwriteExisting": true }, { "MetadataName": "Notes", // This is a BigText field. "Value": "Here are some notes about this certificate.", "OverwriteExisting": true }, { "MetadataName": "BusinessUnit", // This is a Multiple Choice field. "Value": "E-Business", // This is a value pre-defined for the field. "OverwriteExisting": true }, { "MetadataName": "TicketResolutionDate", // This is a Date field in yyyy-mm-dd format. "Value": "2021-07-23", "OverwriteExisting": true }] </pre>
CollectionId	Query	<p>Required*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.</p> <p>This field can also be used to specify the certificate collection containing certificates that should be updated. A value for one of <i>CertificateIds</i>, <i>Query</i>, or <i>CollectionId</i> is required.</p>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.13 POST Certificates Import

The POST /Certificates/Import method is used to import a certificate provided in the request body into Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing information about the import.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/import/

Table 247: POST Certificates Import Input Parameters

Name	In	Description
Certificate	Body	Required. A string containing the base-64 encoded contents of the certificate that is to be imported into Keyfactor Command.
Password	Body	Required* . A string containing the password used to decrypt the imported PFX. This field is required if a PFX certificate is provided in the <i>Certificate</i> field.
Metadata	Body	An object containing the certificate metadata that will be associated with the certificate once it is imported. This is provided as a set of key value pairs with the metadata field name in the key and the value in the value. For example: <pre> "Metadata": { "AppOwnerFirstName": "John", "AppOwnerLastName": "Smith" } </pre>
StoreIds	Body	An array of strings indicating the certificate store GUIDs that the imported certificate will be installed into.

Name	In	Description																																								
StoreTypes	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StoreTypeid</td> <td> <p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Java Keystore</td> </tr> <tr> <td>2</td> <td>PEM File</td> </tr> <tr> <td>3</td> <td>F5 SSL Profiles</td> </tr> <tr> <td>4</td> <td>IIS Roots</td> </tr> <tr> <td>5</td> <td>NetScaler</td> </tr> <tr> <td>6</td> <td>IIS Personal</td> </tr> <tr> <td>7</td> <td>F5 Web Server</td> </tr> <tr> <td>8</td> <td>IIS Revoked</td> </tr> <tr> <td>9</td> <td>F5 Web Server REST</td> </tr> <tr> <td>10</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>11</td> <td>F5 CA Bundles REST</td> </tr> <tr> <td>100</td> <td>Amazon Web Services</td> </tr> <tr> <td>101</td> <td>File Transfer Protocol</td> </tr> <tr> <td>1xx</td> <td>User-defined certificate stores will be given a type ID over 101.</td> </tr> </tbody> </table> </td> </tr> <tr> <td>Alias</td> <td></td> <td> <p>Required*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 74 for more information. This field may be required depending on the store type selected.</p> </td> </tr> <tr> <td>Overwrite</td> <td></td> <td> <p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p> </td> </tr> </tbody> </table>	Name	Description	StoreTypeid	<p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Java Keystore</td> </tr> <tr> <td>2</td> <td>PEM File</td> </tr> <tr> <td>3</td> <td>F5 SSL Profiles</td> </tr> <tr> <td>4</td> <td>IIS Roots</td> </tr> <tr> <td>5</td> <td>NetScaler</td> </tr> <tr> <td>6</td> <td>IIS Personal</td> </tr> <tr> <td>7</td> <td>F5 Web Server</td> </tr> <tr> <td>8</td> <td>IIS Revoked</td> </tr> <tr> <td>9</td> <td>F5 Web Server REST</td> </tr> <tr> <td>10</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>11</td> <td>F5 CA Bundles REST</td> </tr> <tr> <td>100</td> <td>Amazon Web Services</td> </tr> <tr> <td>101</td> <td>File Transfer Protocol</td> </tr> <tr> <td>1xx</td> <td>User-defined certificate stores will be given a type ID over 101.</td> </tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.	Alias		<p>Required*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 74 for more information. This field may be required depending on the store type selected.</p>	Overwrite		<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p>
Name	Description																																									
StoreTypeid	<p>An integer indicating the ID of the store type being used. There must be one for each type of store ID used. The possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Java Keystore</td> </tr> <tr> <td>2</td> <td>PEM File</td> </tr> <tr> <td>3</td> <td>F5 SSL Profiles</td> </tr> <tr> <td>4</td> <td>IIS Roots</td> </tr> <tr> <td>5</td> <td>NetScaler</td> </tr> <tr> <td>6</td> <td>IIS Personal</td> </tr> <tr> <td>7</td> <td>F5 Web Server</td> </tr> <tr> <td>8</td> <td>IIS Revoked</td> </tr> <tr> <td>9</td> <td>F5 Web Server REST</td> </tr> <tr> <td>10</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>11</td> <td>F5 CA Bundles REST</td> </tr> <tr> <td>100</td> <td>Amazon Web Services</td> </tr> <tr> <td>101</td> <td>File Transfer Protocol</td> </tr> <tr> <td>1xx</td> <td>User-defined certificate stores will be given a type ID over 101.</td> </tr> </tbody> </table>	Value	Description	0	Java Keystore	2	PEM File	3	F5 SSL Profiles	4	IIS Roots	5	NetScaler	6	IIS Personal	7	F5 Web Server	8	IIS Revoked	9	F5 Web Server REST	10	F5 SSL Profiles REST	11	F5 CA Bundles REST	100	Amazon Web Services	101	File Transfer Protocol	1xx	User-defined certificate stores will be given a type ID over 101.											
Value	Description

11	F5 CA Bundles REST																																									
100	Amazon Web Services																																									
101	File Transfer Protocol																																									
1xx	User-defined certificate stores will be given a type ID over 101.																																									
Alias		<p>Required*. A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 74 for more information. This field may be required depending on the store type selected.</p>																																								
Overwrite		<p>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being imported (true) or not (false).</p>																																								

Name	In	Description
Schedule	Body	A string containing the time the imported certificate should be scheduled to be installed into the certificate store. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).

Table 248: POST Certificates Import Response Data

Name	Description														
ImportStatus	An integer indicating the status of the import job indicating, for example, whether the certificate was newly created in Keyfactor Command or already existed in Keyfactor Command and was just updated based on provided private key, metadata, or location information.														
InvaieldKeyStores	An array of objects indicating which key store items failed with some information. Included parameters are: <table border="1" data-bbox="490 835 1401 1377"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>KeystoreId</td> <td>A string indicating the ID of the store that failed.</td> </tr> <tr> <td>ClientMachine</td> <td>A string indicating the client machine of the store that failed.</td> </tr> <tr> <td>StorePath</td> <td>A string indicating the path to the location of the certificate store that failed.</td> </tr> <tr> <td>Alias</td> <td>A string indicating the alias for the certificate in the store that failed.</td> </tr> <tr> <td>Reason</td> <td>An integer indicating the simple reason why it failed.</td> </tr> <tr> <td>Explanation</td> <td>A string indicating a more specific reason for the failure.</td> </tr> </tbody> </table>	Name	Description	KeystoreId	A string indicating the ID of the store that failed.	ClientMachine	A string indicating the client machine of the store that failed.	StorePath	A string indicating the path to the location of the certificate store that failed.	Alias	A string indicating the alias for the certificate in the store that failed.	Reason	An integer indicating the simple reason why it failed.	Explanation	A string indicating a more specific reason for the failure.
Name	Description														
KeystoreId	A string indicating the ID of the store that failed.														
ClientMachine	A string indicating the client machine of the store that failed.														
StorePath	A string indicating the path to the location of the certificate store that failed.														
Alias	A string indicating the alias for the certificate in the store that failed.														
Reason	An integer indicating the simple reason why it failed.														
Explanation	A string indicating a more specific reason for the failure.														
JobStatus	An integer indicating the state of all certificate store jobs.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.14 POST Certificates Revoke

The POST /Certificates/Revoke method is used to revoke one or more certificates with the specified ID(s). This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/revoke/

OR

/certificates/collections/revoke/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 230](#)).

Table 249: POST Certificates Revoke Input Parameters

Name	In	Description																				
CertificateIDs	Body	Required. An array of integers containing the list of Keyfactor Command reference IDs for certificates that should be revoked.																				
Reason	Body	<p>An integer containing the specific reason that the certificate is being revoked. Available values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL. Only valid in the case that a cert is already on a CRL in a manner that it can be removed, such as Certificate Hold																					
Comment	Body	Required. A string containing a freeform reason or comment on why the certificate is being revoked.																				
EffectiveDate	Body	A string containing the date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.																				

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.7.15 POST Certificates Analyze

The POST /Certificates/Analyze method is used to parse a raw binary certificate returned from a CA into human-readable list of certificate details. For input data supplied with chain certificates, the output will include analysis of the primary certificate and the chain certificates. This method returns HTTP 200 OK on a success with a list of the contents of the certificate and the certificates in the chain, if applicable.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

OR

/certificates/import/

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 250: POST Certificates Analyze Input Parameters

Name	In	Description
Certificate	Body	Required. A string containing either the PEM-encoded string of the certificate not including the header and footer (e.g. -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----) or the base-64 encoded contents of the certificate. Both certificates with and without private keys are supported for analysis.
Password	Body	A string containing the password used to encrypt the private key of the certificate, if applicable.

Table 251: POST Certificates Analyze Response Data

Name	Description
IssuedDN	A string containing the distinguished name of the certificate.
IssuerDN	A string containing the distinguished name of the issuer of the certificate.
Thumbprint	A string containing the thumbprint of the certificate.
NotAfter	A string containing the date/time, in UTC, on which the certificate expires.
NotBefore	A string containing the date/time, in UTC, on which the certificate was issued by the certificate authority.
Metadata	An object containing the metadata fields populated for the certificate.
IsEndEntity	A Boolean indicating whether the certificate is the end entity of the chain (true) or not (false).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.7.16 POST Certificates Recover

The POST /Certificates/Recover method is used to recover or download a certificate with private key. For certificates that are available for key recovery from the Microsoft CA, the certificate is recovered from the CA. For certificates with a private key stored in Keyfactor Command, the certificate is downloaded from Keyfactor Command. This method returns HTTP 200 OK on a success with a base-64-encoded representation of the certificate and private key, including optional certificate chain, in JKS, PEM or PFX format. For certificates without private keys in DER, PEM or P7B format, use the *POST /Certificates/Download* method (see [POST Certificates Download on page 1173](#)).

 **Tip:** CA-level key recovery is supported for Microsoft CAs to allow recovery of private keys for certificates enrolled outside of Keyfactor Command. CA-level key archiving is not supported for enrollments done through Keyfactor Command. CA-level key recovery is not supported for EJBCA CAs. For enrollments done through Keyfactor Command for either Microsoft or EJBCA CAs, use Keyfactor Command private key retention (see [Details Tab on page 387](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/private_key/read/

OR

/certificates/collections/private_key/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 252: POST Certificates Recover Input Parameters

Name	In	Description
Password	Body	Required . The password to set on the certificate.
CertID	Body	Required *. An integer indicating the Keyfactor Command reference ID of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	Required *. A string indicating the serial number of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	Required *. A string indicating the distinguished name of the issuer of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	Required *. A string indicating the thumbprint of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (<i>true</i>) or not (<i>false</i>). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user

Name	In	Description
		<p>must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.</p>
x-certificateformat	Header	<p>The desired output format for the certificate. Supported options are:</p> <ul style="list-style-type: none"> • JKS Selecting the JKS option allows you to create a Java keystore with the returned PFX value. • PEM Output the certificate in base-64 encoded PEM format along with the private key and any optional chain certificates in a single file. • PFX Selecting the PFX option allows you to create a PKCS#12 (PFX/P12) file with the returned PFX value.

Table 253: POST Certificates Recover Response Data

Name	Description
PFX	<p>The base-64-encoded representation of the certificate in PEM or PFX format with the optional certificate chain. The string will need to be base-64 decoded for both PEM and PFX. This can be accomplished in a number of ways. For example, using PowerShell and a manually generated file containing just the base-64 string returned in the response (not the full response):</p> <pre>\$b64 = Get-Content 'C:\path\to\source\file' \$targetFile = 'C:\path\to\target\file' \$bytes = [Convert]::FromBase64String(\$b64) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>Using PowerShell within the script where the full response (including two key/value pairs) is returned and placed in the variable \$response:</p> <pre>\$ResponseContent = \$response.Content ConvertFrom-Json \$targetFile = 'C:\path_to_target_file\' + \$ResponseContent.FileName \$bytes = [Convert]::FromBase64String(\$ResponseContent.PFX) [IO.File]::WriteAllBytes(\$targetFile, \$bytes)</pre> <p>In the second case, the name provided in FileName is used for the PFX output file.</p>
FileName	The CN of the certificate presented as a file name (e.g. mycertificatekeyexamplecom.pfx).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.7.17 POST Certificates Download

The POST /Certificates/Download method is used to download a certificate from Keyfactor Command. This method returns HTTP 200 OK on a success with the base-64-encoded certificate without private key, including optional certificate chain, in DER, PEM or P7B format. For certificates with private keys in PEM or PFX format, use the *POST /Certificates/Recover* method (see [POST Certificates Recover on page 1169](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 254: POST Certificates Download Input Parameters

Name	In	Description
CertID	Body	Required* . An integer indicating the Keyfactor Command reference ID of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
SerialNumber	Body	Required* . A string indicating the serial number of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IssuerDN	Body	Required* . A string indicating the distinguished name of the issuer of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
Thumbprint	Body	Required* . A string indicating the thumbprint of the certificate to retrieve. One of the following is required : <ul style="list-style-type: none"> • <i>CertID</i> • <i>Thumbprint</i> • <i>SerialNumber</i> and <i>IssuerDN</i>
IncludeChain	Body	A Boolean indicating whether to include the certificate chain with the certificate (<i>true</i>) or not (<i>false</i>). If you select <i>true</i> , you must select a certificate format of PEM or P7B.
ChainOrder	Body	A string indicating the order in which the certificate chain should be returned if <i>IncludeChain</i> is set to <i>true</i> . Supported values are <i>EndEntityFirst</i> or <i>RootFirst</i> .
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate

Name	In	Description
		collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.
x-certificateformat	Header	The desired output format for the certificate. Supported options are: <ul style="list-style-type: none"> • DER DER is not supported if IncludeChain is set to <i>true</i>. • PEM Output the certificate in base-64 encoded PEM format along with any optional chain certificates in a single file. • P7B This option is only supported if IncludeChain is set to <i>true</i>

Table 255: POST Certificates Download Response Data

Name	Description
Content	The base-64-encoded certificate in DER, PEM or P7B format with the optional certificate chain.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.7.18 POST Certificates Revoke All

The POST /Certificates/RevokeAll method is used to revoke all the certificates in the specified query and/or collection ID. The endpoint makes use of the *Revoke All Enabled* application setting (see [Application Settings: Console Tab on page 602](#)). If *Revoke All Enabled* is set to *False*, the endpoint will return an error indicating revoke all is not allowed and not complete the request. This method returns HTTP 200 OK on a success with a list of the successfully revoked certificate IDs on a success or a list of the failed certificate IDs if any revocations fail.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/revoke/
OR
OR

/certificates/collections/revoke/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Note: As of Keyfactor Command version 10, enrollment (PFX and CSR), renewal, and revocation requests all flow through Keyfactor Command workflow. This will result in no changes to the enrollment, renewal, and revocation user experience unless customizations have been added in workflow (see [Workflow Definitions on page 230](#)).

Table 256: POST Certificates Revoke All Input Parameters

Name	In	Description																				
Query	Body	Required* . A string containing a query to limit the certificates to revoke (e.g. field1 -eq value1 AND field2 -gt value2). Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns. For querying guidelines, refer to Certificate Search Page on page 34 . A value for either <i>Query</i> or <i>CollectionId</i> is required . If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.																				
Reason	Body	An integer containing the specific reason that the certificates are being revoked. Available values are: <table border="1" data-bbox="565 674 1403 1297"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>-1</td> <td>Remove from Hold</td> </tr> <tr> <td>0</td> <td>Unspecified</td> </tr> <tr> <td>1</td> <td>Key Compromised</td> </tr> <tr> <td>2</td> <td>CA Compromised</td> </tr> <tr> <td>3</td> <td>Affiliation Changed</td> </tr> <tr> <td>4</td> <td>Superseded</td> </tr> <tr> <td>5</td> <td>Cessation of Operation</td> </tr> <tr> <td>6</td> <td>Certificate Hold</td> </tr> <tr> <td>7</td> <td>Remove from CRL</td> </tr> </tbody> </table> <p>The default is <i>Unspecified</i>.</p>	Value	Description	-1	Remove from Hold	0	Unspecified	1	Key Compromised	2	CA Compromised	3	Affiliation Changed	4	Superseded	5	Cessation of Operation	6	Certificate Hold	7	Remove from CRL
Value	Description																					
-1	Remove from Hold																					
0	Unspecified																					
1	Key Compromised																					
2	CA Compromised																					
3	Affiliation Changed																					
4	Superseded																					
5	Cessation of Operation																					
6	Certificate Hold																					
7	Remove from CRL																					
Comment	Body	Required . A string containing a freeform reason or comment indicating why the certificates are being revoked.																				
EffectiveDate	Body	The date and time when the certificate will be revoked. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z). The default is the current date and time.																				
IncludeRe- voked	Body	A Boolean that indicates whether revoked certificates should be included in the revocation (true) or not (false). The default is <i>false</i> .																				
IncludeExpired	Body	A Boolean that indicates whether expired certificates should be included in																				

Name	In	Description
		the revocation (true) or not (false). The default is <i>false</i> .
CollectionId	Query	<p>Required*. An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information. This field can also be used to specify the certificate collection containing certificates that should be revoked. A value for either <i>Query</i> or <i>CollectionId</i> is required. If both <i>Query</i> and <i>CollectionId</i> are specified, certificates from both sources will be revoked.</p> <p>For example:</p> <pre>https://keyfactor.keyexample.com/KeyfactorAPI/Certificates/RevokeAll?CollectionId=14</pre>

Note: This endpoint is not exposed in the Keyfactor API Reference and Utility to reduce accidental usage. You may still make use of it by calling it from your own tool.

3.6.7.19 DELETE Certificates Query

The DELETE /Certificates/query method is used to delete a group of certificates from Keyfactor Command that match the criteria provided in the body. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /certificates/collections/delete/
- OR
- /certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 257: DELETE Certificates Query Input Parameters

Name	In	Description
sq	Body	<p>Required. Query to limit the requested set of certificates that should be deleted in the form (without parameter name):</p> <pre>CN -contains "mycertificate.keyexample.com"</pre> <p>See Certificate Search Page on page 34 for querying guidelines to build your body query.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.20 DELETE Certificates Private Key

The DELETE /Certificates/PrivateKey method is used to delete the stored private key of each certificate ID in the list provided in the body from the Keyfactor Command platform. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- /certificates/collections/delete/
- OR
- /certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 258: DELETE Certificates Private Key Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers containing the Keyfactor Command reference IDs for certificates for which the associated private keys should be deleted in the form:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; display: inline-block; margin: 10px 0;">[123,789,567]</div> <p>Use the <i>GET /Certificates</i> method (see GET Certificates on page 1141) to determine the certificate IDs.</p>
CollectionId	Query	<p>An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.7.21 DELETE Certificates Private Key ID

The DELETE */Certificates/PrivateKey/{id}* method is used to delete the stored private key of the submitted certificate ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/delete/
 OR
/certificates/collections/delete/#/ (where # is a reference to a specific certificate collection ID)
 Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions. See also the *CollectionId* input parameter, below.

Table 259: DELETE Certificates Private Key {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the certificate whose private key should be deleted. Use the <i>GET /Certificates</i> method (see GET Certificates on page 1141) to retrieve a list of certificates based on entered search criteria to determine the certificate ID. This information is also available in the certificate details for a certificate in the Keyfactor Command Management Portal.
CollectionId	Query	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8 Certificate Authority

The CertificateAuthority component of the Keyfactor API includes methods for listing, creating, updating and deleting certificate authority records in Keyfactor Command as well as for publishing CRLs.

Table 260: Certificate Authority Endpoints

Endpoint	Method	Description	Link
/PublishCRL	POST	Publishes the Certificate Revocation List of the given certificate authority.	POST Certificate Authority PublishCRL on page 1284
/	GET	Returns a list of all certificate author-	GET Certificate Authority on

Endpoint	Method	Description	Link
		ities.	page 1201
/	POST	Creates a new certificate authority record.	POST Certificate Authority on page 1216
/	PUT	Updates an existing certificate authority record.	PUT Certificate Authority on page 1248
/ {id}	GET	Returns details for the certificate authority identified by the specified ID.	GET Certificate Authority ID on page 1186
/ {id}	DELETE	Deletes the certificate authority record for the specified ID.	DELETE Certificate Authority ID on page 1185
/Test	POST	Validates that the certificate authority with the provided information can be reached.	POST Certificate Authority Test on page 1280
/SourceCount	GET	Retrieve the count of certificate authorities with full or incremental synchronization scans configured.	GET Certificate Authority Source Count on page 1284
/AvailableForests	GET	Retrieve the list of forests in Active Directory Keyfactor Command	GET Certificate Authority Available Forests on page 1285
/Import	POST	Import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix	POST Certificate Authority Import on page 1294

Endpoint	Method	Description	Link
		(e.g. keyexample.com).	
/HealthMonitoring/Schedule	GET	Retrieve the current schedule for the CA health monitoring job.	GET Certificate Authority Health Monitoring Schedule on page 1286
/AlertRecipients/CAHealthRecipients	POST	Create new recipients to receive CA health monitoring alerts in Keyfactor Command	POST Certificate Authority Alert Recipients CA Health Recipients on page 1287
/AlertRecipients/CAHealthRecipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts.	GET Certificate Authority Alert Recipients CA Health Recipients on page 1286
/AlertRecipients/CAHealthRecipients/{id}	GET	Retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID.	GET Certificate Authority Alert Recipients CA Health Recipients ID on page 1288
/AlertRecipients/CAHealthRecipients/{id}	PUT	Update the CA health monitoring alert recipient with the specified ID.	PUT Certificate Authority Alert Recipients CA Health Recipients ID on page 1290
/AlertRecipients/CAHealthRecipients/{id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	DELETE Certificate Authority Alert Recipients CA Health Recipients ID on page 1289
/AlertRecipients/CAThresholdRecipients	POST	Create new recipients to receive CA	POST Certificate Authority Alert Recip-

Endpoint	Method	Description	Link
		threshold alerts in Keyfactor Command.	ients CA Threshold Recipients on page 1292
/AlertRecipients/CAThresholdRecipients	GET	Retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts.	GET Certificate Authority Alert Recipients CA Threshold Recipients on page 1291
/AlertRecipients/CAThresholdRecipients/{id}	GET	Retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID.	GET Certificate Authority Alert Recipients CA Threshold Recipients ID on page 1292
/AlertRecipients/CAThresholdRecipients/{id}	PUT	Update the CA threshold alert recipient with the specified ID.	PUT Certificate Authority Alert Recipients CA Threshold Recipients ID on page 1293
/AlertRecipients/CAThresholdRecipients/{id}	DELETE	Delete the CA threshold recipient with the specified Keyfactor Command reference ID.	DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID on page 1290

3.6.8.1 DELETE Certificate Authority ID

The DELETE /CertificateAuthority/{id} endpoint is used to delete the certificate authority record with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Note: A CA that has active records associated with it (e.g. certificates, certificate requests) cannot be deleted from Keyfactor Command.

Table 261: DELETE Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority record to delete.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.8.2 GET Certificate Authority ID

The POST /CertificateAuthority method is used to retrieve details for a specified certificate authority. This method returns HTTP 200 OK on a success with the details for the certificate authority.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 262: GET Certificate Authority {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command ID of the certificate authority record to retrieve.

Table 263: GET Certificate Authority {id} Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 5px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 5px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a8d9f9; padding: 5px; border-radius: 5px;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	<p>A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i>, a value must be provided for the <i>Agent</i>. The default is <i>false</i>.</p>
Agent	<p>A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).</p>
Standalone	<p>A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i>.</p>
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c9e6; padding: 10px; border-radius: 10px;">  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more information. </div>
IssuanceMax	<p>An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.</p>

Name	Description
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	This is considered deprecated and may be removed in a future release.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div data-bbox="565 1024 1406 1192" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div data-bbox="613 1423 1406 1478" style="background-color: #e0e0e0; padding: 5px; border-radius: 10px; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	Description										
	<table border="1" data-bbox="570 279 1403 527"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p data-bbox="561 562 889 590">This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p data-bbox="561 625 1377 684">An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1" data-bbox="570 709 1403 1024"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p data-bbox="561 1062 1146 1089">Values of 2 and 3 require setting <i>KeyRetentionDays</i>.</p> <p data-bbox="561 1102 889 1129">This value is unset by default.</p> <div data-bbox="570 1157 1403 1451" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p data-bbox="578 1167 1393 1430"> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	<p data-bbox="561 1486 1406 1581">An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	<p data-bbox="561 1612 1390 1776">A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The</p>										

Name	Description
	<p>default is <i>false</i>.</p> <div data-bbox="565 327 1406 596" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="565 747 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="565 1066 1406 1482" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="565 1507 1406 1703" style="background-color: #e1bee7; padding: 10px; border-radius: 10px;"> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication</p>

Name	Description
	<p>along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="565 737 1406 1205" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="565 1234 1406 1499" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 381 and see PUT Templates on page 2435).</p> </div>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="565 1654 1406 1745" style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> <pre>"AllowedRequesters": ["Power Users",</pre> </div>

Name	Description				
	<div data-bbox="565 275 1403 380" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p>"Read Only"]</p> </div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1499 1403 1633" style="margin-left: 20px;"> <thead> <tr> <th data-bbox="571 1507 688 1570">Name</th> <th data-bbox="688 1507 1396 1570">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1570 688 1625">Off</td> <td data-bbox="688 1570 1396 1625">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.
Name	Description				
Off	Turn off a previously configured schedule.				

Name	Description								
	<table border="1"> <thead> <tr> <th data-bbox="565 275 690 336">Name</th> <th data-bbox="690 275 1398 336">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="565 336 690 499">Interval</td> <td data-bbox="690 336 1398 499">A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												

Name	Description										
	<p> common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>										
IncrementalScan	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1077 1403 1705"> <thead> <tr> <th data-bbox="565 1077 690 1142">Name</th> <th data-bbox="690 1077 1403 1142">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="565 1142 690 1207">Off</td> <td data-bbox="690 1142 1403 1207">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="565 1207 690 1705">Interval</td> <td data-bbox="690 1207 1403 1705"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
AllowOneClickRenewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).</p>										
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>).</p>										

Name	Description
	The default is <i>false</i> . This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.3 GET Certificate Authority

The GET /CertificateAuthority method is used to retrieve a list of certificate authorities defined in Keyfactor Command. This method returns HTTP 200 OK on a success with details for all the defined certificate authorities.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 264: GET Certificate Authority Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 265: GET Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 5px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 5px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 5px; border-radius: 5px;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	<p>A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i>, a value must be provided for the <i>Agent</i>. The default is <i>false</i>.</p>
Agent	<p>A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).</p>
Standalone	<p>A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i>.</p>
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c9e6; padding: 10px; border-radius: 10px;">  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more information. </div>
IssuanceMax	<p>An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.</p>

Name	Description
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	This is considered deprecated and may be removed in a future release.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div data-bbox="565 1024 1404 1192" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div data-bbox="613 1423 1404 1476" style="background-color: #e0e0e0; padding: 5px; border-radius: 5px; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="border: 1px solid green; padding: 5px; background-color: #e0f2f1;"> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The</p>										

Name	Description
	<p>default is <i>false</i>.</p> <div data-bbox="565 327 1406 596" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="565 747 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="565 1066 1406 1482" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="565 1507 1406 1703" style="background-color: #e1bee7; padding: 10px; border-radius: 10px;"> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication</p>

Name	Description
	<p>along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="565 737 1406 1205" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="565 1230 1406 1497" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 381 and see PUT Templates on page 2435).</p> </div>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="565 1654 1406 1738" style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> <pre>"AllowedRequesters": ["Power Users",</pre> </div>

Name	Description				
	<div data-bbox="565 275 1403 380" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p>"Read Only"]</p> </div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1499 1403 1633" style="margin-left: 20px;"> <thead> <tr> <th data-bbox="571 1507 688 1570">Name</th> <th data-bbox="688 1507 1396 1570">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1570 688 1625">Off</td> <td data-bbox="688 1570 1396 1625">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.

Name	Description										
	<p> common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>										
IncrementalScan	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1077 1398 1703"> <thead> <tr> <th data-bbox="571 1085 688 1140">Name</th> <th data-bbox="688 1085 1391 1140">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1140 688 1203">Off</td> <td data-bbox="688 1140 1391 1203">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="571 1203 688 1694">Interval</td> <td data-bbox="688 1203 1391 1694"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
AllowOneClickRenewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).</p>										
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>).</p>										

Name	Description
	<p>The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.4 POST Certificate Authority

The POST /CertificateAuthority method is used to create a new certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 266: POST Certificate Authority Input Parameters

Name	In	Description
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true.</p> </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true.</p> </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a0c4ff; padding: 10px; border-radius: 5px;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>
ConfigurationTenant	Body	<p>Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com). For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server</p>

Name	In	Description
		<p>makes a good reference ID.</p> <div style="border: 1px solid orange; background-color: #ffe0b2; padding: 10px; border-radius: 10px;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="border: 1px solid blue; background-color: #e0f0ff; padding: 10px; border-radius: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more information.</p> </div>
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are

Name	In	Description
		issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	Body	This is considered deprecated and may be removed in a future release.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	Body	<p>Required. A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; margin-top: 5px; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	Body	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	In	Description										
		<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment

2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="border: 1px solid green; padding: 5px; background-color: #e0f2f1;"> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.										
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that										

Name	In	Description
		<p>do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (true) or not (false). The default is <i>false</i>.</p> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured,</p>

Name	In	Description
		 enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>. Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certi-</p>

Name	In	Description
		 Certificate Template Operations on page 381 and see PUT Templates on page 2435).
AllowedRequesters	Body	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="641 531 1403 688">"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>
FullScan	Body	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that</p>

Name	In	Description																
		<p>were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="630 369 1398 470"> <thead> <tr> <th data-bbox="630 369 745 470">Name</th> <th data-bbox="745 369 1398 470">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 470 745 533">Off</td> <td data-bbox="745 470 1398 533">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="630 533 745 1108">Interval</td> <td data-bbox="745 533 1398 1108"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 		<p data-bbox="646 289 1404 338">  this endpoint. </p> <p data-bbox="630 363 773 390">For example:</p> <pre data-bbox="646 422 1404 611"> "FullScan": { "Daily": { "Time": "2022-05-27T17:30:00Z" } } </pre> <p data-bbox="630 642 667 669">Or:</p> <pre data-bbox="646 695 1404 1020"> "FullScan": { "Weekly": { "Days": ["Monday", "Wednesday", "Friday"], "Time": "2022-05-27T17:30:00Z" } } </pre> <p data-bbox="646 1062 1404 1745">  Tip: There are two types of synchronization schedules available for CAs—Full and Incremental. You do not necessarily need to configure both types. A full scan reads all the certificates and certificate requests in the CA database and synchronizes them to Keyfactor Command regardless of their current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA. </p>

Name	Description											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).											
CAType	Body	<p>An integer indicating the type of CA:</p> <ul style="list-style-type: none"> 0—DCOM 1—HTTPS 										
AuthCertificatePassword	Body	<p>An object indicating the password for the certificate to use to authenticate to the EJBCA CA.</p> <p>Supported methods to store certificate and associated password information are:</p> <ul style="list-style-type: none"> Store the credential information in the Keyfactor secrets table. 										

Name	In	Description								
		<p>A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database.</p> <ul style="list-style-type: none"> Load the credential information from a PAM provider. <p>See Privileged Access Management (PAM) on page 742 and PAM Providers on page 1871 for more information.</p> <table border="1" data-bbox="630 506 1398 1066"> <thead> <tr> <th data-bbox="636 514 857 577">Value</th> <th data-bbox="857 514 1391 577">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="636 577 857 705">SecretValue</td> <td data-bbox="857 577 1391 705">A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td data-bbox="636 705 857 833">Parameters</td> <td data-bbox="857 705 1391 833">An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td data-bbox="636 833 857 1058">Provider</td> <td data-bbox="857 833 1391 1058"> A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID. </td> </tr> </tbody> </table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre data-bbox="630 1163 1398 1297">{ "SecretValue": "MySuperSecretPassword" }</pre> <p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898 and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre data-bbox="630 1486 1398 1730">{ "Provider": "1", "Parameters":{ "Folder": "MyFolderName", "Object": "MyEJBCAClientAuthPassword" } }</pre>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1898 and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre data-bbox="630 432 1403 653"> { "Provider": "1", "Parameters": { "SecretId": "MyEJBAPasswordId" } } </pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i> with the <i>SecretValue</i>. The <i>SecretValue</i> is set to a string containing the base-64-encoded representation of the certificate with private key (in PKCS#12 format) that will be used to authenticate to the EJBCA CA. For example:</p> <pre data-bbox="630 1073 1403 1234"> { "SecretValue": "MIACAQMwgAYJKoZIhvcNAQcBoIAKgASCA+[truncated for display]gQUwRndGMbmIkmwIOuC0MbOY1EyDpACAwGQAAAA" } </pre> <p>Due to its sensitive nature, this value is not returned in this format in responses.</p>
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>

Name	In	Description
AllowOneClickRenewals	Body	A Boolean that sets whether the CA will allow (true) <i>One-Click Renewal</i> on certificates in this CA or not (false). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).
NewEndEntityOnRenewAndReissue	Body	A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (true) or attempt to associate the new certificate with the existing end entity (false). The default is <i>false</i> . This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.
LastScan	Body	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

Table 267: POST Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 10px; border-radius: 5px;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	<p>A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i>, a value must be provided for the <i>Agent</i>. The default is <i>false</i>.</p>
Agent	<p>A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).</p>
Standalone	<p>A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i>.</p>
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c9e6; padding: 10px; border-radius: 10px;">  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more information. </div>
IssuanceMax	<p>An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.</p>

Name	Description
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	This is considered deprecated and may be removed in a future release.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="background-color: #e0e0e0; padding: 5px; border-radius: 5px; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	Description										
	<table border="1" data-bbox="565 275 1391 527"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p data-bbox="565 562 889 590">This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p data-bbox="565 625 1377 688">An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1" data-bbox="565 709 1391 1024"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p data-bbox="565 1060 1149 1129">Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div data-bbox="565 1157 1403 1451" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p data-bbox="574 1171 1393 1430"> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	<p data-bbox="565 1486 1403 1577">An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	<p data-bbox="565 1612 1386 1780">A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The</p>										

Name	Description
	<p>default is <i>false</i>.</p> <div data-bbox="565 327 1406 596" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="565 747 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="565 1066 1406 1482" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="565 1507 1406 1703" style="background-color: #e1bee7; padding: 10px; border-radius: 10px;"> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication</p>

Name	Description
	<p>along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="565 737 1406 1205" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="565 1234 1406 1499" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 381 and see PUT Templates on page 2435).</p> </div>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="565 1654 1406 1745" style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> <pre>"AllowedRequesters": ["Power Users",</pre> </div>

Name	Description				
	<div data-bbox="565 275 1406 380" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p>"Read Only"]</p> </div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1499 1406 1633" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="571 1507 688 1570">Name</th> <th data-bbox="688 1507 1399 1570">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1570 688 1633">Off</td> <td data-bbox="688 1570 1399 1633">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.

Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												

Name	Description										
	<p> common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>										
IncrementalScan	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1077 1398 1703"> <thead> <tr> <th data-bbox="571 1085 688 1140">Name</th> <th data-bbox="688 1085 1391 1140">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1140 688 1203">Off</td> <td data-bbox="688 1140 1391 1203">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="571 1203 688 1694">Interval</td> <td data-bbox="688 1203 1391 1694"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
AllowOneClickRenewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).</p>										
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>).</p>										

Name	Description
	<p>The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.5 PUT Certificate Authority

The PUT /CertificateAuthority method is used to update a certificate authority record in Keyfactor Command. This method returns HTTP 200 OK on a success with details for the CA configuration.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 268: PUT Certificate Authority Input Parameters

Name	In	Description
Id	Body	Required. An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
Delegate	Body	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true.</p> </div>
DelegateEnrollment	Body	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;"> <p> Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true.</p> </div>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e9; padding: 10px; border-radius: 5px;"> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p> </div>

Name	In	Description
ConfigurationTenant	Body	<p>Required. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com). For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain.</p> </div>
Remote	Body	A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i> , a value must be provided for the <i>Agent</i> . The default is <i>false</i> .
Agent	Body	A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).
Standalone	Body	A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i> .
MonitorThresholds	Body	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator.</p> <p>The default is <i>false</i>.</p> <p>See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c8e8; padding: 10px; border-radius: 10px;"> <p> Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more inform-</p> </div>

Name	In	Description
		 ation.
IssuanceMax	Body	An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
IssuanceMin	Body	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	Body	This is considered deprecated and may be removed in a future release.
FailureMax	Body	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	Body	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	Body	Required. A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:

Name	In	Description										
		{\"syncExternal\":true} OR {\"syncExternal\":false}										
AllowedEnrollmentTypes	Body	<p>An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description											
1	PFX Enrollment											
2	CSR Enrollment											
3	PFX and CSR Enrollment											
KeyRetention	Body	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="border: 1px solid green; padding: 10px; background-color: #e8f5e9;"> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description											
0	Key Retention Disabled											
1	Indefinite											
2	After Expiration											
3	From Issuance											
KeyRetentionDays	Body	An integer indicating the number of days for which to retain the										

Name	In	Description
	y	private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.
ExplicitCredentials	Body	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i>.</p> <div data-bbox="634 590 1404 856" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	Body	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="634 1010 1404 1142" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>
ExplicitUser	Body	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="634 1360 1404 1766" style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see</p> </div>

Name	In	Description
		<p> Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p>
ExplicitPassword	Body	<p>An object indicating the password information to use for authentication along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>. Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	Body	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> <p> Tip: For CAs in a two-way trust you don't usually need to</p>

Name	In	Description
		 enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 381 and see PUT Templates on page 2435).
AllowedRequesters	Body	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <pre data-bbox="641 695 1404 856">"AllowedRequesters": ["Power Users", "Read Only"]</pre> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>
FullScan	Body	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal</p>

Name	In	Description																
		<p>schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="630 569 1398 1675"> <thead> <tr> <th data-bbox="636 577 743 667">Name</th> <th data-bbox="743 577 1391 667">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="636 667 743 737">Off</td> <td data-bbox="743 667 1391 737">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="636 737 743 1312">Interval</td> <td data-bbox="743 737 1391 1312"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1" data-bbox="769 905 1372 1073"> <thead> <tr> <th data-bbox="776 913 938 968">Name</th> <th data-bbox="938 913 1365 968">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="776 968 938 1066">Minutes</td> <td data-bbox="938 968 1365 1066">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre data-bbox="769 1157 1372 1297">"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td data-bbox="636 1312 743 1667">Daily</td> <td data-bbox="743 1312 1391 1667"> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1" data-bbox="769 1415 1372 1654"> <thead> <tr> <th data-bbox="776 1423 938 1478">Name</th> <th data-bbox="938 1423 1365 1478">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="776 1478 938 1646">Time</td> <td data-bbox="938 1478 1365 1646">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").		
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").									

Name	In	Description

Name	In	Description						
		<p> current state in Keyfactor Command. An incremental scan reads the certificates and certificate requests in the CA database that have been generated since the last full or incremental scan and synchronizes them to Keyfactor Command. A common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>						
IncrementalScan	Body	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="630 1276 1398 1703"> <thead> <tr> <th data-bbox="630 1276 743 1381">Name</th> <th data-bbox="743 1276 1398 1381">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="630 1381 743 1444">Off</td> <td data-bbox="743 1381 1398 1444">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="630 1444 743 1703">Interval</td> <td data-bbox="743 1444 1398 1703">A dictionary that indicates a job scheduled to run every</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	A dictionary that indicates a job scheduled to run every

Name	Description					
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).					

 **Note:** Although the Keyfactor API Reference and Utility–Swagger–*Example Value* may show examples of various other schedules, only the schedules shown here—that are available

Name	In	Description								
		 in the Management Portal for this functionality—are valid for this endpoint.								
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> • 0—DCOM • 1—HTTPS 								
AuthCertificatePassword	Body	An object indicating the password for the certificate to use to authenticate to the EJBCA CA. Supported methods to store certificate and associated password information are: <ul style="list-style-type: none"> • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 742 and PAM Providers on page 1871 for more information. <table border="1" data-bbox="630 961 1404 1528"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password used to security the EJBCA CA client authentication certificate.</td> </tr> <tr> <td>Parameters</td> <td>An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.</td> </tr> <tr> <td>Provider</td> <td>A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID.</td> </tr> </tbody> </table> <p>For example, the password stored as a Keyfactor secret will look like:</p> <pre data-bbox="630 1621 1404 1753"> { "SecretValue": "MySuperSecretPassword" } </pre>	Value	Description	SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.	Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.	Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID.
Value	Description									
SecretValue	A string containing the password used to security the EJBCA CA client authentication certificate.									
Parameters	An object indicating the parameters to supply for PAM authentication. These will vary depending on the PAM provider.									
Provider	A string indicating the ID of the PAM provider. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of all the PAM providers to determine the ID.									

Name	In	Description
		<p>The password stored as a CyberArk PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1898 and the Folder and Object reference the folder name and object name in the CyberArk safe):</p> <pre data-bbox="634 436 1403 674"> { "Provider": "1", "Parameters":{ "Folder": "MyFolderName", "Object": "MyEJBClientAuthPassword" } } </pre> <p>The password stored as a Delinea PAM secret will look like (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1898 and the SecretId is the ID if the secret created in the Delinea secret server for this purpose):</p> <pre data-bbox="634 867 1403 1083"> { "Provider": "1", "Parameters":{ "SecretId": "MyEJBPasswordId" } } </pre> <p>Due to its sensitive nature, this value is not returned in responses.</p>
AuthCertificate	Body	<p>An object containing information about the client certificate used to provide authentication to the EJBCA CA. This certificate is used to authenticate to the EJBCA database for synchronization, enrollment and management of certificates.</p> <p>The syntax is the same as for <i>AuthCertificatePassword</i> with the <i>SecretValue</i>. The <i>SecretValue</i> is set to a string containing the base-64-encoded representation of the certificate with private key (in PKCS#12 format) that will be used to authenticate to the EJBCA CA. For example:</p> <pre data-bbox="634 1507 1403 1671"> { "SecretValue": "MIACAQMwgAYJKoZIhvcNAQcBoIAkgASCA+[truncated for display]gQUwRndGMbm1kmwIOuC0MbOY1EyDpACAwGQAAAA" } </pre> <p>Due to its sensitive nature, this value is not returned in this format in responses.</p>

Name	In	Description
EnforceUniqueDN	Body	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DNs that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>
AllowOneClickRenewals	Body	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).</p>
NewEndEntityOnRenewAndReissue	Body	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>). The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	Body	<p>A string indicating the date, in UTC, on which a synchronization was last performed for the CA.</p>

Table 269: PUT Certificate Authority Response Data

Name	Description
Id	An integer indicating the Keyfactor Command identifier for the certificate authority. The ID is automatically assigned by Keyfactor Command.
LogicalName	A string indicating the logical name of the certificate authority.
HostName	A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://myca.keyexample.com).
Delegate	<p>A Boolean that sets whether management interactions with the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, these interactions are done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
DelegateEnrollment	<p>A Boolean that sets whether enrollment to the certificate authority via Keyfactor Command should be done in the context of the user making the request (<i>true</i>). If set to <i>false</i>, enrollment is done in the context of the service account under which the Keyfactor Command application pool is running unless <i>ExplicitCredentials</i> is true.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 5px;">  Important: Delegation is only supported with Microsoft CAs and has limitations. Be sure to read more about delegation in Adding or Modifying a CA Record on page 354 before setting this option to true. </div>
ForestRoot	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <div style="background-color: #a9c9e8; padding: 10px; border-radius: 5px;">  Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field. </div>
ConfigurationTenant	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>For EJBCA CAs, this is a reference ID and does not need to be the DNS domain name. The short hostname of the EJBCA CA server makes a good reference ID.</p>

Name	Description
	<div style="background-color: #f9a825; padding: 10px; border-radius: 10px;">  Important: EJBCA and Microsoft CAs cannot be configured with the same <i>Configuration Tenant</i>, so do not set this to the DNS domain name for an EJBCA CA if you will also be configuring Microsoft CAs in the same DNS domain. </div>
Remote	<p>A Boolean that sets whether communications with the certificate authority are done via a Keyfactor Universal Orchestrator configured to manage remote CAs. If set to <i>true</i>, a value must be provided for the <i>Agent</i>. The default is <i>false</i>.</p>
Agent	<p>A string indicating the GUID of the Keyfactor Universal Orchestrator configured to manage the certificate authority (see <i>Remote</i>).</p>
Standalone	<p>A Boolean that sets whether the certificate authority is a standalone CA (<i>true</i>) or not (<i>false</i>). If both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3, <i>KeyRetention</i> may be set. The default is <i>false</i>.</p>
MonitorThresholds	<p>A Boolean that sets whether threshold monitoring is enabled. If set to <i>true</i>, email alerts will be sent when certificate issuance or failures (including denials) since the last threshold alert was sent falls outside the configured limits. If this option is set to <i>true</i>, the following additional fields should also be set:</p> <ul style="list-style-type: none"> • IssuanceMax • IssuanceMin • FailureMax <p>The DenialMax field has been deprecated and should always be zero. Monitoring is not supported for CAs accessed with the Keyfactor Universal Orchestrator. The default is <i>false</i>. See also <i>ThresholdCheck</i> to configure the monitoring frequency.</p> <div style="background-color: #a8c8e8; padding: 10px; border-radius: 10px;">  Note: For full functionality of threshold monitoring, you must also configure email recipients for threshold alerts. These are configured globally rather than on a CA-by-CA basis. See Certificate Authority Monitoring on page 378 for more information. </div>
IssuanceMax	<p>An integer that sets the maximum number of certificates that can be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.</p>

Name	Description
IssuanceMin	An integer that sets the minimum number of certificates that should be issued in the period between scheduled threshold monitoring alert emails before an alert is triggered. If fewer certificates than this are issued in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
DenialMax	This is considered deprecated and may be removed in a future release.
FailureMax	An integer that sets the maximum number of certificate requests that can fail or be denied in the period between scheduled threshold monitoring alert emails before an alert is triggered. If more certificate requests than this fail in the period, a notification will be included in the threshold monitoring email. This value is unset by default.
RFCEnforcement	<p>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set.</p> <p>The default is <i>false</i>.</p> <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; background-color: #e8f5e9;"> <p> Tip: The <i>RFCEnforcement</i> option at the CA level is used only for standalone CAs. RFC enforcement for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435).</p> </div>
Properties	<p>A string indicating additional properties about the certificate authority. This field is used to store the configuration for the <i>Sync External Certificates</i> option. This option allows foreign certificates that have been imported into a Microsoft CA to be synchronized to Keyfactor Command along with the certificates issued by the Microsoft CA. The setting is referenced using the following format:</p> <div style="border: 1px solid #ccc; border-radius: 10px; padding: 5px; background-color: #f0f0f0; text-align: center;"> <pre>{\"syncExternal\":true} OR {\"syncExternal\":false}</pre> </div>
AllowedEnrollmentTypes	An integer that sets the type(s) of enrollment that are allowed through Keyfactor Command for the certificate authority. Possible values are:

Name	Description										
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>PFX Enrollment</td> </tr> <tr> <td>2</td> <td>CSR Enrollment</td> </tr> <tr> <td>3</td> <td>PFX and CSR Enrollment</td> </tr> </tbody> </table> <p>This value is unset by default.</p>	Value	Description	1	PFX Enrollment	2	CSR Enrollment	3	PFX and CSR Enrollment		
Value	Description										
1	PFX Enrollment										
2	CSR Enrollment										
3	PFX and CSR Enrollment										
KeyRetention	<p>An integer that sets the type of key retention to enable for the certificate authority, if any. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Key Retention Disabled</td> </tr> <tr> <td>1</td> <td>Indefinite</td> </tr> <tr> <td>2</td> <td>After Expiration</td> </tr> <tr> <td>3</td> <td>From Issuance</td> </tr> </tbody> </table> <p>Values of 2 and 3 require setting <i>KeyRetentionDays</i>. This value is unset by default.</p> <div style="border: 1px solid green; padding: 5px; background-color: #e0f2f1;"> <p> Tip: The <i>KeyRetention</i> option at the CA level is used only for standalone CAs. Key retention for enterprise CAs is configured on a template-by-template basis (see PUT Templates on page 2435). <i>KeyRetention</i> on a CA may only be set to a value other than zero if both <i>Standalone</i> is set to <i>true</i> and <i>AllowedEnrollmentTypes</i> is set to 1 or 3. Some level of private key retention must be configured when using PFX enrollment with a standalone CA. See Adding or Modifying a CA Record on page 354 for more information.</p> </div>	Value	Description	0	Key Retention Disabled	1	Indefinite	2	After Expiration	3	From Issuance
Value	Description										
0	Key Retention Disabled										
1	Indefinite										
2	After Expiration										
3	From Issuance										
KeyRetentionDays	<p>An integer indicating the number of days for which to retain the private keys for certificates issued by this certificate authority before scheduling them for deletion. This value is unset by default.</p>										
ExplicitCredentials	<p>A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The</p>										

Name	Description
	<p>default is <i>false</i>.</p> <div data-bbox="565 327 1406 596" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
SubscriberTerms	<p>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>). The default is <i>false</i>.</p> <div data-bbox="565 747 1406 877" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. See Application Settings: Enrollment Tab on page 609 for more information.</p> </div>
ExplicitUser	<p>A string indicating the username, in the format DOMAIN\username, for a service account user in the forest in which the Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="565 1066 1406 1478" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="565 1507 1406 1703" style="background-color: #e1bee7; padding: 10px; border-radius: 10px;"> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
ExplicitPassword	<p>An object indicating the password information to use for authentication</p>

Name	Description
	<p>along with the <i>ExplicitUser</i> if <i>ExplicitCredentials</i> is <i>True</i>.</p> <p>Supported methods to store secret information are:</p> <ul style="list-style-type: none"> • Store the secret information in the Keyfactor secrets table. A Keyfactor secret is a user-defined username or password that is encrypted and stored securely in the Keyfactor Command database. • Load the secret information from a PAM provider. See Privileged Access Management (PAM) on page 742 for more information. <p>Due to its sensitive nature, this value is not returned in responses.</p>
UseAllowedRequesters	<p>A Boolean that sets whether the allowed requesters option is enabled (<i>true</i>) or not (<i>false</i>). See also <i>AllowedRequesters</i>. The default is <i>false</i>.</p> <div data-bbox="565 737 1406 1205" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This option is supported for all CAs, but it must be used for Microsoft CAs where integrated authentication is not supported and EJBCA CAs. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting request certificates for the selected security roles at the CA level on a Microsoft CA.</p> </div> <div data-bbox="565 1234 1406 1499" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: For CAs in a two-way trust you don't usually need to enable <i>UseAllowedRequesters</i> on the CA, though this may be required in some circumstances depending on the security configuration in the environment. However, templates for a two-way trust environment always require configuration of this option at a template level to support enrollment (see Certificate Template Operations on page 381 and see PUT Templates on page 2435).</p> </div>
AllowedRequesters	<p>An array of strings indicating Keyfactor Command security roles that are allowed to enroll for certificates via Keyfactor Command for this CA. For example:</p> <div data-bbox="565 1654 1406 1745" style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> <pre>"AllowedRequesters": ["Power Users",</pre> </div>

Name	Description				
	<div data-bbox="565 275 1404 380" style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p>"Read Only"]</p> </div> <p>The allowed requesters option is used to select Keyfactor Command security roles that a user must belong to in order to successfully enroll for certificates in Keyfactor Command via this CA.</p> <p>This is used for EJBCA CAs and Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest. Since Keyfactor Command cannot make use of the access control model of the CA itself to determine which users can enroll for certificates at either a template or CA level without using integrated authentication, this setting replaces that functionality. This setting is similar to setting <i>request certificates</i> for the selected security roles at the CA level on a Microsoft CA.</p> <p>In addition to granting permissions at the CA level, you need to enable the <i>UseAllowedRequesters</i> option to grant permissions on a template-by-template basis (see PUT Templates on page 2435).</p> <p>The values set here are only considered if <i>UseAllowedRequesters</i> is set to <i>true</i>.</p>				
FullScan	<p>An object indicating the schedule for the full synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1501 1404 1627" style="margin-top: 10px;"> <thead> <tr> <th data-bbox="571 1509 690 1572">Name</th> <th data-bbox="690 1509 1398 1572">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1572 690 1627">Off</td> <td data-bbox="690 1572 1398 1627">Turn off a previously configured schedule.</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.

Days	An array of values representing the days of the week on which to run the job. These can either be entered as integers (0 for Sunday, 1 for Monday, etc.) or as days of the week (e.g. "Sunday").												

Name	Description										
	<p> common configuration would be a full scan once or twice a week to provide a clean image of the CA database with a frequent incremental scan to provide timely updates to Keyfactor Command. For a large CA database, a full scan can take a long time to complete. Since an incremental scan only synchronizes updates that have occurred to the CA database since the last synchronization was run, this process is generally quick (other than for the initial synchronization when Keyfactor Command is first installed). The frequency of the incremental scans would depend on the volume of certificate requests coming into the CA.</p>										
IncrementalScan	<p>An object indicating the schedule for the incremental synchronization of this certificate authority.</p> <p>Prior to Command v11, it was possible to create a Keyfactor schedule via the API that was impossible to display via the Management Portal schedule picker. For example, an interval that is not on the interval dropdown (e.g., every 107 minutes). Now, the API will also not allow interval values to be saved that cannot be represented in the Management Portal. Previously saved schedules that don't meet these restrictions can still be parsed and used, but not edited and re-saved, as a result errors may be encountered on re-saving invalid schedules that were created via the API.</p> <p>The following schedule types are supported:</p> <table border="1" data-bbox="565 1077 1398 1703"> <thead> <tr> <th data-bbox="571 1085 688 1140">Name</th> <th data-bbox="688 1085 1391 1140">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="571 1140 688 1203">Off</td> <td data-bbox="688 1140 1391 1203">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="571 1203 688 1694">Interval</td> <td data-bbox="688 1203 1391 1694"> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>	IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.	Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.	ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.
Value	Description										
IssuedDN	A string indicating the distinguished name of the client certificate used to authenticate to the EJBCA CA in X.500 format. For example: <pre> "IssuedDN": "CN=SuperAdmin,OU=IT,O="\Key Example, Inc.\",L=Independence,ST=OH,C=US" </pre>										
IssuerDN	A string indicating the distinguished name of the EJBCA CA in X.500 format.										
Thumbprint	A string indicating the thumbprint of the client certificate used to authenticate to the EJBCA CA.										
ExpirationDate	A string indicating the expiration date of the client certificate used to authenticate to the EJBCA CA.										
EnforceUniqueDN	<p>A Boolean that sets whether the unique DN requirement is enforced on the CA (<i>true</i>) or not (<i>false</i>).</p> <p>Checking this will cause Keyfactor Command, upon enrollment, to search the EJBCA CA for end entities with DN's that match the DN in the certificate request. If a matching DN is found, the process will update the existing end entity in EJBCA with the new certificate request information rather than creating a new end entity. If you enable this option in Keyfactor Command, it must also be enabled on the matching EJBCA CA. A mismatch in these settings can result in enrollment failures.</p> <p>This setting applies to HTTPS CAs only.</p>										
AllowOneClickRenewals	<p>A Boolean that sets whether the CA will allow (<i>true</i>) <i>One-Click Renewal</i> on certificates in this CA or not (<i>false</i>). If you wish to use <i>One-Click Renewal</i> for certificates, the Allow One-Click Renewals option must be enabled in both the templates and CAs to which you want <i>One-Click Renewal</i> to apply (see Certificate Template Operations on page 381 and Adding or Modifying a CA Record on page 354).</p>										
NewEndEntityOnRenewAndReissue	<p>A Boolean that sets whether a renewal and reissue requests against an EJBCA CA will create a new end entity for the new certificate (<i>true</i>) or attempt to associate the new certificate with the existing end entity (<i>false</i>).</p>										

Name	Description
	<p>The default is <i>false</i>.</p> <p>This value must be set to <i>true</i> for CA records created for the Keyfactor AnyCA Gateway REST to allow renewal and reissue enrollments to succeed.</p>
LastScan	A string indicating the date, in UTC, on which a synchronization was last performed for the CA.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.6 POST Certificate Authority Test

The POST `/CertificateAuthority/Test` method is used to validate that a connection can be made to the certificate authority with the provided information. This method returns HTTP 200 OK on a success with details for the success or failure of the CA validation.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/certificate_authorities/read/`

Table 270: POST Certificate Authority Test Input Parameters

Name	In	Description
id	Body	Required. An integer indicating the CA id in the Keyfactor database.
CAType	Body	An integer indicating the type of CA: <ul style="list-style-type: none"> • 0—DCOM Use this option for Microsoft CAs and CA gateways. • 1—HTTPS Use this option for EJBCA CAs. <p>The default is 0.</p>
ExplicitCredentials	Body	A Boolean that sets whether explicit credentials are enabled for this certificate authority (<i>true</i>) or not (<i>false</i>). Set this to <i>true</i> for CAs that do not support integrated authentication or are not configured for integrated authentication and enter credentials in the <i>ExplicitUser</i> and <i>ExplicitPassword</i> fields. This option is only supported for Microsoft CAs. The default is <i>false</i> . <div style="border: 1px solid #c8e6c9; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: This option is set to <i>true</i> primarily for Microsoft CAs where integrated authentication is not supported. Integrated authentication is generally supported for Microsoft CAs, Keyfactor CA gateways, or Keyfactor CA management gateways on servers joined to the local Active Directory forest in which Keyfactor Command is installed and any Active Directory forests in a two-way trust with this forest.</p> </div>
ExplicitPassword	Body	A string containing either <i>null</i> , or the password for the <i>ExplicitUser</i> , including: SecretValue, parameters, and provider if applicable. <div style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin-top: 10px;"> <pre>"ExplicitePassword": { "secretValue": "string", "parameters": { "additionalProp1": "string", "additionalProp2": "string", "additionalProp3": "string" }, "provider": 0 }</pre> </div>
ExplicitUser	Body	A string indicating the username, in the format DOMAIN\user-name, for a service account user in the forest in which the

Name	In	Description
		<p>Microsoft CA resides or, for non-domain-joined machines, local machine account credentials on the machine on which the CA is installed when <i>ExplicitCredentials</i> is set to <i>true</i>.</p> <div data-bbox="721 394 1406 911" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: This service account user needs appropriate permissions in the Microsoft CA security settings to accomplish the tasks you plan to carry out for this CA through Keyfactor Command. For example:</p> <ul style="list-style-type: none"> • Certificate enrollment • Certificate revocation • Certificate key recovery • Certificate request approval and denial <p>These tasks will be carried out on the CA in the context of the credentials you provide here. Access control for these tasks on CAs is controlled with Keyfactor Command security (see Security Roles and Claims on page 622) and the <i>AllowedRequesters</i> option.</p> </div> <div data-bbox="721 936 1406 1167" style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Note: When the <i>ExplicitCredentials</i> option is configured, enrollment and other tasks (e.g. revocation) is done in the context of the user configured here, not the user making the request in Keyfactor Command. This overrides the existing AD security policy used by Keyfactor Command.</p> </div>
AuthCertificate	Body	<p>Required*. An object indicating the PKCS#12 client certificate to use to authenticate to the CA using the following format. This certificate is used to authenticate to the CA database for synchronization, enrollment and management of certificates. The certificate is provided in the following format:</p> <div data-bbox="721 1394 1406 1749" style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> <pre> "AuthCertificate": { "secretValue": "string", "parameters": { "IssuedDN": "CN=superadmincert", "IssuerDN": "CN=CorpIssuingCA1, DC=keyexample, DC=com", "Thumbprint": "913D80B33517DD6F42428664883DA43BB64D0EEE", "ExpirationDate": "2025-07-17T18:24:23Z" }, "provider": 0 </pre> </div>

Name	In	Description
		This parameter is required for EJBCA CAs.
AuthCertificatePassword	Body	<p>Required*. An object containing password for the client certificate used to provide authentication to the CA.</p> <pre> "authCertificatePassword": { "secretValue": "string", "parameters": { "additionalProp1": "string", "additionalProp2": "string", "additionalProp3": "string" }, "provider": 0 </pre> <p>This parameter is required for EJBCA CAs.</p>
LogicalName	Body	Required. A string indicating the logical name of the certificate authority.
HostName	Body	Required. A string indicating the DNS hostname (for DCOM configurations) or URL (for HTTPS configurations) of the certificate authority (e.g. myca.keyexample.com or https://-myca.keyexample.com).
ConfigurationTenant	Body	<p>Required*. A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p>This parameter is required for Microsoft CAs.</p>
ForestRoot	Body	<p>A string indicating the forest root name or DNS domain name for the certificate authority (e.g. keyexample.com).</p> <p> Note: This field is retained for legacy purposes and will auto-populate with the value provided in the <i>ConfigurationTenant</i> field.</p>

Table 271: POST Certificate Authority Test Response Data

Name	Description
Success	A Boolean that indicates whether the CA could successfully be reached (True) or not (False).
Message	A string indicating a message about the validation test of the certificate authority.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.7 POST Certificate Authority PublishCRL

The POST /CertificateAuthority/PublishCRL method is used to publish a Certificate Revocation List from a specified Certificate Authority to its defined publication points. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/revoke/
OR

/certificates/collections/revoke/#!/ (where # is a reference to a specific certificate collectionPAM provider ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 272: POST Certificate Authority PublishCRL Input Parameters

Name	In	Description
CertificateAuthorityHostName	Body	The host name of the machine hosting the CA. This field is optional, but is recommended.
CertificateAuthorityLogicalName	Body	Required. The logical name of the CA.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.8 GET Certificate Authority Source Count

The GET /CertificateAuthority/SourceCount method is used to retrieve the count of certificate authorities with full or incremental synchronization scans configured. This method returns HTTP 200 OK on a success with a count. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 273: GET Certificate Authority Source Count Response Body

Name	Description
n/a	An integer indicating the number of CAs with with full or incremental synchronization scans configured in the Keyfactor Command database.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.9 GET Certificate Authority Available Forests

The GET /CertificateAuthority/AvailableForests method is used to retrieve the list of Active Directory forests that are available to Keyfactor Command (the current forest and any forests in a two-way trust with this forest). This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 274: GET Certificate Authority Available Forests Response Body

Name	Description
n/a	An array of strings containing the list of the available Active Directory forests.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.10 GET Certificate Authority Health Monitoring Schedule

The GET /CertificateAuthority/HealthMonitoring/Schedule method is used to retrieve the current schedule for the CA health monitoring job. This method returns HTTP 200 OK on a success with the list of schedule settings. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 275: GET Certificate Authority Health Monitoring Schedule Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the schedule.
Schedule	A string indicating the schedule for the health monitoring job. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).
ScheduleType	An integer indicating the type of schedule. Health monitoring schedules have type 10.
Enabled	A Boolean that indicates whether health monitoring is enabled (true) or not (false).
Name	A string indicating the Keyfactor Command reference name of the health monitoring job. This is the name that appears in log output for the job.
EntityId	An internally used Keyfactor Command field.
LastRun	A string indicating the last run time of the job in ISO 8601 UTC time format (e.g. 2023-05-19T16:23:01Z).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.11 GET Certificate Authority Alert Recipients CA Health Recipients

The GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method is used to retrieve the list of recipients configured in Keyfactor Command for CA health monitoring alerts. This method

returns HTTP 200 OK on a success with the list of CA health recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 276: GET Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.12 POST Certificate Authority Alert Recipients CA Health Recipients

The POST /CertificateAuthority/AlertRecipients/CAHealthRecipients method is used to create new recipients to receive CA health monitoring alerts in Keyfactor Command. This method returns HTTP 200 OK on a success with the details of the health monitoring recipients.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 277: POST Certificate Authority Alert Recipients CA Health Recipients Input Body

Name	In	Description
Emails	Body	<p>Required. An object containing a set of strings with the email address of each recipient. For example:</p> <pre>{ "Emails": ["Recipient1@keyexample.com", "Recipient3@keyexample.com"] }</pre>

Table 278: POST Certificate Authority Alert Recipients CA Health Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Note:** Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.13 GET Certificate Authority Alert Recipients CA Health Recipients ID

The GET `/CertificateAuthority/AlertRecipients/CAHealthRecipients/{id}` method is used to retrieve the CA health monitoring recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details for the recipient.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 279: GET Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to retrieve. Use the <code>GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</code> method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 1286) to retrieve the ID.

Table 280: GET Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.14 DELETE Certificate Authority Alert Recipients CA Health Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} endpoint is used to delete the CA health monitoring recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 281: DELETE Certificate Authority Alert Recipients CA Health Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority health monitoring recipient record to delete. Use the <i>GET /CertificateAuthority/AlertRecipients/CAHealthRecipients</i> method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 1286) to retrieve the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.15 PUT Certificate Authority Alert Recipients CA Health Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAHealthRecipients/{id} method is used to update the CA health monitoring alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 282: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Input Body

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the CA health monitoring recipient. Use the GET /CertificateAuthority/AlertRecipients/CAHealthRecipients method (see GET Certificate Authority Alert Recipients CA Health Recipients on page 1286) to retrieve the ID.
Email	Body	Required. A string indicating the updated email address of the recipient.

Table 283: PUT Certificate Authority Alert Recipients CA Health Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the new email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.16 DELETE Certificate Authority Alert Recipients CA Threshold Recipients ID

The DELETE /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} endpoint is used to delete the CA threshold recipient with the specified Keyfactor Command reference ID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

 /certificate_authorities/modify/

Table 284: DELETE Certificate Authority Alert Recipients CA Threshold Recipient {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the Keyfactor Command reference ID of the certificate authority threshold recipient record to delete. Use the GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients method (see GET Certificate Authority Alert Recipients CA Threshold Recipients below) to retrieve the ID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.17 GET Certificate Authority Alert Recipients CA Threshold Recipients

The GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients method is used to retrieve the list of recipients configured in Keyfactor Command for CA threshold alerts. This method returns HTTP 200 OK on a success with the list of threshold alert recipients. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 285: GET Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.8.18 GET Certificate Authority Alert Recipients CA Threshold Recipients ID

The GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} method is used to retrieve the CA threshold recipient configured in Keyfactor Command with the specified ID. This method returns HTTP 200 OK on a success with the details of the CA threshold recipient.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/read/

Table 286: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Parameters

Name	In	Description
id	Path	Required. An integer that specifies the reference ID of the certificate authority threshold recipient record to retrieve. Use the <i>GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients</i> method (see GET Certificate Authority Alert Recipients CA Threshold Recipients on the previous page) to retrieve the ID.

Table 287: GET Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the email address of the CA threshold recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.19 POST Certificate Authority Alert Recipients CA Threshold Recipients

The POST /CertificateAuthority/AlertRecipients/CAThresholdRecipients method is used to create new recipients to receive CA threshold alerts in Keyfactor Command This method returns HTTP 200 OK on a success with the details of the threshold recipients.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 288: POST Certificate Authority Alert Recipients CA Threshold Recipients Input Body

Name	In	Description
Emails	Body	<p>Required. An object containing a set of strings with the email address of each recipient. For example:</p> <pre> { "Emails": ["Recipient1@keyexample.com", "Recipient3@keyexample.com"] } </pre>

Table 289: POST Certificate Authority Alert Recipients CA Threshold Recipients Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the recipient.
Email	A string indicating the email address of the recipient.

 **Note:** Only recipients created with the POST request are returned in the response. Any pre-existing recipients are not included in the response.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.8.20 PUT Certificate Authority Alert Recipients CA Threshold Recipients ID

The PUT /CertificateAuthority/AlertRecipients/CAThresholdRecipients/{id} method is used to update the CA threshold alert recipient with the specified ID. This method returns HTTP 200 OK on a success with the details submitted.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 290: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Input Body

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the CA threshold recipient. Use the GET /CertificateAuthority/AlertRecipients/CAThresholdRecipients method (see GET Certificate Authority Alert Recipients CA Threshold Recipients on page 1291) to retrieve the ID.
Email	Body	Required. A string indicating the updated email address of the recipient.

Table 291: PUT Certificate Authority Alert Recipients CA Threshold Recipients {id} Response Body

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the CA threshold recipient.
Email	A string indicating the new email address of the CA threshold recipient.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.8.21 POST Certificate Authority Import

The POST /CertificateAuthority/Import method is used to import into Keyfactor Command any certificate authorities from the provided configuration tenant DNS suffix (e.g. keyexample.com). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_authorities/modify/

Table 292: POST Certificate Authority Import Input Parameters

Name	In	Description
dns	Query	Required. The DNS suffix of the configuration tenant to query for CAs to import. For example:

Name	In	Description
		<code>https://keyfactor.keyexample.com/KeyfactorAPI/CertificateAuthority/Import?dns=keyother.com</code>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.9 Certificate Collections

The Certificate Collections component of the Keyfactor API is used to create, edit, list, and set permissions on certificate collections.

Table 293: Certificate Collections Endpoints

Endpoint	Method	Description	Link
/	GET	Returns all certificate collections with details about the collection configuration.	GET Certificate Collections on the next page
/	POST	Creates a new certificate collection.	POST Certificate Collections on page 1299
/	PUT	Updates an existing certificate collection.	PUT Certificate Collections on page 1305
/ {id}	GET	Returns the certificate collection with the specified ID.	GET Certificate Collections ID on page 1309
/ {id}	DELETE	Deletes the certificate collection with the specified ID.	DELETE Certificate Collection ID on page 1311
/ {name}	GET	Returns the certificate collection with the specified name.	GET Certificate Collections Name on page 1311
/Copy	POST	Creates a new certificate collection	POST Certificate

Endpoint	Method	Description	Link
		based on an existing collection.	Collections Copy on page 1314
/NavItems	GET	Returns the list of <i>favorite</i> certificate collections (that have been set to <i>Show in Navigator</i>).	GET Certificate Collection Nav Items on page 1320
{id}/Favorite	PUT	Updates the <i>favorite</i> setting for the collection specified.	PUT Certificate Collection ID Favorite on page 1320
/CollectionList	GET	Returns information about the definitions for all collections, including the de-duplication setting.	GET Certificate Collections List on page 1321

3.6.9.1 GET Certificate Collections

The GET /CertificateCollections method is used to return a list of all certificate collections. This method returns HTTP 200 OK on a success with details about each defined certificate collection. This method allows URL parameters to specify paging and the level of information detail.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 294: GET Certificate Collections Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Name • Query • Favorite
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 295: GET Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.2 POST Certificate Collections

The POST /CertificateCollections method is used to create a new saved collection of certificates or update an existing collection. This method returns HTTP 200 OK on a success with details about the certificate collection.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/
/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 296: POST Certificate Collections Input Parameters

Name	In	Description												
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	<p>Required. A string containing the search criteria for the collection. For example:</p> <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> <p>See Certificate Search Page on page 34 for querying guidelines. See also <i>CopyFromId</i>.</p>												
DuplicationField	Body	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. The default is 0. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													

Name	In	Description
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p>Q Example: Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> { "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> </div> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p>

Name	In	Description
		<p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses <code>POST /CertificateCollections/Copy</code> (or <code>POST /CertificateCollections</code>—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre data-bbox="732 831 1393 1157"> { "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>In the response, Gina sees the following:</p> <pre data-bbox="732 1247 1393 1682"> { "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Notice that Gina has not achieved her desired goal. The</p>

Name	In	Description
		<p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre data-bbox="732 800 1398 1178"> { "Id": 16, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 297: POST Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.3 PUT Certificate Collections

The PUT /CertificateCollections method is used to update an existing saved collection of certificates. This method returns HTTP 200 OK on a success with details about the certificate collection.

Note: Certificate collections that are configured for *Certificate Entered Collection* or *Certificate Left Collection* workflows (see [Workflow Definition Operations on page 235](#)) cannot be edited. This is done to prevent triggering a large number of entered/left workflows.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

/certificates/collections/modify/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificates/collections/modify/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 298: PUT Certificate Collections Input Parameters

Name	In	Description						
ID	Body	Required. The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command. Use the GET /CertificateCollections method (see GET Certificate Collections on page 1296) to locate the ID of the collection you wish to update.						
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.						
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.						
Query	Body	<p>Required. A string containing the search criteria for the collection. For example:</p> <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> <p>See Certificate Search Page on page 34 for querying guidelines.</p>						
DuplicationField	Body	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. The default is 0. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name

Value	Description									
2	Distinguished Name									
3	Principal Name									
4	Keyfactor Renewal									
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .								
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .								

Table 299: PUT Certificate Collections Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.4 GET Certificate Collections ID

The GET /CertificateCollections/{id} method is used to retrieve details for a certificate collection with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 300: GET Certificate Collections {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the ID of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to retrieve a list of all the certificate collections to determine the certificate collection ID.

Table 301: GET Certificate Collections {id} Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.5 DELETE Certificate Collection ID

The DELETE /CertificateCollections/{id} method is used to delete the certificate collection with the specified ID from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/modify/
OR
/certificates/collections/modify/{#}/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 302: DELETE Certificate Collection {id} Input Parameters

Name	In	Description
id	Path	Required. An integer indicating the Keyfactor Command reference ID of the certificate collection to delete. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to retrieve a list of certificate collections to determine the collection ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.6 GET Certificate Collections Name

The GET /CertificateCollections/{name} method is used to retrieve details for a certificate collection with the specified name. This method returns HTTP 200 OK on a success with details for the certificate collection.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 303: GET Certificate Collections Name Input Parameters

Name	In	Description
name	Path	<p>Required. A string indicating the name of the certificate collection to retrieve. Use the <i>GET /CertificateCollections</i> method (see GET Certificates on page 1141) to retrieve a list of all the certificate collections to determine the certificate collection name.</p> <p> Tip: When using the Keyfactor API Reference and Utility, provide this name without quotation marks.</p>

Table 304: GET Certificate Collections ID Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Automated	An internally used Keyfactor Command field.												
Content	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.7 POST Certificate Collections Copy

The POST `/CertificateCollections/Copy` method is used to copy an existing saved collection of certificates in order to create a new collection. The permissions, query and description of the existing collection are copied to the new collection. Providing the *Query* or *Description* parameter in the request overrides the copied value and replaces it with the value provided in the request. This method returns HTTP 200 OK on a success with details about the new certificate collection.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/certificates/collections/read/`
`/certificates/collections/modify/`
OR

`/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)

`/certificates/collections/modify/#/` (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 305: POST Certificate Collections Copy Input Parameters

Name	In	Description												
Name	Body	Required. The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	Body	Required. The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name. See also <i>CopyFromId</i> .												
Query	Body	<p>Required. A string containing the search criteria for the collection. For example:</p> <pre>"Query": "(IssuedDate -ge \"%TODAY-7%\" AND TemplateShortName -ne NULL) OR (IssuedDate -ge \"%TODAY-7%\" AND IssuerDN -contains \"keyexample\")"</pre> <p>See Certificate Search Page on page 34 for querying guidelines. See also <i>CopyFromId</i>.</p>												
DuplicationField	Body	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. The default is 0. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description													
0	None													
1	Common Name													
2	Distinguished Name													
3	Principal Name													
4	Keyfactor Renewal													

Name	In	Description
ShowOnDashboard	Body	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false). The default is <i>false</i> .
Favorite	Body	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false). The default is <i>false</i> .
CopyFromId	Body	<p>An integer identifying an existing certificate collection from which to copy the query string.</p> <p>Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to locate the ID of the collection whose query you wish to copy.</p> <p>When you use this parameter, the permissions, query and description of the existing collection are copied to the new collection. Providing the <i>Query</i> or <i>Description</i> parameter in the request overrides the copied value and replaces it with the value provided in the request if the requesting user has global <i>Read</i> permissions for certificates. If the requesting user is granted <i>Read</i> permissions to the collection via collection-level security rather than global security, the <i>Query</i> the user provides will be appended to the existing query rather than overwriting it. See the below example.</p> <div style="background-color: #fff9c4; padding: 10px; border-radius: 10px;"> <p>Q Example: Gina wants to create a new collection using the <i>CopyFromId</i> option. She first uses <i>GET /CertificateCollections/{id}</i> to list the collection she plans to copy from and sees the following results:</p> <pre style="background-color: #e0e0e0; padding: 10px; border-radius: 10px;"> { "Id": 10, "Name": "Keyexample Collection", "Description": "Certificates in the Keyexample Domain", "Automated": false, "Content": "CN -contains \"keyexample.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true }</pre> </div> <p>Gina wants her new certificate collection to retain the same collection-level permissions as the <i>Keyexample Collection</i>. However, she wants the collection to report on a different domain name. The <i>Keyexample Collection</i> is configured to grant collection-level permissions of <i>Read</i>, <i>Edit Metadata</i>,</p>

Name	In	Description
		<p> and <i>Download with Private Key</i> to the <i>Power Users</i> role.</p> <p>At the Key Example company, users with the Power Users role do not have global certificate <i>Read</i> permissions because all certificate permissions are granted using certificate collection permissions. Only full Keyfactor Command administrators have global certificate <i>Read</i> permissions. Users with the Power Users role have <i>Modify</i> permissions for certificate collections to allow them to create new collections. This level of permissions is significant for what Gina wants to do. Gina holds the Power Users role and is not a full administrator.</p> <p>Gina uses <code>POST /CertificateCollections/Copy</code> (or <code>POST /CertificateCollections</code>—the behavior and output would be the same) to create a new certificate collection using the <i>CopyFromId</i> option with the following command:</p> <pre data-bbox="732 831 1395 1157"> { "CopyFromId": 10, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Query": "CN -contains \"keyother.com\"", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>In the response, Gina sees the following:</p> <pre data-bbox="732 1247 1395 1682"> { "Id": 15, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyexample.com\") AND (CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Notice that Gina has not achieved her desired goal. The</p>

Name	In	Description
		<p> new collection contains a query for both the keyexample.com domain and the keyother.com domain. Gina's new query was appended to the existing query rather than overwriting the existing query. This happened because Gina does not have global <i>Read</i> permissions for certificates and is done to prevent a user from increasing the scope of certificates they can view.</p> <p>Gina asks Martha, who is a full Keyfactor Command administrator and has the global <i>Read</i> permissions for certificates, to copy the collection for her. Martha first deletes the first Keyother Collection that Gina created and then runs the same command that Gina ran to create a new collection.</p> <p>In the response, Martha sees the following:</p> <pre data-bbox="732 800 1398 1178"> { "Id": 16, "Name": "Keyother Collection", "Description": "Certificates in the Keyother Domain", "Automated": false, "Content": "(CN -contains \"keyother.com\")", "Query": "(CN -contains \"keyother.com\")", "DuplicationField": 2, "ShowOnDashboard": false, "Favorite": true } </pre> <p>Notice that when Martha runs the command, Gina's goal is achieved.</p>

Table 306: POST Certificate Collections Copy Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Description	The description for the collection. This description appears at the top of the page in the Management Portal for this collection and can be more detailed than the collection name.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
Query	A string containing the search criteria for the collection.												
DuplicationField	<p>An integer that sets the type of de-duplication (a.k.a. ignore renewed certificate results by) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
ShowOnDashboard	A Boolean that sets whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
Favorite	A Boolean that sets whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.8 GET Certificate Collection Nav Items

The GET /CertificateCollection/NavItems method is used to return a list of the collections that have been set as favorites to *Show in Navigator*. This method returns HTTP 200 OK on a success with the collection names and IDs. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

Table 307: GET Certificate Collection Nav Items Response Data

Name	Description
Id	An integer indicating the Keyfactor Command reference ID of the certificate collection.
Name	A string indicating the name of the certificate collection.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.9 PUT Certificate Collection ID Favorite

The PUT /CertificateCollection/{id}/Favorite method is used to update the *Favorite / Show in Navigator* setting for a collection. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/modify/

OR
/certificates/collections/modify/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 308: PUT Certificate Collection{id} Favorite Input Body

Name	In	Description
id	Path	An integer indicating the Keyfactor Command reference ID of the certificate collection. Use the <i>GET /CertificateCollections</i> method (see GET Certificate Collections on page 1296) to retrieve a list of certificate collections to determine the collection ID.
ShowInNavigator	Body	A Boolean indicating whether the certificate collection should appear on the menu (true) or not(false). For example: <pre>{ "ShowInNavigator": true }</pre>

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.9.10 GET Certificate Collections List

The GET /CertificateCollections/CollectionList method is used to return the definitions for all certificate collections. This method returns HTTP 200 OK on a success with details for each certificate collection, including the de-duplication setting.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/collections/read/
OR
/certificates/collections/read/#!/ (where # is a reference to a specific certificate collection ID)

Permissions for certificates can be set at either the global or certificate collection level. See [Certificate Collection Permissions on page 627](#) for more information about global vs collection permissions.

Table 309: GET Certificate Collections List Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Collection Manager Search Feature on page 89 . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Name• Query
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 310: GET Certificate Collections List Response Data

Name	Description												
ID	The Keyfactor Command reference ID for the certificate collection. The ID is automatically assigned by Keyfactor Command.												
Name	The name for the certificate collection. This name appears at the top of the page in the Keyfactor Command Management Portal for this collection and can be configured to appear on the Management Portal menu under Certificate Collections. It will also appear in other places within the Management Portal where you can reference certificate collections (e.g. expiration alerts and certain reports). Because it can appear on the menu and in selection dropdowns, the name should be fairly short.												
Content	A string containing the search criteria for the collection. This field contains the same value as <i>Query</i> and is retained for backwards compatibility.												
DuplicationField	<p>A string indicating the type of de-duplication (a.k.a. <i>ignore renewed certificate results by</i>) to apply to the collection when using the collection in areas of Keyfactor Command that apply de-duplication (e.g. expiration alerts). For more information, see Saving Search Criteria as a Collection on page 42. Possible values are:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>None</td> </tr> <tr> <td>1</td> <td>Common Name</td> </tr> <tr> <td>2</td> <td>Distinguished Name</td> </tr> <tr> <td>3</td> <td>Principal Name</td> </tr> <tr> <td>4</td> <td>Keyfactor Renewal</td> </tr> </tbody> </table>	Value	Description	0	None	1	Common Name	2	Distinguished Name	3	Principal Name	4	Keyfactor Renewal
Value	Description												
0	None												
1	Common Name												
2	Distinguished Name												
3	Principal Name												
4	Keyfactor Renewal												
Favorite	A Boolean that indicates whether the collection appears on the Navigator—on the <i>Certificates</i> top-level menu dropdown—(true) or not (false).												
ShowOnDashboard	A Boolean that indicates whether the results from this collection are included on the Management Portal dashboard <i>Certificate Counts by Collection</i> graph (true) or not (false).												
HasQueryPermissions	A Boolean that indicates whether the user has query permissions (true) or not (false).												

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10 Certificate Stores

The CertificateStores component of the Keyfactor API (formerly known as the JKS API) provides a set of methods to support management of certificate locations.

Through different remote Keyfactor orchestrators, Keyfactor Command can inventory, install, and remove certificates for each of the store types. For certain store types, additional actions are supported as well. The CertificateStores component provides a way to programmatically schedule jobs for these stores. For more information about certificate stores and their support within Keyfactor Command, see the *Keyfactor Command Reference Guide* and *Keyfactor Command Orchestrator Installation and Configuration Guide*, or contact your Keyfactor representative. The set of methods in this API component that can be used to manage certificate stores and their scheduled jobs is listed in [Table 311: Certificate Stores Endpoints](#).

Table 311: Certificate Stores Endpoints

Endpoint	Method	Description	
/	DELETE	Deletes multiple certificate stores specified in the request body.	DELETE Certificate Stores on page 1326
/	GET	Returns all certificate stores with paging and option to specify detail level.	GET Certificate Stores on page 1327
/	POST	Creates a new certificate store if valid parameters are supplied.	POST Certificate Stores on page 1339
/	PUT	Updates an existing certificate store.	PUT Certificate Stores on page 1367
/ {id}	DELETE	Deletes a certificate store by its GUID.	DELETE Certificate Stores ID on page 1397
/ {id}	GET	Returns certificate store details for the specified certificate store.	GET Certificate Stores ID on page 1398
/ {id}/Inventory	GET	Returns certificate inventory for the specified certificate store.	GET Certificate Stores ID Inventory

Endpoint	Method	Description	
			on page 1416
/Server (*deprecated)	GET	Returns a list of certificate store servers.	GET Certificate Stores Server on page 1418
/Server (*deprecated)	POST	Creates a new certificate store server.	POST Certificate Stores Server on page 1421
/Server (*deprecated)	PUT	Updates an existing certificate store server.	PUT Certificate Stores Server on page 1426
/Password	PUT	Updates the password for a certificate store.	PUT Certificate Stores Password on page 1431
/DiscoveryJob	PUT	Creates a job to find certificate stores.	PUT Certificate Stores Discovery Job on page 1434
/AssignContainer	PUT	Assigns a certificate store to a container.	PUT Certificate Stores Assign Container on page 1440
/Approve	POST	Approves an array of pending certificate stores.	POST Certificate Stores Approve on page 1451
/Schedule	POST	Creates an inventory schedule for a certificate store.	POST Certificate Stores Schedule on page 1462
/Reenrollment	POST	Schedules a reenrollment of a certificate into a certificate store.	POST Certificate Stores Reenrollment on page 1465
/Certificates/Add	POST	Configures a management job to add a certificate to one or more stores with the provided schedule.	POST Certificate Stores Certificates Add on page 1467
/Certificates/Remove	POST	Configures a management job to remove a certificate from one or	POST Certificate Stores Certificates

Endpoint	Method	Description	
		more stores with the provided schedule.	Remove on page 1473

3.6.10.1 DELETE Certificate Stores

The DELETE /CertificateStores method is used to delete multiple certificate stores in one request. The certificate store GUIDs should be supplied in the request body as a JSON array of strings. This endpoint returns 204 with no content upon success. GUIDs of any certificate stores that could not be deleted are returned in the response body. Delete operations will continue until the entire array of GUIDs has been processed.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 312: DELETE Certificate Stores Input Parameters

Name	In	Description
IDs	Body	<p>Required. An array of strings indicating Keyfactor Command certificate store GUIDs for certificate stores that should be deleted in the form:</p> <pre>[52fe526d-9914-4239-b74b-b47d0607cf7c,8ec160d9-3242-4eb4-956b-a7651af6c542]</pre> <p>Use the GET /CertificateStores method (see GET Certificate Stores on the next page) to retrieve a list of all the certificate stores to determine the certificate store GUIDs.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.2 GET Certificate Stores

The GET /CertificateStores method is used to return a list of all certificate stores defined in Keyfactor Command. The results include both approved certificates stores and certificates stores found on discovery but not yet approved. This method allows URL parameters to specify paging and the level of information detail. This method returns HTTP 200 OK on a success with details about the certificate store(s).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 313: GET Certificate Stores Input Parameters

Name	In	Description
queryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Certificate Store Search Feature on page 410. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • AddSupported (True, False) • AgentAvailable (True, False) • AgentId • Approved (True, False) • Category (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) • CertificateId • ClientMachine • Container (ContainerName) • ContainerId • HasInventoryScheduled (True, False) • PrivateKeyAllowed (0-Forbidden, 1-Optional, 2-Required) • RemoveSupported (True, False) • StorePath <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px; margin-top: 10px;"> <p> Tip: Use the following query to limit the results to only active certificate stores and not include discovery results:</p> <p style="text-align: center;">approved -eq true</p> </div>
pageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
returnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
sortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>ClientMachine</i> .

Name	In	Description
sortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 314: GET Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the

Name	Description
	<p>values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 436 1403 600">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 751 1403 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="456 1037 1403 1251">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="456 1444 1403 1688">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store</p>

Name	Description												
	<div style="background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  types that require server credentials (e.g. F5): <ul style="list-style-type: none"> ServerUsername ServerPassword ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="456 1041 1403 1705" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="456 1041 634 1104">Name</th> <th data-bbox="634 1041 1403 1104">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="456 1104 634 1167">Off</td> <td data-bbox="634 1104 1403 1167">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="456 1167 634 1381">Immediate</td> <td data-bbox="634 1167 1403 1381"> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e6ffe6; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td data-bbox="456 1381 634 1705">Interval</td> <td data-bbox="634 1381 1403 1705"> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" data-bbox="659 1524 1378 1688" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th data-bbox="659 1524 829 1587">Name</th> <th data-bbox="829 1524 1378 1587">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="659 1587 829 1688">Minutes</td> <td data-bbox="829 1587 1378 1688">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e6ffe6; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" data-bbox="659 1524 1378 1688" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th data-bbox="659 1524 829 1587">Name</th> <th data-bbox="829 1524 1378 1587">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="659 1587 829 1688">Minutes</td> <td data-bbox="829 1587 1378 1688">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.
Name	Description												
Off	Turn off a previously configured schedule.												
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e6ffe6; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>												
Interval	A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database. <table border="1" data-bbox="659 1524 1378 1688" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th data-bbox="659 1524 829 1587">Name</th> <th data-bbox="829 1524 1378 1587">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="659 1587 829 1688">Minutes</td> <td data-bbox="829 1587 1378 1688">An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.								
Name	Description												
Minutes	An integer indicating the number of minutes between each interval.

Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.3 POST Certificate Stores

The POST /CertificateStores method is used to create new certificate stores in Keyfactor Command. This method returns HTTP 200 OK on a success with details about the certificate store created.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 315: POST Certificate Stores Input Parameters

Name	In	Description
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	Body	Required. A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as

Name	In	Description
		<p>objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="505 405 1404 569">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="505 751 1404 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="505 1035 1404 1283">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="505 1472 1404 1719">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre>

Name	In	Description										
		<p> Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>										
AgentId	Body	Required. A string indicating the Keyfactor Command GUID of the orchestrator for this store.										
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .										
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.										
InventorySchedule	Body	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> <tr> <td colspan="2"> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p> </td> </tr> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x</td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).	<p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>		Interval	A dictionary that indicates a job scheduled to run every x
Name	Description											
Off	Turn off a previously configured schedule.

SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .				
Password	Body	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores on page 1339).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 742 and PAM Providers on page 1871 for more information. <p>The possible values are:</p>

	internal name for the PAM provider type parameter.															
Provider-TypeParams	Unused field															
ProviderId		An integer indicating the Keyfactor Command reference ID for the PAM provider.														
IsManaged		A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.														

Table 316: POST Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the

Name	Description
	<p>values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 443 1403 600">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 758 1403 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="456 1041 1403 1251">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="456 1440 1403 1692">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store</p>

Name	Description												
	<div style="background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  types that require server credentials (e.g. F5): <ul style="list-style-type: none"> ServerUsername ServerPassword ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="456 1037 1398 1707" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="462 1045 634 1108">Name</th> <th data-bbox="634 1045 1391 1108">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="462 1108 634 1171">Off</td> <td data-bbox="634 1108 1391 1171">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="462 1171 634 1381">Immediate</td> <td data-bbox="634 1171 1391 1381"> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e6ffe6; padding: 5px; border-radius: 10px; display: flex; align-items: center;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td data-bbox="462 1381 634 1696">Interval</td> <td data-bbox="634 1381 1391 1696"> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
Name	Description				
	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.4 PUT Certificate Stores

The PUT /CertificateStores method is used to update an existing certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing the certificate store.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should

first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 317: PUT Certificate Stores Input Parameters

Name	In	Description
Id	Body	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	Body	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	Body	Required. A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	Body	Required. A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	Body	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	Body	Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	Body	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here. The default for new stores created with this method is <i>true</i> .
CreateIfMissing	Body	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality. The default is <i>false</i> .
Properties	Body	Required. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types

Name	In	Description
		<p>on page 1546 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="509 516 1403 674">"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="509 863 1403 1020">"{ \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="509 1146 1403 1388">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySu- perSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="509 1577 1403 1745">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}},</pre>

Name	In	Description						
		<pre>\ "ServerUseSsl\":{\ "value\":"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p>						
AgentId	Body	Required. A string indicating the Keyfactor Command GUID of the orchestrator for this store.						
AgentAssigned	Body	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false). The default is <i>true</i> .						
ContainerName	Body	A string indicating the name of the certificate store's associated container, if applicable.						
InventorySchedule	Body	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> </tbody> </table> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>.</p>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).
Name	Description							
Off	Turn off a previously configured schedule.							
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false).							

Name	In	Description								
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Interval</td> <td>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. SetNewPasswordAllowed	Body	A Boolean that indicates whether the store password can be changed (true) or not (false). The default is <i>false</i> .				

Name	In	Description						
Password	Body	<p>An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level (see POST Certificate Stores on page 1339).</p> <p>Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password. This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below). • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 742 and PAM Providers on page 1871 for more information. <p>The possible values are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "SecretValue": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "SecretValue": "MyVerySecurePassword" }</pre> </div> </td> </tr> <tr> <td>SecretType</td> <td>A string indicating the Keyfactor Command reference GUID</td> </tr> </tbody> </table>	Name	Description	SecretValue	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "SecretValue": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "SecretValue": "MyVerySecurePassword" }</pre> </div>	SecretType	A string indicating the Keyfactor Command reference GUID
Name	Description							
SecretValue	<p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div style="background-color: #e0f2f1; padding: 10px; border-radius: 10px;"> <p> Tip: To set the no password option on a store, submit the password with a null value. For example:</p> <pre>"Password": { "SecretValue": {null} }</pre> <p>To set the value to a string to be stored in the Keyfactor secrets table, include the password in quotes. For example:</p> <pre>"Password": { "SecretValue": "MyVerySecurePassword" }</pre> </div>							
SecretType	A string indicating the Keyfactor Command reference GUID

Name	In	Description	
		Name	Description
		ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.
		IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.

Table 318: PUT Certificate Stores Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the

Name	Description
	<p>values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 443 1403 600">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 758 1403 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="456 1041 1403 1251">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="456 1440 1403 1692">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store</p>

Name	Description												
	<div style="background-color: #e1f5fe; padding: 10px; border-radius: 10px;">  types that require server credentials (e.g. F5): <ul style="list-style-type: none"> ServerUsername ServerPassword ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="456 1041 1403 1705" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="456 1041 634 1104">Name</th> <th data-bbox="634 1041 1403 1104">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="456 1104 634 1167">Off</td> <td data-bbox="634 1104 1403 1167">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="456 1167 634 1381">Immediate</td> <td data-bbox="634 1167 1403 1381"> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e8f5e9; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td data-bbox="456 1381 634 1705">Interval</td> <td data-bbox="634 1381 1403 1705"> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.5 DELETE Certificate Stores ID

The DELETE /CertificateStores/{id} method is used to delete an existing certificate store with the specified GUID. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 319: DELETE Certificate Stores Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store to delete. Use the GET /CertificateStores method (see GET Certificate Stores on page 1327) to retrieve a list of all the certificate stores to determine the certificate store GUID.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.10.6 GET Certificate Stores ID

The GET /CertificateStores/{id} method is used to return details for the certificate store with the specified ID. This method returns HTTP 200 OK on a success with a message body containing certificate store details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/read/
 OR
 /certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 320: GET Certificate Stores {id} Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command. Use the GET /CertificateStore method (see GET Certificate Stores on page 1327) to retrieve a list of all the certificate stores to determine the certificate store GUID.

Table 321: GET Certificate Stores {id} Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the

Name	Description
	<p>values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="440 443 1403 600">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="440 758 1403 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="440 1041 1403 1220">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="440 1377 1403 1619">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul data-bbox="526 1734 748 1766" style="list-style-type: none"> • ServerUsername

Name	Description												
	<div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e6f2ff; padding: 10px;">  <ul style="list-style-type: none"> ServerPassword ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #333; color: white;">Name</th> <th style="background-color: #333; color: white;">Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="border: 1px solid #ccc; border-radius: 10px; background-color: #e6ffe6; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td>Interval</td> <td> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Provider-TypeParams	Unused field								
Name	Description														
	indicating the internal name for the PAM provider type parameter.														
Provider-TypeParams	Unused field														
ProviderId	An integer indicating the Keyfactor Command reference ID for the PAM provider.														
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.														
<p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>															

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.7 GET Certificate Stores ID Inventory

The GET /CertificateStores/{id}/Inventory method is used to return a list of all the certificates found in the selected certificate store based on an inventory done using Keyfactor Command an approved orchestrator. The results include both end entity certificates and chain certificates found in the store. This method allows URL parameters to specify paging and sorting. This method returns HTTP 200 OK on a success with details about the certificates in the store.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/{#}/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 322: GET Certificate Stores {id} Inventory Input Parameters

Name	In	Description
id	Path	Required. A string indicating the GUID of the certificate store within Keyfactor Command.
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 323: GET Certificate Stores {id} Inventory Response Data

Name	Description																				
Name	A string indicating the alias for the certificate in the certificate store. The format for this varies depending on the certificate store type and whether the <i>Overwrite</i> flag is selected. See PFX Enrollment on page 146 for more information.																				
Certificates	<p>An array of objects indicating the certificates (end entity and chain) found in the certificate store. Certificate details include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the Keyfactor Command reference ID of the certificate.</td> </tr> <tr> <td>IssuedDN</td> <td>A string indicating the distinguished name of the certificate.</td> </tr> <tr> <td>SerialNumber</td> <td>A string indicating the serial number of the certificate.</td> </tr> <tr> <td>NotBefore</td> <td>A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.</td> </tr> <tr> <td>NotAfter</td> <td>A string indicating the date, in UTC, on which the certificate expires.</td> </tr> <tr> <td>SigningAlgorithm</td> <td>A string indicating the algorithm used to sign the certificate.</td> </tr> <tr> <td>IssuerDN</td> <td>A string indicating the distinguished name of the issuer.</td> </tr> <tr> <td>Thumbprint</td> <td>A string indicating the thumbprint of the certificate.</td> </tr> <tr> <td>CertStoreInventoryItemId</td> <td>An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate.	IssuedDN	A string indicating the distinguished name of the certificate.	SerialNumber	A string indicating the serial number of the certificate.	NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.	NotAfter	A string indicating the date, in UTC, on which the certificate expires.	SigningAlgorithm	A string indicating the algorithm used to sign the certificate.	IssuerDN	A string indicating the distinguished name of the issuer.	Thumbprint	A string indicating the thumbprint of the certificate.	CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.
Name	Description																				
Id	An integer indicating the Keyfactor Command reference ID of the certificate.																				
IssuedDN	A string indicating the distinguished name of the certificate.																				
SerialNumber	A string indicating the serial number of the certificate.																				
NotBefore	A string indicating the date, in UTC, on which the certificate was issued by the certificate authority.																				
NotAfter	A string indicating the date, in UTC, on which the certificate expires.																				
SigningAlgorithm	A string indicating the algorithm used to sign the certificate.																				
IssuerDN	A string indicating the distinguished name of the issuer.																				
Thumbprint	A string indicating the thumbprint of the certificate.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command referenced ID of the certificate in the certificate store.																				
CertStoreInventoryItemId	An integer indicating the Keyfactor Command reference ID of the certificate in the certificate store.																				
Parameters	An object containing the entry parameters associated with the certificate																				

Name	Description
	in the certificate store. Expected entry parameters will vary depending on the configuration of the certificate store type. See POST Certificate Store Types on page 1552 for more information about entry parameters.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.10.8 GET Certificate Stores Server

The GET /CertificateStores/Server method is used to retrieve all servers for certificate stores. Only select types of certificate stores have an associated server. These include F5, IIS, Citrix\NetScaler, and any other custom method you've defined to support this. This method returns HTTP 200 OK on a success with details for each server.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/read/
 OR
 /certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

 **Note:** This method has been deprecated and will be removed from the Keyfactor API in release 12. Certificate store server information is now found in the Properties field of the certificate store (see [GET Certificate Stores on page 1327](#)).

Table 324: GET Certificate Stores Server Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Using the Certificate Store Search Feature on page 410 . The query fields supported for this endpoint are: <ul style="list-style-type: none"> • Id • Name • ServerType
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 325: GET Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
Username	<p>The username used to connect to the certificate store.</p> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>														
Password	<p>The password used to connect to the certificate store.</p> <p> Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.</p>														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	<p>An integer indicating the type of server. Possible values include (plus any custom values):</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>F5 Web Server & F5 SSL Profiles (Deprecated)</td> </tr> <tr> <td>1</td> <td>NetScaler (Deprecated)</td> </tr> <tr> <td>2</td> <td>FTP (Deprecated)</td> </tr> <tr> <td>3</td> <td>F5 Web Server REST</td> </tr> <tr> <td>4</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>5</td> <td>F5 CA Bundles REST</td> </tr> </tbody> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles (Deprecated)	1	NetScaler (Deprecated)	2	FTP (Deprecated)	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles (Deprecated)														
1	NetScaler (Deprecated)														
2	FTP (Deprecated)														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.9 POST Certificate Stores Server

The POST /CertificateStores/Server method is used to create a new server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the newly created server record.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/modify/

OR

/certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. Creating new certificate store server records requires permissions at the global level.

See [Container Permissions on page 629](#) for more information about global vs container permissions.

Note: This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues. Certificate store server information is now found in the Properties field of the certificate store (see [POST Certificate Stores on page 1339](#)).

Tip: If a certificate store that requires a server is missing a server definition within the store record, the certificate store server created with this method will be used. If no credentials are supplied in the request and no certificate store server exists, an error is returned and the request fails.

Table 326: POST Certificate Stores Server Input Parameters

Name	In	Description								
Username	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> </td> </tr> <tr> <td>Provider</td> <td> <p>An integer that identifies the PAM provider used to store the username. 5	F5 CA Bundles REST														
Name	The host name of the server.														

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.10 PUT Certificate Stores Server

The PUT /CertificateStores/Server method is used to update the server record for a certificate store in Keyfactor Command. This method returns HTTP 200 OK on a success with details of the server record.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. Updating certificate store server records requires permissions at the global level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Note: This method has been deprecated and will be removed from the Keyfactor API in a future release. This method is retained until that time for backwards compatibility. Continuing to use this endpoint with the latest Keyfactor Command functionality could cause serious data issues such as, for instance, overwriting all certificate stores on the server. Certificate store server information is now found in the Properties field of the certificate store (see [PUT Certificate Stores on page 1367](#)). This endpoint has additional functionality, such as being able to set different credentials for different stores on the same server.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 328: PUT Certificate Stores Server Input Parameters

Name	In	Description
Id	Body	The ID of the server.

Name	In	Description								
Username	Body	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> </td> </tr> <tr> <td>Provider</td> <td> <p>An integer that identifies the PAM provider used to store the username. UseSSL	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false). The default is <i>false</i> .								

Name	In	Description
Name	Body	Required. The host name of the server.
Container	Body	An integer that identifies the certificate store container into which the certificate store should be placed for organizational and management purposes.

Table 329: PUT Certificate Stores Server Response Data

Name	Description														
Id	The ID of the server.														
UseSSL	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the server (true) or not (false).														
ServerType	An integer indicating the type of server. Possible values include (plus any custom values): <table border="1" data-bbox="430 829 1404 1270"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>F5 Web Server & F5 SSL Profiles (Deprecated)</td> </tr> <tr> <td>1</td> <td>NetScaler (Deprecated)</td> </tr> <tr> <td>2</td> <td>FTP (Deprecated)</td> </tr> <tr> <td>3</td> <td>F5 Web Server REST</td> </tr> <tr> <td>4</td> <td>F5 SSL Profiles REST</td> </tr> <tr> <td>5</td> <td>F5 CA Bundles REST</td> </tr> </tbody> </table>	Value	Description	0	F5 Web Server & F5 SSL Profiles (Deprecated)	1	NetScaler (Deprecated)	2	FTP (Deprecated)	3	F5 Web Server REST	4	F5 SSL Profiles REST	5	F5 CA Bundles REST
Value	Description														
0	F5 Web Server & F5 SSL Profiles (Deprecated)														
1	NetScaler (Deprecated)														
2	FTP (Deprecated)														
3	F5 Web Server REST														
4	F5 SSL Profiles REST														
5	F5 CA Bundles REST														
Name	The host name of the server.														

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.11 PUT Certificate Stores Password

The PUT /CertificateStores/Password method is used to update a password for a certificate store that supports this functionality. This updates the password stored in Keyfactor Command for the

certificate store but does not update the certificate store itself. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

`/certificate_stores/modify/`

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 330: PUT Certificate Stores Password Input Parameters

Name	Type	Description								
CertStoreID	Body	Required. A string indicating the GUID of the certificate store. Use the <i>GET CertificateStores</i> method (see GET Certificate Stores on page 1327) to retrieve a list of all your certificate stores to determine the GUID of the store.								
NewPassword	Body	<p>Required. A object that sets the password used by Keyfactor Command to access the certificate store. It does not impact the certificate store itself, just Keyfactor Command’s definition of it. Password settings include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>SecretValue</td> <td>A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.</td> </tr> <tr> <td>Provider</td> <td>An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.</td> </tr> <tr> <td>Parameters</td> <td>An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": { "Provider": 2, "Parameters": {</pre> </td> </tr> </tbody> </table>	Name	Description	SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.	Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.	Parameters	An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": { "Provider": 2, "Parameters": {</pre>
Name	Description									
SecretValue	A string containing the password. This value only needs to be supplied if you’re storing your password in the Keyfactor Command data-base.									
Provider	An integer that identifies the PAM provider used to store the password. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of your defined PAM providers to determine the PAM provider ID to use. This value only needs to be supplied if you’re storing your password using a PAM provider.									
Parameters	An object containing the parameters required by your PAM provider, including the information that identifies the location of the password in the PAM solution. Use the <i>GET /PamProviders</i> method (see GET PAM Providers on page 1898) to retrieve a list of the parameters used by your PAM provider. Only parameters where <i>InstanceLevel</i> is equal to <i>true</i> need to be supplied in the request. For example, for Delinea (formerly Thycotic), this might be: <pre>"NewPassword": { "Provider": 2, "Parameters": {</pre>									

Name	Type	Description				
		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre> </td> </tr> </tbody> </table>	Name	Description		<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre>
Name	Description					
	<pre>"SecretId": 5 } },</pre> <p>For CyberArk, this might be:</p> <pre>"NewPassword": { "Provider": 5, "Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre> <p>For a password stored in the Keyfactor Command database, this might be:</p> <pre>"NewPassword": { "SecretValue": "P@ssw0rd" }</pre>					

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.12 PUT Certificate Stores Discovery Job

The PUT /CertificateStores/DiscoveryJob method is used to schedule a discovery job for certificate stores. The certificate store discovery feature is used to scan machines and devices for existing certificates and certificate stores, which can then be configured for management in Keyfactor Command. Certificate store discovery is supported for:

- PEM and Java certificate stores discovered by the Keyfactor Java Agent. Only stores to which the service account running the Keyfactor Java Agent has at least read permissions will be returned on a discover job.

- PEM, Java, F5, F5 bundle and SSL certificates discovered by the Keyfactor Universal Orchestrator with an appropriate custom extension. For more information about the Keyfactor Universal Orchestrator and custom extensions, see [Universal Orchestrator on page 2879](#).
- Any custom certificate store types configured to support this function.

This endpoint returns 204 with no content upon success. The method schedules the discovery job through the orchestrator. The results of the discovery job are determined separately (see [POST Certificate Stores Approve on page 1451](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/modify/

OR

/certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 331: PUT Certificate Stores Discovery Job Input Parameters

Name	In	Description
ClientMachine	Body	Required. A string indicating the name in Keyfactor Command of the client machine that will do the discovery. This is not necessarily the actual DNS name of the server; the orchestrator may have been installed using an alternative as a reference name.
AgentId	Body	Required. A string indicating the Keyfactor Command reference GUID of the orchestrator for this store.
Type	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+. The default is 0 for a JKS discovery using the Keyfactor Java Agent.
JobExecutionTimestamp	Body	The date and time at which the discovery job should run. If no date is provided, the job will be scheduled to run immediately. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Dirs	Body	Required. A string containing the directory or directories to search during the discovery job. Multiple directories should be separated by commas. <ul style="list-style-type: none"> • Java For Java discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server. • PEM For PEM discovery, enter at a minimum either “/” for a Linux server or “c:\” for a Windows server. • F5 For F5 discovery, enter “/”.
IgnoredDirs	Body	A string containing the directories that should not be included in the search. Multiple directories should be separated by commas.
Extensions	Body	A string containing the file extensions for which to search. For

Name	In	Description
		example, search for files with the extension <i>jks</i> in order to exclude files with other extensions such as <i>txt</i> . Use <i>noext</i> to search file files without extensions. The dot should not be included when specifying extensions.
NamePatterns	Body	A string against which to compare the file names of certificate store files and return only those that contain the specified string (e.g. <i>myjks</i>).
SymLinks	Body	A Boolean that sets whether the job should follow symbolic links on Linux and UNIX operating systems and report both the actual location of a found certificate store file in addition to the symbolic link pointing to the file. This option is ignored on Windows.
Compatibility	Body	A Boolean that sets whether the job will run using the compatibility mode introduced in Java version 1.8 to locate both JKS and PKCS12 type files (true) or not (false). This option applies only to Java keystore discover jobs.

Name	In	Description								
ServerUsername	Body	<table border="1" data-bbox="711 359 1403 1892"> <thead> <tr> <th data-bbox="721 371 937 428">Name</th> <th data-bbox="937 371 1403 428">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="721 428 937 596">SecretValue</td> <td data-bbox="937 428 1403 596"> <p>A string containing the username.</p> <p>This value only needs to be supplied if you're storing your username in the Keyfactor Command database.</p> </td> </tr> <tr> <td data-bbox="721 596 937 1066">Provider</td> <td data-bbox="937 596 1403 1066"> <p>An integer that identifies the PAM provider used to store the username. These include F5, Citrix/NetScaler, IIS, and any custom method you've defined to support this.</p>	Name	Description		<pre>"Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>
Name	Description					
	<pre>"Parameters": { "Folder": "Root", "Object": "F5Password" } },</pre>					
ServerUseSsl	Body	A Boolean that indicates whether Keyfactor Command will use SSL to communicate with the certificate store server (true) or not (false). The default is <i>false</i> .				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.10.13 PUT Certificate Stores Assign Container

The PUT /CertificateStores/AssignContainer method is used to assign one or more certificate stores to a container. This method returns HTTP 200 OK on a success with the certificate stores that were just assigned to a container.

If you are creating a new container and assigning stores to it in one action, you should include the following fields:

- NewContainerName
- NewContainerType
- KeystoreIds

If you are assigning stores to an already existing container, you should include the following fields:

- CertStoreContainerId
- KeystoreIds

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 332: PUT Certificate Stores Assign Container Input Parameters

Name	In	Description
CertStoreContainerId	Body	Required* . An integer that identifies the container into which you want to place the certificate store or stores. One of the following is required : <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>
KeystoreIds	Body	Required . An array of strings indicating the certificate store GUIDs for the stores you want to place into the container.
NewContainerName	Body	Required* . A string that sets the name of the container if you would like to create a new container while assigning store(s) to it. One of the following is required : <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>
NewContainerType	Body	Required* . An integer for the container type if you would like to create a new container while assigning store(s) to it. Container types match certificate store types. Use the <i>GET /CertificateStoreTypes</i> method with a query (e.g. <i>storetype -eq 7</i>) or <i>GET /CertificateStoreTypes/{id}</i> method to determine what a particular certificate store type ID maps to. For example, type 2 maps to <i>PEM File</i> and type 10 maps to <i>F5 SSL Profiles REST</i> . One of the following is required : <ul style="list-style-type: none"> • <i>CertStoreContainerId</i> • <i>NewContainerName</i> and <i>NewContainerType</i>

Table 333: PUT Certificate Stores Assign Container Response Data

Name	Description
Id	A string indicating the GUID of the certificate store within Keyfactor Command. This ID is automatically set by Keyfactor Command.
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container, if applicable (see GET Certificate Store Containers on page 1477).
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 for more information. The maximum number of characters supported in this field is 722.
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information). When reading this field, the values are returned as simple key value pairs, with the

Name	Description
	<p>values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 436 1403 600">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre data-bbox="456 751 1403 915">"{ \"privateKeyPath\": {\"value\": \"opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p> <pre data-bbox="456 1037 1403 1251">"{ \"ServerUsername\": {\"value\": {\"SecretValue\": \"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\": {\"value\": {\"SecretValue\": \"MySuperSecretPassword\"}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the <i>Id value</i> from GET PAM Providers on page 1898):</p> <pre data-bbox="456 1444 1403 1688">"{ \"ServerUsername\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyUserID\"}}}, \"ServerPassword\": {\"value\": {\"Provider\": \"1\", \"Parameters\": {\"SecretId\": \"MyPasswordID\"}}}, \"ServerUseSsl\": {\"value\": \"true\"} }"</pre> <p> Note: There are three standard properties that are used for certificate store</p>

Name	Description												
	<div style="background-color: #e6f2ff; padding: 10px; border-radius: 10px;">  types that require server credentials (e.g. F5): <ul style="list-style-type: none"> ServerUsername ServerPassword ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div>												
AgentId	A string indicating the Keyfactor Command GUID of the orchestrator for this store.												
AgentAssigned	A Boolean that indicates whether there is an orchestrator assigned to this certificate store (true) or not (false).												
ContainerName	A string indicating the name of the certificate store's associated container, if applicable.												
InventorySchedule	<p>An object indicating the inventory schedule for this certificate store. The following schedule types are supported:</p> <table border="1" data-bbox="456 1041 1403 1705" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th data-bbox="456 1041 634 1104">Name</th> <th data-bbox="634 1041 1403 1104">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="456 1104 634 1167">Off</td> <td data-bbox="634 1104 1403 1167">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="456 1167 634 1381">Immediate</td> <td data-bbox="634 1167 1403 1381"> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div style="background-color: #e6ffe6; padding: 5px; border-radius: 10px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> <tr> <td data-bbox="456 1381 634 1705">Interval</td> <td data-bbox="634 1381 1403 1705"> A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. 	 is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).				
SetNewPasswordAllowed	A Boolean that indicates whether the store password can be changed (true) or not (false).				
Password	 Note: Secret data is stored in the secrets table or a PAM provider and is not returned in responses.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.14 POST Certificate Stores Approve

The POST /CertificateStores/Approve method is used to approve one or more certificate stores currently in the pending state—having been discovered using the certificate store discover option (see [PUT Certificate Stores Discovery Job on page 1434](#)). If more than one certificate store is included in the array, all stores must be of the same store type (e.g. Java keystore). This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 334: POST Certificate Stores Approve Input Parameters

Name	In	Description
Id	Body	<p>Required. The GUID of the pending certificate store.</p> <p>Use the <i>GET /CertificateStores</i> method (see GET Certificate Stores on page 1327) with a query of “Approved -eq false” to retrieve a list of all your unapproved certificate stores to determine the GUID of the store.</p>
ContainerId	Body	<p>An integer that identifies the container in which the certificate store should be placed on approval. Use the <i>GET /CertificateStores/Containers</i> method (see GET Certificate Store Containers on page 1477) to retrieve a list of your defined certificate store containers to determine the container ID to use.</p>
CertStoreType	Body	<p>Required. An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.</p>
Properties	Body	<p>Required*. Some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;">"{ \"privateKeyPath\": \" /opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value as a key value pair using <i>value</i> as the key. For example, on a POST or PUT request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;">"{ \"privateKeyPath\": {\"value\": \" /opt/app/mystore.key\"}, \"separatePrivateKey\": {\"value\": \"true\"} }"</pre> <p>An example server properties parameter POST for an F5 or Citrix NetScaler store would contain:</p>

Name	In	Description
		<pre data-bbox="456 296 1373 443">"{ \"ServerUsername\":{\"value\":{\"SecretValue\":\"KEYEXAMPLE\\\\jsmith\"}}, \"ServerPassword\":{\"value\":{\"SecretValue\":\"MySuperSecretPassword\"}}, \"ServerUseSsl\":{\"value\":\"true\"} }"</pre> <p data-bbox="431 495 1393 590">An example server properties parameter POST for an F5 or Citrix NetScaler store with the username and password stored as PAM secrets would contain (where the Provider value—1 in this example—is the Id value from GET PAM Providers on page 1898):</p> <pre data-bbox="456 642 1252 831">"{ \"ServerUsername\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":\"MyUserID\"}}}, \"ServerPassword\":{\"value\":{\"Provider\":\"1\",\"Parameters\": {\"SecretId\":\"MyPasswordID\"}}}, \"ServerUseSsl\":{\"value\":\"true\"} }"</pre> <div data-bbox="440 894 1398 1283" style="background-color: #e6f2ff; padding: 10px;"> <p> Note: There are three standard properties that are used for certificate store types that require server credentials (e.g. F5):</p> <ul style="list-style-type: none"> • ServerUsername • ServerPassword • ServerUseSsl <p>These replace the separate certificate store server records that existed in previous versions of Keyfactor Command. For legacy support, if credentials are not provided through store properties during creation or editing of a certificate store, Keyfactor Command will attempt to find a certificate store server record and copy the credentials from it into the store properties for future use.</p> </div> <p data-bbox="431 1314 1377 1367">This field is required for certificate store types that store additional properties in this parameter.</p>
Pass- word	Bo- dy	<p data-bbox="431 1409 1386 1629">Required. An object indicating the source for and details of the credential information Keyfactor Command will use to access the certificates in a specific certificate store (the store password). This is different from credential information Keyfactor Command uses to access a certificate store server as a whole. The former (this setting) is typically used for Java keystores; the latter is typically used for certificates stores in Windows certificate stores and on Citrix NetScaler and F5 devices and set at the server level, not the certificate store level.</p> <p data-bbox="431 1650 1341 1703">Certificate stores that require credentials support up to three possible credential options:</p> <ul style="list-style-type: none"> • Use no store password.

Name	In	Description										
		<p>This option is supported for Java keystores that would normally require a password, but can be configured with the no password option (see <i>Value</i>, below).</p> <ul style="list-style-type: none"> • Store the credential information in the Keyfactor secrets table. A Keyfactor secret is a user-defined password that is encrypted and stored securely in the Keyfactor Command database. • Load the credential information from a PAM provider. See Privileged Access Management (PAM) on page 742 and PAM Providers on page 1871 for more information. <p>The possible values are:</p> <table border="1" data-bbox="435 625 1398 1715"> <thead> <tr> <th data-bbox="441 634 678 688">Name</th> <th data-bbox="678 634 1391 688">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="441 688 678 1325">SecretValue</td> <td data-bbox="678 688 1391 1325"> <p>A string—submitted as an object—indicating a password to be stored as a Keyfactor secret.</p> <div data-bbox="699 793 1377 1304" style="background-color: #e0f2f1; padding: 10px; border-radius: 5px;"> <p> Tip: To set the no password option on a store, submit the password with a null value. Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.15 POST Certificate Stores Schedule

The POST /CertificateStores/Schedule method is used to create and assign a schedule to one or more certificate stores in Keyfactor Command. The POST request must contain an array of certificate store GUIDs and the properties that make up the schedule to attach to the store(s). This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/schedule/

OR

/certificate_stores/schedule/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 335: POST Certificate Stores Schedule Input Parameters

Name	In	Description																				
Storelds	Body	Required. An array of strings providing the certificate store GUIDs to schedule.																				
Schedule	Body	<p>Required. An object indicating the inventory schedule for the certificate store(s). Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Immediate</td> <td>A Boolean that indicates a job scheduled to run immediately (true) or not (false).</td> </tr> <tr> <td colspan="2">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).				
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).									

 **Note:** Although the Keyfactor API Reference and Utility—Swagger—*Example Value* may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.16 POST Certificate Stores Reenrollment

The POST /CertificateStores/Reenrollment method is used to schedule an existing certificate store for reenrollment. The reenrollment method is available for:

- PEM certificate stores managed by the Native Agent.
- PEM and Java certificate stores managed by Java and Android Agents.
- Any custom certificate store types created to support this functionality.

This endpoint returns 204 with no content upon success. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1844](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/enrollment/csr/

/certificate_stores/modify/

OR

/certificates/enrollment/csr/

/certificate_stores/modify/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

In addition, either the user scheduling the reenrollment job or the user configured to provide authentication to the CA (see [Authorization Methods Tab on page 367](#)) must have enrollment permissions configured on the CA and template.

Table 336: POST Certificates Stores Reenrollment Input Parameters

Name	In	Description
KeystoreId	Body	<p>Required. The GUID of the certificate store to schedule for reenrollment.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1327) to retrieve a list of your certificate stores to determine the GUID of the store.</p>
SubjectName	Body	<p>Required. A string containing the reenrollment subject name using X.500 format. For example:</p> <pre>"SubjectName": "CN=websrvr14.keyexample.com,OU=IT,O=\"Key Example, Inc.\",L=Independence,ST=OH,C=US"</pre>
AgentGuid	Body	<p>Required. The GUID of the orchestrator that is registered with the certificate store.</p> <p>Use the GET /CertificateStores method (see GET Certificate Stores on page 1327) to retrieve a list of your certificate stores to determine the GUID of the orchestrator associated with the store.</p>
Alias	Body	<p>Required. The alias of the certificate in the certificate store.</p>
JobProperties	Body	<p>An object indicating the unique parameters defined for the certificate store type. The <i>key</i> is the name of the specific parameter from the certificate store type definition as returned in the JobProperties on the store type using the GET CertificateStoreTypes method and the <i>value</i> is the value that should be set for that parameter on a certificate in the certificate store. For example, for NetScaler, the key name that is optionally used to associate a certificate with a virtual server is <i>NetscalerVserver</i> and is returned by GET CertificateStoreTypes like so:</p> <pre>"JobProperties": ["NetscalerVserver"]</pre> <p>It can be seen in the Keyfactor Command Management Portal when editing the certificate store type in the field for <i>Management Job Custom Fields</i>.</p> <p>The setting is referenced using the following format:</p> <pre>"JobProperties": [{"NetscalerVserver": "MyVirtualServerName"}]</pre> <p> Note: The only built-in certificate store type that makes use of job properties that can be set on a certificate-by-</p>

Name	In	Description
		 certificate basis in the store is NetScaler, which does not support reenrollment. You may have custom certificate store types that make use of this functionality.
CertificateAuthority	Body	A string indicating the certificate authority to which to direct the enrollment request. If this parameter is not provided, the value set in the <i>Certificate Authority For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab on page 614).
CertificateTemplate	Body	A string indicating the certificate template to use for the enrollment request. If this parameter is not provided, the value set in the <i>Template For Submitted CSRs</i> application setting will be used (see Application Settings: Agents Tab on page 614).

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.10.17 POST Certificate Stores Certificates Add

The POST `/CertificateStores/Certificates/Add` method is used to add a certificate to one or more certificate stores. This method returns HTTP 200 OK on a success with an array of GUIDs for the add jobs. Use the GET `/OrchestratorJobs/JobHistory` method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1844](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

- `/certificates/collections/read/`
- `/certificate_stores/schedule/`
- OR
- `/certificates/collections/read/#/` (where # is a reference to a specific certificate collection ID)
- `/certificate_stores/schedule/#/` (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See [Certificate Collection Permissions on page 627](#) and [Container Permissions on page 629](#) for more information about global vs collection and container permissions.

Table 337: POST Certificate Stores Certificates Add Input Parameters

Name	In	Description										
CertificateId	Body	Required. An integer containing the Keyfactor Command reference ID of the certificate to be added to the certificate store(s).										
CertificateStores	Body	<p>Required. An array of objects indicating the certificate store GUIDs to identify the certificate stores to which the certificate should be added and provide appropriate reference information for the certificate in the store. Parameters include:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>CertificateStoreIds</td> <td>Required. A string containing the GUID for the certificate store to which the certificate should be added.</td> </tr> <tr> <td>Alias</td> <td>Required* A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. Some certificate store types don't require an alias and some do. See Add Certificate on page 74 for more information. This field may be required depending on the store type selected.</td> </tr> <tr> <td>JobFields</td> <td>An object that sets extra values for the job fields that will be associated with the add job. This option is typically used with custom Any Agent implementations.</td> </tr> <tr> <td>Overwrite</td> <td>A Boolean that sets whether a certificate in the store with the <i>Alias</i> provided should be overwritten with the certificate being added (true) or not (false). The default is <i>false</i>. Use the <code>GET /Certificates/Locations/{id}</code> method (see GET Certificates Locations ID on page 1116) to retrieve a list of the locations an existing certificate is in to determine the alias</td> </tr> </tbody> </table>	Name	Description	CertificateStoreIds	Required. A string containing the GUID for the certificate store to which the certificate should be added.	Alias	Required* A string providing an alias to be used for the certificate upon entry into the certificate store. The function of the alias varies depending on the certificate store type. For example, for an F5 device, it serves as the file name used to store the file in the device file system, minus the extension (e.g. use alias MyFile for a file named MyFile.pfx) while for a Java keystore, it is stored in the keystore associated with the certificate. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description									
ExactlyOnce	<p>A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, exactly once at 11:45 am:</p> <pre>"ExactlyOnce": { "Time": "2023-11-27T11:45:00Z" }</pre> <p> Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>.</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).					
Name	Description									
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).									
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user's certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.								

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily

for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.10.18 POST Certificate Stores Certificates Remove

The POST /CertificateStores/Certificates/Remove method is used to remove a certificate from one or more certificate stores. The POST request must contain an array of certificate store GUIDs and the certificate properties that identify the certificate to remove. This method returns HTTP 200 OK on a success with an array of GUIDs for the removal jobs. Use the GET /OrchestratorJobs/JobHistory method to check on the progress of the job after submission (see [GET Orchestrator Jobs Job History on page 1844](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/collections/read/

/certificate_stores/schedule/

OR

/certificates/collections/read/#/ (where # is a reference to a specific certificate collection ID)

/certificate_stores/schedule/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificates and certificate stores can be set at either the global or certificate collection and certificate store container level. You can use a mixture with, for example, global certificate permissions and container-level certificate store permissions. See [Certificate Collection Permissions on page 627](#) and [Container Permissions on page 629](#) for more information about global vs collection and container permissions.

Table 338: POST Certificate Stores Certificates Remove Input Parameters

Name	In	Description								
CertificateStores	Body	<p>Required. An array of objects indicating the certificate store GUIDs and related information to identify the certificate to remove from the certificate store(s). Certificate store detail includes:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Alias</td> <td>Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see GET Certificates ID on page 1124) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.</td> </tr> <tr> <td>CertificateStoreIds</td> <td>Required. A string containing the GUID for the certificate store from which the certificate should be removed.</td> </tr> <tr> <td>JobFields</td> <td>An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.</td> </tr> </tbody> </table> <p>For example, to remove from one IIS personal store and one NetScaler store:</p> <pre> "CertificateStores": [{ "Alias": "MyCertificate.pfx", "CertificateStoreId": "fde12aa7-6643-43db-88e8-5c91c5ce78b3" }, { "Alias": "C2107973A928859C21330E566B299CD4A0705AE8", "CertificateStoreId": "322e12ea-43b2-4aab-80ae- </pre>	Name	Description	Alias	Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see GET Certificates ID on page 1124) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.	CertificateStoreIds	Required. A string containing the GUID for the certificate store from which the certificate should be removed.	JobFields	An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.
Name	Description									
Alias	Required. A string containing the unique identifier for the certificate in the certificate store. Each type of certificate store has a different format for this alias. Use the <i>GET /Certificates/{id}</i> method (see GET Certificates ID on page 1124) to retrieve the certificate store IDs in which the certificate is stored (CertStoreId) and the aliases under which the certificate is stored in these stores. This information is also available in the certificate details in the Management Portal.									
CertificateStoreIds	Required. A string containing the GUID for the certificate store from which the certificate should be removed.									
JobFields	An object that sets extra values for the job fields that will be associated with the removal job. This option is typically used with custom Any Agent implementations.									

Name	In	Description										
		<pre>c4ad4569b4e7" }]</pre>										
Schedule	Body	<p>Required. An object indicating the inventory schedule for the removal job. Supported schedules are:</p> <table border="1" data-bbox="618 531 1398 905"> <thead> <tr> <th data-bbox="618 531 841 592">Name</th> <th data-bbox="841 531 1398 592">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="618 592 841 653">Off</td> <td data-bbox="841 592 1398 653">Turn off a previously configured schedule.</td> </tr> <tr> <td data-bbox="618 653 841 905">Immediate</td> <td data-bbox="841 653 1398 905"> A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div data-bbox="862 758 1377 890" style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div> </td> </tr> </tbody> </table> <p data-bbox="618 905 841 1010">ExactlyOnce</p> <p data-bbox="841 905 1398 1010">A dictionary that indicates a job scheduled to run at the time specified with the parameter:</p> <table border="1" data-bbox="862 1010 1377 1346"> <thead> <tr> <th data-bbox="862 1010 1027 1071">Name</th> <th data-bbox="1027 1010 1377 1071">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="862 1071 1027 1346">Time</td> <td data-bbox="1027 1071 1377 1346">The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p data-bbox="841 1346 1398 1430">For example, exactly once at 11:45 am:</p> <pre data-bbox="862 1430 1377 1570">"ExactlyOnce": { "Time": "2023-11-27T11:45:00Z" }</pre> <div data-bbox="862 1591 1377 1732" style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>ExactlyOnce</i>. </div>	Name	Description	Off	Turn off a previously configured schedule.	Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div data-bbox="862 758 1377 890" style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description											
Off	Turn off a previously configured schedule.											
Immediate	A Boolean that indicates a job scheduled to run immediately (true) or not (false). <div data-bbox="862 758 1377 890" style="border: 1px solid green; border-radius: 10px; padding: 5px; margin-top: 10px;">  Tip: In some instances, jobs initially scheduled as <i>Immediate</i> will appear on a GET as <i>null</i>. </div>											
Name	Description											
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).											

Name	In	Description
		 Note: Although the Keyfactor API Reference and Utility—Swagger— <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CollectionId	Body	An integer specifying an optional certificate collection identifier to validate that the user executing the request has sufficient permissions to do so. If a certificate collection ID is not supplied, the user must have global permissions to complete the action. Supplying a certificate collection ID allows for a check of the user’s certificate collection-level permissions to determine whether the user has sufficient permissions at a collection level to complete the action. See Certificate Collection Permissions on page 627 for more information.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.11 Certificate Store Containers

The CertificateStoreContainers component of the Keyfactor API provides a set of methods to support management of certificate store containers.

Table 339: Certificate Store Containers Endpoints

Endpoint	Method	Description	Link
/	GET	Returns a list of certificate store containers.	GET Certificate Store Containers on the next page
/	POST	Adds a certificate store container.	POST Certificate Store Containers on page 1479
/ {id}	DELETE	Deletes a certificate store container.	DELETE Certificate Store Containers ID on page 1509
/ {id}	GET	Returns details for the specified certificate store container.	GET Certificate Store Containers ID on page 1509

Endpoint	Method	Description	Link
/id}	PUT	Edits a certificate store container.	PUT Certificate Store Containers on page 1484

3.6.11.1 GET Certificate Store Containers

The GET /CertificateStoreContainers method is used to retrieve all certificate store containers. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 340: GET Certificate Store Containers Input Parameters

Name	In	Description
PerformRoleCheck	Query	This parameter is not used.
RoleIdList	Query	This parameter is not used.
QueryString	Query	<p>A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search dropdowns for the same feature. For querying guidelines, refer to: Using the Containers Search Feature on page 432. The query fields supported for this endpoint are:</p> <ul style="list-style-type: none"> • CertStoreType (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol) • HasSchedule (True, False) • Id • Name (Short Name)
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 341: GET Certificate Stores Containers Response Data

Name	Description
Id	An integer indicating the ID of the container.
Name	A string indicating the name of the container.
OverwriteSchedules	A Boolean indicating whether the schedule set on the container will overwrite schedules set individually on the certificate stores (true) or not (false).
Schedule	A string containing the inventory schedule set for the container. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
StoreCount	An integer indicating the number of stores of the type referenced by CertStoreType in the container.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.11.2 POST Certificate Store Containers

The POST /CertificateStoreContainers method is used to add a new certificate store container. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 342: POST Certificate Stores Containers Input Parameters

Name	In	Description																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<p>An object containing the inventory schedule set for the container. Schedules are shown in cron syntax. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": { "Time": "2023-11-25T23:30:00Z" }</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).													
Name	Description																	
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).																	

Name	In	Description
		 Note: Although the Keyfactor API Reference and Utility—Swagger— <i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.
CertStoreType	Body	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+. The default is 0 for a JKS keystore.

Table 343: POST Certificate Stores Containers Response Data

Name	Description																
Id	An integer indicating the ID of the container.																
Name	A string indicating the name of the container.																
Schedule	<p>An object containing the inventory schedule set for the container. Schedules are shown in cron syntax. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Name	Description																
Off	Turn off a previously configured schedule.																
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.												
Name	Description																
Minutes	An integer indicating the number of minutes between each interval.																
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> <pre>"Daily": {</pre>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).												
Name	Description																
Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:mm:ss.000Z (e.g. 2023-11-19T16:23:01Z).																

Name	Description				
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <pre>"Time": "2023-11-25T23:30:00Z" }</pre> </td> </tr> </tbody> </table> <p> Note: Although the Keyfactor API Reference and Utility—Swagger—<i>Example Value</i> may show examples of various other schedules, only the schedules shown here—that are available in the Management Portal for this functionality—are valid for this endpoint.</p>	Name	Description		<pre>"Time": "2023-11-25T23:30:00Z" }</pre>
Name	Description				
	<pre>"Time": "2023-11-25T23:30:00Z" }</pre>				
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakey-store, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.				

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.11.3 PUT Certificate Store Containers

The PUT /CertificateStoreContainers method is used to edit the specified certificate store container. This method returns HTTP 200 OK on a success with container details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 344: PUT Certificate Store Containers Input Parameters

Name	In	Description																
Id	Path	Required. An integer indicating the ID of the container.																
Name	Body	Required. A string indicating the name of the container.																
Schedule	Body	<p>An object containing the inventory schedule set for the container. Schedules are shown in cron syntax. Supported schedules are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Off</td> <td>Turn off a previously configured schedule.</td> </tr> <tr> <td>Interval</td> <td> <p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre> </td> </tr> <tr> <td>Daily</td> <td> <p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p> </td> </tr> </tbody> </table>	Name	Description	Off	Turn off a previously configured schedule.	Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.	Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).</td> </tr> </tbody> </table> <p>For example, daily at 11:30 pm:</p>	Name	Description	Time	The date and time to next run the job. The date and time should be given using the ISO 8601 UTC time format YYYY-MM-DDTHH:m-m:ss.000Z (e.g. 2023-11-19T16:23:01Z).
Name	Description																	
Off	Turn off a previously configured schedule.																	
Interval	<p>A dictionary that indicates a job scheduled to run every x minutes with the specified parameter. Any interval that is selected in the UI will be converted to minutes when stored in the database.</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Minutes</td> <td>An integer indicating the number of minutes between each interval.</td> </tr> </tbody> </table> <p>For example, every hour:</p> <pre>"Interval": { "Minutes": 60 }</pre>	Name	Description	Minutes	An integer indicating the number of minutes between each interval.													
Name	Description																	
Minutes	An integer indicating the number of minutes between each interval.																	
Daily	<p>A dictionary that indicates a job scheduled to run every day at the same time with the parameter:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Time</td> <td>The date and time to next run the job. Provider-TypeParams	Unused field																
Name	Description																						
	al name for the PAM provider type parameter.																						
Provider-TypeParams	Unused field																						
Provider-Id	An integer indicating the Keyfactor Command reference ID for the PAM provider.																						
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.11.4 DELETE Certificate Store Containers ID

The DELETE /CertificateStoreContainers/{id} method is used to delete the certificate store container with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
 /certificate_stores/modify/
 OR
 /certificate_stores/modify/#!/ (where # is a reference to a specific certificate store container ID)
 Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 346: DELETE Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container to delete. Use the GET /CertificateStoreContainers method (see GET Certificate Store Containers on page 1477) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.11.5 GET Certificate Store Containers ID

The GET /CertificateStoreContainers/{id} method is used to retrieve the certificate store container with the specified ID. This method returns HTTP 200 OK on a success with container details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificate_stores/read/

OR

/certificate_stores/read/#/ (where # is a reference to a specific certificate store container ID)

Permissions for certificate stores can be set at either the global or certificate store container level. See [Container Permissions on page 629](#) for more information about global vs container permissions.

Table 347: GET Certificate Store Containers {id} Input Parameters

Name	In	Description
id	Path	Required. A string containing the ID of the certificate store container. Use the <i>GET /CertificateStoreContainers</i> method (see GET Certificate Store Containers on page 1477) to retrieve a list of all the certificate store containers to determine the certificate store container ID.

Table 348: GET Certificate Stores Containers {id} Response Data

Name	Description												
Id	An integer indicating the ID of the container.												
Name	A string indicating the name of the container.												
Schedule	A string containing the inventory schedule set for the container. Schedules are shown in cron syntax. For an interval schedule, this will look like I_mm where mm is the number of minutes (e.g. I_30 for every 30 minutes). For daily schedules, this will look like D_hh:mm where hh:mm is the time to run the job (e.g. D_14:30 for daily at 2:30 pm).												
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.												
CertificateStores	An array of objects indicating the certificate store data for the certificate stores within this container. Certificate store details include: <table border="1" data-bbox="360 926 1404 1675"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>A string indicating the GUID of the certificate store within Keyfactor Command.</td> </tr> <tr> <td>DisplayName</td> <td>A string indicating the display name of the certificate store.</td> </tr> <tr> <td>ContainerId</td> <td>An integer indicating the ID of the certificate store's associated certificate store container.</td> </tr> <tr> <td>ClientMachine</td> <td>A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.</td> </tr> <tr> <td>Storepath</td> <td>A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 in the <i>Keyfactor Command Reference Guide</i> for more information.</td> </tr> </tbody> </table>	Name	Description	Id	A string indicating the GUID of the certificate store within Keyfactor Command.	DisplayName	A string indicating the display name of the certificate store.	ContainerId	An integer indicating the ID of the certificate store's associated certificate store container.	ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.	Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 in the <i>Keyfactor Command Reference Guide</i> for more information.
Name	Description												
Id	A string indicating the GUID of the certificate store within Keyfactor Command.												
DisplayName	A string indicating the display name of the certificate store.												
ContainerId	An integer indicating the ID of the certificate store's associated certificate store container.												
ClientMachine	A string containing the client machine name. The value for this will vary depending on the certificate store type. Typically, it is the hostname of the machine on which the store is located, but this may vary. See Adding or Modifying a Certificate Store on page 413 for more information.												
Storepath	A string indicating the path to the certificate store on the target. The format for this path will vary depending on the certificate store type. For example, for a Java keystore, this will be a file path (e.g. /opt/myapp/store.jks), but for an F5 device, this will be a partition name on the device (e.g. Common). See Adding or Modifying a Certificate Store on page 413 in the <i>Keyfactor Command Reference Guide</i> for more information.												

Name	Description
Name	Description
CertStoreInventoryJobId	A string indicating the GUID that identifies the inventory job for the certificate store in the Keyfactor Command database. This will be null if an inventory schedule is not set for the certificate store.
CertStoreType	An integer indicating the ID of the certificate store type, as defined in Keyfactor Command, for this certificate store. Built-in certificates store types are: (0-Javakeystore, 2-PEMFile, 3-F5SSLProfiles, 4-IISRoots, 5-NetScaler, 6-IISPersonal, 7-F5WebServer, 8-IISRevoked, 9-F5WebServerREST, 10-F5SSLProfilesREST, 11-F5CABundlesREST, 100-AmazonWebServices, 101-FileTransferProtocol). Any custom extensions for the Keyfactor Universal Orchestrator you add will have certificate store types numbered 102+.
Approved	A Boolean that indicates whether a certificate store is approved (true) or not (false). If a certificate store is approved, it can be used and updated. A certificate store that has been discovered using the discover feature but not yet marked as approved will be false here.
CreateIfMissing	A Boolean that indicates whether a new certificate store should be created with the information provided (true) or not (false). This option is only valid for Java keystores and any custom certificate store types you have defined to support this functionality.
Properties	<p>A string containing additional properties for the container. Only some types of certificate stores have additional properties that are stored in this parameter. The data is stored in a series of, typically, key value pairs that define the property name and value (see GET Certificate Store Types on page 1546 for more information).</p> <p>When reading this field, the values are returned as simple key value pairs, with the values being individual values. When writing, the values are specified as objects, though they are typically single values.</p> <p>For example, on a GET request for a <i>PEM</i> store configured with a separate private key, the contents of this field might be:</p> <pre style="border: 1px solid #ccc; border-radius: 10px; padding: 10px; margin: 10px 0;">"{ \"privateKeyPath\": \"opt/app/mystore.key\", \"separatePrivateKey\": \"true\" }"</pre> <p>However, the syntax used when updating the properties sets the value</p>

Name	Description				
	<table border="1"> <thead> <tr> <th data-bbox="358 275 553 338">Name</th> <th data-bbox="553 275 1393 338">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="358 338 553 1738"></td> <td data-bbox="553 338 1393 1738"> <p>as a key value pair using <i>value</i> as the key. Name	Description												
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.												
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .												
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.												

Name	Description										
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store). </td> </tr> </tbody> </table> </td> </tr> <tr> <td>SetNewPasswordAllowed</td> <td>A Boolean that indicates whether the store password can be changed (true) or not (false).</td> </tr> </tbody> </table>	Name	Description		<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Name	Description																						
	al name for the PAM provider type parameter.																						
Provider-TypeParams	Unused field																						
Provider-Id	An integer indicating the Keyfactor Command reference ID for the PAM provider.																						
IsManaged	A Boolean indicating whether the credentials for the store are managed by a PAM provider (true) or stored in the Keyfactor secrets table (false). This value is automatically set by Keyfactor Command.																						

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.12 Certificate Store Types

CertificateStoreTypes define constraints and properties of different kinds of certificates stores. Keyfactor Command contains default certificate store types and also allows users to define certificate store types for custom certificate stores.

Table 349: Certificate Store Type Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes a certificate store type using StoreType number.	DELETE Certificate Store Types ID below
/id}	GET	Returns certificate store type details for the specified certificate store type using StoreType number.	GET Certificate Store Types ID on the next page
/Name/{name}	GET	Returns certificate store type details for the specified certificate store type using ShortName.	GET CertificateStoreTypes Name Name on page 1538
/	DELETE	Delete multiple certificate store types using StoreType number.	DELETE Certificate Store Types on page 1545
/	GET	Returns all certificate store types with paging and options to the specified detail level.	GET Certificate Store Types on page 1546
/	POST	Creates a new certificate store type.	POST Certificate Store Types on page 1552
/	PUT	Updates a certificate store type using StoreType number.	PUT Certificate Store Types on page 1566

3.6.12.1 DELETE Certificate Store Types ID

The DELETE /CertificateStoreTypes/{id} method is used to delete an existing certificate store type with the specified ID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/modify/

Table 350: DELETE Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type to delete. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 1546) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.12.2 GET Certificate Store Types ID

The *GET /CertificateStoreTypes/{id}* method is used to return the certificate store type with the specified ID. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/read/ OR container permission

Table 351: GET Certificate Store Types {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 1546) to retrieve a list of all the certificate store types to determine the certificate store type ID.

Table 352: GET Certificate Store Types {id} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers 										

Name	Description
	 with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.12.3 GET CertificateStoreTypes Name Name

The GET `/CertificateStoreTypes/Name/{name}` method is used to return the certificate store type with the specified short name. This method returns HTTP 200 OK on a success with details for the certificate store type specified.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/read/

Table 353: GET Certificate Store Types Name {Name} Input Parameters

Name	In	Description
name	Path	Required. The short name of the certificate store type. Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types on page 1546) to retrieve a list of all the certificate store types to determine the certificate store type short name.

Table 354: GET Certificate Store Types Name {Name} Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.

DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers 										

Name	Description
	 with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.12.4 DELETE Certificate Store Types

The DELETE /CertificateStoreTypes method is used to delete multiple certificate store types in one request. IDs of any certificate store types that could not be deleted are returned in the response body. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/modify/

Table 355: DELETE Certificate Store Types Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate store type IDs for certificate store types that should be deleted in the form (without parameter name):</p> <pre>[106,108,109]</pre> <p>Use the <i>GET /CertificateStoreTypes</i> method (see GET Certificate Store Types below) to retrieve a list of all the certificate store types to determine the certificate store type IDs.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.12.5 GET Certificate Store Types

The GET /CertificateStoreTypes method is used to retrieve a list of all certificate store types. This method returns HTTP 200 OK on a success with details of the certificate store types.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/read/ OR container permission

Table 356: GET Certificate Store Types Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 357: GET Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers 										

Name	Description
	 with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.12.6 POST Certificate Store Types

The POST /CertificateStoresTypes method is used to create certificate store types in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/modify/

Table 358: POST Certificate Store Types Input Parameters

Name	In	Description								
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.								
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.								
Capability	Body	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .								
SupportedOperations	Body	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove The default for each value is <i>false</i> .								
Properties	Body	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="683 1304 1403 1724"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>Required. A string containing the short name of the property. If you choose to define a property, this field is required.</td> </tr> <tr> <td>DisplayName</td> <td>Required. Name	Description								
	allowed (true) or not (false).								
StoreRequired	A Boolean that indicates whether entry of a password on the certificate store as a whole is required (true) or not (false).								
Style	A string containing the style of password: <ul style="list-style-type: none"> • <i>Default</i>: Keyfactor Command will randomly generate a password. • <i>Custom</i>: Allow a password to be entered and authenticated when enrolling for a certificate through Keyfactor Command when installing to a store of this type. The Custom option can be selected only if the <i>Allow Custom Password</i> in the Application Settings, is equal to <i>True</i>. For more details, see Application Settings: Enrollment Tab on page 609. 								
StorePathValue	A string containing the value(s) for the certificate store path.								
PrivateKeyAllowed	A string containing the option for private key requirements for certificates stored in stores with this certificate store type: <ul style="list-style-type: none"> • <i>Forbidden</i>: Private key is not required; generally, applies to trust stores (e.g. Root CA certificates). • <i>Optional</i>: Private key is optional; applies to store types that could represent either a Trust Store or End-Entity Store. • <i>Required</i>: Private key is required; applies to stores that hold an End-Entity Certificate (server or client authorization). 								
ServerRequired	A Boolean that indicates whether server access is required for adding certificate stores for this certificate store type (true) or not (false). If set to true, a user will be prompted for a username and password to connect to the remote server.								
PowerShell	A Boolean that indicates whether jobs for the store type are implemented using PowerShell (true) instead of a .NET class or not (false).								
BlueprintAllowed	A Boolean that indicates whether certificate stores of this type will be included when creating or applying blueprints. For more details, see Orchestrator Blueprints on page 521 .								
CustomAliasAllowed	A string containing the selected certificate store type alias option:								

Name	Description										
	<ul style="list-style-type: none"> • <i>Forbidden</i>: A custom alias is not required and cannot be supplied. • <i>Optional</i>: A custom alias is optional. • <i>Required</i>: A custom alias is required. <p>The certificate store alias serves as an identifier for the certificate in the store. Depending on the type of store, it may be a file name, a certificate thumbprint, a string reference, or some other information. Some types of stores may not support associating an alias with the certificate (e.g. IIS trusted root).</p>										
EntryParameters	<p>An array of objects indicating unique parameters that are required when performing management jobs on a certificate store of this type. Entry parameter options include:</p> <table border="1" data-bbox="548 724 1399 1717"> <thead> <tr> <th data-bbox="548 724 797 783">Name</th> <th data-bbox="797 724 1399 783">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="548 783 797 884">Name</td> <td data-bbox="797 783 1399 884">A string containing the short name of the entry parameter.</td> </tr> <tr> <td data-bbox="548 884 797 984">DisplayName</td> <td data-bbox="797 884 1399 984">A string containing the full display name of the entry parameter.</td> </tr> <tr> <td data-bbox="548 984 797 1234">Type</td> <td data-bbox="797 984 1399 1234"> A string containing the type of the entry parameter: <ul style="list-style-type: none"> • String • Bool • MultipleChoice • Secret </td> </tr> <tr> <td data-bbox="548 1234 797 1717">RequiredWhen</td> <td data-bbox="797 1234 1399 1717"> An object containing Boolean values indicating the circumstances under which a value is required to be provided for this entry parameter. DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers 										

Name	Description
	 with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.12.7 PUT Certificate Store Types

The PUT /CertificateStoreTypes method is used to update a certificate store type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificate_stores/modify/

 **Important:** Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Note: Certificate store types can only be updated in a very limited way if they are actively in use (there are any certificate stores defined for them). Updates to the Name, ShortName and adding a job type are supported in this case as are additions to the SupportedOperations, but no other updates can be saved.

Table 360: PUT Certificate Store Types Input Parameters

Name	In	Description				
StoreType	Body	Required. An integer indicating the Keyfactor Command reference ID for the certificate store type.				
Name	Body	Required. A string containing the full name of the certificate store type. A unique value must be supplied.				
ShortName	Body	Required. A string containing the short name assigned to the certificate store type. A unique value must be supplied with a maximum of 10 characters.				
Capability	Body	<p>A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).</p> <div style="border: 1px solid #add8e6; padding: 5px; margin-top: 10px;">  Note: The <i>Capability</i> cannot be changed on an edit if an orchestrator has registered with Keyfactor Command, been approved, and included the certificate store type in its capability list. </div>				
LocalStore	Body	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator. The default is <i>false</i> .				
SupportedOperations	Body	<p>An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions:</p> <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove <p>The default for each value is <i>false</i>.</p>				
Properties	Body	<p>An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i>. 		<p data-bbox="690 283 738 336"></p> <p data-bbox="795 283 1388 483">property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record.</p> <ul data-bbox="771 493 1396 1029" style="list-style-type: none"> <li data-bbox="771 493 1396 1029">• Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).

Table 361: PUT Certificate Store Types Response Data

Name	Description								
Name	A string containing the full name of the certificate store type.								
ShortName	A string containing the short name assigned to the certificate store type.								
Capability	A string containing a reference name for the certificate store type (e.g. NS for a NetScaler store).								
StoreType	An integer indicating the Keyfactor Command reference ID for the certificate store type. The ID is automatically assigned by Keyfactor Command.								
ImportType	An integer that indicates the import type for the certificate store type. The ID is automatically assigned by Keyfactor Command and generally matches the <i>StoreType</i> for custom certificate store types.								
LocalStore	A Boolean that indicates whether the store is local to the orchestrator machine (true) as, for example, JKS and PEM stores managed by the Keyfactor Java Agent or remote (false) as, for example, IIS stores managed by the Keyfactor Universal Orchestrator.								
SupportedOperations	An object containing Boolean values that indicate whether the certificate store type is enabled for the following functions: <ul style="list-style-type: none"> • Add • Create • Discovery • Enrollment • Remove 								
Properties	An array of objects indicating unique parameters for the certificate store type. In the Keyfactor Command Management Portal these are known as <i>Custom Fields</i> . Property parameters include: <table border="1" data-bbox="545 1346 1406 1709"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string containing the short name of the property.</td> </tr> <tr> <td>DisplayName</td> <td>A string containing the full display name of the property.</td> </tr> <tr> <td>Type</td> <td>A string containing the type of the property: <ul style="list-style-type: none"> • String • Bool </td> </tr> </tbody> </table>	Name	Description	Name	A string containing the short name of the property. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .	Options	A string containing a comma-separated list of multiple choice options for this entry parameter.
Name	Description										
	ficate job. <ul style="list-style-type: none"> • OnRemove: If set to <i>true</i>, a value must be provided for this field when configuring a remove certificate job. • OnReenrollment: If set to <i>true</i>, a value must be provided for this field when configuring a reenrollment job. 										
DependsOn	A string containing the name of the parameter on which this parameter depends. This only applies if at least two custom parameters have been created for this certificate store type. This option is used to configure one custom parameter to display only if another custom parameter contains a value.										
DefaultValue	A string containing the default value for the entry parameter. If <i>Type</i> is <i>Multiple Choice</i> , this field should contain a single value that represents the default selection from the provided list (see Options) for this entry parameter. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .										
Options	A string containing a comma-separated list of multiple choice options for this entry parameter.										
	<p> Tip: What's the difference between properties (custom fields) and entry parameters?</p> <ul style="list-style-type: none"> • Properties are about the certificate store definition itself and are static. For example, you might use a property to define the primary node name of an F5 instance. This node name is the same no matter what inventory or management jobs you do with the F5 device(s). Values for properties are entered in the certificate store record when creating or editing the certificate store record. • Entry parameters are about the specific certificate within the certificate store. They are used to send additional information related to the certificate to the server or device that hosts the certificate store when running management jobs for that certificate store. Often this is more fluid information that isn't the same for every use of that certificate store. For example, several virtual servers 										

Name	Description
	 with separate certificates in the same folder may exist on a NetScaler device. When replacing one certificate, updates may need to be made to only the virtual server that is using the certificate. In this case, the authorized user will be prompted to enter the virtual server name based on an entry parameter. Values for entry parameters are entered at the time a management job is initiated (e.g. adding a certificate to a certificate store).
InventoryEndpoint	A string containing the orchestrator endpoint to which inventory updates are sent.
InventoryJobType	A GUID identifying the job type for inventory jobs.
ManagementJobType	A GUID identifying the job type for management jobs.
DiscoveryJobType	A GUID identifying the job type for discovery jobs.
EnrollmentJobType	A GUID identifying the job type for reenrollment jobs.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (🔍) at the top of the Management Portal page next to the **Log Out** button.

3.6.13 Component Installation

The Component Installation methods are used to list the servers that various Keyfactor Command components have been installed on or to decommission a Keyfactor Command server that is no longer in use.

Table 362: Component Installation Endpoints

Endpoint	Method	Description	Link
/	GET	Return a list of all the Keyfactor Command servers in the current implementation including the components installed on each, with paging (number of pages to return and number of results per page) and sorting options.	GET Component Installation on the next page
/id}	DELETE	Delete the Keyfactor Command server with the	DELETE

Endpoint	Method	Description	Link
		specified ID from the Keyfactor Command database.	Component Installation ID on the next page

3.6.13.1 DELETE Component Installation ID

The DELETE /ComponentInstallation/{id} method is used to delete the Keyfactor Command server with the specified ID and all its components from the Keyfactor Command database. This endpoint returns 204 with no content upon success.

Important: Servers should not be deleted if they are serving any active role in the Keyfactor Command environment, as this operation cannot be undone.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/system_settings/modify/

Table 363: DELETE Component Installation {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference ID of the Keyfactor Command server to delete. Use the GET /ComponentInstallation method (see GET Component Installation below) to determine the ID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.13.2 GET Component Installation

The GET /ComponentInstallation method is used to return a list of all the Keyfactor Command components installed for the current implementation. This method returns HTTP 200 OK on a success with details about the installed components on each server. This method allows URL parameters to specify paging and the level of information detail.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/system_settings/read/`

Table 364: GET Component Installation Input Parameters

Name	In	Description
QueryString	Query	A string containing a query to limit the results (e.g. field1 -eq value1 AND field2 -gt value2). The default is to return all records. Fields available for querying through the API for the most part match those that appear in the Keyfactor Command Management Portal search drop-downs for the same feature. For querying guidelines, refer to: Certificate Search Page on page 34 . The query fields supported for this endpoint are: <ul style="list-style-type: none">• Machine• Version
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
SkipCount	Query	An integer indicating the number of records that should be skipped in providing results, starting from the beginning of the records (for pagination). This field is optional and no records will be skipped if not provided.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Name</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 365: GET Component Installation Response Data

Name	Description
ID	An integer indicating the Keyfactor Command reference ID for the server installation.
Machine	A string containing the FQDN of the server.
Version	A string containing the version of Keyfactor Command installed on the server.
Components	<p>A string containing a comma-separated list of the components installed on the server. Possible components include:</p> <ul style="list-style-type: none"> • Console The server with this role provides the web-based administration interface (the Management Portal) that is used to view and report on certificates issued in the environment and enroll for certificates. This role is required on all Keyfactor Command servers. • Logi The server with this role hosts the Logi Analytics Platform for reporting. This role is required on all Keyfactor Command servers. • Agents The server with this role hosts the back-end service for receiving requests from and sending requests to Keyfactor agents and orchestrators. This role is optional. • KeyfactorAPI The server with this role hosts the newer Keyfactor API. This role is required on all Keyfactor Command servers. • Service The server with this role hosts back-end services required to support Keyfactor Command. This includes the Keyfactor Command Service, which is used for all periodic tasks throughout Keyfactor Command, including CA synchronization, monitoring alerts, and report automation. This role is required on all Keyfactor Command servers.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.14 CSR Generation

The CSR Generation component of the Keyfactor API includes methods necessary to generate certificate signing requests and determine which ones are pending.

Table 366: CSR Generation Endpoints

Endpoint	Method	Description	Link
/Pending/{id}	DELETE	Deletes a pending CSR by ID.	DELETE CSR Generation Pending ID below
/Pending/{id}	GET	Returns the details of a specific CSR request based on the ID number.	GET CSR Generation Pending ID on the next page
/Pending	DELETE	Deletes multiple pending CSRs.	DELETE CSR Generation Pending on the next page
/Pending	GET	Returns a list of all pending CSRs.	GET CSR Generation Pending on page 1588
/Generate	POST	Generate and configure a CSR request.	POST CSR Generation Generate on page 1589

3.6.14.1 DELETE CSR Generation Pending ID

The DELETE /CSRGeneration/Pending/{id} method is used to delete a certificate signing request with the defined ID that has not yet been enrolled. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 367: DELETE CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the certificate signing request for the CSR that should be deleted. Use the <i>GET /CSRGeneration/Pending</i> method (see GET CSR Generation Pending on page 1588) to retrieve a list of all the pending CSRs to determine the CSR IDs.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.14.2 GET CSR Generation Pending ID

The GET /CSRGeneration/Pending/{id} method is used to return a generated CSR with the defined ID that has not yet been enrolled. This method returns HTTP 200 OK on a success with the CSR in PEM format. This method does not return the parsed subject name or CSR request time. If you need that information, use the *GET /CSRGeneration/Pending* method (see [GET CSR Generation Pending on the next page](#)).

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 368: GET CSR Generation Pending {id} Input Parameters

Name	In	Description
id	Path	Required. The ID of the CSR that should be retrieved.

Table 369: GET CSR Generation Pending {id} Response Data

Name	Description
CSRFilePath	The proposed file name for the CSR file. This is considered deprecated and may be removed in a future release.
CSR	The text of the CSR in PEM format.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.14.3 DELETE CSR Generation Pending

The DELETE /CSRGeneration/Pending method is used to delete multiple certificate signing requests that have not yet been enrolled in one request. Delete operations will continue until the entire array of IDs has been processed. This endpoint returns 204 with no content upon success.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 370: DELETE CSR Generation Pending Input Parameters

Name	In	Description
ids	Body	<p>Required. An array of integers indicating the Keyfactor Command certificate signing request IDs for CSRs that should be deleted in the form (without parameter name):</p> <pre>[8,14,27]</pre> <p>Use the GET /CSRGeneration/Pending method (see GET CSR Generation Pending below) to retrieve a list of all the pending CSRs to determine the CSR IDs.</p>

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.14.4 GET CSR Generation Pending

The GET /CSRGeneration/Pending method is used to return details for generated CSRs that have not yet been enrolled. This method returns HTTP 200 OK on a success with details of the pending CSRs with details.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/requests/manage/

Table 371: GET CSR Generation Pending Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.
SortField	Query	A string containing the property by which the results should be sorted. Fields available for sorting through the API for the most part match those that appear as sortable columns in the Keyfactor Command Management Portal. The default sort field is <i>Id</i> .
SortAscending	Query	An integer that sets the sort order on the returned results. A value of 0 sorts results in ascending order while a value of 1 sorts results in descending order. The default is ascending.

Table 372: GET CSR Generation Pending Response Data

Name	Description
Id	A unique integer for the CSR generated.
CSR	A string containing the text of the CSR in PEM format.
RequestTime	A string containing the date and time that the CSR was generated in UTC time.
Subject	An array or strings containing the subject of the certificate including the certificate subject information, the subject alternative names, the key length, and the hash algorithm.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.14.5 POST CSR Generation Generate

The POST /CSRGeneration/Generate method is used to generate and configure a CSR. This method returns HTTP 200 OK on a success with a message body containing the text of the CSR file created.

This method generates a private key and stores it in the Keyfactor Command database. When you use the CSR resulting from this method to enroll for a certificate through Keyfactor Command (see [POST Enrollment CSR on page 1658](#)), the resulting certificate is married together with the stored private key and may then be download with private key (see [POST Certificates Recover on page 1169](#)).

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
`/certificates/enrollment/csr/generation/`

Note: This endpoint no longer includes the CSRFilePath return value in the response from the API call. Code separate from the API should be used to handle receipt of the CSR and placement on the file system.

Table 373: POST CSR Generation Generate Input Parameters

Name	In	Description						
Curve	Body	<p>A string indicating the elliptic curve for the requested key. ECC curves may be specified using the well-known OIDs for ECC algorithms. Well-known OIDs include:</p> <ul style="list-style-type: none"> • 1.2.840.10045.3.1.7 = P-256/prime256v1/secp256r1 • 1.3.132.0.34 = P-384/secp384r1 • 1.3.132.0.35 = P-521/secp521r1 						
KeyLength	Body	<p>Required*. An integer indicating the desired key size of the certificate. Supported key sizes are:</p> <ul style="list-style-type: none"> • 255 • 256 • 384 • 448 • 521 • 2048 • 3072 • 4096 • 8192 <p>This value is required only if <i>KeyType</i> = RSA.</p>						
KeyType	Body	<p>Required. A string indicating the desired key encryption of the certificate. Supported key types are:</p> <ul style="list-style-type: none"> • RSA • ECC • Ed448 • Ed25519 						
SANs	Body	<p>An object that contains the elements for Keyfactor Command to use when generating the subject alternative name (SAN) for the certificate requested by the CSR, each of which is supplied as an array of strings. Possible values for the key are:</p> <table border="1" data-bbox="565 1493 1403 1682"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>rfc822</td> <td>RFC 822 Name</td> </tr> <tr> <td>dns</td> <td>DNS Name</td> </tr> </tbody> </table>	Value	Description	rfc822	RFC 822 Name	dns	DNS Name

		<p>CSR.</p> <p>This field is required if the <i>Common Name Regular Expression</i> application setting is set to the default value of <code>.+</code>. See Application Settings: Enrollment Tab on page 609 for more information.</p>																								
Organization	O	The desired organization of the certificate to be requested with the CSR.																								
OrganizationalUnit	OU	The desired organizational unit of the certificate to be requested with the CSR.																								
Locality	L	The desired city of the certificate to be requested with the CSR.																								
State	ST	The desired state of the certificate to be requested with the CSR.																								
Country	C	The desired country (two characters) of the certificate to be requested with the CSR.																								
Email	E	The desired email address of the certificate to be requested with the CSR.																								

Name	In	Description
Template	Body	<p>A string indicating the desired template to be used for the certificate to be requested with the CSR. The template must have been configured in Keyfactor Command to support CSR generation. This field is optional.</p> <div style="background-color: #f9a825; padding: 10px; border-radius: 10px;"> <p> Important: The template will not be included in the CSR. The template is referenced in order to retrieve key and other information to help populate the CSR. In addition, the CSR generation function supports template-level regular expressions for both subject parts and SANs. If system-wide and template-level regular expressions exists for the same field and you select a template, the template-level regular expression is applied.</p> <p>If you choose to select a template during CSR generation, you will need to choose the same template during CSR Enrollment, because the CSR file will contain elements from the template which may conflict with other template configurations.</p> </div>

Table 374: POST CSR Generation Generate Response Data

Name	Description
CSR	The text of the CSR in PEM format.

 **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon  at the top of the Management Portal page next to the **Log Out** button.

3.6.15 Custom Job Types

The Custom Job Types component of the Keyfactor API includes methods necessary to create, update, list and delete custom orchestrator job types. Custom job types are intended to execute jobs on an orchestrator built using the AnyAgent framework that are outside the standard list of job functions built into Keyfactor Command. This powerful feature can execute just about any job that requires processing on the orchestrator and submitting data back to Keyfactor Command. The data submitted by custom jobs to Keyfactor Command is stored as a string and is limited to 2 MB.

Table 375: Custom Job Types Endpoints

Endpoint	Method	Description	Link
/id}	DELETE	Deletes the custom job type for the specified ID.	DELETE Custom Job Types ID below
/id}	GET	Returns details for the custom job type for the specified ID.	GET Custom Job Types ID on the next page
/	GET	Returns all the custom job types.	GET Custom Job Types on page 1598
/	POST	Creates a custom job type.	POST Custom Job Types on page 1600
/	PUT	Updates an existing custom job type.	PUT Custom Job Types on page 1604

3.6.15.1 DELETE Custom Job Types ID

The DELETE /JobTypes/Custom/{id} method is used to delete an existing custom job type with the specified GUID. This endpoint returns 204 with no content upon success.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/modify/

Table 376: DELETE JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1598) to retrieve a list of all the custom job types to determine the job type GUID.

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.15.2 GET Custom Job Types ID

The GET /JobTypes/Custom/{id} method is used to return a custom job type with the specified GUID. This method returns HTTP 200 OK on a success with details for the custom job type.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/read/

Table 377: GET JobTypes Custom {id} Input Parameters

Name	In	Description
id	Path	Required. The Keyfactor Command reference GUID of the custom job type. Use the <i>GET /JobTypes/Custom</i> method (see GET Custom Job Types on page 1598) to retrieve a list of all the custom job types to determine the job type GUID.

Table 378: GET JobTypes Custom {id} Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Job type fields parameters are:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string that indicates the name for the job type field.</td> </tr> <tr> <td>Type</td> <td> <p>A value that indicates the data type of the job type field. DefaultValue	A string containing the default value of the job type field. If <i>Type</i> is <i>Boolean</i> , this field should contain <i>true</i> or <i>false</i> .																									
Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.15.3 GET Custom Job Types

The GET /JobTypes/Custom method is used to retrieve a list of all custom job types. This method returns HTTP 200 OK on a success with details for each job type.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/read/

Table 379: GET Job Types Custom Input Parameters

Name	In	Description
PageReturned	Query	An integer that specifies how many multiples of the returnLimit to skip and offset by before returning results, to enable paging. The default is 1.
ReturnLimit	Query	An integer that specifies how many results to return per page. The default is 50.

Table 380: GET Job Types Custom Response Data

Name	Description																									
Id	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it.																									
Description	A string containing a description for the custom job type.																									
JobTypeFields	<p>An array of job type fields that indicate the type of tasks the job type is designed to perform. Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.15.5 PUT Custom Job Types

The PUT /JobTypes/Custom method is used to create a custom orchestrator job type in Keyfactor Command. This method returns HTTP 200 OK on a success with a message body containing a list of certificate store type details.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/agents/management/modify/

Important: Any previously populated fields that are not submitted with their full existing data using this method will be cleared of their existing data. When using this method, you should first do a GET to retrieve all the values for the record you want to update, enter corrected data into the field(s) you want to update, and then submit all the fields using PUT, including the fields that contain values but which you are not changing.

Table 383: PUT JobTypes Custom Input Parameters

Name	In	Description																									
Id	Body	The Keyfactor Command reference GUID for the custom job type. This ID is automatically set by Keyfactor Command.																									
JobTypeName	Body	Required. A string containing the short name for the custom job type. This is used to reference the job type when submitting a job for it. This name should not contain spaces.																									
Description	Body	A string containing a description for the custom job type.

Required	A Boolean that sets whether the job type field is required (true) or not (false).																									

Tip: See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon (?) at the top of the Management Portal page next to the **Log Out** button.

3.6.16 Enrollment

The Enrollment component of the Keyfactor API includes methods necessary to enroll certificate signing requests (CSRs) and personal information exchanges (PFxs).

Table 385: Enrollment Endpoints

Endpoint	Method	Description	Link
/Settings/{Id}	GET	Returns the template settings to use during enrollment.	GET Enrollment Settings ID on the next page
/CSR/Context/My	GET	Returns the templates available for CSR enrollment by the current user.	GET Enrollment CSR Content My on page 1616
/PFX/Context/My	GET	Returns the templates available for PFX enrollment by the current user.	GET Enrollment PFX Content My on page 1634
/AvailableRenewal/Id/{id}	GET	Returns the type of renewals available for the referenced certificate ID.	GET Enrollment Available Renewal ID on page 1653
/AvailableRenewal/Thumbprint/{thumbprint}	GET	Returns the type of renewals available for the referenced certificate thumbprint.	GET Enrollment Available Renewal Thumbprint on page 1656
/CSR	POST	Performs a CSR enrollment.	POST Enrollment CSR on page 1658
/PFX	POST	Performs a PFX enrollment.	POST Enrollment PFX on page 1665
/CSR/Parse	POST	Returns information found in a CSR in a human friendly form.	POST Enrollment CSR Parse on page 1683
/PFX/Deploy	POST	Adds a certificate into a certificate store following a PFX enrollment or certificate renewal.	POST Enrollment PFX Deploy on page 1685
/PFX/Replace	POST	Replaces a certificate in a certificate store following a PFX enrollment.	POST Enrollment PFX Replace on page 1691

Endpoint	Method	Description	Link
/Renew	POST	Performs a certificate renewal.	POST Enrollment Renew on page 1694

3.6.16.1 GET Enrollment Settings ID

The GET /Enrollment/Settings/{id} method is used to return the template settings to use during enrollment for a given template. The response will be the resolved values for the template settings (based on whether they are global or template-specific). This method returns HTTP 200 OK on a success with details of the template regular expressions, defaults, and policy. If there is a template-specific setting, the template-specific setting will be shown in the response. If there is not a template-specific setting, the global settings will be shown in the response.

Tip: The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:

/certificates/enrollment/csr/
OR
/certificates/enrollment/pfx/
OR
/certificates/enrollment/csr/generation/

Table 386: GET Enrollment Settings {id} Input Parameters

Name	Description
id	An integer indicating the Keyfactor Command reference ID for the enrollment template. Use the <i>GET /Templates</i> method (see GET Templates on page 2422) to retrieve a list of all the templates to determine the template ID.

Table 387: GET Enrollment Settings {id} Response Data

Name	Description										
TemplateRege- xes	<p>An array of objects containing the regular expressions resolved for the template.  **Tip:** See the *Keyfactor API Reference and Utility* which provides a utility through which the Keyfactor API endpoints can be called and results returned. It is intended to be used primarily for validation, testing and workflow development. It also serves secondarily as documentation for the API. The link to the Keyfactor API Reference and Utility is in the dropdown from the help icon () at the top of the Management Portal page next to the **Log Out** button.

3.6.16.2 GET Enrollment CSR Content My

The GET /Enrollment/CSR/Context/My method is used to check the templates and CAs available for CSR enrollment for the current user. This method has no input parameters other than the standard headers (see [Endpoint Common Features on page 849](#)). It returns HTTP 200 OK on a success with the list of templates that are available for enrollment via Keyfactor Command and the CAs those templates may be enrolled from along with template and CA configuration details. Results are returned based on the enrollment permissions of the user making the request—both Keyfactor Command permissions and template and CA level permissions on the originating CA. Templates or standalone CAs are included in the results only if the user has appropriate permissions in both locations and the template and CA are configured for CSR enrollment in Keyfactor Command.

 **Tip:** The following permissions (see [Security Roles and Claims on page 622](#)) are required to use this feature:
/certificates/enrollment/csr/

Table 388: GET Enrollment CSR Content My Response Data

Name	Description														
Template- s	<p>An array of objects containing the templates available for enrollment by the user. Each object contains the following parameters:</p> <table border="1" data-bbox="370 411 1406 1591"> <thead> <tr> <th data-bbox="370 411 602 478">Name</th> <th data-bbox="602 411 1406 478">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="370 478 602 573">Id</td> <td data-bbox="602 478 1406 573">An integer indicating the Keyfactor Command reference ID of the certificate template.</td> </tr> <tr> <td data-bbox="370 573 602 737">Name</td> <td data-bbox="602 573 1406 737">A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td data-bbox="370 737 602 900">DisplayName</td> <td data-bbox="602 737 1406 900">A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.</td> </tr> <tr> <td data-bbox="370 900 602 1026">RequiresAp- proval</td> <td data-bbox="602 900 1406 1026">A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).</td> </tr> <tr> <td data-bbox="370 1026 602 1362">RFCEn- forcement</td> <td data-bbox="602 1026 1406 1362">A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.</td> </tr> <tr> <td data-bbox="370 1362 602 1591">CAs</td> <td data-bbox="602 1362 1406 1591">An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the Keyfactor Command reference ID of the certificate template.	Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.	DisplayName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.	RequiresAp- proval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).	RFCEn- forcement	A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.	CAs	An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:
Name	Description														
Id	An integer indicating the Keyfactor Command reference ID of the certificate template.														
Name	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.														
DisplayName	A string containing the common name (short name) of the template. This name typically does not contain spaces. For a template created using a Microsoft management tool, this will be the Microsoft template name.														
RequiresAp- proval	A Boolean indicating whether the template has been configured with the Microsoft <i>CA certificate manager approval</i> option enabled (true) or not (false).														
RFCEn- forcement	A Boolean indicating whether certificate enrollments made through Keyfactor Command for this template must include at least one DNS SAN (true) or not (false). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. By default, this is set to <i>false</i> at a system-wide level and may be overridden on a template-by-template basis.														
CAs	An array of objects indicating the certificate authorities that allow enrollment for the template and the requesting user. The template must be available for enrollment on the CA, the template and CA must be configured for enrollment in Keyfactor Command, and the requesting user must have enrollment permissions. Information about the CA includes:														

Name	Description												
	<table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td> <table border="1"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Name</td> <td>A string indicating the full name of the CA, made up of the DNS hostname of the certificate authority (e.g. corpca01.keyexample.com) and the logical name (e.g. CorplssuingCA1) for a full name similar to corpca01.keyexample.-com\\CorplssuingCA1.</td> </tr> <tr> <td>RFCEenforcement</td> <td>A Boolean that sets whether certificate enrollments made through Keyfactor Command for this CA must include at least one DNS SAN (<i>true</i>) or not (<i>false</i>). In the Keyfactor Command Management Portal, this causes the CN entered in PFX enrollment to automatically be replicated as a SAN, which the user can either change or accept. For CSR enrollment, if the CSR does not have a SAN that matches the CN, one will automatically be added to the certificate if this is set. This setting at the CA level applies only to standalone CAs. For CAs that use templates, this setting is controlled at the template level and is ignored at the CA level.</td> </tr> <tr> <td>SubscriberTerms</td> <td>A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).</td> </tr> </tbody> </table> <div style="border: 1px solid green; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Tip: Configure a link to the custom terms using the <i>URL to Subscriber Terms</i> application setting. SubscriberTerms	A Boolean that sets whether to add a checkbox on the enrollment pages to force users to agree to a custom set of terms before enrolling (<i>true</i>) or not (<i>false</i>).												

Name	Description										
Enroll- mentFields	<p>An array of objects containing custom enrollment fields. These are configured on a per-template basis to allow you to submit custom fields with CSR enrollments and PFX enrollments to supply custom request attributes to the CA during the enrollment process. This functionality offers such benefits as:</p> <ul style="list-style-type: none"> • Preventing users from requesting invalid certificates, based on your specific certificate requirements per template. • Providing additional information to the CA with the CSR. <p>Once created on the template, these values are shown in Keyfactor Command on the PFX and CSR enrollment pages in the <i>Additional Enrollment Fields</i> section. The fields are mandatory during enrollment. The data will appear on the CA / Issued Certificates attribute tab for certificates enrolled with a template configured with Keyfactor Command enrollment fields.</p> <div style="border: 1px solid #add8e6; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note: These are not metadata fields, so they are not stored in the Keyfactor Command database, but simply passed through to the CA. The CA in turn could, via a gateway or policy module, use this data to perform required actions.</p> </div> <p>The array contains the following parameters:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Id</td> <td>An integer indicating the ID of the custom enrollment field.</td> </tr> <tr> <td>Name</td> <td>A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.</td> </tr> <tr> <td>Options</td> <td>For multiple choice values, an array of strings containing the value choices.</td> </tr> <tr> <td>DataType</td> <td>An integer indicating the parameter type. The options are:</td> </tr> </tbody> </table>	Name	Description	Id	An integer indicating the ID of the custom enrollment field.	Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.	Options	For multiple choice values, an array of strings containing the value choices.	DataType	An integer indicating the parameter type. The options are:
Name	Description										
Id	An integer indicating the ID of the custom enrollment field.										
Name	A string indicating the name of the custom enrollment field. This name will appear on the enrollment pages.										
Options	For multiple choice values, an array of strings containing the value choices.										
DataType	An integer indicating the parameter type. The options are:
